R: You now undertake a classical hand levitation, but your words have another level of meaning where hand levitation becomes equivalent to penis levitation. Several times you mention You can't stop it. Are you thereby attempting to symbolically depotentiate his conscious mind's ability to stop a penis erection?
E: Yes.

R: It is fascinating to hypothesize that his left hemisphere may be so preoccupied with levitating his right hand that it leaves his right hemisphere more available to accept and act upon your therapeutic suggestions given in the symbolic language of the right hemisphere. Recent research (Smith, Chu, and Ed-monston, 1977; Diamond and Beaumont, 1974; Kinsbourne and Smith, 1974) indicates that preoccupying the dominant cerebral hemisphere with one activity does tend to leave the other hemisphere free to deal with other data. This may be the neuropsychological basis of your common practice of interspersing therapeutic suggestions in the symbolic language of the unconscious (or non-dominant hemisphere) along with hand levitation or any other approach to induction that occupies the attention of the dominant cerebral hemisphere. A great deal of systematic research is now required to test this hypothesis of hemispheric interaction in trance induction and suggestion in order to ascertain the parameters under which this therapeutic approach could be maximized.

Posthypnotic Suggestion Contingent on Inevitabilities

E: And you can enjoy it. It won't be your hair. It won't be your hair. It will be the feeling of hers. And you can't lower your hand until you've enjoyed sensing the feeling of hair sensing a warm body.

[Pause]

And nothing can tell you that your penis won't stand up. Nothing can tell you that.

[Pause]

And nothing can prevent it from feeling hair and a vagina for as long as you want.

[Pause]

And I want you to notice your hand doesn't feel as if it's touching your hair, it feels as if it's touching that lady's hair.

[Pause]

E: I initiated the process of lifting toward his face and hair. Once that was well under way and could not be stopped, then I could shift it to the issue of vagina and pubic hair.
R: Having accepted the initial condition, he is carried on by its momentum to accepting the therapeutic suggestion.

E: Now he can't avoid sensing a warm body when he is with her; that's inevitable and I've symbolically tied an erect penis to her warm body when I say You can't lower your hand until you've enjoyed... warm body.

R: This is a basic principle of posthypnotic suggestion wherein you always make a suggested behavior contingent on an inevitability. Further Posthypnotic Suggestion

And I want you to have the surprise of your life because sometime today or tomorrow your hand will touch the hair on her head, and you'll find what your penis will insist on doing. And you're going to let that be a surprise are you not?

[P nods his head yes]

[Pause]

And you're going to be so delighted with the forcefulness of your desire. But you will not offend the lady. But you will be pleased with the very forcefulness of the desire.

[Pause]

And philosophers of old have said, As a man thinketh, he is. And you'll never forget that, will you? And now think this question over well, are you willing to tell us something about the lady?

[P nods head yes]

E: Sometime today or tomorrow actually means anytime. It could be next month and still fall within the generalized time range of this suggestion.

R: Here you again make a posthypnotic suggestion about penis erection contingent on another inevitability (touching her hair).

E: How do you offend the lady? By either being too forceful or not forceful enough. I've covered both possibilities there forcefulness of your desire. When I then ask him if he wants to tell us something about the lady, it implies he has choice, and if he tells us something he also has the right to hold back other things. The right to hold things back gives him potency and power. Preparation for Awakening
All right, take your time and awaken and just spontaneously tell us something about her.

[Pause as P opens his eyes and focuses as if he is awake. His hand remains at his head, however, and he does not reorient any other part of his body]

P: Well, she is beautiful. She is the same age as I am. And I never loved anyone like this before in my life.

E: I’ve just given him the implied posthypnotic suggestion to hold back and he responds with the generalization Well, she is beautiful. He is actually holding back. He’s following a posthypnotic suggestion without even realizing it.

R: In having him hold back you're returning him to his normally awake ego controls and are thereby preparing him for a full awakening.

E: Yes, when he admits loving her more than anyone else in his life, he is volunteering that on a more conscious awake level. Symbolically Displacing and Discharging a Lack of Confidence

E: What did you just learn about yourself?

P: More confidence, for one thing.

E: There is something lacking in your confidence?

P: Yes, there was doubt.

E: There is something now lacking in your confidence. I'll tell you what it is. You can't put your hand down.

P: Hum!?

E: When he talks about confidence here, he’s implying a lack of confidence, so I displace it onto the hand. Put the lack of confidence in a harmless place.

R: This is a way of displacing and discharging a lack of confidence in a symbolic manner. Two-level Communication with True Trance Awakening

E: And you can't push it down until you have a feeling of intense satisfaction.

[Long pause as P closes his eyes. He finally opens them again, puts his hand down, and adjusts his whole body slightly, as is characteristic of patients awakening from trance.]
P: Yeah, I feel pretty good now!

E: And what are you going to need?

P: Uh?

E: You don't have to tell us.

P: No.

E: But you think it over. She's got two beautiful twins, and both deserve a name.

[Pause]

P: Yeah.

E: After a pleasant sexual intercourse what happens?

R: You relax and your penis goes down. So your suggestion that he can't put his hand down until he has a feeling of intense satisfaction is another bit of two-level communication that he receives just as he is waking up. This tends to build a bridge between the therapeutic suggestion on the unconscious and conscious levels.

E: He then responds with, Yeah, I feel pretty good now! A two-level response without his quite realizing it. I now continue with remarks about her two beautiful twins, which he recognizes as a reference to her breasts. If he is to make love to her, he had better appreciate her breasts. Indirect Ideodynamic Focusing

E: Someone who liked mountain climbing was asked on a social occasion, Do you intend to do any mountain climbing this weekend? And he said, Oh, yes, but he didn't name the mountain. That was a secret between him and his wife. And every couple should have a language of love.

[Pause]

P: I feel better now.

E: And another friend of mine was asked at the dinner table, Would you like to have a cup of soup? He answered, Yes, I always like a cupful. What he really meant was, Yes, I always like a cup full of life.

P: Yeah.
R: You're here emphasizing the two-level communication about love play in everyday life.

E: Yes, these two-level communications are like the secret language of childhood.

R: Since they come from childhood, they are rich in the sort of ideodynamic responses he will need in his new love life. You are thus activating these processes by talking about them. This is another example of indirect ideodynamic focusing for a therapeutic response. Therapeutic Restructuring of a Former Symptom

E: Now, I always tell young men, Sometime in your lifetime you're going to lose your erection. And what you don't know is that your unconscious mind is telling you that the beauty of your wife's body is overwhelming. And to enjoy that fact. Because that's the greatest possible compliment you both can receive. If on some occasion unexpectedly you lose your erection, it's a very profound compliment, because as soon as you realize you have complimented her in the most ultimate fashion, then your erection comes back.

[Pause]

R: Do you actually believe that a loss of erection could really be a compliment, or is this just a rationalization you're offering him?

E: He's placed a bad interpretation on a loss of erection. Why should he keep that forever and ever? Life is much better if sometimes it rains and sometimes it doesn't. I've seen many cases where it really was a compliment. Further Therapeutic Analogies

E: How long did you practice in X city?

P: Since Y. I retired a few years ago. [A general conversation now takes place about P's medical practice and his use of hypnosis on his patients.]

E: How many Ginkgo trees are there in X?

P: I don't know.

E: I was given a drive through X and passed an intersection and I said to my friend who was driving, 'Didn't we just pass a Ginkgo tree up that side street? I've never seen one, but I'm sure it was a Ginkgo tree. He said, You're right. Later he showed me some petrified Ginkgo wood.
P: Oh!

E: [To R] Do you know the Ginkgo tree?

R: Oh yes, very well! They have live motile sperm!

P: Yes.

E: One time when I was in X, I ordered oysters. The waiter said, You're lucky, we have just two orders left. I said, I'll take them both.

[A round of laughter at the implied association between eating oysters and sexual potency. The conversation then drifts to seafood in general and P's hobbies, one of which has to do with working with fine grains and textures of wood.]

What more would you like to say to me?

P: I don't think there is anything. I just feel entirely different. I feel as if a load has been lifted off my shoulders. I just feel that I have confidence in myself that I did not have before.

E: Now I'm not able to travel, but will you send me a wedding invitation? P: Yes, I'll do that. It's a wonderful feeling. It's a good feeling. E: How do you like this?

[The senior author shows P a fine sculpture of a bird emerging from a branch of wood. The front part of the bird is carved very simply and elegantly, while the latter part of its body is not sculptured at all; it simply merges into the natural form of the wood.]

P: I've never seen anything like it.

E: Like a butterfly emerging from a cocoon. Only this time it's a bird.

P: Did you carve it?

E: No, I used to carve. Do you like wood-carving?

P: I've never done any, but I like it.

E: Would you like to see the world's largest private collection of iron wood carvings?

[The therapy session thus ends with P being shown the senior author's collection of ironwood carvings made by the Indians of Central Mexico.]
R: You terminate the interview with these further therapeutic analogies that now shift the relationship from doctor-patient to friends as you invite him into your home to look at your collection of carvings.

E: He knows I like oysters and he likes wood carvings and so do I. We share likings.

R: Since you like sexuality, then he must like it, too. This aspect of your work is essentially a transference cure as well as a way of resolving the transference, since you become just another human being with your personal tastes, etc.

Death as Ally idea i.e look to left shoulder where death sits...your ally...is to ask yourself question ... is this a good day to die? ... i.e am I ‘right’ with the world? ... if this was my last act, and would define my life, would I be content to be defined by this last act? ... i.e to act always to the fullness of your integrity and powers ... so do not need to call a priest to make last rites to make you ‘right with the world / god / self’...you have total integrity...today is a good day to die...living ‘true’, ‘authentic’, with integrity ... you would happily go to the great father / next life with this last act / deed / thought / intention as your ‘visiting card’, the ‘defining act’ that ‘defines you’ and all you stood for in your life...you could die at this moment sure in the knowledge that you have not let yourself down, not betrayed your authenticity...if you were to be judged by what is in your heart, your mind, what your motives and desires, and plans are, at this very moment as it is unfolding, would you happily face the judgement, or dread that judgement? ... it is about impeccably following the warriors path to truth, justice, and beauty...so that your every action, thought, intention promoted these ends...so that you were sowing the seeds of truth, justice, and beauty for eternity...without worrying about ‘am I being paid enough’ or ‘someone else is more fortunate than me’, or someone else has undeserved benefits people like me deserve...to not focus on ‘what can I harvest for myself today’, but what seeds can I sow for ‘my’ infinite future selves...what patterns and habits have I formed and reproduced and modelled for other sentient beings as an investment in OUR future, and thus MY future, as any of THEM ... if I were to be randomly new incarnated as any sentient being in this world, what have I done to endure that ALL of them are lives worth living, and thus MY own next lives will also be worth living...???

NLP refer to Zen ‘be here now’ as ‘up-time’...i.e Castaneda’s ‘turning off the world’, my own ‘escaping history’, Zen’s ‘turning off the internal dialog’...all about existing in moment, letting world speak TO you as passive receptor, with all channels open and receiving, without any noetic structure/definitions of your mind filtering out/labelling/defining/limiting/’tuning out’ anything...,
Dilts observes common everyday expressions, and makes great breakthroughs …sudden Zen moments … I can not … and I don’t think … both are active choices … choosing to not (you could or you couldn’t, and you chose couldn’t, because the statement reveals that you could have chosen to be able to to i.e you can not, and you can/could do … and you suddenly realise that you have chosen NOT to think something, when you could just as easily have chosen to THINK it !)

I can NOT do it … is active…they are NOT doing IT … what they are DOING is NOT doing it… so not doing is an action … so when say ‘I can not do that’…well that is true…you can NOT do it, but you could instead DO it, rather than NOT doing it…

I DON’T think they’ll respond positively / like me / I’ll succeed / I’ll be welcome etc… Well why don’t you simply DO think they’ll like you / you’ll succeed? … both are equally active actions … you have the choice of NOT thinking something positive, or to DO think something positive … and vice versa…you can NOT do something, or you can DO something…both are equally active actions on your part…choices you have made…non-consciously…your non-conscious ‘learnt’ NOT to do something or to DO something, often very quickly, and with very superficial reasons (overheard something, saw something, imagined something, made some ‘connection’ between impressions, often NON-consciously) … so can replace the earlier sub-optimal limiting belief / impression / stimulus response, with a new, more optimal / empowering / resourceful one…

As all impressions / feelings / emotions / pain / pleasure are representations i.e decoding electrical signals into a feeling / sensation … idea is that, instead of ‘feeling’ pain i.e ‘kinesthetic’ representation of the electrical signals / pressure we ‘feel’ as pain … we could instead ‘see’ or ‘hear’ pain i.e convert it into an image / colored shape / or sound … so we get the ‘feedback’ ‘intended’ by the unconscious / nervous system … i.e something wrong … etc … without any ‘suffering’ … one step above Zen idea of feeling pain without ‘suffering’ … !!!

Grinder: speak internally with unconscious…acknowledge/thank it for the solutions it has provided to date, that let you survive…ask it now, as an adult, with more experience, to generate alternative solutions to the ones it currently has in place, and then to select the most optimal ones i.e replace limiting beliefs with resourceful beliefs…dysfunctional beliefs / symptoms with more functional ones…achieve the avoidance / secondary gains / payoffs more optimally … when it is ready, could it provide a physical sign, such as …

Double bind is technique / trick to get person to do something that contradicts a limiting belief they have stated e.g I cannot say no … so ask them to ask X
question Y, and they will say, ‘no, I can’t’…repeat…after a few times draw
attention to fact that client has said NO to YOU several times, without any feared
consequences… i.e to get person to act in way contradictory to their limiting
belief, without feared consequences / generalized feared negative outcomes …

Look for generalisations (so can prove wrong with one individual case that
contradicts), deletions (negative hallucinations/denial), and distortions … in the
sentences client uses i.e language… i.e surface structure Vs deep structure of
language i.e what omitted / distorted i.e difference between reality and their
utterance e.g She always says no… MHR INTERROGATION … !!!

Mirror, e.g breathing, with some other gesture e.g nod of your head, movement of
something, until corresponds…then change your movement slightly, to see if
their breathing pattern shifts to match it…this is how you can ‘tell’ if you have
rapport i.e have developed / initiated rapport i.e can now ‘lead’ …

NLP was about modelling successful behaviors / approaches … genius … what
did they do that was different to mediocre? … Processes …

We interact with the world through 5 senses … result is maps / models /
representations of the ‘objective’ world … to NLP … to MHR no need for actual
‘objective’ world ‘out there’ at all … like Schopenhauer’s ‘The world as will and
representation’, the map may be the actual terrain … i.e no actual terrain at all,
only maps … no ‘out there’… all ‘in here’ i.e all experience constructed
internally, in own mind … even ‘locus’ of ‘brain’ may be illusion …

For NLP / linguists, language is a representation system i.e encoding system for
reality … for MHR / Nietzsche etc it arises from desire / need to communicate …
i.e we do not ‘think’ in words…but to share our thoughts, words are convenient
i.e nouns, then verbs, then descriptive words … like Aristotle, most people fail to
move down into the lower levels of composition of assumptions i.e arrive at some
convenient level of composition e.g man is measure of all things / free will …
language exists so it MUST be primary / fundamental / necessary … like
functionalists generally … e.g interactions become institutionalized … and we
arrive at time of institutions, and take them for ‘the lowest level of composition’
i.e fail to see how they emerge from interactions … etc… and Chomsky et al
assuming there is some logical master grammar that all languages are built from,
when in fact grammar just describes the institutions that arose from
interactions… thus my ‘phrasal syntax’ and ‘language feeling right or wrong’ Vs
there being some rule…as if languages built from rules…fail to see that the rules
are descriptions of what ‘feels’ right, after the fact of the language conventions
having emerged…evolved…constantly changed…
Note that reason, when you look into someone’s eyes, you see a mechanical device, is that in fact ‘we’, the person, is NOT looking OUT of their eyes—the eyes are a device for focusing light onto the back of the head…we are literally in Plato’s ‘cave’… our personal projection room… ‘looking’ at the screen hanging on the inside back of our heads…this is where the light that enters our eyes is projected… we are really ‘facing’ backwards, when we ‘look’ forwards … at the cave wall formed by the back of our heads … there is absolutely never a 1:1 correspondence between ‘out there’ i.e some putative objective reality / electromagnetic soup, and ‘in here’, what we experience as ‘reality’…

NLP called Neuro Linguistic Programming … as it recognizes that first we code the ‘out there’ via ‘representations’ i.e the 5 conscious senses … these senses filter out very narrow bandwidths of the electromagnetic spectrum e.g 400-600 nanometers, 20-20,000 Hz… e.g we do not ‘perceive’ the radio waves / internet spectrums we are bathed in … our computers are set up to ‘encode’ and ‘decode’ these signals … so we are adding ‘senses’ … N.B our senses are subtractive i.e they take away most of the spectrum…most of ‘objective reality’ … we cannot say if there are sentient beings acting all around us, using their own technologies, operating on different ‘wavelengths’ i.e vibrational frequencies… feeding off our emotions? … playing with us … we being their ‘virtual reality’ …

So our interface with objective ‘reality’ is first limited by our 5 senses … what bandwidths they can ‘perceive’ and hence what ‘impressions’ we have of ‘reality’ … that is the ‘neurological’ level of composition … the brain and senses … the next level relates to language … words are magical … can induce trance … we can be ‘told’ something is real, and it becomes real … fantasy … hallucination … santa claus, gods, easter bunnies, passenger airliners flying into the WTC and Pentagon … because we encode our experience into linguistic models … language … words … metaphors made up of words which evoke images, associations, feelings, and real ‘experiences’ … we can read a book and become immersed in it … a reality made up of words … we can construct experiences out of words… we can ‘suggest’ reality … propaganda … conditioning …

While NLP originally developed to model ‘genius’…it is TROONATNOOR … i.e very wide in use / abuse … a powerful tool for good… a terrible weapon for bad …when understood in its holistic context … NLP is a key player in TROONATNOOR … the ‘discoverers’ were probably unaware of the long tradition in Zen, Buddhism etc …of NLP …
Necessary and accidental … i.e. modelling genius…is color of tie, ritual perform, key to outcome? … what can you take away from the behavior, and still attain the outcome i.e what part of geniuses behavior, habits, approach, actions, state of mind etc can you ignore…parsimony … what part of rituals / behaviors / state of mind is necessary i.e actually contributes to outcome…and what can you economically ignore i.e not reproduce in your model…

Most high performers / geniuses have rituals e.g. ‘lucky routine’ or ‘lucky hat’ etc which has become an ‘anchor’ for their high performance state … not superstitious…this set of ‘lucky’ ritual behaviors recall that state … anchor it … trigger it… i.e mind associates these with the ideal high performance state due to imprinting e.g first time success associated with the tie and hat, so from now on by conditioning imprint, if you wear that tie and hat, your will trigger the association, and the unconscious recalls the ‘high performance state’…the Zen state…

We can artificially construct such states, and anchor them, deliberately … identify the ideal / optimal states that work for us, worked for successful people … immerse ourselves in a vivid reconstruction of the state at all 5 sense levels, 3 main audio, visual, kinesthetic levels…modes and sub-modes… e.g the Zen ‘open mind’ ‘empty mind’ ‘expectant mind’ where all mental noise is eliminated, all prejudice / preconceptions stilled … so we are in the moment … interfacing with exactly what is here and now … reacting to our adversaries moves in real time … not anticipating … seeing what is actually there, now … like opening a portal for our unconscious to act for us… avoid square gating … can perform the most elaborate sets of moves impossible for conscious mind to coordinate… access the creative source…the no-thing from which all things emerge…

Religion anchors fear, guilt, shame using linguistic weaponized words and language e.g. description of hells and gods and original sin … pairs them with rituals and locations e.g churches standardized architecture and rituals… it is the oldest NLP…weaponized NLP…mind control…terrorism…

Biggest challenge is to open the ‘Bardot’ of now…a moment free from prejudice, preconception, reproduction of past beliefs / expectations … need exercises … e.g. yoga, meditation, Zen …therapeutic / generative / resourceful trance states … in which we can ‘escape history’, stop its automatic reproduction … allow the unknowable / incomprehensible no-mind, the unconscious, the ‘black box’, to flow into our being…to recalibrate ‘reality’…to seek more optimal solutions … to identify the NLP coded definitions that are faulty… to replace them with new definitions … more optimal and resourceful definitions… to re-construct new models…Thanatos…dis-integrate the old … allow for a new integration…a new synthesis… a purge…
From the mp3s…cannot find the original text?

NLP spelling strategy is to visualize word, then spell it in your mind, and focus on whether it ‘feels’ right or not…if it doesn’t, then try an alternative spelling, until you hit upon the one that ‘feels right’ … use ‘benchmark’ of word you are confident you can spell, and how you ‘feel’ when you spell it i.e how that ‘confidence’ feels … compare it to words whose spelling you are unsure of…what is different in how you ‘feel’ about it…use this as your model / guide … assumes have seen the word correctly spelt and used the word before, so that it has been imprinted at some level in the unconscious…i.e using the unconscious … accessing indicators / tells of unconscious as guide … need to ensure student DOES visualize (use NLP ‘tell’s a.k.a ‘eye accessing cues’ to decide if student following this strategy … can observe great spellers and see if THEY use this strategy … then to monitor students teaching this strategy to explicitly … i.e attempt to model the ‘genius’ of ‘great spellers’ i.e the strategy’s they implicitly or explicitly / knowingly or unknowingly, deliberately or intuitively, automatically or due to training, DO… i.e origin of NLP was in modelling genius…to make explicit, the implicit strategies / behaviors of the genius … even to genius themselves … can ask genius … but many strategies come ‘naturally’ to the genius e.g sporting talent, musician, writer, mathematician, physicist, salesperson, manager, (philosopher! No, too dangerous for ‘society’ a.k.a ‘beneficiaries of society’ as we know it)…

Erickson managed two level communication … the superficial one to the consciousness … and interweaved into this, and defined by subtle hand signals or two separate pitches / tones in his voice, one targeted towards the unconscious, which he trusted it to recognize, and decode i.e the unconscious would attend to the words, phrases directed toward it, while conscious mind oblivious to …

We are seeking to enlist the help of the unconscious…bypassing conscious…so content of experience that lead to limiting belief / phobia / illness/ psychosomatic symptom, not important…in any case their own representations of it are at least one level of composition removed, i.e mere subjective beliefs about what happened … subjective experience of it …

People tend towards using 3 discrete types of words in their language, audio, visual, or kinesthetic … if listen to them, will usually find one dominate e.g I see what you mean, I feel you, I hear you … with concomitant ‘tells’ for each e.g
looking down to left, up to right, etc… if mirror their use of such language, and ‘tells’, can develop rapport quickly …

Rapport as positive feeling of understanding, acceptance, approval, agreement … secures client’s attention … a ‘yes set’… conditions/trains client to become extremely attentive to/responsive to / focused on, therapist’s subtle communications and therefore suggestions …

Client is victim of learned limitations, in the form of mental sets, frames of reference, belief systems, definitions, noetic structures, models, imprints… that prevent them accessing their full creative resourcefulness… therapist’s role is to free them of these … unleash their full positive potential … for happiness, satisfaction, goal attainment, success etc … using therapeutic trance to ‘re-write’ their conditioned programming … to experience the world and themselves ‘outside of the invisible prison’ they have been imprisoned in by these limiting beliefs about self and world … open them up to therapeutic suggestions that empower them to choose more optimal definitions / beliefs / models … break out of dysfunctional patterns / habits / cycles … replace / displace with more optimal habits of thought and behavior …

Must build sense of positive expectancy in client … placebo effect … self-fulfilling prophecy … fait accompli … that improvement is a given … in fact has already occurred … suspend conditioned / learned / dysfunctional / sub-optimal beliefs / definitions / reactions … a Bardot … suspend the flow of history / habit / reproduction of history / repeat of cycle / repeat of pattern … so now open to / receptive to / available for / capable of experiencing self and world differently than have been doing … to escape history … This ‘gap’ in the flow of the person’s history is called a ‘Therapeutic trance’ in NLP etc.

There is no method of trance induction that works with everyone, or even the same person on two occasions … need to break the flow … like Moses parting the Red Sea (See of Reeds) … which is basically what the ‘metaphors’ a.k.a ‘book of Moses’ represents … a break with the old … re-inventing the self, and the history of an entire ‘people’… a new ‘law’ … the ‘past’ is represented by the Pharaoh … the future by ‘The Mosaic Law’ … to ‘cross the Jordan’ or ‘The Red Sea’, you need to ‘stop the flow of time’ … stop the past reproducing from the previous moment to the next … in the ‘Bardot’ of ‘Now’ … trance is ‘being in the moment’ … being fully ‘present’ … not thinking of the past, or of the future… intensely ‘in the now’ … where therapeutic suggestions / resources can be offered and ‘taken up’ by a newly receptive client … able to ‘start afresh’ … to ‘learn anew’… to break with the past … dysfunctional habits … beliefs …
Suspension of disbelief and extraordinary / exceptional expectation of ‘cure’ accounts for ‘placebo effect’ including those associated with ‘miracles’ and ‘faith healing’ …

N.B 3 main representational systems visual, audio, kinesthetic … the modalities are the 5 senses … the sub-modalities are ‘adjectives’ and ‘adverbs’ related to them…

MHR World as will and representation…centuries before NLP … Schopenhauer … NLP use of term makes his use clearer now …

Clients who understand therapeutic trance can help them, will be amenable to therapists attempts i.e can be guided to experience their own unique form of T.T … the art is to help them find it … each T.T experienced, and the process that facilitated it, will be unique … but a rough 5 stage model has been offered …

Fixate of attention on inner reality. Use distraction, shock, surprise, doubt, confusion, distraction etc to ‘interrupt’ the reproduction of history i.e provide a gap in the constant stream of reproducing the old beliefs, to allow receptivity to new i.e space to breathe / pause / room to grow / clearing in forest/canopy to allow sunshine in so new things can grow, pause in flow of red sea / river Jordan so we can cross to ‘other side’ … need to ‘interrupt’ habitual noetic structures / beliefs … offer chance for ‘mutation’ in evolution of person … (referred to as ‘de-potentiating habitual frameworks and belief systems’) … begin an unconscious search using indirect suggestions via jokes, wordplay, stories i.e activate the unconscious to begin search … like entering ‘search terms’ in google, but indirectly, as want to harness massive power of unconscious, and bypass conscious censor/reason/limiting beliefs / imprints …this will activate the client’s unconscious personal associations … seek a hypnotic response i.e have patient experience / define some behavior that is likely /common / predictable to therapist as having taken place autonomously, i.e unconsciously, to imprint belief in power of the unconscious mind i.e to recognize this … give it credence … thus set up self-fulfilling prophecy / placebo effect … put client in receptive state of mind i.e of confident positive expectancy …

Fixation of attention: classical hypnosis approach … formal standardized methods of trance induction … what see in movies … client gazes at pendulum, candle flame, therapist’s eyes … anything that is likely to hold client’s attention … but often more effective to focus client’s attention internally on their own body / sensations … e.g focus client’s attention on own hand, and how it ‘wants’ to rise, all by itself, to generate internal imagery of the hand rising … or on relaxing own body … or on some other vivid internal imagery or experience … all of which focus / fix attention on something limited, to absorb all their
attention ... thus turn off the ‘internal noise’ ... this limited focus turns off all other focus ... breaks the flow of habitual focus / thought ...

Can use a fascinating story, fact, or fantasy to fixate attention ... aim is simply to absorb / focus their attention on limited thing ... e.g. common everyday trance experiences ... where absorbed / pre-occupied with something, and ‘miss’ what is going on around us ... daydream ...

Focus on client’s problem i.e. validating it, acknowledging it, can be used to fixate / absorb their attention ... also builds rapport / yes sets ... i.e. client now open to suggestions / what therapist has to say i.e. grateful for validation of ‘reality’ ... ‘someone in their corner’, ‘on their side’ ...

Tailor approach to client. Don’t expect ‘one size fits all’. What worked once, with same or other client, may not work this time.

Fixating attention interrupts / distracts consciousness from its routine habitual limiting beliefs ... suspend the constant chatter / reproduction of habitual beliefs / definitions / noetic structures ... points of view ... filters ... belief system temporarily in a ‘Bardot’ ... taken out of flow of history-present-future and located in the now ... opportunity to break patterns / cycles ... not reproduce them ... not fixated on past problems, future problems, but the Zen NOW moment ... freedom from the limits imprinted in the past ... they don’t need to be projected into the future ... reproduced ... they can now be replaced / displaced with generative / resourceful / helpful / more optimal beliefs ... including beliefs about the future ... like hitting ‘stop’ in a video editing software, then being free to ‘edit’ what ‘learned’ or ‘imprinted’ in the past, and edit that the ‘future’ that this has been ‘constructing’ i.e. going back and re-writing the script ... without the limiting beliefs ‘learned’ ... and thus freeing up a positively different future ... i.e. consistent with the new belief sets / definitions ... stop acting out past ...

In the ‘Bardot’ of NOW, in the ‘moment’, the latent, habitual, patterned behaviors are disrupted ... they are confused ... they are halted momentarily ... broken out of their unthinking reproductive cycle ... the ‘positive and negative hallucinations that make up our thought patterns are suddenly exposed to reality ... the reality of the NOW ... in which past experiences are NOT present ... the movie client has been immersed in, that has been constantly repeating and recycling looping has been stopped ... suddenly the client is in reality ... they are open to seeing and defining things as they are ... here ... now ... free to re-define and re-evaluate ... free to form new meanings ... new definitions ... new beliefs ... the power of the habit is its constancy ... repetition ... the mind is parsimonious ... it works on seeking out patterns ... it is quick to jump to conclusions ... which is key to survival as infant / child ... but the pattern that was appropriate then, is often no longer appropriate ... only we are loathe to
expend mental energy on re-adjusting our noetic structures … our models of the world and our ‘selves’ … our mind is hungry to establish patterns, and then stubborn in giving them up … tends to re-interpret all following experience in light of existing pattern that it has established … economical … parsimonious … comfort of ‘known’ … but human life is so changing … so evolving … and holding onto old beliefs / perceived patterns can be dysfunctional … like chick imprinted on ping pong ball later exclusively defining similar objects, rather than other chickens, as appropriate sex objects …

Trance / hypnosis basically an altered state, a break-in-state, in which person becomes free to re-define / re-imprint / challenge / change their beliefs and the habits these ‘inform’ …

Shock / surprise is the traditional ZEN means to fixing attention on the NOW … interrupting / breaking the continually reproducing patterns of the past … making person available / present … actually HERE and NOW … the Zen teacher would either propose a ‘Koan’, a mental riddle, or whack the student with a stick … both ‘part the Red Sea / River Jordan’ … there is now a gap … a clearing … an empty space … the constant repeating of history has been suspended … something NEW has a chance to bloom in the sunlit clearing of the forest …

The Zen ‘Koan’ fixates the mind, demanding its full attention to itself, and away from the previous stream of consciousness / mental chatter / belief systems / habits of being / seeing / defining / expecting … it is a break in the pattern … the pattern is not repeated … the mind is shocked into awakening … into a re-evaluation of reality … of beliefs about it … it is ‘woken from its dogmatic slumber’ as Hume would put it … for dogma is belief that is based on invalid assumptions / definitions that is merely asserted by some authority, such as the conscious mind … limiting beliefs are a form of dogma, as much as the traditional dogmas of the worlds ‘religions’ are deliberate limiting beliefs … sold as ‘noble lies’ to the most intellectually capable who manage to ‘see through’ the lies, to see that they ARE in fact lies … who otherwise, despite threats of ‘fates worse than death’, might have sought to free their less capable comrades, compatriots, fellow travelers, peers, friends, relations etc of these limiting beliefs … these lies … this ‘dogma’ … In fact many ‘phobias’ and ‘allergies’ are in fact noble lies of the unconscious … employed with the best intentions … truly noble … as intended to ensure your survival, to allow you to ‘avoid’ some situations, or to ‘block’ some extremely traumatic experiences from being ‘processed’ … in the same way that many ignorant but well intentioned people believe lying to you is in your best interests … the lie being the means to some noble ends … to get you to do something you otherwise wouldn’t, but which is considered as ‘good’ for you … e.g. getting a child to eat their veges by lying that it will make their hair curly (in a child that desires curly hair!) … or to provide
relief from worry / suffering in a dying person, or a child who has lost a beloved pet etc…

The sudden, unexpected, shocking ‘whack’ of the Zen teacher’s stick demands the student’s full attention…drawing them back into the here and now from their reveries … from their ‘looping film’, their constantly reproducing and thus maintaining beliefs … hence THANATOS and SHIVA as creative energies …

Yoga is meant to ‘still’ the mind … like Zen … to bring you to the here and now … free of ‘history’ … to break patterns … to break habits … to break the flow… to part the waters … many people gain the same outcome, or seek to, through the means of psychotropic drugs that offer a ‘trip’, or an experience that can break them out of their patterns, out of their mind … free their mind … open the doors of perception … allow something NEW to enter the mind … the no-thing from which all things emerge … the creative source … the uncarved block … a new start … a death … a ‘Bardot’ in the terms of Tibetan Buddhism, as explicated in ‘The Tibetan Book of The Dead’ … with the moment following death offering this chance … but where every single moment of life also offers the same chance, the Bardot of NOW … death being a shock … a break in the cycle … a momentary pause … a chance to escape the constantly reproducing / repeating cycles of history … of birth-life-death-new-birth…

A work of art can produce this surprise, shock , awe , break … a person can be so surprising in some way that they induce the same effect … to pull you out of your dreary patterned habitual zombie state , comfortably numb or neurotically miserable … like the ‘slap in the face’ given to the hysterical person, to bring them out of a negative spiral of emotion that has caught them in its thrall …

Confusion, doubt, disequilibrium, shock, experience of the fantastic, unusual, unrealistic …

Trance is a temporary suspension of continuity … a suspension of belief … an open clearing in the mind free of pre-conceptions / patterned belief systems / weeds / garbage / idols / dogma … it is the pure ‘I am that I am’. The total absence of all idols, all ‘fixed definitions’ … pure potentiality … the source …the no-thing from which all things emerge …

Many famous ‘Eureka moments’ occur as ‘accidents’ not intended or expected … chance observations that were seized on … a sudden impression of a pattern becoming clear … usually during a period of gestation / distraction / passivity i.e after weeks, years of research, deliberate conscious focus, after having ‘fed’ the unconscious with huge amounts of material / questions which have been consciously striven over … while occupied in some totally unrelated activity, the unconscious presents an ‘illuminating moment’… a sudden ‘eureka moment’ … an inspirational realization …
The Bardot is where all ideas emerge … born a blank slate … ideas / beliefs are imprinted on this by the ‘new’ experiences … and by repetition of similar experiences which is then taken to be a pattern … and thus to define reality … we need to return to a momentary ‘blank slate’ to become receptive to new patterns, to breaking the old, to challenging the old, to replacing and displacing the old patterns, to form a new ‘reality’ i.e model of reality …representation of reality …

The mind requires a reason to re-adjust its noetic structure… to challenge the patterns it has assumed represent ‘reality’ … this ‘reason’ often comes in the form of some shock, surprise, novel ‘inconsistent with the assumed pattern’ experience … these succeed in attracting the unconscious and conscious mind’s attention … give it a reason to re-visit its internal representations of ‘reality’, to re-evaluate what it had, up to then, assumed to be a valid patterning of reality…a valid model…for this NEW experience does NOT fit the pattern previously experienced … so strongly that the mind could not simply deny it, overlook it, distort and filter it so that it could be rejected as ‘irrelevant’, ‘superficial’, or actually consistent with the pattern of past experience that had been imprinted by a traumatic / dramatic experience in one go, or over time, by repetition … it challenges the dogma, it pulls down the idol…the idol is closely observed…. It is mere wood and metal … not a living god at all … the belief that it was ‘real’ is suddenly challenged… in a way that the pattern cannot deflect … something too real happened… something too inconsistent … somehow managed to crack the sphere of reflexive subjective social reality … enough to shake the mind out of its dogmatic slumber, to turn its head from the shadow on the cave wall, toward the light at the entrance to the cave, and the ‘reality’ it can no longer deny exists …

The mind is lazy. Economical. Parsimonious. The easiest conclusions to draw are accepted by most. The ones offered by authority figures are consumed passively. It is the quickest, easiest ways to form an internal representation of reality that is available…safer and quicker than experiencing things for yourself… much more convenient to accept ready-made quick fixes to the pressing need to ‘know’ reality. To have a model to work on. To navigate ‘reality’. And so the ‘model’ offered in association with acceptance, approval, love, and other benefits, is likely to be quickly internalized and introjected … like the imprinting of ducklings on the first moving object they perceive… it is a matter of life and death…find mamma…find protection and shelter…find a safe place…model your behavior on the ‘successful’ significant others you see around you … take their word as gospel … trust them … trust tradition … there is an infinite reality around you, and it is disconcerting…it is comforting to ‘know’ something firmly … to believe something comforting… to at least feel secure… to belong … to find a niche … to be part of something bigger and stronger and safer than you alone…
Consider how little motivation there is for the mind to change its assumptions and beliefs, once it has found a set that have, to date, ensured its survival, in a confusing and dangerous world … what would it take to shake a firm conviction, based on nothing but the written or spoken words of someone everyone else appears to believe, when it is comforting, and offers benefits, and rewards? E.g to throw down the idols known as ‘truth’ and ‘dogma’ and ‘religion’, whether it be secular, like Marxism and man-made global climate change, or ecclesiastical, like Christianity, Judaism, or Islam. All, by the way, constructs of the same group of self defined ‘Jews’.

Zen teaches us to avoid all ‘idols’. To avoid the ‘violence of language’. To avoid limiting our ideas to the limits of the human mind itself. To the 5 sense impressions. To avoid all dogma. To, like the Humean Skeptic, never assume anything, to never ‘know’ anything. To retain a mind open and receptive to the creative no-thing from which all things emerge. To allow that creative source to flow into us. To ‘present’ the mind in the here and now. To ‘Be here now’.

Therapeutic trance is a continuation of the Zen legacy, in its own limited way.

The ‘Zen moment’ is a therapeutic trance of the highest order.

Aim is to initiate an unconscious search for a solution. To activate / employ / seek the help of, the unconscious mind. To communicate with it indirectly, bypassing the conscious mind’s censor, filters etc.

Jokes elicit a powerful reaction as they appeal to the unconscious … bypassing the conscious mind’s censor e.g ‘they actually SAID THAT?’ i.e what everyone thinks, but too afraid to say i.e self-censorship of conscious mind … i.e ‘allows’ greater freedom to say what feel / mean / think … context of a ‘joke’… harmless … disarms … a truly funny joke always contains some element of truth, or exaggeration of some element of truth … it is freeing to be able to express this ‘truth’… Vs NOT funny, forced humor … but even ‘swearing’ a form of ‘shock’ and ‘surprise’ i.e again, they ‘said that?’ i.e words not usually ‘allowed’ to say … humor offers new options … new freedoms … it is ‘allowed’ … like the court jester in medieval times, was the only one who was ‘allowed’ to criticize the king… Monty Python’s ‘Life of Brian’ was brilliant in ‘allowing’ people to admit the silliness of the whole ‘Jesus’ story … otherwise conscious mind would ‘censor’ such thoughts as dangerous / threats … the ‘relief’ of humor may be the relief of having expressed a dangerous, unacceptable thought / idea / feeling and having ‘survived’ the feared consequences i.e social rejection, abandonment, punishment, loss of benefits of ‘going along to get along’ i.e mitlaufen …
Indirect suggestions initiate unconscious processes / searches / associations... so that the client is surprised by result... and result appears autonomous / automatic / involuntary ... magical ... i.e unconscious carrying out action... like digestion, breathing, pulling hand from flame, walking ... bypass censorship ... like a coded message / cipher / dark web encrypted web-site ... talk to unconscious about sex, without ‘triggering’ counter-productive censorship/judgement/rejection/denial of conscious mind e.g coming out of the closet ... no point pushing conscious mind to come out, when it is in denial / fearful of consequences ... has to come from unconscious mind i.e acceptance / approval of self as O.K, and sexuality as O.K, safe, to overcome the denial, before being able to empower client to risk ‘coming out’ i.e empower with resources to deal with situation positively and successfully...

Catalepsy, anesthesia, amnesia, hallucinations, age regression, time distortion etc are all spontaneous phenomena observed by hypnotists in the course of their practice, and by the general public in their daily lives... later found these could be induced deliberately via suggestion ... and used as an indicator of trance depth i.e success of trance induction ... i.e that trance had been achieved ... and could now be employed therapeutically... therapist facilitates trance, client’s own unconscious then takes advantage of it ... to re-define their noetic structure / belief sets ... the success is the work of the unconscious, not the therapist ... their suggestions provide opportunities for the unconscious, rather than directing it ... any directly suggested changes will be temporary ... the lasting changes can only be achieved by the unconscious mind ... stage hypnotists apparent control of a ‘victim’ are only temporary, and with the ‘victims’ consent ... it is the ‘victim’ who chooses to comply with the hypnotists directions ... they are simply given ‘freedom’ to by the social definitions applied to the situation ... i.e judgement free zone...notion that ‘victim’ not in control ... so any ‘blame’ goes to the hypnotist ... so the actor is free to comply with suggestions they find acceptable / desirable ...

The consequences of therapeutic hypnosis / trance are the result of the actions of the unconscious, and not the therapist’s suggestions. These suggestions merely offer the unconscious access to the ‘self’ ... to bypass the conscious mind’s censorship / filters ... to begin a process of self-discovery and re-definition of ‘self’ and ‘reality’ ... a new ‘synthesis’ based on updated ‘definitions’ ...

Suggestions initiate a train of mental activity... e.g to suggest numbness in the hand, we initiate a recollection of a similar experience where a foot was numb, or at the dentists when an injection was given, to translate that same experience to the hand, at this moment. And so the modalities and sub-modalities of an experience that has been anchored by an actual experience, as a sort of Engram,
can be re-activated, and transferred to the hand, now. The numbness will be as real as the experience it was modelled on. The therapists suggests elicit a recollection and re-mapping of a past experience, onto a present experience, changing merely the part of the body it is experienced in... it re-organises or re-associates the numbness in the foot or gums, to the hand... simply suggest the client recall such an experience, then suggest that the same feeling of numbness can now be experienced in their hand...

Rather than simply induce, by suggestion, a superficial, temporary response, aim of therapist is to re-educate the client’s nervous system / unconscious in terms of the clients own experiences, beliefs ... to stimulate the re-organisation of the unconscious, without knowing how the unconscious achieves this...

Therapist gives client access to own unconscious mind ... via trance ... so unconscious can manifest the desired changes ... replace limiting beliefs with resourceful beliefs...to bypass these limited beliefs by bypassing conscious thought ... direct appeal to unconscious ... in altered state of ‘therapeutic trance’... therapist takes role of clients conscious mind ... need to do this as client’s mind is imprinted with limiting beliefs...and could therefore never direct own unconscious mind ... therapist takes over this role ... and trust in client’s unconscious mind’s creativity...therapist helps give client access to this creativity ... to unconscious mind ... via trance ... client and therapist work together to seek out that altered state / trance in which this is possible ... i.e possible for client to access unconscious minds creativity ... allow unconscious mind to re-imprint / update definitions – beliefs of conscious mind ... i.e to allow unconscious mind to update and re-program ...

Need to get client to become ‘lucid’ in trance i.e like lucid dreaming...to validate that they are in an altered state in which unusual things are possible...to reinforce self-fulfilling prophecy / expectancy of enhanced functioning etc ... placebo effect ...

People experiencing a trance, either as daydream, distraction, or therapeutic trance, commonly experience or demonstrate one or more of the following: relaxation of mind and/or body, slowing pulse, dilated pupils, amnesia, anesthesia, catalepsy, age regression, time distortion, psycho-somatic responses, distortions of perceptions, and dissociation.

They are considered deeper and more genuine when they come about of their own accord, rather than at the suggestion of the therapist.

Erickson would say to clients: ‘If you have experienced some moments of trance in our work today... your right hand, or one of your fingers, can lift all by itself...your head will nod yes all by itself...your eyes will close all by themselves’. ‘If your unconscious no longer needs to have you experience
symptom X your head will nod all by itself”… ‘Your unconscious can review the reasons for that problem, and when it has given your conscious mind its source in a manner that is comfortable for you to discuss, your right index finger can lift all by itself’ … such obvious ‘ideosensory’ responses might instead be replaced with feelings of heaviness, lightness, coolness, warmth, prickliness in the respective body part, in some clients.

Point is to allow unconscious to respond with ideosensory / ideomotor response experienced as involuntary / autonomous / automatic / unintentional / unconscious by client, which will be convincing to the patient i.e placebo effect…belief in efficacy of therapy / power of unconscious …

If your unconscious acknowledges that a process of therapeutic change has been initiated, your head can nod.

When you know you need no longer be bothered by that problem, your index finger can lift, or get warm [or whatever].

Aim is for unconscious to revisit past ‘thesis’ –‘Anti-thesis’–‘Synthesis’ processes which lead to the sub-optimal / limiting synthesis i.e beliefs of TROONATNOOR … and this time to have unconscious reach a more optimal synthesis / belief of TROONATNOOR i.e eliminate phobia, psycho-somatic symptom…limiting belief…

Unique person Vs role e.g authority figure, helper…need to break out of role, and be authentic…

Frame of reference refers to motives of person e.g safety/security, money, goodwill,

Signs client is in altered state should be observed…allow client to enter more deeply by remaining quiet … even stopping mid-sentence if observe client has entered trance…don’t break it…i.e when engaged in inner search / focus and unconscious processes…encourage to deepen / lengthen into therapeutic trance …

‘Response attentiveness’ is being aware of those moments of positive expectancy in client…open to suggestion…

Unconscious search continues after we give up conscious effort … up to 30 items per second? … then suddenly answer comes to us … while engaged in totally unrelated conscious activity …

Indirect suggestion evokes unconscious searches and processes…it is an attitude / approach rather than a technique …
The ‘Interspersal approach’ intersperses words / concepts of comfort to attain relief from pain for client without formally inducing trance … interspersing single words into sentences that encourages patients unconscious to generate / follow patient’s own associations i.e unobtrusively facilitate / lead towards …

Introduce topic / theme e.g about client’s mother, by talking about your own mother / mothers in general … to set up chain of associations in client’s mind that naturally lead to them own thoughts of own mother … this bypasses conscious mind’s resistance to bringing up subject of own mother … so limiting beliefs, mental habits, usual resistance to theme, bypassed / not triggered…

Therapist hypothesizes particular problem exists that client not willing/able to talk about e.g sexual … taboo … cannot target directly as client will put up resistance … so target indirectly using anecdotes, stories, all revolving around that theme e.g sex … all as part of apparently general, interesting conversation…until client finds self revealing details otherwise would not have…if therapist wrong in assumption, no harm done (they get paid for hour anyway, and can know what the issue is NOT)… i.e if nothing in patient’s psyche that can form association with assumed issue / common denominator of stories/anecdotes… client will just feel a little confused…which is good for opening up opportunities … and avoids (?) risk of false memories being suggested directly i.e therapist imposing assumptions on client about what problem is…if their assumption wrong, the client’s mind won’t take up the trail of associations to the assumed issue … it will simply be mildly surprised / confused etc…

MHR people tend to cough at same time, or just after each other…to mirror body postures … and if on verge of action e.g cough, to carry out action…if someone puts down ‘special’ item back to ‘specials basket’ they are more likely to do so to, i.e if other apparently found some fault / lack of value, then they assume same??? … like ‘priming’ i.e movie … showed player / number many times leading up to ‘bet’, so primed person to choose that number, unconsciously…so totally surprised that other could have predicted it … i.e not really conscious during day of how many times that number / player appeared in his experiences…

More likely to be open to suggestion if others around you appear to have responded to suggestion e.g during a ‘performance’ …

Discuss solution seeking, generally, to initiate unconscious searches in client for own unique ways for own unconscious resources to attain it…tell stories of how others have replaced phantom pain with phantom pleasure …interspersed with conversation of ‘how important it is to have comfortable / pleasurable sensations in your (their) wooden foot … etc … without formal induction of trance…
During trance client’s typical / habitual mental sets depotentiated i.e limiting beliefs bypassed … when attention fixed / focused intensely … chance to bypass … chance to use truisms to set off chains of associations in unconscious that lead to limiting beliefs etc being replaced by more resourceful beliefs…

There are many everyday experiences e.g one hand feels lighter than other, automatic/involuntary nodding/shaking of head without realising it, involuntary yawning or eyes closing / blinking, involuntary twitches/movements of arms, legs etc… these all ‘ideomotor’…

Ideosensory refers to experiencing, from memory, warmth of sun or cool breeze on skin, taste of favorite food/drink, favorite smell…

Ideoafferent refers to e.g blushing when embarrassed, feelings of anger/resentment/sadness on recollecting past experiences …or smiling when recollecting something pleasant, funny, etc…

Ideocognitive refers to e.g ‘having a name on the tip of your tongue’

Cannot predict how much time client’s unconscious will require to follow train of associations and find resourceful solutions…. So give it time e.g ‘Sooner or later your hand is going to lift (eyes close, head nod etc)…Your headache (symptom) can now leave as soon as your system is ready for it to leave…Your symptom can now disappear as soon as your unconscious knows you can handle (such and such) problem in a more constructive manner…

You don't have to bother trying to listen to me because your unconscious can do that and respond all by itself. People can sleep and not know they are asleep. They can dream and not remember that dream. You don't know just when those eyelids will close all by themselves. You may not know just which hand will lift first. You don't really know just how your unconscious will help you resolve that problem. But your conscious mind can be receptive to the answer when it does come. Your conscious mind surely has many questions, but it does not really know just when the unconscious will let you give up that undesirable habit. You don't know if it will be sooner or later. You don't know if it will be all at once or slowly, by degrees. Yet you can learn to respect your own natural way of doing things.

Open-ended suggestions avoid imposing limits on the unconscious, which is much more adaptable / creative / generative than the conscious mind could ever be…so rather than directly suggest ANY change / response we want to engage the unconscious to be on the alert for optimal solutions, which change to reflect current situations … very ZEN … very basis of ‘maladjusted’ / ‘maladapted’ is that we are imposing an inappropriate / sub-optimal solution … usually dogma … old beliefs / solutions … appeared to work back then, as we survived, but at what
cost? And couldn’t we solve same problem more optimally? i.e fewer costs / negative externalities? Maybe we are confusing current situation with old one and imposing inappropriate ‘solution’ to current problem … e.g. avoidance survival tactic for child, but adult needs to ‘face’ problem, now able to deal with more optimally … e.g. avoidance Vs facing problem, now able to deal with successfully … conscious mind tends to work with ‘known’ i.e. ‘assumptions’ ‘definitions’ inherited / accumulated i.e. cannot work with huge amounts of new info… whereas unconscious can … more capable of this sort of work …

We all have potentials we are unaware of, and we usually don’t know how they will be expressed. Your mind can review more feelings, memories, and thoughts related to that problem, but you don’t know yet which will be most useful for solving the problem you are coping with. You can find yourself ranging into the past, the present, or the future as your unconscious selects the most appropriate means of dealing with that.

Soon you will find a finger or a thumb moving a bit, perhaps by itself. It can move up or down, to the side or press down. It can be slow or quick or perhaps not move at all. The really important thing is to sense fully whatever feelings develop.

All possibilities of finger movement have been covered, including the possibility of not moving at all. The suggestion is thus fail-safe. The patient is successful no matter what response develops. The therapist is simply exploring the patient’s initial responsiveness while initiating trance by focusing attention.

Soon you will find the weight problem being dealt with by eating more or less of the right foods you can enjoy. You may first gain weight or lose it or remain the same for a while as you learn the really important things about yourself.

The classical notion of hypnosis is the simultaneous focusing and distraction of attention.

Can use questions which leave client wondering how they will respond, which bypasses conscious attempts to answer i.e. bypasses habits / prejudices / predispositions / limiting beliefs …

Eye Fixation exercise. This series begins with a question that requires conscious choice and volition on the part of the patient and ends with a question that can only be carried out by unconscious processes. An important feature of this approach is that it is fail-safe in the sense that any failure to respond can be accepted as a valid and meaningful response to a question. Another important feature is that each question suggests an observable response that gives the therapist important information about how well the patient is following
suggestions. These observable responses are also associated with important internal aspects of trance experience and can be used as indicators of them.

If there is a failure to respond adequately, the therapist can go on with a few other questions at the same level until responsive behavior is again manifest, or the therapist can question patients about their inner experience to explore any unusual response patterns or difficulties they may have. It is not uncommon for some patients, for example, to open their eyes occasionally even after it is suggested that they will remain closed. This seems to be an automatic checking device that some patients use without even being aware of it. It does not interfere with therapeutic trance work. The question format thus gives each patient's own individuality an opportunity to respond in a therapeutically constructive manner. These features are also found in the hand levitation approach, which we will now illustrate.

1. Would you like to find a spot you can look at comfortably? 2. As you continue looking at that spot for a while, do your eyelids want to blink? 3. Will those lids begin to blink together or separately? 4. Slowly or quickly? 5. Will they close all at once or flutter all by themselves first? 6. Will those eyes close more and more as you get more and more comfortable? 7. That's fine. Can those eyes now remain closed as your comfort deepens like when you go to sleep? 8. Can that comfort continue more and more so that you'd rather not even try to open your eyes? 9. Or would you rather try and find you cannot? 10. And how soon will you forget about them altogether because your unconscious wants to dream? (Therapist can observe slight eyeball movements as the patient's closed eyes follow changes on the inner dream scene.)

Hand Levitation

1. Can you feel comfortable resting your hands gently on your thighs? [As therapist demonstrates] That's right, without letting them touch each other. 2. Can you let those hands rest ever so lightly so that the fingertips just barely touch your thighs? 3. That's right. As they rest ever so light, do you notice how they tend to lift up a bit all by themselves with each breath you take? 4. Do they begin to lift even more lightly and easily by themselves as the rest of your body relaxes more and more? 5. As that goes on, does one hand or the other or maybe both continue lifting even more? 6. And does that hand stay up and continue lifting higher and higher, bit by bit, all by itself? Does the other hand want to catch up with it, or will the other hand relax in your lap? 7. That's right. And does that hand continue lifting with these slight little jerking movements, or does the lifting get smoother and smoother as the hand continues upward toward your face? 8. Does it move more quickly or slowly as it approaches your face with deepening
comfort? Does it need to pause a bit before it finally touches your face so you'll know you are going into a trance? And it won't touch until your unconscious is really ready to let you go deeper, will it? 9.  9.  And will your body automatically take a deeper breath when that hand touches your face as you really relax and experience yourself going deeper? 10.  10.  That's right. And will you even bother to notice the deepening comfortable feeling when that hand slowly returns to your lap all by itself? And will your unconscious be in a dream by the time that hand comes to rest? 8c

8c. Questions Facilitating Therapeutic Responsiveness

Questions can be combined with not knowing and with open-ended suggestions to facilitate a variety of patterns of responsiveness.

And what will be the effective means of losing weight? Will it be because you simply forget to eat and have little patience with heavy meals because they prevent you from doing more interesting things? Will certain foods that put on weight no longer appeal to you for whatever reasons? Will you discover the enjoyment of new foods and new ways of preparing them and eating so that you'll be surprised that you did lose weight because you really didn't miss anything?

The last question in this series is an illustration of how compound questions can be built up with and and so to facilitate whatever tendency is most natural for the patient.

The ambiguity and suggestive effect of compound questions has long been recognized in jurisprudence. The use of compound questions by attorneys is therefore forbidden during their cross-examination of a witness. In a hotly contested case a judge or an opposing attorney can often be heard objecting to the compounds by which an unscrupulous attorney may befuddle and perhaps ensnare an unwary witness. In our therapeutic use of compound questions their very ambiguity is of value in depotentiating the patient's learned limitations so new possibilities may be experienced.

8c. Questions Facilitating Therapeutic Responsiveness

Questions can be combined with not knowing and with open-ended suggestions to facilitate a variety of patterns of responsiveness.

And what will be the effective means of losing weight? Will it be because you simply forget to eat and have little patience with heavy meals because they prevent you from doing more interesting things? Will certain foods that put on
weight no longer appeal to you for whatever reasons? Will you discover the enjoyment of new foods and new ways of preparing them and eating so that you'll be surprised that you did lose weight because you really didn't miss anything?

The last question in this series is an illustration of how compound questions can be built up with and and so to facilitate whatever tendency is most natural for the patient.

The ambiguity and suggestive effect of compound questions has long been recognized in jurisprudence. The use of compound questions by attorneys is therefore forbidden during their cross-examination of a witness. In our therapeutic use of compound questions their very ambiguity is of value in depotentiating the patient's learned limitations so new possibilities may be experienced.

Truisms or positive statement followed by desirable suggestion (to listener) used to open up 'yes set'.

Contingent Suggestions and Associational Networks. A hypnotic suggestion that may be difficult for a patient is easier when it is associated with behavior that is familiar. The hypnotic suggestion hitchhikes onto the natural and spontaneous responses that are well within the patient's normal repertory. The contingent suggestion is italicized in the following examples.

With each breath you take you can become aware of the natural rhythms of your body and feelings of comfort that develop.

As you continue sitting there, you will find yourself becoming more relaxed and comfortable.

As your hand lowers, you'll find yourself going comfortably back in time to the source of that problem.

As you mentally review the source of that problem your unconscious can develop some tentative ways of dealing with it.

And when your conscious mind recognizes a plausible and worthwhile solution, your finger can lift automatically.

When you feel ready to talk about it, you'll find yourself awakening feeling refreshed and alert, with an appreciation of the good work you've been able to do.
Contingent suggestions can be tied together into associational networks that create a system of mutual support and momentum for initiating and carrying out a therapeutic pattern of responses. From the broadest point of view a whole therapy session - indeed, an entire course of therapy - can be conceived as a series of contingent responses wherein each successful therapeutic step evolves from all that came before.

Apposition of Opposites. There is tension and relaxation, motivation and inhibition, conscious and unconscious, eros and logos, thesis and antithesis. An awareness and understanding of the dynamics of such opponent processes is of greatest significance in any form of psychotherapy. In this section we can provide only a few illustrations of how we can balance opponent processes by means of verbal suggestion. In the process of hypnotic induction, for example, we have the following:

As that fist gets tighter and tense, the rest of your body relaxes. As your right hand lifts, your left hand lowers.

As that arm feels lighter and lifts, your eyelids can feel heavier and lower until they are closed.

Similar suggestions can be formulated for virtually any of the opponent processes in the sensory, perceptual, affective, and cognitive realms.

As your forehead gets cooler, your hands can get warmer.

As your jaw becomes more and more numb and insensitive, notice how your left hand becomes more and more sensitive.

You can experience all your feelings about something that occurred at age X without being able to remember just what caused those feelings.

When you next open your eyes you will have an unusually clear memory of all that, but without the feelings you had then.

As you review that, you can now experience an appropriate balance of thinking and feeling about the whole thing.

As can be seen from the last three examples, a process of dissociation can be utilized to first help the patient very thoroughly experience both sides of an opponent system before they are brought together at a more adequate level of integration.

MHR Chomsky, linguists etc treat language conventions as if they are the foundation from which languages are built…like functionalists coming across a
set of institutions / social norms, and assuming they are the basis of that society... when in fact these are the cumulative products of ongoing social interaction i.e institutionalized interactions ... may become self-promoting as ‘necessary’ and ‘valuable’ and ‘the basis of society’, but are merely propergents... languages evolve from interactions, accumulations of alternative utterances that develop into ‘languages’, and continue to evolve the languages... unless, as in the case of the above ‘institutions as things in themselves with own interests’, they are ‘fixed’ by some ‘institute for e.g French language’... language is means to ends of communication... the rules may be imagined to exist by ‘authorities’, and imposed upon languages by institutionalization of one of many alternative existing conventions, and then bits forced to comply that would not naturally have complied with the artificially imposed / defined ‘rules’... but that is like the functionalists ascribing ‘form follows function’ and insisting that the cart goes before the horse, and directs the horse... there are no rules... just conventions... hence my ‘phrasal syntax’ approach to teaching and learning languages like English, which were never artificially ‘fixed’ like religious dogma, like French, or Catholicism, or Marxism etc... or man-made global climate change...

Generalisation refers to my levels of composition... of jumping to conclusions as ‘safe bet’ e.g one dog bit me, so now fear all dogs... but now this belief limits you unnecessarily i.e fear of going outside in case ANY dog out there... fear of tiny harmless, kind, good-natured dogs prevents enjoying interacting with all dogs... but at time was question of survival i.e imprint of generalisation ‘dogs dangerous’... or ‘no-one wants me around, so get out of everyone’s way / avoid people / keep quiet ... so while instant fight/flight reaction to sound in forest is pro-survival, remaining on ‘high alert’ in busy city life will kill you from stress / constant fight/flight alert hormones / adrenaline etc... Generalisation that parents didn’t want you to no-one wants you is another obvious limiting belief... if rephrase assumption / belief more specifically i.e mother and father didn’t want me... can escape the generalisation, and start being open to signs of acceptance from other people which the original generalisation lead to a distortion and deletion of i.e you just won’t see / hear / feel what you don’t expect to... will experience it ‘forward feedback’ a.k.a ‘self fulfilling prophecy’ distorted / omitted...
Strategies the unconscious came up with to survive past traumatic experiences were successful, they worked... client survived... but not no longer appropriate to current situation... e.g born in poverty, parsimony necessary to survive... but later successful ‘scrooge’ denies self and others bounty of life... defenseless child learns ‘cannot fight back / inefficacious’ no matter how big and strong grows up as adult, will be prey to bullies... being sick let me avoid something, or get something I needed e.g attention / affection as a child, but as an adult it has no advantages, there are better ways to get / avoid what need / want / don’t... have more power as adult / more choices / more efficacious and optimal means available... small dog bit you as a baby and imprinted ‘dogs dangerous’, though now they pose no threat to the adult you... an embarrassing experience of failure taught you that ‘I am a failure’ and that definition ‘went to heart’ and you sabotaged all chances of success to validate that definition... maybe as a child it prevented you exposing yourself to embarrassment, rejection, abandonment, failure i.e could avoid risk... but now it stops your reaching your full potential...

Classic story of woman who wore / needed contact lenses... but when regressed to younger age, those lenses made it impossible for her to read book covers had read before session... so therapist brought her back, got her to take lenses out, then repeated regression, and she could now read perfectly well, without the lenses... but the effect only lasted a few days... MHR avoidance strategy for avoidance tiresome work / having to study / read etc?

NLP Meta-model... never risk imposing own ‘hallucinations’ i.e interpretations / assumptions on content of client i.e we tend to add material / content / associations / connotations / assumptions about what client’s problem is, then unconsciously seek to find examples / proof we were right... risk ‘leading’ client to ‘providing this proof’ i.e false memories... especially as client suggestive to authority figure / therapist... so must ensure it is client’s content, not ours... so when they give vague communications about problem e.g with partner, respond as if you understand 100% with an utterance you are confident is NOT true e.g ‘Yes I understand, your partner wants anal sex and you don’t like it’, based on
observation and listening… so they respond, oh, no, its not like that, its more about…then repeat with absurd / non-sequiturs until the client reveals exact nature of problem, so you can be sure YOU didn’t manufacture it as an artefact of your interaction with them … didn’t merely prove yourself right re: your ‘reading’ of the situation a.k.a your ‘hallucination’ i.e positive hallucination is seeing, hearing etc something NOT there … which occurs often in communications between people i.e jump to conclusions, based on own faulty assumptions, add ‘facts’ not communicated, form associations / connotations from words, context, body language, which are products of your own mind, and not the interlocutor’s … i.e things NOT communicated which you imagine are … e.g ‘interpreting harmless look as sexual , or critical, or threatening, or accepting, or approving etc … so rather than risk ‘trying to understand and getting it wrong, then insinuating patient to agree i.e false memory etc … chose responses you KNOW are YOURS and NOT theirs i.e most unlikely to be the problem e.g if problem possibly impotence, then act as if ‘Yes I understand, your wife is color blind, and the carpet she wants is repulsive’ etc… so no risk of ‘push polling’, leading question …

MHR we have to learn that we are FREE to define as we wish … define our own realities … not accept those pushed on us by others, often with their own interests at heart, rather than ours … we do NOT have to be defined by our past experiences … we can replace existing beliefs with new ones … empowering ones … liberating ones … more optimal ones … positive sum ones … ones convergent with ‘reality’ … each way of defining has its consequences … advertising, political propaganda, military propaganda, etc, social conditioning, tend to reflect very narrow vest interest group’s ideas about what THEY want you to believe … they may believe it themselves, and be well intentioned … but usually their motives are very selfish … to sell a product whether or not it represents the best alternative for YOU … to have you vote for a party, whether or not that party represents YOUR best interests … to have you become a murderer, simply because THEY need assassins to ‘seize and hold territory’ and
to ‘achieve their personal / organizational war aims’ … from the original ‘professionals’, the ‘priests’, with their ‘noble’ lies which are usually anything BUT noble, beneficent, well-intentioned, from Moses down to Marx and the proponents of that newest (secular) religion ‘man-made global climate change’ (All would be defined as ‘Jews’ by that self-defined group) … if you can convince someone something, even murder, and virtual suicide, is ‘necessary’, they will commit it, no matter what their own instincts. The Bolshevik / Communist Party in the Jew.S.S.R (Yes folks, the main pro-active leadership of that society / movement would be defined as ‘Jews’ by the group that defines themselves as ‘Jews’ … communism, since the days of Jesus, is a ‘Jewish’ notion … and always it was to be the ‘masses’ that endured communism, while the ‘Priests’, the ‘party elites’ enjoyed total luxury ‘The best of the best’, from Moses to Lenin to The ‘Jew’ World Order High Priests, almost exclusively ‘Jews’, with the remainder merely ‘Golems’ or ‘tolerated Goys’ who would be replaced as soon as they had served their function as means to ends) taught their agents that you could condition one generation from birth to age 20 so thoroughly, that any experience they later had that contradicted that conditioning would simply be rejected out of hand by that person’s own mind … in other words they would never ‘experience’ any reality that contradicted the ‘noble’ lies they had been taught… the ‘social reality’ of the Bolsheviks Marxist-Leninism would become each indoctrinated, conditioned ‘comrade’s’ subjective personal reality. Any time ‘objective’ reality, their actual experience of the world contradicted that subjective reality, the actual ‘reality’ would be distorted, rejected, ignored, denied, and have zero impact on the interpretation, definition, and ultimate ‘experience’ of ‘reality’.

Deep trance … just try to ‘argue’ with a Marxist, or ‘man-made global warming’ ‘believer’, a Talmudic ‘Jew’, a ‘Christian’, a ‘Muslim’, or anyone that has been indoctrinated to believe in things that defy and deny reality… they are in a trance… zombies … induced over a lifetime of conditioning … using terrorism a.k.a ‘threats of fates worse than death’ … and lies of an afterlife in heaven, or a utopia on earth, where everyone ELSE does the hard work, and THEY, as the ‘chosen people’, live in houses they did not build themselves, eat food they did not grow themselves, wear clothing they did not make themselves…

Therapeutic trance is about facilitating a re-organisation of beliefs…an UN-programming… a DE-conditioning … to replace deliberate lies and misinformation with the closest things we can find to ‘truth’ … with skepticism … with observable facts and measurements … so that we ‘free’ the slave from their mind prison … we release the ‘prisoner’ from ‘the cave’… we empower them to interact with reality more directly …without being hampered and obstructed by the distorting lenses, filters, and pure lies of religion, whether the ‘traditional’ ones of Judaism, Christianity, Islam, or the new ‘secular’ ones of Marxism and man-made global climate change …
Keep in mind that ‘noble’ lies only serve ‘the nobility’. The masters. These are not beneficent / well-intended lies you tell small children when their beloved pets or family members die, they are not harmless, white, beneficent lies … they are very dangerous, costly, malicious, vicious, self-interested, selfish lies told by masters to slaves, to get them to ‘submit’ to their slavery … to submit to ‘paying interest to a ‘Jewish’ private bank (Federal Reserve Bank) … to killing innocent men, women and children in other countries … to dying for an ‘aggressive takeover’ bid of their own corporate-controlled puppet governments a.k.a ‘war’ … Plato ‘blew the whistle’ on these ‘noble’ lies long before the Catholic Church (a sub-set of the second main ‘Jewish’ religion, Christianity) employed them to enslave Europe in the ‘Dark Ages’. The Saudi family employ the same to enslave their own people in the Middle East with their ‘Wuhabist’ sub-set of the Third main ‘Jewish’ religion ‘Islam’. Threats of fates worse than death in hell. Promises of paradise, of course not in this life, but in a life to come. If only they will kill for them. And blow themselves up for them. And work for them. In this life.

‘In a trance state’, the unconscious mind is activated … programmed … and this is the state that all religious ritual, repetitive sloganizing, repetitive propaganda, repetitive advertisements, is aimed at attaining… direct access to the unconscious that is emotional, irrational, unquestioning … impressionable … beyond the power of the conscious rational educated mind to challenge … the ‘good Muslim / Christian / Marxist / Climate change ‘believer’… all true believers … all ‘good dogs’ … good boys and girls … all ‘submitting’ to the will of their leaders, the priests and princes, politicians and warlords … they all experience the ‘acceptance’ and ‘approval’ every time they deny reality, refuse to ‘face facts’, reject their sense impressions … reject logic and reason … and so the entire programming is achieved on the level of affect, of emotion… and reinforced every moment, from birth to death … beliefs are imprinted at such a sub-conscious, emotional, deep level, that a philosopher like myself has little hope of ever penetrating … to open a free space in the constant train of propaganda that passes for ‘reality’ in most people’s minds… a tiny crack in the wall… through which to offer them a glance at the reality they have been denied, and programmed to deny … a more optimal way of being and seeing … more optimal definitions which converge more closely with ‘objective’ reality … hey you can go to your death believing that tigers won’t eat you … and ignore the fangs and claws ripping apart your flesh, and the sharp odor of the tigers breath as it crushes your wind pipe, blissfully secure in your ‘knowledge’ that ‘a tiger could never eat me, ‘Moses/ Marx / God / Mohammed / Jesus’ et al told me so … and as their life slipped away, they would remain possessed of that belief … and their family would simply not recognize the ‘remains’ as being those of a lost family member … and so, as far as ‘social reality’, and the ‘subjective reality’ of all those involved, no tiger had ever, nor would ever, nor could ever, kill anyone. And so it certainly hadn’t killed our ‘true believer’, our ‘orthodox’ believer … Of course
the uninvolved, open minded, un-programed, neutral bystander would have stood in horror and awe as they observed that tiger tear up, then eat, that ‘true believer’, and wonder at how calmly the person had gone to their deaths … Which is all fine and good is there is no alternative to one day being eaten by a tiger … I mean, why worry about what you can do nothing about, right? … better to remain blissfully ignorant until the fateful day the unavoidable happens, and not suffer … very Zen really … no fear of tigers to ruin your day … I mean you’re gonna get eaten, but why make it any worse than it has to be, by constantly worrying about it, right? … but hey, what if tigers and priests had a deal going? … the ‘tiger king’ paid the priests tribute to keep the people blissfully unaware of the dangers posed by tigers? … I mean, what if there were very simply precautions people could take to protect themselves from tigers … what if it was not at all necessary that they be eaten by tigers? … would the ‘noble’ lie suddenly appear less ‘noble’ to you then? … what if you are slated to be the next ‘victim’ of this noble lie? Or your loved ones? Would that motivate you to wonder whether the priests have been telling fibs? The mass media? The politicians? The generals? ???

Erickson works with unconscious…actively seeks to avoid confronting / awaking the conscious mind, so the therapeutic work cannot be undone by it, and its conditioning… for same reason propaganda/advertising seeks to bypass reason/logic/consciousness and directly target unconscious mind with images, subliminal messages … appeal to affects … so Erickson uses trance therapeutically, to undo the damage done by other people / incidents … prepare client for change with therapeutic suggestions, given under deepest trance possible… de-potentiate limited belief / mental sets… i.e noetic structures … desensitization, cognitive retraining… enhanced by direct suggestion … direct suggestion alone limited in effectiveness as it alone will not evoke the re-association and re-organisation of ideas, understandings, and memories necessary for a cure … therapist merely stimulates patient to act, without knowing what the necessary action will be …

400 to 700 nanometer wavelengths = visible light spectrum … 20 to 20,000 Hz = hearing range of humans… we are immersed in an electromagnetic soup but only ‘perceive’ very narrow, discrete bandwidths of it … most of ‘reality’ occurs without our conscious perception … i.e ‘objective’ reality very big … our ‘subjective reality’ tiny by comparison … what we perceive compared to what exists is extremely superficial … we ‘construct’ our narrow realities, our beliefs about ‘reality’, inside our brains/minds, from the tiny fraction of ‘reality’ available to our senses, that exists ‘out there’ … we base our definitions on ‘impressions’ that arrive through our 5 senses and are heavily edited, filtered, distorted, by our pre-conceptions…our ‘beliefs’… hence ‘gestalt’ i.e we see what expect to see / believe is there…not what is there …
e.g ‘stainless steel’ does actually ‘rust’… but the thin layer of rust that forms is under 380 milli microns … hence we do not ‘see’ it … so the ‘Rostfrei’ german and Spanish translations are misleading … ‘Sichtbar Rostfrei’ would be more accurate … for humans can only ‘see’ within the frequency bandwidth 380 to 680 milli microns …

NLP offers us the freedom to re-write our programs, mental scripts, self-talk, definitions, and perceptions of ‘reality’… of what we are…our self-beliefs…our beliefs about others, and the world in general … to achieve a closer correspondence to that reality… to attain more optimal ‘social realities’ and ‘subjective realities’ conducive to living more satisfying lives, as individuals, groups, societies, as a species, and as sentient beings.

Robert Dilts active in the field of Neurolinguistic Programming (NLP) since its creation in 1975 by John Grinder and Richard Bandler, Milton H. Erickson, M.D. and Gregory Bateson.

‘Well-formed conditions’ refers to setting objectives… state objective in positive i.e what DO want, rather than what don’t want… formulate objectives that can be initiated by you, controlled by you, and chunked down into pieces you can manage… base definition ‘success’ in 5 senses i.e how will you feel, what will it look like, taste like, smell like, etc so can vividly ‘remember’ how it felt ‘when’ you achieved it i.e Buddhist method of ‘remembering’ solutions / successes rather than imagining them per se… assume already achieved… so what has changed… check for secondary gains/ ecology/ holitic context e.g conflicts of interest e.g if I get this, I will lose this etc … overcome these objectives individually i.e find solutions so are totally integrated / consistent / congruent… as a whole… identify resources need e.g training, finance, change of attitudes, overcoming of fears, discipline, collaborators/collaboration … get qualifications or collaborate etc … what is first step I can take right now? … Imagine you are now looking back on having achieved your outcomes… immerse self in all senses of it… how does it feel/ look/ taste/ smell etc … look back on all the steps along the way … how did you achieve all this? … what were the steps you took to get here?

NLP studies, then models optimal, ways in which our minds produce/construct/model/generate their models of reality i.e subjective reality… how it is ‘produced’… how what is ‘out there’ becomes what is ‘in here’ i.e our beliefs… how we come to define ourselves, the world, others, etc in particular ways… it is what I have been writing about since the beginning… for over a quarter of a century, without realizing this is what NLP is all about…

There is a saying: ‘If you believe you can, or if you believe you can’t, either way you will be right’.
Beliefs can be conscious, though many of these are actually not genuine…while our genuine beliefs are often unconscious…thinking processes…emotional knee-jerk reactions…

Even our ‘immune system’ can be ‘imprinted’ by traumatic experiences…develop phobias a.k.a ‘allergies’… and begin attacking healthy cells, or mutating / becoming cancerous…due to ‘their’ beliefs / imprints’… a.k.a cancer, A.I.Ds, arthritis, asthma…

Many of our beliefs about what we can and can’t do, be, achieve, experience, enjoy, etc are unconscious … they have been unconsciously programmed into us…we are no aware of them… often ‘imprinted’ very early in our lives by significant others, and traumatic events…

When we seek to change bad, unproductive / destructive etc habits, it is often the unconscious beliefs that get in the way…

N.B when ‘faking’ expectancy, model constructed expectancy on real feelings of expectancy you have had i.e excitement about getting test results back, about to win game, some real experience where you were expecting some positive result / feedback / experience and looking forward to it with excitement…model all the sub-modalities of each modality e.g 5 senses…sight, sound, taste, touch, smell…so have intense sensation of positive expectation…for the belief you are new-imprinting, re-imprinting etc…

Cancer is always present, like most pathogens people allergic to…but only suddenly become ‘problem’… but do NOT use war analogies…defining one element in process as bad guy, and one as good guy, as this may ‘hook’ into existing psychological conflicts in which the good and bad guys have been defined according to some imprinted schema…or actually constructed to serve a purpose in the belief system… treat more as two elements on same team that have stopped communicating well, stopped working together…need to get them communicating again…both mean well…tumor is excessive cell growth not held ‘in check’ by other checks and balances of system…cell growth obstructs functioning of organs and immune system… need to improve communication…not demonise one part of system and glorify other… wrong metaphors…can make problem worse i.e demonization of part of self is never going to produce an integrated holistic system… Need to integrate all the parts… regain balance in cell growth… communicate with immune system so it stops identifying own body as ‘enemy’… stops treating harmless hay pollen as ‘pathogen’, and ‘going to war’ with friendly neighbor…what ‘propaganda’ has been spread among the cells and various units of the body that have led it to falsely identify / demonise harmless particles as enemies… and started this war a.k.a ‘allergic reaction’ to a non-pathogen / friendly neighbor?… when was this belief ‘imprinted’? When were the tumor cells instructed ‘keep growing, don’t
stop’? When did the immune system suddenly start identifying the body cells themselves as ‘foreign bodies’ that needed to be eliminated? To start attacking itself. Civil war. So NEVER use war analogies / metaphors…fight propaganda / misunderstanding with truth…not demonization of one part of self and glorification of another…re-integrate…accept self completely…find more optimal ways to ‘defeat’ your demons…to face them…to turn them back into friends…for all ‘illness’ and ‘pain’ is communication…telling you something is wrong…attracting your attention to something that needs your attention…but because the messenger is unwanted / the messenger not welcome, you demonise it…blame it…claim you are its victim and thus justified in hating it, and seeking to silence it…but that communication breakdown will totally fuck you up…like it fucks up all systems, all organisations, from multi-celled animals, to organisations, to institutions, to states, to entire planets…Ignoring the message, demonizing the messenger, and falsely labelling / defining things as ‘good’ and ‘bad’, even ‘evil’…is demonization…is bound to destroy any system…lead to ‘war’…and death and misery…pain is telling you to stop doing something…to stop and look and pay attention…to get out of the ‘trance’ of the rat race, the rush to destruction, to stop the excesses…to face your demons…they are messengers…they have something to tell you…something maybe you THINK you don’t want to hear…something too traumatic, you feel, to face…but face it you must, if you are to be healthy again…

Basic definitions of identity…impose limits on self…often below threshold of possible…

We often stop well short of our true potential…limited by beliefs…which limit our confidence, hope, faith, expectations, and thus prevent us investing the resources, energy, time, etc required to achieve goals which are really within our reach…if only we believed…we are often capable of much more than we believe…

i.e beliefs motivate / don’t behaviors necessary to success…transformation…growth…realization full potential…

how common is it for women to get breast cancer, or men to simply die of heart attack, soon after their ‘roles’ in life change i.e mother’s children left home, feel life over…man retires, feel has no ‘role’ / purpose / function…and dies…falls prone to whatever pathogens around, whatever genetic vulnerabilities exist…or no satisfaction offered by roles available…i.e empty nest, no career prospects, why bother?

Change beliefs change what willing to do…motivations linked to expectations of success at achieving something you really want / feel worth sacrificing etc for…
i.e have desired outcome, feel can achieve, have resources to achieve, so motivated...

Beliefs about self-efficacy will change how you interpret outcomes i.e positive expectancy means will look for, identify, and celebrate the slightest gains...while negative person fails to see, looks for signs of failure i.e how interpret same situation... confidence looks for positive, despair looks for negative...both exist...question of focus...

Diseases that kill one person, go into ‘re-mission’ in other...what is difference? Unconscious beliefs play their role... death wish? ... escape from something?... what allows to avoid, what benefits does the ‘disease’ offer?... person with ‘mission’ to live for ... re-mission after lost previous mission?

Tendency to interpret ‘info’ according to existing beliefs, rather than allow info to change beliefs... once imprinted...thus religion must ‘imprint’ children ... few people become ‘religious’ re: a particular dogma / cult, as adults, and few of these remain ‘religious’ very long ... Vs children ‘inherit’ their parents religion, political views (though may ‘rebel’ in adolescence, tend to ‘become’ their parents later in life)...

Every ‘problem’ a person has often serves some role for them...e.g bad habits like smoking / drinking / a bad relationship / some ‘allergy’ or other ‘illness’... so while person claims ‘want’s to change, in reality a conflict of wants exists...they want the ‘good’ of something, without the bad e.g the fun of drunken orgies without the hangover, health etc problems... so find some alternative way of attaining these ‘benefits’...replace / displace ... and face what avoiding (with illness / belief etc) head on... so this ‘function’ of bad habit served in more creative way...

Psycho-cybernetics...form extremely vivid, multi-level, consistent, convergent, realistic image of outcome...then work on main ‘representation’ ‘modality’ e.g visual, emotional, kinetic...and then work on sub-modalities...work out what makes an idea / vision ‘real’ for person by comparing with ideas / visions person currently feels are real...down to body posture person adopts when visualizing / remembering the ‘real’ ‘memory’ / belief... ask to ‘remember’ ‘recall' etc something feel is really really real...observe...main modality...sub-modalities
e.g main ‘feeling’, supported by ‘sounds’, ‘scents’, body posture, etc… use to define ‘accessing cues’ for person…get to recall something, to imagine something, to visualize something, to recall how something tastes/smells etc, to imagine how something tastes/feels…to compare ‘recall’ Vs ‘imagined’…and to determine when client doing which i.e making up / lying Vs remembering something that really happened…and how stands, where looks i.e down to left, up to right…then when have established what client wants, what beliefs require updating / re-programming, work on the representations and sub-modalities of that belief, and what want to achieve, i.e the vision of future them having had that success…so can make the ‘vision’ as real as anything ever experienced…model own ‘vision’ self on ‘real self’…i.e how felt, posture, etc when felt happy, successful…i.e had self-defined success…felt good…

NLP uses term ‘representation’ after Schopenhauer’s concept… ‘Life as will and representation’ i.e we do not ‘know’ anything directly, if at all…all impressions / experiences ‘constructed’ by our mind…encoded…constructed… so we have to discover each person’s ‘representation’ of an experience … or ‘reality’ … and work with that…offers scope for re-imprinting, for re-coding, for re-constructing… ‘Knowledge’ of self and world…

‘Modalities’ or ‘representations’ are the way we process impressions, and form beliefs, definitions about/of TROONATNOOR

Compare current and desired state…and beliefs about what is desirable…work out what resources / training / education / attitudes etc required to realize desired state / situation / feeling…

Often the ‘resource’ required is a re-assessment of faulty ‘imprinting’…and re-imprinting with valid / efficacious beliefs…

Unconscious may not want to change, even though person states ‘I want to change’…i.e benefits / avoidance of ‘symptom’…current state…

Speed readers don’t verbalise words in head…take direct meaning without internal verbalization…form meaning of words directly from image, rather than first changing into a mental sound… people with problems learning to read/ spell need to identify how the ‘correctly’ spelt word ‘feels’ on many levels, rather than trying to use phonetics (how it sounds in their head)… i.e rich multi-layers of sub-modes i.e all other senses, not just ‘visual’ or ‘phonetic’…

Representations / modalities are NLP for the 5 main senses, i.e seeing, hearing, touching, smelling/tasting… i.e how we represent the world around us…how we form impressions of it..construct our experience of it…
Require genuine (unconflicted) desire, resources to facilitate, and opportunity to employ them (resistance of significant others to your desired change e.g beneficiaries of your current state other than yourself...e.g partner fears losing you, fat smoking also friends want to keep you down to their own level for same reasons

i.e congruency / consistency of beliefs / desires Vs conflicted

observe physiological changes e.g eyes moving up to form images, or moving down for feelings and sounds ... e.g to successfully form internal images in ‘minds eyes’ often best to look up to the right, make breathing shallower, and adopt an upright, alert posture...

Need congruency of beliefs e.g visualizing self as success, can see it, but the voice in their head saying ‘this is not possible’...i.e example of conflicting sub-modalities

Sequence of representations and sub-modalities used to ‘model’ an action e.g sport, dance e.g a dance ‘move’ or a golf ‘swing’...

Modes and sub-mode. Visual: brightness, clarity, size, location, focus

Auditory: volume, tempo, sound location, reverb, echo.

Kinesthetic: pressure and duration of touch, texture, direction of contact.

Like using guitar effects, changing the sequence of modes, and the range of sub-modalities, has huge effect on final ‘representation’ and thus ‘belief’ / definition / experience...especially vis a vis ‘how real’ a representation / visualization etc will seem...thus how powerful an agent of change / transformation ... will change subjective experience of any event...

Some people can ‘learn’ sport or dance moves easily...others learn math easily...i.e particular skills / behaviors ... they can form mental representations of the actions / ideas of some ideas / observations quicker and more efficaciously than others... so one strategy is to model own ‘success’ ... i.e what have you learned easily and well, and what representations did you employ...i.e ‘strategy’ used to ‘learn’... something...

Congruency is full conscious and unconscious commitment to an objective / goal ... i.e what say want, and what really, deep down, want...e.g superficial Vs genuine ... e.g want to lose weight, but really want to enjoy pleasure of food, excuse of overweightness, and keeping other ‘problems’ to the background i.e power of belief, ‘all I need is to lose weight and I’ll be happy, so I will be happy,
once I get around to losing this weight…i.e false hope … avoids facing truths about life… i.e still will be ugly, stupid, unpopular, poor, etc…

Often ‘symptom’ is way of asserting control…taking control back…e.g others controlling you in some way…the symptom gave you some control e.g parents forced to take sports, but asthma gets you out of it…unconsciously… learn to associate X and Y, causally…then rely on ‘symptom’ for that outcome… If being sick got you out of something…or brought you positive attention…etc…

Need to find more optimal ways of getting what need i.e rather than relying on ‘symptom’…

Therapy often required to gain insights into unconscious imprinting, motivations etc that conflict with superficial expressions of ‘I want to…’ etc.. can subvert any attempts to change conscious behavior , as underlying beliefs / motives are unconscious…

Must have / form genuine belief in efficacy of action i.e possibility of success…at unconscious and conscious levels…i.e be convinced can achieve state / outcome…i.e expectations theory … often helps to show examples where others have achieved the same desired outcome, and model on them…but also need to internalize i.e ‘I’ can do it also…i.e must identify with model…otherwise may feel, ‘sure, they could, but I can’t’…so have to use comparisons that person can accept as related to them… not ‘pie in the sky’, not ‘geniuses’, or ‘talented’ or ‘special’ or ‘miracles’…but people ‘like them’…with same resources…etc…

Have to believe that it is do-able, achievable, within their range of possibilities…THEIR…not some outlier…

People can feel helpless, and hopeless…and undermine any other work they are doing… and lead to apathy…why bother…impossible…no point…just give up…and send message to unconscious to ‘put me out of my misery, let me die’, and they do…their immune system stops working, attacks own body, cell growth continues out of hand, producing tumors, metastasizing around the body, and preventing organ functioning, leading to organ failure, and death…

Pay attention to verbal and physiological incongruities e.g say yes, but body is screaming ‘no’…like person holding out hand to spider, saying they are fine, but body shaking etc in terror… but usually more subtly…so have to do ‘reading’ first, to ‘calibrate’ the individual…to ‘read’ their ‘tells’…so have a basis for future analysis…i.e ‘benchmarks’ to work from… ‘zero levels’ on scales… the ‘basis year’ for calculations of ‘inflation’ or ‘deflation’… pay attention to muscle tension e.g in facial features, neck, shoulders, jaw, as these are very reliable indicators / tells of internal conflict/stress etc…
If you are in an ‘associated state’ it means you are fully immersed in, and experiencing the experience, as the experiencer, with the subjective experience of that person you are imagining, thus experiencing it from the inside e.g. enter-into-it VS dissociative states in which you observe the action as an indifferent, objective, unaffected, neutral etc. bystander/observer…so you will be visualizing yourself as an observer, free from any fear or need to react…indifferent…impartial…objective…able to ‘direct’ the action like a film director…without the usual limits you experience when you ARE the person…way to side-step and bypass or test the limiting beliefs from the outside…gives greater freedom…free of judgements that usually limit expression…can’t be hurt…can begin to ‘process’ an experience without the affect…be objective about how ‘irrational’ the fear is etc…bypass the usual stimulus-response knee-jerk reaction of fear, loathing, anger, hatred etc…

the aim of Zen and science is to ‘know’ something intuitively i.e. to ‘enter into it’ and know it fully, rather than merely attempt to define it from the outside…if you can ‘enter into’ something fully, and become it, walk in its shoes, be it, you gain insights not available to pure speculation or external observation…”to see ourselves as others see us”!!! To escape from our conditioned mind prisons. Get a fresh perspective. Break the cycles of reproducing the internal mental dialog…open up a space for creative, generative, resourceful energy…a Bardot…a zen moment…where the ‘no-thing’ from which all things emerge…the generative source…can freely express itself…stop the constant ‘replay’, ‘loops’, ‘cycles’, reproduction of history…escape history…write history from this moment…be in this moment free of the baggage of past and future fear…give moment present to bloom in…something NEW…a break with the past…the dull and listless burdensome repeats…

Eye accessing cue…tells…correlate to visual, auditory, or kinesthetic thinking

Future pacing is a projection of the person into the future, the mental rehearsal of various stimulus-response situations in the future without the limiting belief / symptom suffered in the past…conditions mind to expect no symptoms…to become familiar with feeling good in the context that used to be associated with symptoms / fear / pain etc…

Incongruity refers to an internal conflict that results in a person sending conflicting messages e.g. I am happy, but look terribly sad. On more subtly level the ‘tell’ is asymmetry in physiology…

An ‘Impasse’ is when you ‘draw a blank’ i.e. ‘can’t remember’… ‘it gets foggy from here on in’…

Meta-model: 17 language distinctions used to gather highly specific sensory impressions, sensory based information…meta-programs are the habitual
thinking processes people use to sort information and make sense of their world…MHR noetic structures…our ‘representational system’… i.e how world is ‘represented’ in our minds via pictures, sounds, feelings…

Sub-modalities of 5 senses…e.g Visual modality with sub-modalities of brightness, clarity, focus, size, associative Vs dissociative; Audio modality with sub-modalities of tone, pitch, volume, tempo, duration; Kinesthetic modality with sub-modalities of pressure, extent, duration etc…

Trans derivational search (T-D search) refers to anchoring a feeling, then regressing in time to situations the person had this same feeling

When getting a person to make a positive idea real, work on all levels, i.e physiology, verbal, etc…make it as real as possible… as real as the most real experience they’ve ever had…work out what makes those ‘memories’ so real…sub-modalities…details…and re-create for ‘desired’ outcome…projection into future of what want…in same way as projected into past ‘recollection’…

Placebo (I will please) effect widely documented…experiments reveal power of the mind to experience outcomes independently of ‘facts’ of situation…e.g have a doctor pretend to give people experiencing pain a ‘morphine shot’, and 50 to 70% of them will experience relief from that pain, even though there was nothing in the shot that could account for this i.e no pharmacologically active ingredients… usually ‘sugar pills’ used… or if double blind study, then inactive ingredient that looks / feels same as active e.g same colored pill, same sort of injection… based on expectations…beliefs… brain told ‘this will relieve pain’… pain and pleasure all in the brain… and same works in reverse…if give study participants an active ingredient, then 5% or so of them won’t experience the desired effects, if they don’t believe the pill or shot is going to work… and so of the 30 to 50% for whom the placebo won’t work, about half of these people wouldn’t benefit from the actual active ingredient either…beliefs are that powerful…

We are all familiar with funny stories of people getting ‘high’ after eating something they believed was marijuana.

And examples of people ‘re-interpreting their experience to fit with their expectations / beliefs, rather than the other way around’ e.g the person who insisted they were a corpse. The therapist asked them if corpses bleed, ready to prove to the client that they were not a corpse, as they bled. The client replied ‘well of course NOT’…the therapist pricked their finger so it bled, and of course the client’s reaction was not to accept that, ipso facto, they were NOT a corpse, but re-defined the experience to be consistent with their beliefs, expressing their amazement so ‘Wow, so corpses DO bleed’.
So it becomes clear that all ‘treatments’ have a pharmacological and a placebo effect. That all experiences are dependent on how the person interprets them. That expectations can produce self-fulfilling prophecies, independent of the ‘facts’ of the situation or ‘logical consistency’.

This is both our greatest challenge, and our greatest opportunity. For we must battle with invalid definitions, beliefs, and the active interpretative power of the mind…but this means we can use these same challenges as resources…we can actively re-program, re-define, and re-interpret in ways beneficial to ourselves and clients…others…though of course we should expect resistance from the current beneficiaries of lies, distortions, etc…from those within the people we want to help, and from society, pharma corporations, religious organisations etc…

A certain percentage of ‘cancer’ patients will automatically go into ‘remission’, without any pharmacological or radiation therapy intervention… and most of those who receive these costly, and often debilitating, painful, expensive, undignified procedures, don’t survive. So how many of the supposed ‘successes’ of the expensive medical interventions actually due to natural ‘remissions’. And what does this say about the justifications given for such treatments. Especially given the negative iatrogenic outcomes and massive financial costs?

In other words, give the same doctor a placebo to administer in the same way they would have administered an expensive ‘supposed active’ pharmacological substance, and chances are they would have the same beneficial effects, without the financial cost, and without the negative side-effects of the ‘drugs’, many of which are more experimental, from a scientific point of view, than the for-profit pharma companies that make them would care to admit…

A lot of research indicates that the common denominator in success…given a huge range of different approaches, treatments, routes, was the belief of the person that they were going to succeed e.g survive, reach the top, be a success in some field…seems it is not the ‘treatment’ or ‘situation’ of people that accounts for their success or survival, but their belief that they would survive, succeed...(though of course there may have been many more who believed in themselves, like Adolf Hitler, who were still defeated!)…the point is that many more people could have survived / succeeded, had they had the key ingredient they lacked…you are not likely to fight on, hard, long, make sacrifices, suffer setbacks, if you don’t really believe it is worth it, that in the long run you are going to win!

Beliefs include attributions of cause-effect…e.g what is ‘cause’ of a symptom e.g illness, cancer, virus, allergy, phobia… if believe unconscious imprinting is
cause, then un-doing this imprinting will cure symptom … if it in fact is…but cannot know until assume it is…and see if it resolves issue after un-imprinting… noble lie? … can be ‘ignoble lie’ of ‘karma’ or ‘original sin’ i.e attribute as God’s punishment for transgressing some dogma of a religion e.g Catholic… ‘god’s punishment for masturbation’ or something equally silly…or in Freud’s compelling argument, ‘Oedipal desires’…”

N.B power of suggestion… many organizations in recent years have heavily invested resources in ‘sick building syndrome’ … when real cause not air conditioning, venting etc, but organizational / corporate culture… and famous case of airport in Australia where so many people suddenly displayed similar symptoms, after false alarm re: biological agent released…

Beliefs include ‘meaning’ of the symptom…if god is punishing you, or karma from past ‘sins’ is to blame, then you must endure it… if it is ‘deserved’ or ‘earned’ in some other way e.g for some mean action, you may be inclined to accept it as legitimate suffering… if it is due to a poor character, which is irredeemable, then there is no point trying to ‘correct’ it, as you are doomed… none of these ‘definitions’ will motivate the search for, and application, of resources, especially requiring effort, sacrifice, cost etc to you…

I am worthless. I don’t deserve success. If I succeed something bad will happen to ‘correct’ for my good fortune, so it is dangerous to be happy / successful.

Sometimes the symptom is tightly connected to the sense of self…so that losing the symptom represents a loss of self…a need to totally re-orientate out of comfort zones…people identify with a ‘self’, and cannot imagine ‘losing’ it… it would be a form of death…

Some doctors cannot accept the power of the unconscious, and so deny its power in their own lives…i.e might define all their past career as a fraud…

All these forms of ‘ecological congruency’ or ‘holistics’ or ‘noetic structures’…

Belief as unconscious patterns of thought… processes that are cyclic…always becoming / renewing / reproducing…so if can break the pattern / cycle for a moment, have chance to introduce something new…stop the pattern…break the habit…build up new patterns of thought, and behavior… make many symptoms no longer congruent, so they evaporate…
Free floating anxiety caused by unconscious conflict... mind attributes the anxiety to something concrete and logical to 'explain' the feeling... rather than dig into unconscious to discover its real source... or to avoid the real source... logical explanation has nothing to do with real source... the real reason why the person feels anxious... often related to sexual arousal, sexual taboos, sexual repression... person unwilling to face/confront as 'taboo'... 'dirty hands need constant washing as person always unconsciously thinking about masturbation and sexual caressing etc'...

Any 'blanks' in a person's memory often hiding something... screen memories often put in place of real memory, or 'just draw a blank'... a clue that you have stumbled upon something important... traumatic... or challenges the person's self-definition/identity... doesn't want to admit... painful or embarrassing or unpleasant...

Look for language like 'can't' and 'shouldn't'... i.e taboos... imprinted limits

Look for global definitions of 'self' e.g I can't... I'm not... I am... e.g a smoker, a drinker, and over-eater... weak-willed...

Find out what client/self believes will happen if 'don't' or 'do' taboo thing/compulsively required thing... e.g command... 'thou shalt' and 'thou shalt not'...

If it is 'something terrible' then directs towards 'free floating anxiety' anchored in unconscious... need to identify/search for experience that laid foundation for that belief...

Fear of thing/action is really fear of perceived, and often imagined, unfounded, consequences i.e global devastation e.g if embarrass self in public... lose face etc...

Fear of rejection/disapproval/abandonment real!!!

What is stopping you from...

Need to identify what makes a feeling/vision/idea/belief real... then reproduce all the qualities for the desired feeling/vision/idea/belief... e.g how it 'feels' when you really believe something... what makes it 'certain'... physiologically, mentally, tastes, smells, posture, 'tells', accessing cues... like being a great actor... what makes their performance believable... no point just visualizing how it will look... or hearing yourself say some words... got to be a holistic impression... so can 'role play' and 'act' it out, rehearse the scene, in advance... so when situation arises, your new response feels compellingly real to you... i.e don't just tell self 'I will be calm, relaxed'... but rehearse the interaction
with you really feeling everything you would normally associate with / feel, when actually relaxed…what does it really MEAN to you to be relaxed…not just words…not a mantra…but a feeling…complete, holistic…

39

Fear of success can be fear of failure i.e unsure will ‘manage’ higher responsibilities

As therapist, more important to know what to change, rather than have an explicit, precise plan of action to change it…i.e which resources to give client and how…techniques aren’t key…what is key is to identify the structure of/ the way the client has constructed their reality, their definitions / beliefs…so can choose position of most leverage to apply techniques to...

We have all had the experience where we were sure we had done or said something, only to realise later that we had only ‘rehearsed’ it in our minds, i.e ‘meant’ to do it… it’s why most of us are not lucid most of the time we are dreaming…we don’t think to ask ‘Am I dreaming’, and then to do a ‘reality check’ e.g can I fly, can I read the same printed text twice and have it remain stable, do my hands looks real, can I read a digital watch…so we are mislead by our thoughts during waking…

When we imagine something, visualize it, we use the same brain cells as when we ‘see’ something…same goes for hearing, tactile sensation … wet dreams … all our impressions are ‘representations’ of what is ‘out there’, in the world, at the ends of our nerve endings … the nerves convert ‘out there’ impressions into electrical signals which the brain then decodes…all our experience, all our pleasure and pain, every sensation and impression, is ultimately a product of, is constructed by, our brains…so we can’t say for sure anything is ‘out there’ at all...

So we use ‘clues’ to distinguish between ‘fantasy’ and ‘reality’…though for the truly scientific, skeptic, there is no real distinction…everything is electromagnetic soup… but read my other TROONATNOOR books if you are up to it…for more on that subject…basically I was writing NLP books long before I ever heard the term…

Basically it comes down to layers of data connected in specific ways, that make one thing ‘real’ and another ‘fantasy’. Or to be more precise, ‘reality’ is just a better constructed fantasy, that many people can agree on…that several people can experience and form a consensus on…Vs try finding someone, after waking, who was in your dream!!! … so ‘reality’ is group dreaming, in a sense …
Basically the move vivid, detailed, sensory rich, feeling rich, and ‘connected-integrated-holistically compelling a memory is, the more we are prone to accept it as having actually occurred, rather than it being a fantasy, daydream, or dream.

The more consistent the things remembered are, with other things we have remembered, the more credence we give them. So because we have very few experiences of ‘flying’ while ‘awake’, we are likely to realise we are dreaming if we can fly…if it occurs to us to wonder at our ability to fly…of course most people, most of the time, just take it for granted…it doesn’t raise any flags, or offer the clue ‘hey, you’re dreaming, you can do ANYTHING you want to do…read my book on Lucent Dreaming for details…

To ‘calibrate’ a person, to check how they reject one ‘memory’ as real and accept another as ‘fake’…to see what sub-routines their conscious mind runs when evaluating how compelling a belief is e.g the belief that this morning I had a cup of tea, rather than coffee (always choose something that person easily might have done, because it is the sort of thing they often do, and might have done this morning, but didn’t) …we want to be able to re-imprint beliefs, so they need to be compelling, to convince the conscious mind to accept them, and thus allow the unconscious mind to re-program the ‘self’ to incorporate these new resources into that ‘self’…

These ‘sub-modalities’ are the conscious minds criteria for rejecting or accepting new information…new beliefs…new definitions…they were used when our original ‘imprinting’, ‘programming’ occurred…so we need to learn how to ‘trick’ our conscious mind…including the use of ‘muscle memory’, which is a key way the unconscious functions…so if, when ‘remembering’ ‘real’ things that happened, you lean on the right leg, and tend to straighten up, and look to the left, you will want to mimic that stance, to employ muscle memory…by association, the mind will accept the re-programmed experience / belief as real, because it associates this stance with true, real, genuine, authentic ‘information’ / ‘data’ / impressions / experience …and thus will ‘believe’ it to be true…in the same way we believe there are ‘things’ out there…that ‘we’ are things…etc…

This is also a way to form connections with the present noetic structure, to incorporate the new beliefs, to displace the old, to replace them. David Hume noted how the stronger belief will absorb the ‘compellingness’ of the weaker…so love and hate both exist together, but the affect of the weaker one will be absorbed by the stronger one, making it even more dominant, and thus virtually eliminating the affect of the weaker…so we are rarely ‘neutral’ about things…we tend to love or hate, to believe or disbelieve…we rarely ‘suspend judgement’ and remain ‘open minded’ and truly ‘skeptic’…

So pick something well within the realm of possibility, that the person would have found agreeable enough, and normal enough to find no reason to disbelieve
they actually did do it… or simply change the details of something they did do slightly…so that it is almost what did happen…then ask them to imagine it did happen for a few moments…then ask them again, whether they actually did X or Y i.e the actual action or the one slightly different that did not happen…observe…take a typical behavioralist approach… ask them why one thing did happen, and the other didn’t…watch their body language, breathing, accessing cues, posture etc, to identify differences between when they are ‘remembering’ the actual and the imagined version of events… e.g they did or did not remember to brush their teeth, or they had 7 rather than 5 sweetener tabs in their coffee…they had 3 or 2 cups of coffee (be sure to note yourself which version was first related as ‘true’)…

Ask them to explain how they know which one is true…and watch as they ‘access’ all the ‘data’ they would search through to make the distinction…these are the ‘tells’ you will need to have them replicate later, when re-imprinting / re-programming themselves... a sequence of processes, of guestures… including visualization, recall of sounds, tastes, smells… referring to other things that happened for consistency i.e whether consistent with other facts that seem real…

Then tell the person you are going to ask the same question ‘What really happened this morning’, but that you want them to try to convince you that it was the thing that didn’t happen…to pretend to themselves…to convince themselves that it really was true e.g like they had to lie to someone about it, to save a friend’s life…and realised that to convince others, they first had to believe it themselves…to make themselves believe it…

Get them to visualize both versions of the ‘reality’ and place them side by side in their minds eye…and then to describe any differences…how can they tell which really happened…e.g context … clues…what makes one more real than the other, if both could have happened…e.g muscle memory of moving arm, pressing sweetener container, lifting hand, where left cup etc … if they look up to left they are re-creating a memory, rather than constructing one… i.e remembering, not constructing…can remember saying something to self at time, or to someone else…remember looking at clock and thinking something…remember having done the same thing you did this morning many other times i.e routine habit…this morning was not different, therefore had 2 cups, not 3…

If there was an auditory component, i.e they remember asking for two cups of coffee, Get them to lie to you several times about how many cups of coffee or tabs sweetener they usually have…so that the ‘auditory’ memory is now confused…now they have a memory or telling you they normally have 3 cups…and now ask them to decide which ‘memory’ is real…i.e aim to delve deeper into the process they would normally use to decide if a memory is real or
fantasy… n.b just repeating something visually, and verbally, telling yourself it is true, and visualizing it as if it was true, make something seem more true…so repetition is important to conditioning people…brainwashing…e.g mass media…advertisements must repeat…repeat a lie over and over …

Direct suggestion can activate conscious processes to the point where unconscious processes are inhibited, and we lose the full power of the unconscious resources … probably much more powerful than any suggestion…much more appropriate than anything the therapist could imagine…

You don't really know just how your unconscious will help you resolve that problem. But your conscious mind can be receptive to the answer when it does come.

Your conscious mind surely has many questions, but it does not really know just when the unconscious will let you give up that undesirable habit. You don't know if it will be sooner or later. You don't know if it will be all at once or slowly, by degrees. Yet you can learn to respect your own natural way of doing things.

It is presumptuous to assume that anyone could possibly know ahead of time just what is the most creative approach to the new that continually overtakes us. Indeed, one view of maladjustment is that we do in fact attempt to impose old views and solutions into changed life circumstances where they are no longer appropriate (Rossi, 1972). Open-ended suggestion is a means of dealing with this problem. Let client consciously choose for self, and unconscious to have open / blank check…

We all have potentials we are unaware of, and we usually don't know how they will be expressed.

Your mind can review more feelings, memories, and thoughts related to that problem, but you don't know yet which will be most useful for solving the problem you are coping with.

You can find yourself ranging into the past, the present, or the future as your unconscious selects the most appropriate means of dealing with that.

He doesn't know what he is learning, but he is learning. And it isn't right for me to tell him, You learn this or you learn that! Let him learn whatever he wishes, in whatever order he wishes.

Soon you will find a finger or a thumb moving a bit, perhaps by itself. It can move up or down, to the side or press down. It can be slow or quick or perhaps not move at all. The really important thing is to sense fully whatever feelings develop.
All possibilities of finger movement have been covered, including the possibility of not moving at all. The suggestion is thus fail-safe. The patient is successful no matter what response develops. The therapist is simply exploring the patient’s initial responsiveness while initiating trance by focusing attention.

Exactly the same approach can be used when the patient has experienced therapeutic trance and is ready to deal with a problem.

Soon you will find the weight problem being dealt with by eating more or less of the right foods you can enjoy. You may first gain weight or lose it or remain the same for a while as you learn the really important things about yourself.

In both of these illustrations we can observe how we are distracting the patient's consciousness from the important area of responsiveness with an interesting idea in the end (in italics), so that the unconscious can have more opportunity to determine which of the response possibilities (not in italics) will be expressed. This is in keeping with the classical notion of hypnosis as the simultaneous focusing and distraction of attention.

When asked, Did you experience the hypnotic state as basically similar to the waking state? most subjects (83 percent) reported affirmatively. On the other hand, when asked, Did you experience the hypnotic state as basically different from the waking state? 72 percent responded affirmatively… such questions focused the subjects on different aspects of their experiences. The first question focused their attention on the similarities between the waking and hypnotic states; the second focused attention on the differences…

The following are illustrations of how a series of questions may be used to initiate and deepen trance by two different approaches to induction - eye fixation and hand levitation. In each illustration the first few questions may be answered by responsive behavior that is guided by conscious choice. The next few questions may be answered by either conscious intentionality or unconscious choice. The last few can only be answered on an unconscious or autonomous level of responsiveness. These series of questions cannot be used in a fixed and rigid manner, but must always incorporate and utilize the patient's ongoing behavior. It is understood that patients need not respond in a conventional verbal manner to these questions, but only with the responsive behavior suggested. Patients usually do not recognize that a very important but subtle shift is taking place. They are no longer verbally interacting in a social manner with their typical defenses. Rather, they are focused intensely within themselves wondering about how they will respond. This implies that a dissociation is taking place between their conscious thinking (with its sense of control) and their apparently autonomous responses to the therapist’s questions. The apparently autonomous nature of their behavioral responses is usually acknowledged as hypnotic.
that the stage is set for further autonomous and unconsciously determined therapeutic responses. Eye Fixation

1. 1. Would you like to find a spot you can look at comfortably? 2. 2. As you continue looking at that spot for a while, do your eyelids want to blink? 3. 3. Will those lids begin to blink together or separately? 4. 4. Slowly or quickly? 5. 5. Will they close all at once or flutter all by themselves first? 6. 6. Will those eyes close more and more as you get more and more comfortable? 7. 7. That's fine. Can those eyes now remain closed as your comfort deepens like when you go to sleep? 8. 8. Can that comfort continue more and more so that you'd rather not even try to open your eyes? 9. 9. Or would you rather try and find you cannot? 10. 10. And how soon will you forget about them altogether because your unconscious wants to dream? (Therapist can observe slight eyeball movements as the patient's closed eyes follow changes on the inner dream scene.)

This series begins with a question that requires conscious choice and volition on the part of the patient and ends with a question that can only be carried out by unconscious processes. An important feature of this approach is that it is fail-safe in the sense that any failure to respond can be accepted as a valid and meaningful response to a question. Another important feature is that each question suggests an observable response that gives the therapist important information about how well the patient is following suggestions. These observable responses are also associated with important internal aspects of trance experience and can be used as indicators of them.

If there is a failure to respond adequately, the therapist can go on with a few other questions at the same level until responsive behavior is again manifest, or the therapist can question patients about their inner experience to explore any unusual response patterns or difficulties they may have. It is not uncommon for some patients, for example, to open their eyes occasionally even after it is suggested that they will remain closed. This seems to be an automatic checking device that some patients use without even being aware of it. It does not interfere with therapeutic trance work. The question format thus gives each patient's own individuality an opportunity to respond in a therapeutically constructive manner. These features are also found in the handlevitation approach, which we will now illustrate. Hand Levitation

1. 1. Can you feel comfortable resting your hands gently on your thighs? [As therapist demonstrates] That's right, without letting them touch each other. 2. 2. Can you let those hands rest ever so lightly so that the fingertips just barely touch your thighs? 3. 3. That's right. As they rest ever so light, do you notice how they tend to lift up a bit all by themselves with each breath you take? 4. 4. Do they begin to lift even more lightly and easily by
themselves as the rest of your body relaxes more and more? 5. 5. As that goes on, does one hand or the other or maybe both continue lifting even more? 6. 6. And does that hand stay up and continue lifting higher and higher, bit by bit, all by itself? Does the other hand want to catch up with it, or will the other hand relax in your lap? 7. 7. That's right. And does that hand continue lifting with these slight little jerking movements, or does the lifting get smoother and smoother as the hand continues upward toward your face? 8. 8. Does it move more quickly or slowly as it approaches your face with deepening comfort? Does it need to pause a bit before it finally touches your face so you'll know you are going into a trance? And it won't touch until your unconscious is really ready to let you go deeper, will it? 9. 9. And will your body automatically take a deeper breath when that hand touches your face as you really relax and experience yourself going deeper? 10. 10. That's right. And will you even bother to notice the deepening comfortable feeling when that hand slowly returns to your lap all by itself? And will your unconscious be in a dream by the time that hand comes to rest?

8c. Questions Facilitating Therapeutic Responsiveness

Questions can be combined with not knowing and with open-ended suggestions to facilitate a variety of patterns of responsiveness.

And what will be the effective means of losing weight? Will it be because you simply forget to eat and have little patience with heavy meals because they prevent you from doing more interesting things? Will certain foods that put on weight no longer appeal to you for whatever reasons? Will you discover the enjoyment of new foods and new ways of preparing them and eating so that you'll be surprised that you did lose weight because you really didn't miss anything?

The last question in this series is an illustration of how compound questions can be built up with and and so to facilitate whatever tendency is most natural for the patient.

The ambiguity and suggestive effect of compound questions has long been recognized in jurisprudence. The use of compound questions by attorneys is therefore forbidden during their cross-examination of a witness. In a hotly contested case a judge or an opposing attorney can often be heard objecting to the compounds by which an unscrupulous attorney may befuddle and perhaps ensnare an unwary witness. In our therapeutic use of compound questions their very ambiguity is of value in depotentiating the patient's learned limitations so new possibilities may be experienced.
Five classes of compound suggestion that have been of particular use in hypnotherapy: (a) the yes set and reinforcement, (b) contingency, (c) apposition of opposites, (d) the negative, and (e) shock, surprise, and creative moments. Other forms of indirect suggestion such as implication, binds, and double binds are so complex.

The Yes Set and Reinforcement

A basic form of compound statement widely used in daily life is the simple association of a certain and obviously good notion with the suggestion of a desirable possibility.

It's such a beautiful day, let's go swimming.

Contingent Suggestions and Associational Networks

A useful form of compound statement occurs when we tie a suggestion to an ongoing or inevitable pattern of behavior. A hypnotic suggestion that may be difficult for a patient is easier when it is associated with behavior that is familiar. The hypnotic suggestion hitchhikes onto the natural and spontaneous responses that are well within the patient's normal repertory. The contingent suggestion is italicized in the following examples.

With each breath you take you can become aware of the natural rhythms of your body and feelings of comfort that develop.

As you continue sitting there, you will find yourself becoming more relaxed and comfortable.

As your hand lowers, you'll find yourself going comfortably back in time to the source of that problem.

As you mentally review the source of that problem your unconscious can develop some tentative ways of dealing with it.

And when your conscious mind recognizes a plausible and worthwhile solution, your finger can lift automatically.

When you feel ready to talk about it, you'll find yourself awakening feeling refreshed and alert, with an appreciation of the good work you've been able to do.

As can be seen from the last four examples, contingent suggestions can be tied together into associational networks that create a system of mutual support and momentum for initiating and carrying out a therapeutic pattern of responses. From the broadest point of view a whole therapy session - indeed, an entire
course of therapy - can be conceived as a series of contingent responses wherein each successful therapeutic step evolves from all that came before.

Most biological systems can be conceptualized as a homeostatic balance of processes that prevents the overall system from straying outside the relatively narrow range required for optimal functioning. This balancing or apposition of opponent processes is also evident on the psychological and social levels. There is tension and relaxation, motivation and inhibition, conscious and unconscious, eros and logos, thesis and antithesis. An awareness and understanding of the dynamics of such opponent processes is of greatest significance in any form of psychotherapy. In this section we can provide only a few illustrations of how we can balance opponent processes by means of verbal suggestion. In the process of hypnotic induction, for example, we have the following:

As that fist gets tighter and tense, the rest of your body relaxes. As your right hand lifts, your left hand lowers.

As that arm feels lighter and lifts, your eyelids can feel heavier and lower until they are closed.

Similar suggestions can be formulated for virtually any of the opponent processes in the sensory, perceptual, affective, and cognitive realms.

As your forehead gets cooler, your hands can get warmer.

As your jaw becomes more and more numb and insensitive, notice how your left hand becomes more and more sensitive.

You can experience all your feelings about something that occurred at age X without being able to remember just what caused those feelings.

When you next open your eyes you will have an unusually clear memory of all that, but without the feelings you had then.

As you review that, you can now experience an appropriate balance of thinking and feeling about the whole thing.

As can be seen from the last three examples, a process of dissociation can be utilized to first help the patient very thoroughly experience both sides of an opponent system before they are brought together at a more adequate level of integration.

The Negative
Closely associated with the apposition of opposites is the senior author's emphasis on the importance of discharging the negativity or resistance that builds up whenever a patient is following a series of suggestions. In everyday life we can recognize how people who are negative or resistant usually have a history of feeling they were imposed upon too much. Because of this they now want to have it their way! They resist being overdirected and very often do the opposite of what they believe others want them to do. This oppositional tendency, of course, is actually a healthy compensation for their early histories. Nature apparently wants us to be individuals, and many believe that the history of man's cultural and psychological development

And you can, can you not? You can try, can't you? You can't stop it, can you? You will, won't you? You do, don't you? Why not let that happen?

Research has demonstrated another value in this close juxtaposition of the positive and the negative. It has been found that it is 30 percent more difficult to comprehend a negative than a positive (Donaldson, 1959). Thus the use of negatives can introduce confusion that tends to depotentiate a patient's limited conscious set so that inner work can be done.

The use of the negative is also related to another indirect form - not knowing and not doing. This use of the negative can be very usefully and casually introduced in contingent suggestions, such as the following that utilize the connective until.

You don't have to go into trance until you are really ready.

You won't take a really deep breath until that hand touches your face.

You won't really know just how comfortable you can be in trance until that arm slowly lowers all the way down to rest on your lap.

And you really don't have to do [therapeutic response] until [Inevitable behavior in patient's near future].

You won't do it until your unconscious is ready.

The latter use of the negative is actually a form of the conscious-unconscious double bind

Shock, Surprise, and Creative Moments

A most interesting form of compound suggestion is illustrated when a shock surprises patients' habitual mental frameworks so their usual conscious sets are depotentiated and there is a momentary gap in their awareness, which can then be filled with an appropriate suggestion
one sometimes blushes in an uncontrolled manner when unconscious emotional processes are touched upon. If a person is not blushing during such an unguarded moment, one can frequently precipitate a blushing response by simply asking, Why are you blushing?

In everyday life a loud noise may startle us so that we freeze, momentarily inhibiting all body movement; we are thrown into a momentary trance as the unconscious races for a means of comprehending what is happening. The answer may flash that it was only a car backfiring, and we relax. But if in that precise moment someone yells the suggestion, bomb! we almost certainly will flinch, look around in panic, or fall to the ground to protect ourselves. Daily life is filled with less dramatic examples of unexpected shocks that startle and surprise and perhaps lead to a double-take, where we have to look back or go over that again to comprehend what is really going on. We could theorize that foul language is actually a form of shock that has developed in most cultures to startle the listeners so they will be more available to what is being said and be more readily influenced by it.

If people have problems because of learned limitations, it can be therapeutic to momentarily depotentiate those limitations with some form of psychological shock. They can then reevaluate their situation via the automatic process of unconscious search that is initiated within them. In this case the process of shock, surprise, and creative moments is open-ended; the patient's own unconscious processes provide whatever reorganization or solution that emerges. If nothing satisfactory comes forth, the therapist may then add suggestions as further stimuli during the momentary gap, in hope that they may catalyze a therapeutic response.

Momentary shock can be generated in therapeutic dialogue by interspersing shock words, taboo concepts, and emotions. Words like sex, secrets, and whispering momentarily fix attention, and the listener is more receptive. A momentary pause after the shock allows an inner search to take place. It can be followed by reassurance or an appropriate suggestion.

Your sex life

[Pause]

Just what you need to know and understand about it.

Secretly what you want

[Pause]
Is most important to you.

You may get divorced

[Pause]

Unless you both really learn to get what you need in the relationship.

In each of these examples the shock in italics initiates an inner search that can lead to the expression of an important response during the pause. The therapist learns to recognize and evaluate the nonverbal body reactions to such psychological shock. If there are indications that the patient has become preoccupied with the inner search, the therapist simply remains quiet until the patient comes forth with whatever material has been stimulated. If there are no indications of material coming from the patient, the therapist ends the pause with a reassurance or suggestion, as illustrated above. The most effective initiators of shock utilize the patient's own frames of reference, taboos, and needs for a break out of the old so that a creative reorganization can take place.

Implication and the Implied Directive

Implication is a basic linguistic-psychological form that provides us with the clearest model of the dynamics of indirect suggestion. Most psychotherapists agree that it is not what the therapist says that is important but what the patient hears. That is, the words of the therapist only function as stimuli that set off many personal trains of association within the patient. It is these personal trains of association within the patient that actually function as a major vehicle for the therapeutic process.

Implications bypass consciousness and automatically evoke the desired unconscious processes that will facilitate trance induction in a way that the conscious mind could not because it does not know how.

Since the essence of hypnotic suggestion is that responses are carried out on an autonomous or unconscious level, it is usually futile to expect the conscious mind to carry them out via direct suggestion. When direct suggestions are successful, they usually involve preparation for hypnotic work in the same sense that brushing one's teeth and lying in bed are conscious, preparatory acts that set the stage for going to sleep, which is then mediated by unconscious processes.

Everything we say has implications. Even the most general conversation can be analyzed as a study in implication - how the words of one speaker can evoke all sorts of associations in the listener. In everyday life as well as in hypnotherapy it is often the implications that are more potent as suggestions than what is being said directly. In a public conversation the participants are frequently inhibited,
and respond with associations that are nothing more than clichés. In a more personal interaction, such as hypnotherapy, the participants have license to respond with their more intimate or idiosyncratic associations. In such personal interactions we are sometimes surprised at what associations and feelings we experience. When our conscious mind is surprised in this manner, the therapy has been successful in facilitating an expression of our individuality that we were not previously aware of. We could say that potentials have been released or new dimensions of insight and consciousness have been synthesized.

Now you know you do many things all day long without being aware of them. Your heart just beats along without any help or conscious direction from you. Just as you usually breathe without being aware of it. And even when you walk, your legs seem to move by themselves and take you wherever you want to go. And your hands do most of the things you want them to do without your saying Now hands do this, now hands do that. Your hands work automatically for you, and you usually don't have to pay attention to them. Even when you speak, you do it automatically, you don't have to be consciously aware of how to pronounce each word. You can speak without even knowing it. You know how to do it automatically without even thinking about it. Also, when you see or hear things or when you touch or feel things, they work automatically without you having to be conscious of them. They work by themselves and you don't have to pay attention. They just take care of themselves without your having to be bothered about them.

The implied directive has three recognizable parts:

1. a time-binding introduction; 2. the implied suggestion that takes place within the patient; 3. behavioral response that signals when the implied suggestion has been accomplished.

Thus, as soon as

1. the time-binding introduction

your unconscious has reached the source of that problem,

2. the implied suggestion initiating an unconscious search taking place within the patient

your finger can lift.

3. the behavioral response that signals when the implied suggestion has been accomplished.
As can be seen from this illustration, the implied directive is an indirect form of suggestion that initiates inner search and unconscious processes and then lets us know when a therapeutic response has been accomplished.

When you have found a feeling of relaxation and comfort, your eyes close all by themselves.

In this example the patient must obviously make a search on an unconscious level that will ideally initiate parasympathetic responses that can be experienced as comfort and relaxation. Eye closure is a response naturally associated with such internal comfort and thus serves as an ideal signal that the internal process has taken place.

As that comfort deepens, your conscious mind can relax while your unconscious reviews the nature of the problem. And when a relevant and interesting thought reaches your conscious mind, your eyes will open as you carefully consider it.

This example builds upon the first and initiates another unconscious search for a general exploratory approach to a problem.

As can be seen from these examples, an unconscious search initiates an unconscious process that actually solves the problem that the conscious mind could not handle. These unconscious processes are the essence of creativity and problem-solving in everyday life as well as in therapy. Hypnotherapy, in particular, depends upon the successful utilization of such unconscious processes to facilitate a therapeutic response.

When you have found a feeling of relaxation and comfort, your eyes close all by themselves.

In this example the patient must obviously make a search on an unconscious level that will ideally initiate parasympathetic responses that can be experienced as comfort and relaxation. Eye closure is a response naturally associated with such internal comfort and thus serves as an ideal signal that the internal process has taken place.

As that comfort deepens, your conscious mind can relax while your unconscious reviews the nature of the problem. And when a relevant and interesting thought reaches your conscious mind, your eyes will open as you carefully consider it.

could not handle. These unconscious processes are the essence of creativity and problem-solving in everyday life as well as in therapy. Hypnotherapy, in particular, depends upon the successful utilization of such unconscious processes to facilitate a therapeutic response.

Typically we are caught in circumstances that allow us only unpleasant alternatives of response. We are caught between the devil and the deep blue sea. We thus experience an avoidance-avoidance conflict; we have to make a choice even though we would like to avoid all the alternatives. In such circumstances we usually choose the lesser of the two evils.

Psychological binds can also be constructed on the model of an approach-approach conflict. In this case one is in the bind of having to choose only one of a number of desirable courses of action and excluding all the other desirable possibilities. In common parlance, you can't have your cake and eat it too.

Structure binds that offer only therapeutic alternatives of response.

Would you like to enter trance now or later? Would you like to enter trance sitting or lying down? Would you like to go into a light, medium, or deep trance?

Therapeutic avoidance-avoidance bind. He was told that if he was not asleep within fifteen minutes of going to bed, he had to get up and wax floors until he felt he could sleep. If he was still not asleep within fifteen minutes, he had to get up again and so continue this procedure until he was asleep. We may call this situation a therapeutic avoidance-avoidance bind because the gentleman was presented with negative alternatives over which he had conscious, voluntary choice. He could choose between the negative alternatives of insomnia or waxing floor.

We cannot direct our sub/unconscious mind directly ... but we can suggest / initiate unconscious processes ... e.g search for more optimal solutions / responses ... i.e tap unconscious potentials / resources ...

If your unconscious wants you to enter trance, your right hand will lift all by itself. Otherwise your left hand will lift. If the patient simply sits quietly, and no hand response is evident after a few minutes, the therapist can introduce a further double bind with the following addition.

Since you've been sitting quietly and there is yet no hand response, you can wonder if your unconscious would prefer not to make any effort at all as you go into trance. It may be more comfortable not to have to move or talk or even bother trying to keep your eyes open. You don't have to listen to me because your
unconscious is here and can hear what it needs to, to respond in just the right way.

And it really doesn't matter what your conscious mind does because your unconscious can find the right means of coping with that pain [or whatever].

You've said you don't know how to solve that problem. You are uncertain and confused. Your conscious mind really doesn't know what to do. And yet we know that the unconscious does have access to many memories and images and experiences that it can make available to you in ways that can be most surprising for solving that problem. You don't know what all your possibilities are yet. Your unconscious can work on them all by itself. And how will you know when it has been solved? Will the solution come in a dream you will remember, or will you forget the dream but find that the problem is gradually resolving itself in a way that your conscious mind cannot understand? Will the resolution come quickly while wide-awake or in a quiet moment of reflection or daydreaming? Will you be at work or at play, shopping or driving your car, when you finally realize it? You really don't know, but you certainly can be happy when the solution does come.

Reminds me of Hume...two potentials exist e.g hate / love, conscious / unconscious, habitual / new and more resourceful, and by de-potentiating one, give the other the power it had, thus realising the chosen potential ...

You can as a person awaken, but you do not need to awaken as a body.

[Pause]

You can awaken when your body awakens but without a recognition of your body.

You can dream you're awake even though you're in trance.

[Pause]

Or you can act as if you're in trance even while awake.

You can find your hand lifting without knowing where it is going.

[Pause]

Or you may sense where it is going even though you're not really directing it.
You can make an abstract drawing without knowing what it is.

[Pause]

You can later find some meaning in it even though it does not seem related to you personally.

You can speak in trance even though you don't always recognize the meaning of your words.

[Pause]

Or you can remain silent as your head very slowly nods yes or shakes no all by itself in response to my questions.

The double dissociation double blind tends to confuse a patient's conscious mind and thus depotentiate his habitual sets, biases, and learned limitations. The senior author's question, Are you willing to cooperate with me by continuing to pace the floor, even as you are doing now? is an unusually fecund example of the use of a number of indirect hypnotic forms in a single sentence. Being a question, it immediately fixes the patient's attention and sends him on an inner search for an appropriate response. It is an excellent compound suggestion that associates an important suggestion about cooperation with his ongoing behavior of pacing the floor. Pacing the floor constantly was the patient's own ability that was rapidly assessed, accepted, and utilized to facilitate ayes set. The question came as a bit of a shock and surprise that depotentiated his dominant mental set about his own resistance and startled him into a strong exclamation of his need to cooperate. Rapport was thus strongly established, and therapy structured as a joint endeavor. With such a strong immediate rapport, a high expectation was set in motion, heightening the patient's response attentiveness to his own internal states as well as to the therapist's further suggestions. By a gradual process of association and unconscious conditioning this response attentiveness was heightened even further, so the patient was finally able to accept suggestions to sit down and go even deeper into himself so that he could relate his history in a state of deep absorption that is described as profound trance.

many iatrogenic problems and neurotic symptoms can be learned by overhearing unfortunate remarks during emergency and stress situations when the patient had lapsed into a spontaneous trance (as a primitive protective response to danger) and was consequently in an unusually heightened state of suggestibility.

The writer's utterances are in italics:

You really can't conceive of what a trance is - no, I can't, what is it? - yes, what is it! - a psychological state, I suppose - A psychological state you suppose, what
else! - I don't know - you really don't know - no, I don't - you don't, you wonder, you think - think what - yes, what do you think, feel, sense? - (pause) - I don't know - but you can wonder - do you go to sleep? - no, tired, relaxed, sleepy - really tired - so very tired and relaxed, what else? - I'm puzzled - puzzles you, you wonder, you think, you feel, what do you feel? - my eyes - yes, your eyes, how? - they seem blurred - blurred, closing - (pause) - they are closing-closing, breathing deeper - (pause) - tired and relaxed, what else? - (pause) - sleep, tired, relaxed, sleep, breathing deeper - (pause) - what else - I feel funny - funny, so comfortable, really learning - (pause) - learning, yes, learning more and more - (pause) - eyes closed, breathing deeply, relaxed, comfortable, so very comfortable, what else? - (pause) - I don't know - you really don't know, but really learning to go deeper and deeper - (pause) - too tired to talk, just sleep - maybe a word or two - I don't know (spoken laboriously) - breathing deeper and you really don't know, just going deeper, sleeping soundly, more and more soundly, not caring, just learning, continuing ever deeper and deeper and learning more and more with your unconscious mind.

The above is simply a condensation of the type of utterances utilized to induce trance. In general, there is much more repetition, usually only of certain ideas, and these vary from patient to patient. Sometimes this technique proves to be decidedly rapid. Frequently with anxious, fearful patients, it serves to comfort them with a conviction that they are secure, that nothing is being done to them or being imposed upon them, and they feel that they can comfortably be aware of every step of the procedure. Consequently, they are able to give full cooperation which would be difficult to secure if they were to feel that a pattern of behavior was being forcibly imposed upon them.

As can be seen from the above, the patient's experience of not knowing, I don't know what trance is, can be an ideal starting point for initiating trance and the exploration of inner realities. The following is a further illustration of how a patient's life experiences can be used to facilitate trance induction.

A volunteer subject at a lecture before a university group declared, I was hypnotized once several years ago. It was a light trance, not very satisfactory, and while I would like to cooperate with you, I'm quite certain that I can't be hypnotized. Do you recall the physical setting of that trance? Oh yes, it was in the psychology laboratory of the university I was then attending. Could you, as you sit here, recall and describe to me the physical setting of that trance situation?

He agreeably proceeded to describe in detail the laboratory room in which he had been lightly hypnotized, including a description of the chair in which he had sat, and a description of the professor who had induced the trance. This was followed by a comparable response to the writer's request that he describe in as orderly and
as comprehensive a fashion as possible his recollection of the actual suggestions given him at that time and the responses he made to them.

Slowly, thoughtfully, the subject described an eye closure technique with suggestions of relaxation, fatigue, and sleep. As he progressed in verbalizing his recollections, his eyes slowly closed, his body relaxed, his speech became slower and more hesitant; he required increasingly more prompting until it became evident that he was in a trance state. Thereupon, he was asked to state where he was and who was present: He named the previous university and the former professor. Immediately, he was asked to listen carefully to what the writer had to say also, and he was then employed to demonstrate the phenomena of the deep trance.

The junior author has found that questions focusing on memories can be a reliable means of assessing the patient's availability for trance and frequently a fine means of facilitating the actual induction of trance. When one woman was asked about her earliest memory, for example, she first responded with one that was long familiar to her. When she was encouraged to explore further, she paused for a few moments, manifesting that inner focus we call the common everyday trance, and then quietly remarked how she seemed to be looking up at a bright light, with nothing else in focus. A moment later her left leg began levitating, while the rest of her body remained immobile but noticeably relaxed. She then reported that she felt a scream building up in her throat. With that she suddenly shook her head, shuffled her body, and obviously reoriented to the awake state. In her inner search for an earlier memory she had spontaneously fallen into a trance and momentarily experienced a genuine age regression to infancy, when her visual field and her body were apparently not entirely under voluntary control, and she felt herself about to cry as an infant might. That frightened her, so she spontaneously reoriented to the awake state.

Although we do not often get responses as dramatic as this, we frequently find that questions focusing patients on an inner review of their lives and activities facilitate that inner search and the unconscious processes in a manner that leads to a recognizably therapeutic trance.

first recognizes and accepts the patient's manifest behavior as a foundation for establishing rapport, and then gradually focuses the patient inward.

Many times, the apparently active resistance encountered in subjects is no more than an unconscious measure of testing the hypnotist's willingness to meet them halfway instead of trying to force them to act entirely in accord with his ideas. Thus, one subject, who had been worked with unsuccessfully by several hypnotists, volunteered to act as a demonstration subject. When her offer was accepted, she seated herself on the chair facing the audience in a stiffly upright,
challenging position. This apparently unpropitious behavior was met by a casual, conversational remark to the audience that hypnosis was not necessarily dependent upon complete relaxation or automatism, but that hypnosis could be induced in a willing subject if the hypnotist was willing to fully accept the subject's behavior. The subject responded to this by rising and asking if she could be hypnotized standing up. Her inquiry was countered by the suggestion, Why not demonstrate that it can be? A series of suggestions resulted in the rapid development of a deep trance. Inquiries by the audience revealed that she had read extensively on hypnosis and objected strenuously to the frequently encountered misconception of the hypnotized person as a passively responsive automaton, incapable of self-expression. She explained further that it should be made clear that spontaneous behavior was fully as feasible as responsive activity and that utilization of hypnosis could be effected by recognition of this fact.

It should be noted that the reply, Why not demonstrate that it can be? constituted an absolute acceptance of her behavior, committed her fully to the experience of being hypnotized, and ensured her full cooperation in achieving her own purposes as well as those of the hypnotist.

Throughout the demonstration, she frequently offered suggestions to the author about what he might next ask her to demonstrate, sometimes actually altering the suggested task. At other times, she was completely passive in her responses.

Again we see how an apparently simple question with a negative - Why not demonstrate that it can be? - immediately accepts and utilizes the patient's resistance, while initiating her into an inner search that evokes partially conscious and partially unconscious processes leading to hypnotic responses. We can see that her so-called resistance is really not a resistance so much as it is a perfectly reasonable reaction against the erroneous dominance-submission view of hypnosis.

blend of both leading and following

For example, a resistive subject who is not receptive to suggestions for hand levitation can be told, Shortly your right hand, or it may be your left hand, will begin to lift up, or it may press down, or it may not move at all, but we will wait to see just what happens. Maybe the thumb will be first, or you may feel something happening in your little finger, but the really important thing is not whether your hand lifts up or presses down or just remains still; rather, it is your ability to sense fully whatever feelings may develop in your hand.

With such wording absence of motion, lifting up, and pressing down are all covered, and any of the possibilities constitutes responsive behavior. Thus a
situation is created in which the subject can express his resistance in a constructive, cooperative fashion.

One writer asked subjects to resist going into a trance in an effort to demonstrate that they could not resist hypnotic suggestion. The subjects cooperatively and willingly proved that they could readily accept suggestions to prove that they could not.

A more comprehensive approach that can be adapted to practically any situation. The procedure is as follows: Depending upon the subject's educational background, a suitable casual explanation is given relating general concepts of the conscious and of the unconscious or subconscious minds. Similarly, a casual though carefully instructive explanation is given of ideomotor activity with a citing of familiar examples, including hand levitation.

Then, with utter simplicity, the subject is told to sit quietly, to rest his hands palm down on his thighs, and to listen carefully to a question that will be asked. This question, it is explained, can be answered only by his unconscious mind, not by his conscious mind. He can, it is added, offer a conscious reply, but such a reply will be only a conscious statement and not an actual reply to the question. As for the question itself, it can be any of several pertinent questions, and it is of no particular significance to the person. Its only purpose is to give the unconscious mind an opportunity to manifest itself in the answer given. The further explanation is offered that the answer to the question asked the unconscious mind will be an ideomotor response of one or the other hand lifting upward, that of the left signifying no, and that of the right signifying yes.

The question is then presented: Does your unconscious mind think that you can go into a trance? Further collaboration is offered: Consciously you cannot know what your unconscious mind thinks or knows. But your unconscious mind can let your conscious mind discover what it thinks or understands by the simple process of causing a levitation of either the right or the left hand. Thus your unconscious mind can communicate in a visibly recognizable way with your conscious mind. Now just watch your hands and see what the answer is. Neither you nor I know what your unconscious mind thinks, but as you see one or the other of your hands lifting, you will know.

If there is much delay, additional suggestions can be given: One of your hands is lifting. Try to notice the slightest movement, try to feel and to see it, to enjoy the sensation of its lifting and be pleased to learn what your unconscious thinks.

Regardless of which hand levitates, a trance state frequently of the somnambulistic type supervenes simultaneously. Usually, it is advisable to utilize, rather than to test, the trance immediately since the subject tends to arouse promptly. This is often best done by remarking simply and casually. It is very
pleasing to discover that your unconscious can communicate with your conscious mind in this way. There are many other things that your unconscious can learn to do. For example, now that it has learned that it can develop a trance state and to do so remarkably well, it can learn various trance phenomena. For instance, you might be interested in -. The needs of the situation can then be met.

This technique centers around the utilization of the subject's interest in his own unconscious activity. A yes or no situation is outlined concerning thinking, with action contingent upon that thinking and constituting an overt unconscious communication, a manifestation basic to, and an integral part of a hypnotic trance. In other words, it is necessary for the subject to go into a trance in order to discover the answer to the question. No matter which answer you give, you have to go into a trance first.

Willing subjects disclose their unaffected interest from the beginning. Resistant subjects manifest their attitudes by difficulty in understanding the preliminary explanations, by asking repeatedly for instructions, and then by an anticipation of hand levitation by lifting the left hand voluntarily. Those subjects who object to trance induction in this manner tend to awaken at the first effort to test or to utilize the trance. Most of them, however, will readily go back into the trance when told. And you can go into a trance just as easily and quickly as your unconscious answered that question just by continuing to watch as your unconscious mind continues to move your hand up toward your face. As your hand moves up, your eyes will close, and you will go into a deep trance. In nearly all instances, the subject then develops a trance state.

An essential component of this technique is an attitude of utter expectancy, casualness, and simplicity on the part of the operator, which places the responsibility for any developments entirely upon the subjects.

As your hand moves up, your eyes will close, and you will go into a deep trance.

One of the subjects felt very, very strongly that she was not a good subject. As I observed that intensely rapt attention (response attentiveness) she was giving me, however, I could feel very strongly that she was a good subject. So I asked her to 'Give your unconscious mind the privilege of manifesting in some way that you are a good hypnotic subject but that you will not consciously recognize it. At the same time you can continue to function well at the conscious level. I might add that the manifestation might be obvious to the audience but not to you.' Even as she continued to focus closely on me and not the audience or anything else, she said, 'I'm not a good subject, and I don't believe you can convince me.

At this point I was utilizing her resistance to let her think she was awake and not in a somnambulistic trance. But the very intensity of her absorption in watching
my every move and following everything I said was a clue to her somnambulistic condition.

I asked her again if I could put her into a trance, but she shook her head 'no,' she wouldn't cooperate. At that moment her left hand began levitating, but she did not see it because she was looking over toward me on the right.

She laughed and joked with the doctors in the audience and said she did not like to feel she was being uncooperative, but she did feel she couldn't go into a trance. Remember, I told her to function very well at the conscious level and very well at the unconscious level. And there she was talking to me and talking to the audience in this fashion. I indicated to one of the doctors in the audience that he should come up and pinch her levitated left hand. He found that she had a total anesthesia in that left hand, that she was willing to swear to the group that she was wide awake and that she couldn't possibly be in a trance. The doctor then came around and pinched her right hand, and she said, 'Ouch, that hurts! Naturally I would feel a pinch.' She was pinched again on the left hand but did not feel it.

What I wanted to demonstrate to the doctors there, and what I want to stress to you, is the separation of functioning that goes on all the time in the human body, separation at an intellectual level, separation at an emotional level, separation at a sensory level, just as you have forgotten the shoes on your feet at this moment and the glasses on your face.

This dramatic example illustrates the importance of the hypnotherapist's learning to recognize that state of rapt response attentiveness when the patient is, for all practical purposes, already in a trance state fixated on the therapist, no matter what may be said to the contrary. When the senior author observes this state of intense absorption on himself, he offers patients one or more forms of indirect suggestion that provides them with an opportunity for a hypnotic response. In this case he used a form of the conscious-unconscious double bind that enabled her unconscious to select a hypnotic manifestation (hand levitating that she had already been primed for by watching others), while allowing her conscious mind to keep its usual patterns of functioning. She was thus able to keep her resistance while manifesting good hypnotic responsiveness.

The following is another illustration wherein trance was induced even under the most resistant conditions, where the subject was a professional actor attempting to simulate hypnosis. Unknown to the senior author, at a lecture demonstration before a medical group, one of the subjects was a trained actor. He watched the other subjects carefully and then, in accord with previous secret arrangements with several people in the audience, he simulated hypnosis and demonstrated anesthesia, negative and positive auditory and visual hallucinations, and developed uncontrollable sneezing upon hallucinating goldenrod in bloom, at the
request of one of the conspirators, relayed through the senior author. However, the senior author noted that the actor's manifestation of catalepsy was faulty, and his time relationships were wrong. Minor startle reflexes were noted, too, and the subject was observed to be controlling the involuntary tendency to turn his head toward the author when addressed from the side. Accordingly, he was asked to demonstrate hand levitation in response to carefully given suggestions. The actor did not show the usual time lag in response to suggestions of a sudden little jerk or quiver. This served to convince the senior author that he was being hoaxed.

Accordingly, the subject was furnished with pencil and paper and instructed to do automatic writing and to do this automatic writing in the correct style of true automatic writing. The actor had never witnessed automatic writing; however, as he began writing, suggestions were offered of writing slowly and better and better, writing automatically the sentence, 'This is a beautiful day in June.' The word this" was repeated four times with strong intonations to fixate consciousness on it, while the rest of the sentence was said more softly and swiftly, so that it would tend to be missed by consciousness and fall into the unconscious. The word this was written in his ordinary script, but the rest of the sentence was written in the characteristic script of automatic writing. The actor subject was now beginning to experience some genuine trance behavior without realizing it. As he finished writing, the paper and pencil were removed from his sight and he was asked to awaken with an amnesia for trance events. He roused immediately and was asked to discuss hypnosis for the audience. With great satisfaction he proceeded to expose the hoax perpetrated upon the senior author to the amazement of the audience in general and the glee of the conspirators. The subject talked freely of what he had done and demonstrated his ability to sneeze at will.

After he had recounted everything except the automatic writing, this was shown to him and he was asked what he thought of it. He read the sentence aloud, stated that it was just a simple statement with no particular relevancy. Asked about the script, he observed that it appeared to be somewhat labored and juvenile. It soon became apparent to everyone that he had a total amnesia for the writing, that he was genuinely curious about the writing and why he was being questioned about it. When his amnesia had been adequately demonstrated, he was asked to duplicate that writing exactly. He agreed readily, but as he took the pencil and set it to the paper, it was at once obvious that he had developed a trance state again (repeating trance behavior tends by association to reinduce trance). After he had written the sentence this second time, he was aroused with instructions for an amnesia for trance events. As he aroused, he resumed his mockery of the author for being so easily deceived. Again he was shown the writing. He recognized that he had seen the one sentence a few moments ago, but there was a second sentence that he had not seen before.
He was allowed to retain the amnesia for a week. In the meantime those physicians who had arranged for the hoax sought out the senior author and related the whole plan to deceive him and to determine if hypnotic phenomena could be deliberately and successfully imitated. They also stated that they had tried to convince the actor that he had done the automatic writing but had failed in their efforts. They added that they had arranged for the actor to meet the senior author again so that the hypnotic amnesia could be removed.

Their request was met to their satisfaction and to the amazement of the actor, who summarized the entire matter by the simple statement, Well, it is obvious to me now that the best way to fake hypnosis is to go into a trance. 5

As you sit comfortably in that chair, you can feel the weight of your arms resting on the arms of the chair. And your eyes are open and you can see the desk and there is only the ordinary blinking of the eyelids, which you may or may not notice, just as one may notice the feeling of the shoes on one's feet and then again forget about it. And you really know that you can see the bookcase and you can wonder if your unconscious has noted any particular book title. But now again you can note the feeling of the shoes on your feet as they rest on the floor, and at the same time you can become aware of the lowering of your eyelids as you direct your gaze upon the floor. And your arms are still resting their weight on the arms of the chair, and all these things are real and you can be attentive to them and sense them. And if you look at your wrist and then look at the corner of the room, perhaps you can feel or sense the change in your visual focus. Perhaps you can remember when, as a child, you may have played with the experience of looking at an object as if it were far off and then close by. And as associated memories of your childhood pass through your mind, they can range from simple memories to tired feelings because memories are real. They are things, even though abstract, as real as the chair and the desk, and the tired feeling that comes from sitting without moving, and for which one can compensate by relaxing the muscles and sensing the weight of the body, just as one can feel so vividly the weariness of the eyelids as fatigue and relaxation develop more and more. And all that has been said is real and your attention to it is real and you can feel and sense more and more as you give your attention to your hand or to your foot or the desk or your breathing or to the memory of the feeling of comfort some time when you closed your eyes to rest your gaze. And you know that dreams are real, that one sees chairs and trees and people and hears and feels various things in dreams and that visual and auditory images are as real as chairs and desks and bookcases that become visual images. In this way, with increasing frequency, the writer's utterances became simple, direct suggestions for subjective responses. This is an excellent illustration of the interspersal approach to introduce patients to their own subjective responses gradually and in a manner that focuses attention inward for trance. Associating their inner realities with outer objects, through which they could validate their experiences; enabled them to accept the former to
a greater and greater degree. The senior author then uses a series of open-ended suggestions in a very general discussion of sensations, feelings, memories, dreams, and visual images as a means of indirect associative and ideodynamic focusing to deepen their involvement with whatever subjective realities were most available to them.

The experience of anxiety, confusion, doubt, uncertainty, and depression is characteristic of most patients involved in a process of growth and personality change (Rossi, 1967, 1968, 1971, 1972a, 1972b, 1973; Erickson, Rossi, and Rossi, 1976). Thus while the patient is uncomfortable with these manifestations, the therapist can recognize in them the hopeful indications of a much-needed process of personality transformation that is taking place within the patient. We could even conceptualize that the typical states of depression and uncertainty with which most people enter therapy are actually spontaneous manifestations of the second and third stages (depotentiating habitual conscious sets and unconscious search) of our general paradigm of trance induction and suggestion. They are entirely normal and necessary stages in the natural process of personality growth and transformation (Rossi, 1972a). Depression and uncertainty only take pathological forms when a problem is so overwhelming that one cannot work through these uncomfortable affects on one's own. In helping patients cope with these states we can again recognize how hypnotherapy can be understood as a facilitator of natural processes inherent in psychological growth.

A trance state was induced readily and the patient was casually reminded of his wish for comfort in the dental chair. Thereupon, he was instructed to be attentive to the instructions given him and to execute them fully.

Suggestions were then given him that his left hand would become exceedingly sensitive to all stimuli, in fact painfully so. This hyperesthetic state would continue until he received instructions to the contrary. Throughout its duration, however, adequate care would be exercised to protect his hand from painful contacts.

The patient made a full and adequate response to these suggestions. In addition to the hyperesthesia of the hand, and entirely without any suggestion to that effect, he spontaneously developed an anesthesia of his mouth, permitting full dental work with no other anesthetic agent.

Even in subsequent efforts anesthesia or analgesia could not be induced directly or purposely except as a part of the hyperesthesia-anesthesia pattern peculiar to that patient. However, this is not a single instance of this type of behavior. Other comparable cases have been encountered from time to time.

Apparently, psychologically, the patient's fixed understanding was that the dental work must absolutely be associated with hyper-sensitivity. When this rigid
understanding was met, dental anesthesia could be achieved in a fashion analogous to the relaxation of one muscle permitting the contraction of another.

Hypnosis had been attempted repeatedly and unsuccessfully on a dentist’s wife by her husband and several of his colleagues. Each time, she stated, she became absolutely scared stiff, so I just couldn't move and then I'd start crying. I just couldn't do anything they asked. I couldn't relax, I couldn't do hand levitation. I couldn't shut my eyes; all I could do was be scared silly and cry.

A naturalistic approach employing synergism was utilized. A general summary of her situation was offered to her in the following words:

You wish to have hypnosis utilized in connection with your dental work. Your husband and his colleagues wish the same, but each time hypnosis was attempted, you have failed to go into a trance. You got scared stiff and you cried. It would really be enough just to get stiff without crying. Now you want me to treat you psychiatrically, if necessary, but I don't believe it is. Instead, I will just put you in a trance so that you can have hypnosis for your dentistry.

She replied, But I'll just get scared stiff and cry.

She was answered with, No, you will first get stiff. That is the first thing to do and do it now. Just get more and more stiff, your arms, your legs, your body, your neck - completely stiff - even stiffer than you were with your husband.

Now close your eyes and let the lids get stiff, so stiff that you can't open them.

Her responses were most adequate.

Now the next thing you have to do is to get scared silly and then to cry. Of course, you don't want to do this, but you have to because you learned to, but don't do it just yet.

It would be so much easier to take a deep breath and relax all over and to sleep deeply.

Why don't you try this, instead of going on to getting scared silly and crying?

Her response to this alternative suggestion was immediate and remarkably good.

The next suggestion was, Of course you can continue to sleep deeper and deeper in the trance state and be relaxed and comfortable. But any time you wish, you can start to get scared stiff and silly and to cry. But maybe now that you know how to do so, you will just keep on being comfortable in the trance so that any dental or medical work you need can be done comfortably for you.
A simple posthypnotic suggestion to enable the induction of future trances was then given.

The technique used was essentially the same as that utilized in a half dozen similar instances.

She was asked if she were willing to have any reasonable procedure employed to correct her problem. Her answer was, Yes, anything except that I mustn't be touched, because I just go crazy if I'm touched. This statement her husband corroborated.

She was instructed that hypnosis would be employed. She consented hesitantly, but again demanded that no effort be made to touch her.

She was told that her husband would sit continuously in the chair on the other side of the office and that the writer would also sit beside her husband. She, however, was personally to move her chair to the far side of the room, to sit down there and watch her husband continuously. Should either he or the writer at any time leave their chairs, she was to leave the room immediately, since she was sitting next to the office door.

Then she was to sprawl out in her chair, leaning far back with her legs extended, her feet crossed, and all the muscles fully tensed. She was to look at her husband fixedly until all she could see would be him, with just a view of the writer out of the corner of her eye. Her arms were to be crossed in front of her and her fists were to be tightly clenched.

Obediently she began this task. As she did so, she was told to sleep deeper and deeper, seeing nothing but her husband and the writer. As she slept more and more deeply, she would become scared and panicky, unable to move or to do anything except to watch both and to sleep more and more deeply in the trance, in direct proportion to her panic state.

This panic state, she was instructed, would deepen her trance, and at the same time hold her rigidly immobile in the chair.

Then gradually, she was told, she would begin to feel her husband touching her intimately, caressingly, even though she would continue to see him still on the other side of the room. She was asked if she were willing to experience such sensations and she was informed that her existing body rigidity would relax just sufficiently to permit her to nod or to shake her head in reply, and that an honest answer was to be given slowly and thoughtfully.

Slowly she nodded her head affirmatively.
She was asked to note that both her husband and the writer were turning their heads away from her, because she would now begin to feel a progressively more intimate caressing of her body by her husband, until finally she felt entirely pleased, happy and relaxed.

Approximately five minutes later she addressed the writer,

Please don't look around. I'm so embarrassed. May we go home now, because I'm all right?

She was dismissed from the office and her husband was instructed to take her home and passively await developments.

Two hours later a joint telephone call was received explaining simply, Everything is all right.

A check-up telephone call a week later disclosed all to be well. Approximately 15 months later they brought their first-born in with greatest of pride.

Another example is that of an enuretic eight-year-old boy, half carried, half dragged into the office by his parents. They had previously solicited the aid of the neighbors on his behalf, and he had been prayed for publicly in church. Now he was being brought to a crazy doctor as the last resort with a promise of a hotel dinner, to be provided following the interview.

His resentment and hostility toward all were fully apparent.

The approach was made by declaring You're mad and you're going to keep right on being mad, and you think there isn't a thing you can do about it, but there is. You don't like to see a 'crazy doctor,' but you are here and you would like to do something, but you don't know what. Your parents brought you here, made you come. Well, you can make them get out of the office. In fact, we both can - come on, let's tell them to go on out. At this point the parents were unobtrusively given a dismissal signal, to which they readily responded, to the boy's immediate, almost startled, satisfaction.

The writer then continued, But you're still mad and so am I, because they ordered me to cure your bedwetting. But they can't give me orders like they give you. But before we fix them for that - with a slow, elaborate, attention-compelling, pointing gesture - look at those puppies right there. I like the brown one best, but I suppose you like the black-and-white one, because its front paws are white. If you are very careful, you can pet mine, too. I like puppies, don't you?

Here the child, taken completely by surprise, readily developed a somnambulistic trance, walked over, and went through the motions of petting two puppies, one
more than the other. When finally he looked up at the writer, the statement was made to him, I'm glad you're not mad at me any more and I don't think that you or I have to tell your parents anything. In fact, maybe it would serve them just right for the way they brought you here if you waited until the school year was almost over. But one thing is certain. You can just bet that after you've had a dry bed for a month, they will get you a puppy just about like little Spotty there, even if you never say a word to them about it. They've just got to. Now close your eyes, take a deep breath, sleep deeply, and wake up awful hungry.

The child did as instructed and was dismissed in the care of his parents, who had been given instructions privately.

Two weeks later he was used as a demonstration subject for a group of physicians. No therapy was done.

During the last month of the school year, the boy each morning dramatically crossed off the current calendar day.

Toward the last few days of the month he remarked cryptically to his mother, You better get ready.

On the 31st day, his mother told him there was a surprise for him. His reply was, It better be black-and-white. At that moment his father came in with a puppy. In the boy's excited pleasure he forgot to ask questions.

Eighteen months later the boy's bed was still continuously dry.

A careful study of these examples reveals the same pattern. In each case the senior author associates (1) what patients can do well with (2) trance behavior in which (3) they can now experience what they want in a hallucinated inner reality. This binds their real behavioral capacities to hallucinated wishes so that the wishes can become actualized. Therapeutic trance is the binding glue, the state of concentration or the medium in which fantasies and wishes are associated and bound to behavioral capacities so that what is desired can be actualized in real behavior. In hypnotherapeutic practice we are continually building bridges between what patients can do and what they want to do. This will become more and more evident in the next chapter on posthypnotic suggestion and in practically all the case studies that follow.

Exercises

1. Listen to tape recordings of your therapy sessions and determine to what degree you are utilizing the patients' own behaviors, interests, and personality characteristics to facilitate their therapeutic work.
2. As you study these recordings, consider where you might have introduced alternative remarks and suggestions that could utilize the patient's repository of life experiences and more highly developed functions to facilitate therapeutic progress. Explore those forms of indirect suggestions that fit easily within your own verbal repertory so that you can utilize them most effectively to facilitate the patient's inner searches and unconscious processes even without the formal induction of trance.

3. Study video recordings of your therapy sessions to discover those moments of rapt response attentiveness when your patient was most focused on you. How well did you utilize these moments to introduce therapeutic remarks?

4. Plan how you could use these moments of response attentiveness to introduce indirect forms of suggestions that could facilitate free association related to therapeutic issues. Some simple examples are as follows.

Do your eyes feel like resting and closing for a moment while your unconscious mind explores that [whatever]?

I want you to be quiet for a moment, and as you think that over we will see what else your unconscious mind brings up about it. And you don't have to talk until you really feel comfortable about it.

Therapists must find the combination of words that is natural to them and their patients in order to facilitate the inner search and unconscious processes in a casual and comfortable manner.

5. The above approach easily lends itself to indirect forms of trance induction. During those moments of common everyday trance when the patients may be apparently absorbed within themselves, looking out a window, staring at their hands, the floor, the ceiling, or whatever, therapists can introduce options for trance via indirect forms, such as the following:

You are absorbed in something now, and if your unconscious agrees that this is a comfortable moment for you to enter trance, you will find that your eyes will seem to close all by themselves.

Does your unconscious want those eyes to close so you can just continue as you are even more comfortably?

Just let yourself continue as you are and your body won't even have to move until your unconscious has a surprising solution to that, even though your conscious mind may not yet know what it is, exactly.
During a moment of rapt response attentiveness, when the patient’s attention is focused on the therapist, trance could be introduced as follows:

I know you are not entirely aware of it, but I’m noticing something about you that indicates you may be ready to enter trance. And if your unconscious really wants to, you’ll find those eyelids closing [handlifting, or whatever].

6. Absolutely refuse to permit yourself to use any ritualized and mechanical form of hypnotic induction until you have noticed half a dozen or more of the patient’s patterns of manifest behavior, interests, abilities, inner life experiences, frames of reference, resistances, or symptoms that you can incorporate into the induction procedure. Then practice the process of integrating each patient’s individuality into all the standard forms of trance induction such as eye fixation, hand levitation, and so on.

7. Study the patient’s manifest behavior and symptoms to determine how they can be channeled into therapeutic responses. Practice building associative bridges between the known and possible to the unknown and desired.

8. Further study in the lore of hypnotic induction comes from many unexpected quarters. A volume on hypnotic poetry (Snyder, 1930), for example, presents the thesis that there are two basic types of poetry: hypnotic (spell-weaving) and intellectualistic. The former tends to induce trance, while the latter appeals more to the intellect. The author discusses many of the literary devices that may induce a hypnotic effect, such as (1) a perfect pattern of sound and stress, with heavy vocal stress falling at half-second intervals; (2) absence of abrupt changes or intellectual challenges; (3) vagueness of imagery, permitting each individual’s personal unconscious to fill in the details; (4) fatigue for what we would call depotentiating habitual mental frameworks; (5) the use of repetition or refrain; and (6) giving an unusually clear and direct suggestion or posthypnotic suggestion only after lulling the listener into an agreeable state with the foregoing. He goes on to point out how poetic inspiration and perhaps artistic creation in general always involve an autohypnotic state. A careful study of the poems he presents gives the hypnotherapist a broader conception of the creative work involved in every hypnotic induction.

Classical studies like the above lend credence to the many current efforts to understand trance as a function of the specialized activities and interaction patterns of the left and right cerebral hemispheres.

Traditionally, posthypnotic suggestion has been used to assess the effectiveness of trance and to reinforce a therapeutic process. It was believed that a person who receives a suggestion during trance and then carries it out afterward proves by
that very fact that an effective trance was experienced. Trance was conceptualized as a blank state during which an individual was easily programmed just as one might write upon a blank slate. We now recognize that this blank slate and programming model of hypnosis is misleading for psychotherapeutic work. Individuals retain their own personality dynamics during trance. Therapeutic trance is a means of focusing attention and utilizing personality dynamics in a manner that permits unconscious processes to mediate responses that are of clinical value. In the broadest sense we can speak of posthypnotic suggestion whenever we introduce an idea during a moment of receptivity that is later actualized in behavior. That moment of receptivity can occur during a formally induced trance or during the common everyday trance in which attention is fixed and absorbed in a matter of great interest.

The traditional approach to direct posthypnotic suggestion usually takes the form, After you awaken from trance, you will do [or experience] such and such. Indirect posthypnotic suggestion, by contrast, involves the use of the indirect forms of suggestion together with a number of other processes found in everyday life as well as clinical practice. The most useful of these are contingency suggestions and associational networks, whereby we tie the posthypnotic suggestion to inevitable patterns of behavior that the patient will experience in the future. These inevitable behavior patterns function as cues or vehicles for the execution of the posthypnotic suggestion.

It is more difficult to reject two or more suggestions given together in an associational network than it is to reject a single suggestion standing alone.

Most therapists automatically alter the tone and cadence of their voice during trance work. The patients, in turn, become automatically and usually unconsciously conditioned to experience trance in response to these vocal alterations. If the therapist adopts these vocal changes during an ordinary conversation, the patient will frequently begin to experience partial aspects of trance without quite knowing why. Since these minimal cues bypass the patient's conscious frames of reference, they are often surprisingly effective.

MANAGING / ELIMINATING SUFFERING/PAIN WITHOUT DRUGS

Pain in itself may be serving certain useful purposes to the individual. It constitutes a warning, a persistent warning of the need for help. It brings about physical restriction of activity, thus frequently benefitting the sufferer. It instigates physiological changes of a healing nature in the body. Hence, pain is not just an undesirable sensation to be abolished, but rather an experience to be so handled that the sufferer benefits.

One can think of a mother suffering extremely severe pain and all-absorbed in her pain experience. Yet she forgets it without effort or intention when she sees
her infant dangerously threatened or seriously hurt. One can think of men in combat who have been seriously wounded, but do not discover their injuries until later.

Situations where pain is taken out of awareness by more compelling stimuli of another character. The simplest example of all is the toothache forgotten on the way to the dentist's office, or the headache lost in the suspenseful drama portrayed at the cinema. By such experiences as these in the course of a lifetime, be they major or minor, the body learns a wealth of unconscious psychological, emotional, neurological and physiological associations and conditionings. These unconscious learnings repeatedly reinforced by additional life experiences constitute the source of the potentials that can be employed through hypnosis to control pain intentionally without resorting to drugs.

The affect and impact of pain is a product of actual current pain, remembered past pain, and anticipated future pain...and whether the pain is defined as ‘life threatening’ or ‘significant’ e.g. pain in penis or eye Vs pain in fingernail cuticles and what potential loss might occur in relation to that pain i.e. what it ‘means’... e.g. novel pain, that we believe is temporary and will soon pass, is much less threatening / debilitating etc than chronic pain we’ve endured of a long time and expect to have to continue to endure forever... i.e. these facts can diminish or extenuate the experience of pain...it’s ‘meaning’... i.e. all these factors lead to ‘pain’ being a ‘construct’ that can thus be reduced / eliminated via hypnotic intervention...

Long continued pain in an area of the body may result in a habit of interpreting all sensations in that area as automatically painful. The original pain may be long since gone, having been replaced/continued by psycho-somatic pain which is 100% construct...

Pain can beiatrogenic i.e a result of a Doctor imparting distress, fear, tension, anxiety and psycho-somatic ‘grounds’ for pain due to their attitude and comments during treatment...can be positive or negative... Dr has ‘authority’ status that can suggest / produce / instill beliefs in patient which become self-fulfilling limiting or resourceful beliefs...

Direct hypnotic suggestion for total relief of pain works only in a small percentage of cases, and where it fails, can discourage client from further therapeutic hypnosis treatment / instill expectations of inefficacy of hypnotic treatments...and tends to be limited in duration i.e works for a short time only, and then the pain returns.

The permissive indirect hypnotic abolition of pain. This is often much more effective, and although essentially similar in character to direct suggestion, it is
worded and offered in a fashion much more conducive to patient receptiveness and responsiveness.

Forgetting of pain (amnesia) often occurs naturally i.e. when our attention is distracted by something more compelling e.g. fear of tiger under bed, or compelling movie or book … distraction / displacement of attention from pain to other impression … amnesia in relationship to pain can be applied hypnotically in a great variety of ways. Thus one may employ partial, selective, or complete amnesias in relationship to selected subjective qualities and attributes of sensation in the pain complex as described by the patient, as well as to the total pain experience.

Hypnotic analgesia, which may be partial, complete, or selective. Thus, one may add to the patient's pain experience a certain feeling of numbness without a loss of tactile or pressure sensations. The entire pain experience then becomes modified and different and gives the patient a sense of relief and satisfaction, even if the analgesia is not complete. The sensory modifications introduced into the patient's subjective experience by such sensations as numbness, an increase of warmth and heaviness, relaxation, etc. serve to intensify the hypnotic analgesia to an increasingly complete degree.

Hypnotic anesthesia is a fifth method in treating pain. This is often difficult and may sometimes be accomplished directly, but is more often best accomplished indirectly by the building of psychological and emotional situations that are contradictory to the experience of the pain and which serve to establish an anesthetic reaction to be continued by post-hypnotic suggestion.

Hypnotic replacement or substitution of sensations. For example, one cancer patient suffering intolerable pain responded most remarkably to the suggestion of an incredibly annoying itch on the sole of her foot. Her body weakness occasioned by the carcinomatosis and hence inability to scratch the itch rendered this psychogenic pruritis all-absorbing of her attention. Then hypnotically, feelings of warmth, of coolness, of heaviness and of numbness were systematically induced for various parts of her body where she suffered pain. And the final measure was the suggestion of an endurable but highly unpleasant and annoying minor burning-itching sensation at the site of her mastectomy. This procedure of replacement substitution sufficed for the patient's last six months of her life. The itch of the sole of her foot gradually disappeared but the annoying burning-itching sensation at the site of her mastectomy persisted.

Hypnotic displacement of pain is a seventh procedure. This is the employment of a suggested displacement of the pain from one area of the body to another. This can be well illustrated by the instance of a man dying from prostatic metastatic carcinomatosis and suffering with intractable pain in both states of drug narcosis and deep hypnosis, particularly abdominal pain. He was medically trained and
understood the concept of referred and displaced pain. In the hypnotic trance he readily accepted the idea that, while the intractable pain in his abdomen was the pain that would actually destroy him, he could readily agree that equal pain in his left hand could be entirely endurable, since in that location it would not have its threatening significances. He accepted the idea of referral of his abdominal pain to his left hand, and thus remained free of body pain, becoming accustomed instead to the severe pain in his left hand which he protected carefully. This hand pain did not interfere in any way with his family life during the remaining three months of his life. It was disclosed that the displaced pain to the left hand often gradually diminished, but the pain would increase upon incautious inquiry.

This possibility of displacement of pain also permits a displacement of various attributes of the pain that cannot otherwise be controlled. By this measure these otherwise uncontrollable attributes become greatly diminished. Thus the total complex of pain becomes greatly modified and made more amenable to hypnotic intervention.

Hypnotic dissociation can be employed for pain control, and the usual most effective methods are those of time and body disorientation. The patient with pain intractable to both drugs and hypnosis can be hypnotically reoriented in time to the earlier stages of his illness when the pain was of minor consideration. And the disorientation of that time characteristic of the pain can be allowed to remain as a posthypnotic continuation through the waking state. Thus the patient still has his intractable pain, but it has been rendered into a minor consideration as it had been in its original stages.

One may sometimes successfully reorient the patient with intractable pain to a time predating his illness and, by posthypnotic suggestion, effect a restoration of the normal sensations existing before his illness. However, although intractable pain often prevents this as a total result, pleasant feelings predating the illness may be projected into the present to nullify some of the subjective qualities of his pain complex. Sometimes this effects a major reduction in pain.

In the matter of body disorientation, the patient is hypnotically dissociated and induced to experience himself as apart from his body. Thus one woman with the onset of unendurable pain, in response to posthypnotic suggestions, would develop a trance state and experience herself as being in another room while her suffering body remained in her sickbed. This patient explained to the author when he made a bedside call, Just before you arrived, I developed another horrible attack of pain. So I went into a trance, got into my wheel chair, came out into the living room to watch a television program, and left my suffering body in the bedroom. And she pleasantly and happily told about the fantasized television program she was watching. Another such patient remarked to her surgeon, You know very well, Doctor, that I always faint when you start
changing my dressings because I can't endure the pain, so if you don't mind I will
go into a hypnotic trance and take my head and feet and go into the solarium and
leave my body here for you to work on. The patient further explained, I took a
position in the solarium where I could see him (the surgeon) bending over my
body but I could not see what he was doing. Then I looked out the window and
when I looked back he was gone, so I took my head and feet and went back and
joined my body and felt very comfortable. This particular patient had been
trained in hypnosis by the author many years previously, had subsequently
learned autohypnosis, and thereafter induced her own autohypnotic trance by the
phrase, You know very well, Doctor. This was a phrase that she could employ
verbally or mentally at any time and immediately go into a trance for the
psychological-emotional experience of being elsewhere, away from her painful
body, there to enjoy herself and remain until it was safe to return to her body. In
this trance state which she protected very well from the awareness of others, she
would visit with her relatives, but experience them as with her in this new setting
while not betraying that personal orientation.

A ninth hypnotic procedure in controlling body pain, which is very similar to
replacement or substitution of sensations is hypnotic reinterpretation of pain
experience. By this is meant the reinterpreting for the patient in hypnosis of a
dragging, gnawing, heavy pain into a feeling of weakness, of profound inertia,
and then as relaxation with the warmth and comfort that accompanies deep
muscular relaxation. Stabbing, lancinating and biting pains may sometimes be
reinterpreted as a sudden startle reaction, disturbing in character, but momentary
in duration and not painful. Throbbing, nagging, grinding pain has been
successfully reinterpreted as the unpleasant but not distressing experience of the
rolling sensations of a boat during a storm, or even as the throbbing that one so
often experiences from a minor cut on the fingertip with no greater distressing
characteristics. Full awareness of how the patient experiences his pain is required
for an adequate hypnotic reinterpretation of the pain sensation.

Hypnotic time distortion, first described by Cooper and then later developed by
Cooper and Erickson (Cooper, L., and Erickson, M., Time Distortion in
Hypnosis, Baltimore: Williams and Wilkins, 1959) is often a most useful
hypnotic measure in pain control. An excellent example is that of the patient with
intractable attacks of lancinating pain which occurred approximately every
twenty to thirty minutes, night and day, and which lasted from five to ten
minutes. Between the attacks the patient's frame of mind was essentially one of
fearful dread of the next attack. By employing hypnosis and teaching him time
distortion, it was possible to employ, as is usually the case in every pain patient, a
combination of several of the measures described here. In the trance state, the
patient was taught to develop an amnesia for all past attacks of pain. He was then
taught time distortion so that he could experience the five to ten minute pain
episodes in ten to twenty seconds. He was given posthypnotic suggestions to the
effect that each attack would come as a complete surprise to him, that when the attack occurred he would develop a trance state often to twenty seconds duration, experience all of the pain attack, and then come out of the trance with no awareness that he had been in a trance or that he had experienced pain. Thus the patient, in talking to his family, would suddenly and obviously go into the trance state with a scream of pain, and perhaps ten seconds later come out of the trance state, look confused for a moment, and then continue his interrupted sentence.

An eleventh hypnotic procedure is that of offering hypnotic suggestions effecting a diminution of pain, not a complete removal of the pain, since it had become apparent that the patient was not going to be fully responsive. This diminution is usually best brought about by suggesting to the hypnotized patient that his pain is going to diminish imperceptibly hour after hour without his awareness that it is diminishing until perhaps several days have passed. He will then become aware of all pain or of special pain qualities. By suggesting that the diminution occur imperceptibly, the patient cannot refuse the suggestion. His state of emotional hopefulness, despite his emotional despair, leads him to anticipate that in a few days there may be some diminution; particularly that there may be even a marked diminution of certain attributes of his pain experience. This, in itself, serves as an autosuggestion to the patient. In certain instances, however, the patient is told that the diminution will be to a very minor degree. One can emphasize this by Utilizing the ploy that a one percent diminution of his pain would not be noticeable, nor would a 2 percent, nor a 3 percent, nor a 4 percent, nor a 5 percent diminution, but that such an amount would nevertheless be a diminution. One can continue the ploy by stating that a 5 percent diminution the first day and an additional 2 percent the next day still would not be perceptible. And if on the third day there occurred a 3 percent diminution, this, too, would be imperceptible. But it would total a 10 percent diminution of the original pain. This same series of suggestions can be continued to a reduction of pain to 80 percent of its original intensity, then to 70 percent, 50 percent, 40 percent, and sometimes even down to 10 percent. In this way the patient may be led progressively into an even greater control of his pain.

However, in all hypnotic procedures for the control of pain one bears in mind the greater feasibility and acceptability to the patient of indirect as compared with direct hypnotic suggestions, and the need to approach the problem by indirect and permissive measures as well as by employing a combination of the various methodological procedures described above.

Rapport, then positive expectation of benefit, response attentiveness, focus on self/symptoms/therapist (anything can be used to induce trance), make person receptive to treatment / success…
Offer stories / metaphors for the result you want e.g other people who have managed to alter own sensory-perceptions and gained results e.g pain relief, relief from symptoms presenting with, and how … basically ‘linguistically’ programming the computer (which may be the best way to refer to levels of consciousness we do not actively work with i.e we work with symbols, like programmer…the computer has its own bios, programs etc which programmer does NOT need to understand at all…only needs to understand the protocols / program language i.e inputs required … computer does not ‘think’…it computes…like brain …what we call unconscious or sub-conscious mind…it processes symbols and outputs actions / emotions / feelings / sensations / impressions / representations…we interface with a camera (eyes), microphone (ears), computer can now ‘read’ like us, and ‘feel’ pressure e.g touch-screens, and respond to various other inputs like we do…what it does with those inputs is a ‘black box’ to all but the programmers and compilers … WE, our conscious selves, are really merely ‘connected’ to this black box…Question is how to program it to get the emotions / experiences / feelings / actions etc we desire from it…as masters of it…while others are actively trying to program us to act / feel / motivate / emote etc what THEY want…i.e propaganda / advertising / education / religion are ALL NLP … neuro refers to our ‘representation’ systems and how these ‘representations’ of whatever might be ‘out there’ in the ‘objective’ electro-magnetic soup get ‘in there’, and then what manipulations are carried out upon these ‘impressions’…i.e how impressions / ideas of ‘out there’ are formed…even impressions of ‘what am I’, i.e TROONATNOOR…Like me typing on my keyboard, or speaking into voice recognition software or ‘reading’ / scanning pages with an OCR system, my own computer in my head (that is the locus we represent for it, though my ‘mind’ could be light years away and merely identifying with this ‘head’… the ‘Linguistic’ part is the words / symbols we encode and decode ‘third party’ impressions with i.e what people say, what they write (most religion is merely this ‘Linguistic’ element i.e what some person wrote down in some book and some other person reads to us)… Programming is the ‘black box’ bit… genetic programs for defining some things as ‘good’ e.g pleasure / survival / beauty / truth / justice and some as bad ‘evil’ e.g pain, suffering, misery, loneliness, death, lies, injustice, all of which we equally experience as ‘ugly’ as any maladaptive physical property…but we can be programmed to have ‘false’ impressions and to hate the things we should rightly love…i.e twisted perceptions / distortions / lies / propaganda / disinformation of all kinds from impression management i.e a man can smile and smile and be an absolute , the smiling friendly traitor, the priests, the Madison avenue manipulators, the political analysts/pollsters/campaign advisors, and sometimes simply our own senses play tricks on us… and momentary impulses overwhelm reason with good or bad consequences e.g excessive bravery and selflessness in saving another in danger, and risking own life, excessive hatred of someone you’ve never met because a poster told you to…jealousy, envy, greed,
excessive desire can blind us ... deaden us to others pain...or to our own pain...can be heroic or horrific ...

Erickson tells personal and third-hand stories which condition clients to expect positive outcomes, miracles i.e sets up self-fulfilling prophecies, expectations, directly laying the seeds of the therapeutic outcomes in the computer...basically using symbols like any computer programmer, using the code the computer works in, which is metaphor, projection, imagery, symbols, patterns ... does this intuitively or after years of having 'gleaned' the language ... Bandler etc modelled his behavior to find pattern that anyone can reproduce i.e like teaching a student a programming language which they can then use to program a robot or other computer to carry out particular tasks, express particular 'emotions' i.e behaviors...only difference (and only in theory) is sentience / awareness i.e there is a part of our body which 'experiences' all the inputs / impressions i.e input/output / throughput ... we feel pain, pleasure, joy, sadness etc we FEEL...THAT is 'experience'... IN the beginning was the word, and the word was with god, and the word was god...linguistic before neuro?... how programmed? Intrinsic program? Motive, impulse? For ...

Erickson’s stories are the main feature of his success...they prepare the soil for sowing the seeds of his suggestions ... they program the computer with the appropriate symbolic metaphoric programming language...the computer is by nature attentive to these symbols and metaphors...and ‘compiles’ new beliefs and resources based on them, devoid of any ‘image’, ‘sound’, ‘subjectivity’ i.e pure zeros and ones without ‘meaning’ or representations i.e direct pure energetic vibrations / resonances which affect the ‘material’ world to produce the representations we have of it, and the world itself, ... like sound vibrations making shapes and patterns in a tray of sand ... so much so that a science fiction writer imagines something, and over decades or centuries it comes into being...for better or worse... health or illness, war or peace, prosperity or famine, truth or lies, justice or injustice, beauty or ugliness ...function or dysfunction...

The computer is ‘god’...it is the universe...it is us...hologramically...each of us is the whole, and the whole is each of us... but partitioned into ‘selves’...to have ‘experience’...

As Erickson stated ‘we learn things in a very unusual way, a way that we don’t know about’ ... unconsciously, without realising it, our computers take in data from our environment and decide which parts of it should be directed at our narrow locus of ‘consciousness’...so that we end up attending to a narrow bandwidth of it...infinite information surrounds us, demanding our ‘attention’, but our mind is limited ... has to filter our less important from important...so we ‘notice’ certain colors, sounds, and activity around us more than others...e.g we
notice changes in our environment more than the continual...and sudden more
than gradual e.g tiger appearing in forest, sound of potential predator, smell of a
fruit in the distance ... as computer defines these as ‘dangers’ / threats or
opportunities...we will notice a sexual image immediately it appears, in any
form, even merely suggestive of a sexual act or organ...naturally (unless we’ve
been programmed to repress such attending in which case the computer will note
it, but the ‘mind’ will distort it/ filter it out/ deny it etc)... real dialectic is from
virtual computer to virtual computer i.e what we are ... and the forms in our
representations e.g computer on our desk, virtual reality games...they are what
we really are...expressions of it...we are going through a real Hegelian dialectic
from virtual/computer to organic and synthesizing the two as organic virtual
reality... the problem is the ‘Babylonian ‘Jews’ have hijacked the process, want
to use it to enslave 2800 of us for every one of them...??

Erickson slept on the floor of a factory with pneumatic hammers pounding away,
and managed to train himself to actually hear only the voices of the workers
(during the night shift he ‘slept’ on the floor of the factory, with the supervisors
consent)...told this story to clients to prepare them for their own computer
rearranging their own representation systems to stop ear ringing, not hear
disturbing noises in environment...

n.b Bandler came from programming background ... heuristic...didn’t need
‘theory’ of why a computer could ‘output’ x or y, understood that the computer
was a series of on/off, zeros and ones... but if you knew a programming
language, you could interact with it, and get it to ‘do’ things...i.e results
oriented...no huge theory of mind or philosophy...focused on getting
results...didn’t care why it worked (except for modelling/teaching purposes),
wanted to know WHAT works and find patterns in what works to model /
teach...so never out to prove himself right i.e to prove some ‘theory’
right...totally zen approach...what works...receptive to seeing what was going
on...so could model it...not bound up in theoreticizing... you don’t need to know
what the computer is doing, to compile the zeros and ones, the on/off switches, to
be able to program it...to get a different more optimal, resourceful set of beliefs /
responses from people...to eliminate/reduce pain, and other ‘limiting’ factors
including beliefs...how does computer learn to ‘read’ and ‘spell’ and ‘dance’ and
motivate/inspire others around it? ... HE doesn’t need to know, what he wants is
results...to understand the programming language, to be able to write new code,
rather than create a new programming language / act as a compiler...he doesn’t
need to know how the black box works, only how to communicate with it and tell
it what to do / what you want from it...to make it your servant ... because it has
not ability to discriminate beyond pleasure and pain i.e zeros and ones it can get
‘imprinted’ with false definitions, false assumptions, false data...it will act on
this data...the ‘mind’ is the programmer...while the computer probably records
ever sound, every optical impulse, and converts them into representations i.e
encodes them, and then stores them, and then decodes them… they have no meaning to the computer at all…just zeros and ones…there are programs and sub-programs that access these zeros and ones to make ‘experiences’ i.e ‘meanings’ i.e ultimately pleasurable sensations/memories/feelings/ emotions from them…

Key to Bandler is that the content that lead to a limiting belief is irrelevant…it is random…no significant…you don’t have to relive it and ‘understand’ it…it was arbitrary…like dust in a storm… unlike other therapies which focus on the content and ‘understanding’, Bandler treats them as mere arbitrary random experiences which just happened to have imprinted some limiting belief, symptom, etc in the computer…feeding it erroneous data…which it has no way of discriminating / qualitatively judging …if it ‘feels / sounds / looks / tastes ‘ etc ‘real’, it treats it as real as any ‘objective’ reality… and ‘computes’ based on it e.g X+Y= Z when Y =a. But if Y really equals b then you’ve got your ‘limiting belief’ or ‘symptom’… So Bandler says, fuck your ‘history’, escape it, it was just some random shit that occurred, not relevant…what matters is the ‘false data’ it fed your computer…so now lets go and find that false data, maybe go back to the moment it was inputted, and over-write that data with some more optimal, resourceful data / belief / impression / input … the computer now has different data to work with, and comes up with different results … e.g the symptoms vanish / the beliefs are restructured … the computer is none the wiser, but it has different data…so now it computes a different result / outcome … a resourceful rather than limiting belief…a reduction/elimination of pain…a new skill…a new habitual response to a particular situation e.g phobia / addiction…

Rapport opens up computer to being receptive to new inputs that challenge existing inputs i.e ‘trust’ source of new data / inputs therefore be receptive to over-writing…whether ‘mind’ is ‘gate-keeper’ to computer? i.e filter / active at input stage, or maybe later organisation stage (is this the real reason we sleep? To give mind time to arrange the data in the computer, even set up partitions e.g multiple personalities?, to deal with cognitive dissonance by partitioning data sets so they don’t overlap i.e so have mutually conflicting data partitioned off from each other, to deal with this fact i.e that X here =1 and X here =b…until later finds that X=c which is compatible with both sets? i.e internal dialectic of computer…

Are there really levels? Or is computer different part of one level i.e programs, memory data storage, partitions, bios, sub-routines, malware programs looking for ‘false’ definitions / lies / bad data sectors … need to understand computers a bit more to model this…but probably will find that the latest AI / robots will be ‘synthesis’ i.e cyborgs synthesis of software/hardware i.e organic / symbolic … will and representation can be expressed ‘knowingly’ i.e gain control of the
virtual reality program called ‘life’ and ‘DNA’ … to program own will… not ‘thy will be done’…but ‘to chose what you want’…i.e free will…

All experience is a process…not a thing…we are processes…not objects…not wooden/metal idols / dogma / limited fixed things…we are limitless being expressing the will to experience which requires limits be imposed…we forgot we did it…others trying to impose their wills on us…imprint us with limiting beliefs that suit their own perceived self interest…they are just as much victims as those they impose upon…idolatry is treating life as a thing / an incident / an object / fixed / dogmatic … rather than a set of possibilities…a process…a continuing, undending, process…flowing…free…limitless…life as a game … all games need ‘rules’… but don’t nominalise them as ‘reality’…they are just one possible set of realities… and some people have become fixated upon them…the idea of wealth, power, exploitation, enslavement of other beings as mere means towards the ends of that enslaving will…objects…

So anything in your data bank is just data that can be re-written, over-written, by more vivid ‘impressions’ which you can generate deliberately and mindfully i.e re-construct the imprinting episode and re-write the script of what happens, to re-imprint a new more optimal resourceful belief…it was just random shit that happened…irrelevant what it was…just some bad script writing / poor copy writing / lazy writing / lousy book/film … find out what got you ‘thinking that way’ i.e what ‘programmed you’, what laid that false data, that erroneous belief, that limiting belief, that phobia, that response…then re-live it in ways that empower you rather than disempower you… it makes no difference if you ‘experience’ something in your own head while sitting in your living room, or are in the jungle, fighting tigers, winning battles with demons…its all the same to the computer…just input…make your NEW memories / experiences as vivid as possible, on every sensory level, every sub-level of your representation systems, visual, acoustic, feeling, taste, smell, sense of direction, and be the you you want to be in that imagined experience, and your computer will accept the new data, overwrite the old data, it will be displaced / replaced, as Buddha suggested…the new will over-write the old…new beliefs … new habits… it is that simple…no need for years of psychotherapy to ‘understand’ anything…your computer does not ‘understand’ ANYTHING in the way YOU do…it doesn’t ‘see’ anything with its camera or ‘hear’ anything with its microphone…it does not ‘understand’ any command the programmer gives it…it is a process … an input-output process…hit key X on computer and output letter X on computer monitor…it does not need to , and doesn’t, have a clue what X is, or a keyboard is, or the implications of marking ‘X’ on a ballot box for m for the millions of people who are going to suffer from the policies of that candidates ‘puppet masters’…

A story/metaphor is a ‘frame of reference’ around which the therapist can work i.e don’t engage conscious mind with argument i.e it will resist if what it is told
by you doesn’t agree with its own ‘experience’ or ‘programming’…so don’t try to convince person that their own unconscious mind can filter out pain / noise / smells … tell it stories about how it does this, how YOU have done this, or others have done this…i.e stories in which the characters DO it e.g when you are asleep your mind is conscious of noises etc, but filters out of your perception so they don’t wake you up…even incorporates them into dreams so they won’t wake you…you can see or hear a friend in a crowd…a mother can hear her own babies cries above a mass of noise i.e tuned into…can tune out of i.e positively and negatively hallucinate i.e not see car keys on table where you left them…see things in inkblots that are just random shapes…project emotions / intentions onto people and objects they don’t have…that our minds do these things automatically, without our conscious deliberate effort…so we can employ the unconscious to do the same for pain / fear / habits / ringing in ears / ‘voices in our heads’ …hallucinations (like a brilliant mind guy learned to do… don’t try to argue with person and overcome their objections to new data that contradicts / challenges their noetic structures / idolized dogma / belief systems…tell stories and offer metaphors which demonstrate as self-fulfilled prophecies of what you want their computer to compute for them…only possible if they are receptive i.e you have rapport / trust / yes-set…to over-write existing data…otherwise their ‘auto-immune response’ will attack the messenger and message as ‘hostile’ ‘threatening’ ‘malicious’ deceptive etc… the metaphors/stories produce a new ‘frame of reference’ from which to consider the new data…it is a new data set…does not engage the existing ones…therefore won’t arouse their resistance …just a few harmless stories the computer inputs, bypassing any conscious resistance (hey, that’s not right, I know already this and this and this cos that fucker told me that and its in that book etc) …computer can partition it first as stories, then data, then it can access that data, and possibly ‘correct’ existing data, all without the intercession / resistance of the conscious mind which is has been programmed to be ‘hostile’ to contradictions to its ‘dogma’…

Dogma is idols, nominalizations, re-ifications that are no longer living and malleable. Cannot be changed. They are ‘dead’. As compared to the ‘living’ truth that is malleable, in a process of becoming. This is the meaning of ‘idol’ and ‘living gods’ in the bible…

Intersperse suggestions between the stories, in a slightly different tone of voice (i.e vocal/auditory anchoring/Stimulus-response conditioning)…’And you can forget that pain…’ etc…

Interspersing Therapeutic Suggestions

E: Now this matter of tuning yourself. I spent three months on the Mississippi River and I got invited into a home and I felt so cooped up after being out in the open. Getting into a room, everywhere you look, your looks come to an end.
When you read the old-time sailing stories, where you look to the end of the earth with nothing interfering. And the old-time stories of sailors’ claustrophobic reactions. Fear of closed spaces.

Also when I got back from that canoe trip . . . have you ever tried to sleep on a soft bed? You are miserable. I had learned to sleep on the ground, in brush piles, inside the canoe. My ribs fighting with canoe ribs.

When I got home and had a mattress, that was torture. The Indians did not like, in the early days, the white man’s bed. They wanted the ground to sleep on. They wanted comfort. Just nothing but sheer comfort.

On the Tribal Eye program on KAET. Those nomads from Iran. How can they dress with all those petticoats? And be comfortable in the hot sun on those desert plains? And you can get so used to the ringing in your ears that you don't hear it.

I grew up on the farm. I had to be away from the farm for quite some years before I learned the barn smell on your hands when you live on the farm. I never smelled it when I was on the farm. I had to be away from it for a long time before I discovered the barn smell.

R: I guess that is why it is so hard to convince someone who doesn't wash often enough that he has to wash more often. He doesn't smell himself!

E: I can tell you a funny story about that. One year the boy in the next room at the rooming house had a fellow roomer who came from South Dakota. And Hebbie came from Milwaukee. And Hebbie told Lester, "You stink, go take a bath." It was the latter part of September and Lester said, But I took a bath last July. I won't need one until at least Thanksgiving Day. But he really stunk, and Hebbie said, You are going to take a bath if I have to put you in the tub myself. What people don't know, that they can lose that pain and they don't know they can lose that ringing in the ears. When I discovered that that barn smell had come back, I could really smell it. I wondered how long it would take me that day to lose it? Then by midafternoon I couldn't smell it. All of us grow up believing that when you have pain, you must pay attention to it. And believing when you have ringing of the ears that you must keep on hearing it.

N.B difference between ‘having’ pain, and ‘paying attention to it’ . . . it is a message / communication ‘something is wrong’ . . . but if you cannot do anything about the problem, there is no point ‘suffering’ the pain . . . most people have had experiences of ‘not noticing’ or ‘forgetting’ pain . . . we think we HAVE TO attend to it i.e notice it i.e hear it i.e feel it . . . but in reality that is just ONE option . . . if we NEED to ignore it, we can . . . though best to work out what the problem is and deal with that . . . but if this is not an option, there is no need to feel the pain, at least as severely as you do . . . you can change the ‘signal’ to something that you
can attend to, to remind yourself that you have a problem you need to deal with, while not being overwhelmed by it, ‘suffering’ i.e change it into a blue flashing light or musical note, and it will serve the same purpose your computer / mind intended…it will be satisfied…it’s intention is to alert you to an urgent problem…

Yes-set / openness / receptiveness produced by the interesting stories…we ‘suspend judgement’ or ‘suspend disbelief’ during stories…that is the norm…we enjoy stories…anecdotes from another’s life…so we are open and receptive during this listening…and if we change from one anecdote / story to another quickly, the conscious mind has no chance to raise objections (hey, that’s not possible, that couldn’t happen, I was told X and you said Y, I read that …etc) and the implications of the metaphor / story / anecdote is allowed to pass into the computer as data…it is not filtered out…which is why religions use trance states / repetition / incense / chanting/ dancing / singing / awe-inspiring architecture and beautiful music…to induce state of receptivity … even use ‘stories’ and metaphors and parables and fables and fairy tales to deliver messages … sadly limiting beliefs / mind controls / fear / guilt / neuroses…we become absorbed in the fantastical tale, the soothing inspirational music, the colors, the lighting, the resonance of the people and building, the images…a state of trance…receptive to suggestion…in an altered state…our internal dialog is switched off…we shut down the world … stop the world … we become suggestible…at deep computing levels new data is encoded, as the mind is receptive, attending to the fascinating stories and delicious music and atmosphere, our conscious minds distracted, not filtering out, or overwhelmed with sensory inputs e.g from drugs, potions…we are here and now…we escape history…we stop the world…stop the internal dialog… and in these moments the priests fill us with hatred for ‘other’ religions, for our own human desires, for ourselves, and fill us with irrational fears… and sell us the idea that we need THEM for our own salvation…as if eternal life was not the essential nature of each of us, as if we needed to enslave ourselves to THEM to EARN these things from these filthy, deceitful, malicious fuckers…

A Buddhist monk can turn off their senses, totally ignore them…attend to whatever they set their minds to attend to, as their bodies burn up around them, to the shock and confusion of observers, who ‘just don’t get it’…what they are doing…they are proving that everything is a question of perception…they are free…they have mind control…they have free will…but sadly (or are they right), they reject this experience engine called ‘earth’, hoping to find ‘higher’ realms …

A therapeutic frame of reference is a condition of receptivity to suggestions / information about new possibilities the client previously was unaware of / had false / erroneous ideas/beliefs/information about… i.e believed they couldn’t
quite smoking, so now resistant to any contradictory information ... so need first to open up mind, make receptive to, the new information...with stories of positive experiences of others that contradict their experience, so far, but without directly doing so i.e bypassing the 'argumentative mind'...just telling stories / anecdotes...so no resistance built up / activated ... receptive to stories / anecdotes as interesting...allow to set up frame of reference conducive to replacing / over-writing/ displacing etc old limiting beliefs / fears / pain, with new resourceful beliefs ... i.e I can do this...I have these choices...without directly 'arguing' with the existing beliefs/ challenging noetic structures directly...slipping by the censors and idols and filters and accessing the computer...entering new data without first erasing old...but computer will compute and this process will lead to data either being partitioned for later synthesis, or incorporated with existing, over-writing it...etc...

What about de-fragmentation of computer?...is that 'understanding' and 'eloquence' and 'expertise' and 'confidence' i.e how I go about learning new things...amass data, organise, re-organise, until fluent i.e 'contiguous' data that flows easily i.e vs data all over disc needing to be read in stop start fashion ... etc...I probably AM a computer in a virtual reality network...all this is probably simply prosaic statement of fact, like a computer manual or computer language textbook...who tricked us into being slaves to ??? or was it just a glitch in the program? Or just a 'novel' experience engine’ ... there’s no accounting for taste :D

Accepting the Therapeutic Frame of Reference

E: Now, the pain you feel, where? Where do you feel the pain?

H: Right at the present time, in my foot.

E: Yes.

W: Where there is no foot.

H: Where there is no foot.

E: All right, I had a friend named John. He was a psychiatrist, and we were visiting. He reached down and scratched his ankle. I said, John, that really itches, doesn't it? And he said, Yes. We both knew it was a wooden leg.

H: My understanding is that when I was in the hospital there was a double amputee over there. I saw him twice. I had seen him at the hospital and I had seen him over at Good Sam's taking therapy. But the nurse taking care of him at St.
Joseph, when he said his foot itched, she'd reach down and scratch his sheet and relieve it.

W: Where his foot would have been?

H: Where his foot would have been! She would scratch the sheet down there and said that it would relieve it.

After listening to the senior author recount his anecdotes and stories of the relativity of sensations and phantom limb pain, the husband now shows evidence of accepting and joining this therapeutic frame of reference by telling his own anecdote about it. He goes further as he now begins to make an emphatic effort to convince his own wife when she asks a doubting question. Creating Expectancy by Introducing New Response Possibilities: Phantom Pleasure

E: Like I asked my friend John, So you scratched it, how does your foot feel now? He said, Good. That nurse was very wise. Because you can have good feelings in the foot. Not just painful ones.

H: Oh, I hope so, Doctor.

E: That's what is overlooked in these amputees. They forget that they can also have good feelings.

H: I was at the leg man's yesterday. My leg wouldn't unlock. I went to him. He had three different rooms. No, two different besides mine. In each one they were talking about what can we do for this phantom pain that he got. He said, It is driving me nuts. Of course, I never opened my mouth, because I was in another room. I didn't say I was out here or nothing. I knew I had had relief from what you done before.

E: All right. Now I want to have you two recorded so that Dr. Rossi could include it in the book. Now if you have phantom pain in a limb, you may also have phantom good feelings. And they are delightful.

H: That I haven't had yet.

E: That's right.

H: That I haven't had yet.

E: But you can learn them!

A frame of reference is a new way of looking / experiencing something…a new p.o.V…need to become open to / receptive to…open minded …
Offer suggestion tentatively at first...don’t go too fast ... avoid current beliefs to block i.e set up objections...it is an extension of the new frame of reference offered with the stories, anecdotes, metaphors...offers a potential resourceful belief up to the computer (non-conscious)...i.e gently suggest new idea e.g that you can feel phantom ‘pleasure’, and not only pain...prepare mind to make it more receptive to later suggestions...like ploughing field / fertilizing/preparing before sowing seeds ... for later harvest ... set up non-conscious expectations of possibility of therapeutic response i.e receptivity to idea as first step to self-fulfilling prophecy...sowing the seed of positive expectation of change / benefit / result ... introduce therapeutic expectations gradually, from something casual and offhand, to something slight and easy to accept without challenge / provoking belief system to challenge it as ‘contradictory’, and thus bypass conscious mind’s beliefs and probably challenges...until make stronger and stronger suggestions of what is possible, once have gained rapport/trust/ trance and conscious defensiveness objections themselves have been overcome...note that target is computer / non-conscious mind, bypassing conscious ‘learned’ beliefs which would otherwise challenge / feel contradicted by...conscious belief system acts as system to maintain own integrity...keep its model...its representations intact...simple...automatic...habitual...comfort zone...often satisfying emotionally e.g secondary gains or ecological necessity i.e if one belief ‘falls’ the dominoes may collapse...house of cards...long chain of beliefs mutually supporting each other and perceived benefits e.g racism, sexism, species-ism, supremacy, religious dogma...

Therapeutic outcomes by Geometric progression / baby steps which become giant steps...i.e find positive result, e.g moments free from pain / anxiety / cravings, and then double the duration of them each day... at first such small ‘progress’ that hard to deny you’ve experienced it i.e set up progression of successes...set up expectation of success...but as double duration each time, starting with one second, the patient ends up extending the duration to more than 24 hours in 18 days...

Trance is ‘emptiness’ i.e absence of mental noise / thought / projection to past or future, no worry or fear or regret ... present in the NOW...the moment ... the bardot of now... unaware of surroundings...or focused on narrow part of surroundings, shutting out rest...

Having a new observe another more experienced patient go into trance was one of Erickson’s strategies...or if someone in room has gone into trance, use as example for others of how it can happen so easily/ naturally...so make them receptive to idea ... self-fulfilling prophecy...

N.B point of bypassing conscious mind is that the conscious mind does NOT know how to do ANYTHING e.g breathing, walking, talking, etc ... so conscious
mind will reject idea that ‘you can do X’ because it doesn’t know how to...believes it impossible...Vs non-conscious mind / computer which carries out all the muscle co-ordinations etc necessary, silently, invisibly, without the conscious mind being conscious of it...so always need to address the non-conscious mind, offer it open ended suggestions that it can work with, as IT knows more than YOU do...more resourceful/unlimited/creative...

Trance Induction and Facilitating Unconscious Processes

E: [To W] Now suppose you lean back and uncross your legs. Look at that spot there. Don't talk. Don't move. There is nothing really important to do, except go into a trance. You have seen your husband do it. And it is a nice feeling. Your blood pressure is already changing. You may close your eyes now [pause as W closes her eyes and visibly relaxes her facial muscles] and go deeper and deeper into the trance. You do not have to try hard to do anything. You just let it happen. And you think back; there are a goodly number of times this afternoon when you stopped hearing the ringing. It is hard to remember things that don't occur. But the ringing did stop. But because there was nothing there, you don't remember it.

Having prepared her for trance induction by using her husband as a model, the senior author now induces trance with a few instructions that have three objectives: to fixate attention (look at that spot), to depotentiate her habitual frames of references (Don't talk. Don't move. There is nothing really important to do), and to give free reign to her unconscious (go into a trance).

He then states a common though little recognized fact about the experience of symptoms. Symptoms may seem constant and unchanging. Yet invariably there are moments when we are so distracted that they are outside the central focus of our awareness. This automatic mental mechanism that shifts our attention and thereby attenuates and usually completely obliterates the experience of the symptom is evoked as the senior author describes it. This little-recognized fact is usually received with a sense of surprise by patients - a surprise that further depotentiates their old symptomladen frame of reference and initiates a search on an unconscious level for those unconscious processes that may now be utilized for symptom relief.

Relying upon Unconscious Learning: The Conditions for Direct Suggestion

E: Now the important thing is to forget about the ringing and to remember the times when there was no ringing. And that is a process you learn. I learned in one night's time not to hear the pneumatic hammers in the boiler factory - and to hear a conversation I couldn't hear the previous day. The men had been told I had come in the previous evening, and I talked to them and they kept trying to tell me. But you can't hear us, you haven't gotten used to it. And they couldn't understand. They knew I have only been there a short time - one night - and they
knew how long it had taken them to learn to hear conversations. They put their emphasis upon learning gradually. I knew what the body can do automatically. [Pause] Now rely upon your body. Trust it. Believe in it. And know that it will serve you well.

The senior author now strongly emphasizes that symptom changes will take place via an unconscious process. It is important for the conscious mind to rely upon your body, trust it, and so on. He drops the direct suggestion to forget about the "ringing" into the

frame of reference he structured before trance induction in his story about learning not to hear the pneumatic hammers in his sleep at the boiler factory. Thus when direct suggestions are used, they are always placed like a key in the lock of a frame of reference that was previously structured by the therapist and accepted by the patient.

We can summarize the requisite conditions for the successful use of direct suggestion as follows: 1. creating frames of reference as an internal environment or belief system that can accept the direct suggestion. 2. patient's reliance on unconscious processes to automatically mediate the suggestion and new learning that is needed. 3. therapist's partially evoking and thereby facilitating the utilization of such unconscious processes by illustrating them in ways that are personally meaningful in the patient's actual life experience.

unconscious processes of synesthesia whereby pleasure from one sense modality (kinesthetic or proprioceptive sensations from the fingers) could be shifted to another (her auditory perceptions).

You go into a trance, I suggest, by counting to 20, and awaken by counting backward from twenty to one, but each person should go into a trance in the way he learns naturally by himself

Trance Induction: Displacing and Discharging Hostility and Doubt

Erickson first asked Annie to stand in the middle of a small Indian rug about a yard in diameter that was on his office floor. He then proceeded with an unusual trance induction.

E: Annie, you are not to move off that carpet. And you are not going to like what I am doing. It will be offensive to you. It will be offensive to Archie. Now here is a strong oak cane, Archie. You can hold it and you can clobber me at any moment that you think I am doing wrong. You won't like what I'm going to do, Archie, but watch me carefully and clobber me just as soon as you think it is necessary.
Now I'm going to take this other cane and you watch what I'm doing. You will feel what I'm doing Annie. Archie will see what I'm doing. I will stop as soon as you close your eyes and go into a deep trance.

The senior author gently and tentatively touched about her upper chest area with the tip of his cane and then began to gingerly push the upper part of her dress apart, as if to expose her breasts. She closed her eyes, remained rigidly immobile, and apparently went into a deep trance. She had to escape the unpleasant reality of that cane. As soon as she closed her eyes and manifested a trance state, Archie was so surprised he almost dropped his cane.

What are the dynamics of such an induction? With his apparently shameless poking about Annie's dress, Erickson was channeling their very evident hostility and vague doubts about hypnosis in general into a very specific rejection of Erickson's initial behavior. Annie was so constituted psychologically that she had no alternative in the situation.

The poking cane certainly fixated her attention, and the shock of it all certainly depotentiated whatever conventional mental framework she had about how doctors behave and what hypnosis was about. As she stood there, desperately uncertain about what was happening, she was sent on an unconscious search for the trance-inducing processes within her own mind that would release her from her embarrassment. The senior author said he would stop only when she went into trance. She could only escape the unpleasant poking by going into trance. She need not reject the whole situation outright, because, after all, her husband was right there with a stout cane supposedly protecting her. By giving Archie the cane, the senior author was very carefully giving him a channel through which he could focus his hostility. He was also fixing Archie's attention so intently that the young man was in that state of intense response; attentiveness characteristic of therapeutic trance as he watched the unorthodox proceedings with disbelief. Thus his general doubt and disbelief about hypnosis could now be channeled, displaced, and discharged onto the apparently ridiculous behavior he was witnessing. Without quite realizing it, he also became convinced that Erickson could perform the unspeakable, the unorthodox, and, by implication, an unusual cure.

Contradictory beliefs can exist side by side in a dissociated state … cognitive dissonance avoided by this…contradiction not registered/attended to…

Annie, when you awaken, you can sit in your chair, and no matter what you think, whatever I say is true. Do you agree to that? [Annie nods her head yes repetitiously in the slight and slow manner characteristic of the perseverative behavior of trance.] Whatever I say is true, no matter what you think. This allows her unconscious free reign i.e her conscious mind had agreed to ‘suspend’ its
typical analytical responses / rejection / denial / objections regarding the efficacy of trance induction and its therapeutic efficacy … simply bypasses conscious mind which would other sabotage / reject the very possibility…allow space for suspension of disbelief…in which non-conscious can operate…

Now you are awake, Annie. You don't know what has happened. You can think that you wish you knew, but you don't know.

With this the senior author was stating the obvious. Certainly Annie did have questions on her mind about what, if anything, had happened. Thus the truth of the first part of the statement, You can think that you wish you knew opened a yes or acceptance set for the critical suggestion that follows, but you don't know. This suggestion is critical because it implies that something important did happen, but she does not know what. The implication that something happened means she may no longer be what she has always experienced herself as being. The something that happened may be hypnosis; it may mean she now will be able to experience whatever reality Erickson is going to suggest. The not knowing thus opens a gap in her belief system that initiates an unconscious search for the internal resources (unconscious processes) that will be needed to carry out Erickson's further suggestions. Not knowing thus facilitates the utilization of inner resources that she had never been able to contact previously in a voluntary manner.

Surprise Question for Not Doing

E: Aren't you surprised you can't stand up?

With this suggestion in the form of a question, Annie did indeed experience amazement at not being able to stand up. The senior author said she would be surprised, and she certainly was. His question quickly filled the gap and expectation that had been opened in her belief system by setting into operation mental processes that somehow prevented her from standing up. Annie probably did not know why she did not stand up. Neither was she aware that the senior author had also prescribed her reaction of "surprise at not being able to stand up. Certainly it was true that she would be surprised at not being able to stand up. His question was thus another obvious truism that anyone would have to accept. Even without the previous gap having been opened in her belief system, this question of surprise could stand as beguilingly effective suggestion that anyone would have to accept as true. And most would also experience its implication of the involuntary behavior of not being able to stand.

Self-Test for Anesthesia

E: No matter how hard I struck you with this cane, you would not feel it. And suppose you take your hand and hit yourself hard on the thigh. It's difficult for me
to come over and do it myself, so go ahead. Hit yourself as hard as you can on your thigh. It won’t hurt!

With this Annie did indeed strike a numb thigh and was startled at the effect. She replied, I felt it in my hand but I didn’t feel anything in my leg. Having successfully experienced one fairly easy hypnotic phenomenon in not being able to stand, Erickson judged that she was now ready to experience the really important phenomenon of anesthesia. He made a veiled threat with the thought of striking her with his fearsome cane, so that she cannot help but feel some relief at being permitted to test the anesthesia by herself. Erickson then offers further relief with the fact that he really cannot come over to her (since he is crippled) and thus reinforces her further for a successful self-test of anesthesia. Erickson (Erickson, Rossi, and Rossi, 1976) has stated, The unconscious always protects the conscious. Certainly Annie did feel a need for protection at this moment. The protection came from her unconscious, which effectively mediated the neuropsychological mechanisms that permitted her to say she had indeed experienced an anesthesia in her leg. Pressing on, the senior author now extends the anesthesia further.

He could doubt Erickson’s explanations, but he could not doubt his wife’s reactions. Hence the negative attitude induced by his physician was not disputed by his witnessing Annie’s experience - it was depotentiated. That is, he was now experiencing a suspension of his previously doubtful and disbelieving frame of reference. Before he could reassert his doubt, Erickson quickly introduced him to a formally labeled trance.

Compound Suggestion Introducing Trance

E: You heard that, Archie, you can go into trance now.

Annie’s experience was an effective use of modeling hypnotic behavior for her more resistant husband. The senior author then formally induced trance with a compound statement. You heard that was an undeniable truth that opened an acceptance set for the suggestion, Archie, you can go into trance now. Archie could not deny the reality of his senses regarding his wife’s experience, and thus had to accept Erickson’s suggested reality of trance.

Utilizing Previous Sense Memories to Replace Pain: A Pun

E: Now, Archie, you’ve had many long years of happy feelings. Why not get those happy feelings back? You’ve had all the pain you need.

With such suggestions the senior author began to evoke Archie’s sense memories of previous years of good body feelings before his back injury. These memories
of good body feelings will be utilized to replace his current pain. Notice the therapeutic pun contained in the phrase happy feelings back. Without realizing it Archie was receiving associations of happy feelings with his injured back.

Realistic Expectations of Pain Relief and Booster Shots

E: I cannot guarantee you against all future pain, but I can tell you to use pain as a warning.

With such suggestions Archie was able to experience considerable relief from pain. A few months later he caught the flu and telephoned Erickson for a booster shot, since with the flu there was a recurrence of back pain.

R: People really are not asleep in trance; in fact, there is a high degree of mental activity. Perhaps those who say everyone cannot experience trance means you cannot put everyone in a sleeplike state of being an automaton responding indiscriminately to everything that is suggested.

E: Yes, you cannot put everyone into such a passive or submissive state.

R: By hypnosis and trance you mean focused concentration, focused attention. You certainly can facilitate that with anyone whose motivations and needs you understand.

E: Therapeutic trance is focused attention directed in the best manner possible to achieve the patient's goals.

Shifting Frames of Reference for Anesthesia and Analgesia

E: When I want a patient to develop an analgesia, I'm very likely not to mention this question of analgesia. I'm very willing to let the patient tell me all about that pain until I can see from the expression on his face that he thinks I understand. I'm not averse to saying a few things, little things that makes the patient think I do understand. And then I'm very likely to ask him some simple question that takes him far away from this question of the pain: Where did you spend last summer? The patient can be rather surprised at that question about last summer. Last summer he didn't have that pain. We can go into the question of the pleasures and joys and satisfaction of last summer. Emphasize comfort, physical ease, joys, and satisfactions, and point out to the patient how nice it is to continue to remember the joys and satisfactions of last summer, the physical ease of last summer. When the patient seems to be getting just a little bit edgy, I remind him of when he was rowing the boat and got that blister on his hand. It hurt quite a bit but fortunately healed up.
I haven't been afraid to mention hurt or pain or distress, but it is far away from that backache the patient started telling me about. I've mentioned pain from a blister due to rowing a boat last summer and I haven't been shocked by that uneasy expression on his face. Because you see in hypnosis your task is to guide the thinking and the association of ideas that the patient has along therapeutic channels. You know very well that you can have a painful spot on your body and go to a suspenseful movie and lose yourself in the action on the screen and forget all about that pain in your leg or the pain in your arm, aching tooth or wherever. You know that, so why not do exactly the same sort of thing with your patient? If you are operating on a patient in your office and you are aware of the fact that it can cause pain, you can direct your patient's thinking to an area far removed from the pain situation.

I was listening to her complaint about pain, anxiety, distress, and I asked her what she did in her childhood. I made good contact with her by talking of the distress she was interested in, but I shifted to another frame of reference - childhood. She now talked about her childhood distress, but that was so far away that it was less disturbing and she felt a bit more comfortable. My next step was to ask her what her favorite pleasure was as a child. Now, how do you get from pain, anxiety, distress, to pleasure as a child? In this case it took only two associative steps. It was so delightful to switch and discuss with me a favorite activity of her childhood. Now she discussed this pleasure in immediate connection with my first question of her experience of distress in childhood. By that immediate succession of questions I tied the two together - distress and favorite activity.

After she told me all about her favorite pleasures as a child, one in particular, I suggested that when she went to the dentist's office, she should really settle in the dental chair. As she really squirmed around in the chair and really felt her seat on the chair seat, her back on the back of the chair, her arms on the arms of the chair, and her head on the headrest, she would have an overwhelming recollection of her favorite childhood activity that would absolutely dominate the entire situation. Now, what had I done? I had taken the painful realities of the dental chair, squirming around trying to get a nice comfortable seat (and I wiggled around in my seat to role-play the way I wanted her to find herself in that dental chair), and associated it with one of her favorite childhood activities. The thing that she remembered was playing in the leaves on the lawn. In the autumn you can build great big houses out of the leaves, nice pathways through piles of leaves, you could bury yourself in the leaves. You could squirm around and get nice and comfortable in those leaves and the rest of the real world would seem far away.
With that she simply went into a very nice anesthetic trance in the dentist's office without any direct suggestions for anesthesia. Now and then the dentist would ask her some stupid question when she really wanted to think about the leaves. The dentist thought that she was an awfully cooperative patient. Mentally she would notice that here was some stupid person trying to talk to her when she was burying herself in the leaves, probably some grownup yelling at her, but she was more interested in the leaves. She could have dental surgery done and not be bothered by it.

You can achieve anesthesia indirectly by shifting the person's frames of reference. In this case the critical shift was to, What was your favorite activity as a child? And then I could really elaborate on that. In other words, you very carefully raise a question.

You raise it in such a way that you can slide past the difficulty and start up another train of mental activity, of emotional activity, that precludes the possibility of feeling pain. Some of my sophisticated subjects with training in clinical psychology and psychiatry, that I have used as subjects, will pick apart the technique that I have used on them. They then recognize the validity of it from their own experiences. They will have me employ precisely the same techniques on them again because they know that they are human and that you can do the same thing with pleasure, over and over again.

I think it is an error to always strive to get an anesthesia or an analgesia directly. I think you should be willing to accomplish them indirectly because every time you ask somebody Forget that this is a watch, you're asking them to do a specific thing - to forget - to forget what? A watch. Now, remember, forget that watch. That's what you're saying when you say," Forget the watch. But you can ask them to look at this, an interesting thing. It rather amuses me. It's rather fascinating how you can look at something and become tremendously fascinated with it, and then the topic of conversation changes, and you drift far away to that trip you had in Europe. Now what was it I came up here for? You drifted far, far away from your original preoccupation because you started following your different trains of thought.

when you induce an analgesia, you are asking your patients to lose a certain amount of their reality contact. You are asking them to alter it. Then they begin to feel funny - they may recognize it or they may not. But they can react to that by getting out of the situation because it is strange and uncomfortable. Therefore, whenever you induce an analgesia or an anesthesia, you must see to it that your patients don't get frightened in one way or the other by the loss of their usual reality relationship

them that one of the astonishing things is that as they begin to feel more comfortable or they get more and more interested in this or that, perhaps they will
notice the light in the office is of a softer hue. Quite often I have told patients in my office, I hope you don't mind here as we continue our work if the light automatically dims and becomes softer or lighter. Whenever their reality orientations are altered, I know patients are going to tell me the office is getting lighter or darker, or getting warmer or colder, or they feel afraid, or that they feel the office is getting bigger or smaller, that they are feeling taller or shorter. They get all manner of changes in their sense of reality whenever we explore anesthesia or analgesia. These spontaneous sensory-perceptual alterations are all indications that the patients' reality orientations are altered; trance is developing whether a formal hypnotic induction has been carried out or not. As patients learn to be more comfortable with these spontaneous alterations, they can allow themselves to go deeper into trance. They learn to give up more and more of their generalized reality orientation (Shor, 1959), and they become more capable of experiencing all the classical hypnotic phenomena as well as achieving their own therapeutic goals.

A woman who had already learned morphine had no effect on her, when Demerol, no matter how large the dose, seemed to have no effect on her. I didn't want to try to struggle with her and tell her she should go into a trance, because that would be a rather futile thing. Therefore, I asked her to do something that she could understand in her own reality orientations. I asked her to stay wide awake from the neck up. That was something she could understand. I told her to let her body go to sleep. In her past understandings as a child, as a youth, as a young woman she had had the experience of a leg going to sleep, of an arm going to sleep. She had had the feeling of her body being asleep in that hypnagogic state of arousing in the morning when you are half awake, half asleep. I was very certain the woman had some understanding of her body being asleep. Thus the woman could use her own past learnings. Just what that meant to her, I don't know. All I wanted to do was to start a train of thinking and understanding that would allow the woman to call upon the past experiential learnings of her body.

I did not ask her to try her level best to cooperate with me in going into a trance, because she didn't know what a trance was. But she did know what being wide awake was. She did know what a body being asleep was, because she had a lifelong experience of both states. The next thing I asked her to do after her body was asleep was to develop an itch on the soles of her feet. How many people have had itches on various parts of their bodies? Miserable itches, uncontrollable itches, distressing itches. We all have had that sort of experience, therefore I was again suggesting something to her that was well within her experience, within her physiological, psychological, neurological experience; within her total body of learnings. I was asking her to do something for which she had memories, understandings, and past.
experience. I was very, very urgent about this development of an itch. The woman shortly reported to me that she was awfully sorry she could not develop an itch. All that she could do was to develop a numb feeling on the dorsum of the foot. In other words the woman was unable in her state of pain to add to her state of pain. She did the exact opposite. She developed a feeling of numbness, not on the sole of the foot, but on the dorsum of the foot.

Now, what was my purpose in seeing her? That is the thing that all of you should keep in mind in dealing with patients. You are seeking to alter their body experiences; their body awareness; their body understandings; their body responses. Every change that develops should be grist for your mill, because it means that the patient is responding. When Cathy told me she had the numbness on the dorsum of the foot, I accepted that as a most desirable thing and I expressed regret, politely, that she had not been able to develop an itch. Why did I express a polite, courteous regret that she had not developed an itch? Why should I criticize or find fault with my patient's responses? I should be gracious about it, because Cathy had a lifelong history of experience with people who had been courteous, who had expressed regret, and who thereby put her at ease since earliest childhood in various situations. Cathy had a background of experience into which my courteous regret could fit.

Now the point I am trying to establish is this: When you talk to patients, talk to them to convey ideas and understandings in such a way that your remarks fit into the total situation with which you are dealing.

You try to elicit an ever-widening response on the patients' part so that they respond more and more with their experiential learnings, with their past memories and understanding. Cathy could accept my apology and feel obligated. Since she failed me in one regard, she could feel obligated to put forth more and more effort on the thing that I accepted. While accepting Cathy's numbness on the dorsum of her foot, I also utilized her own background and personality to intensify her efforts to please me. Since I had been so gracious in accepting her failure to produce the itch, I intensified her motivation to cooperate with me in any further tasks.

The next thing I did was to suggest that the numbness extend not only over the dorsum of the foot but perhaps to the sole of the foot and the ankle. Well, of course, in suggesting the sole of the foot where Cathy had failed to put an itch, she would be all the more eager to produce the numbness. As surely as she did that, she would be obligated to develop a numbness of the ankle. Of course Cathy had had plenty of experience being unaware of the sole of her foot, unaware of her ankle. Cathy knew what numbness was, and she had body learnings of those things. Therefore, when I asked her to do those things, she could make a response. Now Cathy was not paying any attention to her bed, to the pictures on
the wall, to the presence of the other physician with me, to the tape recorder that was in full view. Cathy was directing her mental attention to her body learnings. In the use of hypnosis you need to be aware of the total unimportance of external reality. Now as Cathy developed the numbness in the sole of her foot and the numbness in her ankle, she withdrew more and more completely from the reality of the room. She was giving her reality orientation to her body, not in terms of cancer pain but in terms of body learnings of numbness. Cathy became very greatly interested in letting the numbness progress from her ankles to the calf, to the knee, to the lower third of the thigh, the middle third, the upper third, having it cross over to the other side of her pelvis and go down the other leg so that

she had a numbness from the umbilicus down. Now that interested Cathy. At that moment, of what interest was the ceiling, the bed, the doctor, the walls, or anything else? Cathy's interest was directed to that state of numbness just as dental patients should be so fascinated by the thought of the control of capillary circulation, by the thought of dental anesthesia, by the thought of learning how to chew their food with a different kind of bite so that they won't have temporal mandibular pain. The thing that interests the patients, the reason they are in your office, should be the point of orientation.

With Cathy oriented to the numbness of her leg and pelvis it was a simple matter to extend the numbness up to her neck.

If I want to help Cathy, I have to organize any hypnotic suggestions that I give her in such a fashion that they incorporate some of Cathy's own thinking, some of Cathy's own understanding.

too many operators, too many people who use hypnosis try to be perfectionists, they try to accomplish too much.

the patients they are working on have a lifetime of experience in expecting a certain amount of failure. You, as the therapist, ought to utilize, you ought to go along with, the patients, and you ought to be the one that picks out the area of failure.

So now I express my sorrow, my regret that I couldn't take away the pain at the site of that awful ulcerated area on her chest. I recognized aloud to Cathy that that was a minor pain, a minor distress, and I was awfully sorry that I failed. Now Cathy could agree with me, and she could agree with me when I wished that I could produce the same numbness there that I had produced elsewhere in her body. In other words I made use of the double bind: As long as she had distress at the breast area, she had to have numbness elsewhere in her body. Thus I had all of Cathy's general experience substantiating the numbness of most of her body.
when I left that minor pain, that minor distress, it proved that I was not God. It just gave Cathy another goal to strive for, even though she had the feeling that she would fail as far as this minor pain was concerned. Cathy lived from February, when I saw her, until August. She lapsed into coma and died rather suddenly. But during that length of time, Cathy was free of pain except in this one particular area, but as Cathy said, she didn't hold my failure against me. Why should she? By letting her keep that minor pain, I ensured the success of the rest.

My initial task was to say something that would get Cathy's attention and allow her to make her own personal responses. I then utilized those responses. In the use of hypnosis in medicine, dentistry, and psychology there is a need to explore the kind of thinking and responding that is characteristic of the individual patient. We need to recognize the actual unimportance of what we say as being the goal to be achieved. The importance of what we say lies in its being a stimulus for the elicitation of responses peculiar to the patient. We then help the patients utilize these responses in new ways to achieve their therapeutic goals.

If you saw a hungry tiger walking through that doorway, licking its chops and looking at you, how much pain would you feel? She was apparently stunned by this unexpected question and said, Not a bit. In fact, I'm not feeling any pain now either. Erickson then replied, Is it agreeable to you to keep that hungry tiger around? She said, It certainly is! All the associations to hungry tiger had so focused her attention that she was in a walking trance, from which she need not be awakened. She presented the entire appearance of being awake in all other respects. Yet she could see and experience the presence of that tiger at any time, day or night. The hypnotherapist simply evokes surprising sets of emotional, cognitive, or behavioral responses to interfere with the symptoms he needs to alter.

The senior author then told her that her doctors and nurses might not believe it, but she now experienced the truth of pain relief. And, indeed, her physicians and nurses did not understand. Whenever they came to offer her an injection for pain relief, the woman responded with a warm smile, No, thank you, I don't need any. I have a hungry tiger under my bed. They suspected she was hallucinating and perhaps losing contact with reality, but in those last months of her life she lived in apparent comfort without the use of narcotics or tranquilizing medication. Her family thought she was just fine, however.

Shock; Surprise; Fixation of attention; Common everyday trance; Distracting associations; Altered frames of reference; Posthypnotic suggestion to protect the therapeutic work

Chin on a Chair
The senior author has had to deal with personal pain problems all his life because of poliomyelitis. He usually can control pain effectively during the daytime by simply going into autohypnotic trance. When he gets very tired or goes to sleep at night, however, the pain sometimes returns and wakes him up. He then has to rearrange his muscles and mental composure to get rid of the pain again. Sometimes in the middle of the night this is just not easy. On such occasions he confesses to having sometimes pulled a chair to the side of his bed, hooking his chin over the back of the chair, and pressing down until he could no longer stand the pain he produced voluntarily (Erickson and Rossi, 1977).

Hypnotic suggestion as a highly developed cognitive frame of reference that can sometimes fail during sleep; Distracting involuntary pain with voluntary control over pain

Shaggy Dog Stories

Then there was the patient with paralysis from the level of the twelfth thoracic vertebra who had severe recurring attacks of pain associated with an acute cystitis and poliomyelitis. He would endure his pain until he could no longer control his outcries. Since his general condition was chronic, narcotics were inadvisable. Because he was an earnest, sincere, considerate, socially-minded man, but totally lacking any sense of humor or capacity to understand wordplays and puns, his pain was handled by the simple procedure of instructing the nurses to tell him shaggy-dog stories, especially those employing word-plays and puns. He would listen earnestly, appreciative of the sociability of the nurse, and struggle absorbedly in trying to make sense of her narrative. As time went on the patient spontaneously would summon a nurse and state that his pain was starting up - could she spare a minute or two of her time to talk to him, and he would try to understand her story.

Fixation of attention; Distraction; Unconscious search and processes

Head and Shoulder to the Solarium

In a case of terminal-illness pain in a woman with a young daughter the senior author addressed the young daughter as follows: Now your mother wants to be convinced that she can be free from pain. That is what you are going to do - convince your mother. Now just sit in this chair here, and while you're sitting in that chair, go into a trance and go over to the other side of the room. And I want you to lose all sense of feeling everywhere. You will be without feeling in a deep trance. You are sitting here, but you're over there on the other side of the room and you are watching yourself there. . . . Now you watch, mother. Your daughter is in a deep trance. She thinks she's on the other side of the room. Now keep your
eye on me because I'm going to do something that no mother would ever want done. I rolled the girl's skirt up to expose her bare thighs. The mother looked on in horror as I did that. I raised my hand and I brought it down on her thigh with a terrific slap. The girl was watching herself on the other side of the room. Now I can't slap a girl on the other side of the room, can I? The mother was aghast that there was not a single wince out of the girl. Then I slapped the other thigh. The girl was still comfortable.

This mother was highly addicted to television so I eventually taught her that whenever she had a pain she could not tolerate, she was to leave her body there in bed and take her head and shoulders out into the living room and watch T.V.

This dissociative approach to pain relief was one of the senior author's favorites. In hospital practice he would frequently have patients take their head and shoulders out to the solarium while their surgeon did the necessary work on their bodies in the operating room.

Shock; Surprise; Modeling hypnotic behavior; Dissociation

Numb with Conversation

The conversational approach to fixating and holding the patient's attention can be very useful in traumatic situations. There was an automobile accident in Portland, Oregon, and a man skidded on his face on a gravel road for about thirty feet. A gravel dirt road. He was brought into the hospital as an emergency case. One of the members of the American Society of Clinical Hypnosis - we will call him Dan - who does a great deal of plastic surgery and oral surgery was on emergency call that night. He went in and found that the man was conscious and suffering a great deal of pain. Those of you who know Dan know what a marvelous talker he is. He has a steady stream of words, of humor, of interest, of information, a tremendous wealth of knowledge and humor. Dan said, You really filled your face full of gravel and you know what kind of a job that makes for me. I've got to take tweezers and pick out every confounded little granule of sand and dirt and I am really going to have a job and I've really got to mop up that face and get half the hide off it and you have been suffering pain and you want some help out of it and you really ought to get some kind of pain relief and the sooner you start feeling less pain the better and I don't know what you ought to do while you're waiting for the nurse to bring something to inject in your arm but you really ought to listen to me while I am talking to you and explaining to you that I have to do certain things about your face. You know there is a gash here, that must have been a pretty sharp stone that cut that one, but here is a short one and here is a bad bruise and I really ought to mop it off with alcohol. It will hurt at first a little, but after it is done a few times the sting will deaden the tip of the nerves that are exposed and you stop feeling the sting of the alcohol, and did you ever try to make a violin? You know you can make violins out of myrtle wood,
you can make them out of spruce wood. Did you ever try making one out of oak? Dan had won a national award for the best tone violin that he himself built out of myrtle wood, and Dan kept up his steady stream. Now and then he discussed the tremendous difficulty of really mopping up that face and putting in the stitches and wondering when the nurse would get around to the hypodermic. All the while, behind him, the nurse was passing Dan the right sort of instrument, the right sort of suture, the right sort of swab, and so on. Dan just kept up that steady stream and the patient said, You are awfully gabby, aren't you? Dan said, 'You haven't heard me at my best I can talk with a still greater rate of speed just give me a chance and I'll really get into high. Then Dan started getting into high, You know I think fast too and did you ever hear anybody sing the Bumble Bee? I'd better hum it to you. So Dan hummed the Bumble Bee and finally he said, You know that is about all. The patient said, What do you mean about all? Dan said, Here's a mirror, take a look. The patient looked and he said, When did you put in those sutures? When did you clean my face? When did I get an injection? I thought you were just talking to me, just getting ready. Dan said, I've been working hard for over a couple of hours, about two and a half hours. The patient said, You didn't. You've been talking about five or ten minutes. Dan said, No, take a look, count those stitches if you want to, and how does your face feel? The patient said, My face is numb.

Conversational approach; Fixation of attention; Distraction; Inter-spersal of suggestions; Time distortion

I accepted the patient's absolute statements of uncontrollable pain. I accepted every one of her statements, so she knew that I believed and thought the way she did. Then I began an entirely specious explanation of how that pain came about, so that the patient could understand it in terms of her own frames of reference. I explained how that hypodermic shot of penicillin or whatever it was, probably had a needle with a ragged point and in being stuck in the hip, hit the sciatic nerve. I explained how the tip of the needle could tear nerve fibers, and I gave a long dissertation on the structure of a nerve. It is not just one single fiber; it is made up of many many fibers. I gave a dissertation on the different kinds of sensations that travel over the fibers. You get heat traveling on one fiber and cold on another, and a touch on another, and pressure on another, until that patient thought that I was rather erudite. Finally, when she was rather bored with this increasing hodgepodge of information, I threw in a suggestion here and there about pain wearing out, of the body becoming accommodated. A laborer with tender hands such as mine would have blisters very promptly using the pick and shovel. But with the pick and shovel wielded a half minute one day, a minute the next day, a minute and a half the third day, and a gradual progression in the length of time, there would be a callous formation until the pick and shovel could be handled all day long. I threw in all sorts of apparently sensible analogies. I pointed out that callous formations can be the skin of your hand and that one can
also become used to emotional deprivation. In other words one can form emotional callouses, one can form intellectual callouses, dermal callouses, nerve callouses - all that sort of thing, until the patient listening to me began accepting all of those suggestions and began on her own to seek a way to use them to help herself lose pain. Every one of those things that I said about callous formation had the effect of the patient's thinking: Yes, I know what callous is. I wish I could have a callous at the nerve in my hip where all that pain is. How nice it would be. How would my leg feel if I had a callous there? It would feel this comfortable, as comfortable as my other leg does. I presented ideas that the patient could find acceptable, but I wasn't asking her to accept those ideas. I was merely explaining possibilities, explaining them in such a way that the patient had to reach out and pull in whatever ideas she needed to facilitate her comfort. Now what is this suggestion? I think that this woman with hip pain was in the kind of trance that was effective for her. I did not dare attempt to induce a formal trance that she could recognize, because I knew she would then think the calloused nerves was just my idea that I was trying to force on her.

Yes set; Specious suggestion fitting the patient's frame of reference; Boredom depotentiating conscious sets; Interspersed suggestions initiating unconscious searches and processes; Indirect associative focusing; Indirect ideodynamic focusing; Open-ended suggestions

Symptom Resolution

The basic view of modern psychosomatic medicine is that symptoms are forms of communication. As such, symptoms are frequently important signs or cues of developmental problems that are in the process of becoming conscious. What patients cannot yet clearly express in the form of a cognitive or emotional insight will find somatic expression as a body symptom. The conventional psychoanalytic approach to such problems is to facilitate insight so that the language of body symptoms is translated into patterns of cognition and emotional understanding. It is sometimes found that when patients can talk about their problems with emotional insight, they no longer need to experience their body symptoms.

while emotional insight is usually a very desirable approach in resolving psychosomatic problems, it is by no means the only route. He has developed ways of resolving symptomatic behavior directly on an unconscious level." That is, symptoms may be resolved by working with a patient's psychodynamics in such a manner that consciousness does not know why the body symptom disappears. Moreover, the developmental problem that was expressed in the symptom is also resolved in an apparently spontaneous manner. Patients are usually pleasantly surprised by this. They say they did not even realize the
therapist was working on their sexual problems, their educational problems, or whatever.

Two-level communication is our basic approach to working directly with the unconscious. We use words with many connotations and implications, so that while the patients' conscious frames of reference are receiving communication on one level, their unconscious is processing other patterns of meaning contained in the words. The senior author likes to point out that he uses folk language" or intimate language" to reach deep sources within the patient. He uses such mythopoetic processes (Rossi, 1972b) as analogy, metaphor, puns, riddles, jokes, and all sorts of verbal and imagistic play to communicate in ways that bypass or supplement the patient's usual frames of reference (Erickson, Rossi, and Rossi, 1976).

A pun or a joke can bypass an erroneous and limiting conscious framework and effectively mobilize unconscious processes in ways that the patient's conscious intentionality could not

the effectiveness of these approaches may be in their appeal to the right, or nondominant, hemispheric functioning. While the left, or dominant, hemisphere is proficient in processing verbal communications of an intellectual or abstract nature, the right hemisphere is more adept in processing data of a visuospatial, kinesthetic, imagistic, or mythopoetic nature. Since the right hemisphere is also more closely associated with emotional processes and the body image (Luria, 1973; Galin, 1974), the view has developed that it is also responsible for the formation of psychosomatic symptoms. These symptoms are expressions in the language of the right hemisphere. Our use of mythopoetic language may thus be a means of communicating directly with the right hemisphere in its own language. This is in contrast to the conventional psychoanalytic approach of first translating the right hemisphere's body language into the abstract patterns of cognition of the left hemisphere, which must then somehow operate back upon the right hemisphere to change the symptom. That approach sometimes works, but it is obviously cumbersome and time-consuming. All too often the patient develops marvelous patterns of intellectual insight, yet the body symptom remains. Even if the intellectual insight to the left hemisphere is correct, it may remain isolated from the right hemisphere's sources of symptom formation and maintenance… working directly with the unconscious may be a means of communicating directly with the right, or nondominant, hemisphere, which is probably responsible for psychosomatic symptoms.

Miss X, who had plans to become a professional harpist, consulted the senior author for help with her problem of sweating palms and fingers. Her hands were usually damp, and when she tried to play in front of an audience, the perspiration was so great that her fingers would slip off the strings. The numerous medical
doctors she consulted were both amazed and amused that she could hold one hand extended and soon form a puddle on the floor of the perspiration dripping steadily from her hand. They recommended a sympathectomy but could not be sure even that would solve the problem.

A salient feature of this initial session was the senior author's indirect exploration of the possible relation between the symptom of sweating and sexuality. His clinical experience has been that this symptom is usually associated with a problem in sexual adjustment. Since Miss X presented sweating as her only problem, however, his clinical judgment was to explore the possible relation between the excessive sweating and her sexuality indirectly by two-level communication. He did this by utilizing puns, certain words, and turns of phrase with double meaning, intonations, and pauses that may evoke sexual associations within Miss X if they are in fact associated with her problem. Rather than directly confront her with a clear statement about sexual problems in a manner that might arouse resistances, he simply provides contexts, implications, and association patterns that will enable her to bring up the sexual problem by herself. If he happens to be wrong in his clinical hypothesis about the sexual etiology of her symptom, nothing is lost; Miss X simply will not pick up and utilize the sexual associations.

There is a certain difficulty in presenting this material in a convincing manner in written form, because so many of the possible sexual associations are cued by intonation of voice, pauses, a certain smile or glance, etc. To facilitate the reader's understanding, words and phrases that could arouse latent sexual associations - if they are, in fact, present in the listener - will be italicized the process of preparation. A positive rapport and response attentiveness are established, and he begins to assess which of her abilities may be utilized. He facilitates therapeutic frames of reference and heightens her expectancy of receiving help. He initiates a process of two-level communication whereby he explores the possible sexual etiology of her problem and utilizes her special interest in music to enhance her first experience of therapeutic trance. We witness many of his approaches to depotentiating limitations in her conscious frames of reference and an interesting approach to symptom dynamics during what appears on the surface to be a simple process of hand levitation.

In the second part of this interview he leads her into a deeper experience of trance, during which she is very evidently engrossed in inner work. By the third and final part of this interview he is using ideomotor signaling to evaluate and ratify the process of therapeutic change that has already taken place. During this interview we witness with unusual clarity the logic of his general approach to symptomatic behavior:
1. He establishes rapport and focuses attention into a therapeutic frame of reference. 2. He demonstrates with the patients' own experience how their unconscious controls their behavior. This is a means of depotentiating their habitual framework and belief systems so he can then assign the locus of therapeutic change to the patients' unconscious. 3. He utilizes the indirect forms of suggestion (in this case particularly two-level communication) to evoke searches and processes on an unconscious level that may initiate a change in the dynamics of symptom formation. 4. He then demonstrates the resulting therapeutic change via ideomotor signals and/or the patient's obvious release from symptomatic behavior. 5. He then allows the patient to fully recognize and appreciate the significance of the psychodynamic insights about the source and meaning of the symptom that frequently come up spontaneously at this time. Ideas and attitudes facilitating a general enhancement of the patient's total life experience without the symptom are explored and integrated.

these five steps constitute a paradigm of our general approach to symptom resolution. Within this paradigm the therapist may explore one or more psychodynamic hypotheses about the source and maintenance of the symptom. The senior author's exploration within the two sessions of this case was so indirect, however, that we were not able to ascertain whether his hypothesis about the sexual etiology of Miss X's problem was correct. It wasn't until he received a letter three months after the termination of therapy, wherein Miss X confirmed that sweating was no longer a problem and that she had simultaneously resolved an important sexual difficulty, that we had confirmation that his two-level approach was correct and therapeutic.

utilization of a patient's own creative potentials rather than the older tradition of hypnosis as a form of direct suggestion

it is possible to release a patient's creative potentials in such a way that a problem can actually be resolved without patient or therapist really knowing the exact why or dynamics of cure.

The hypnotherapist is more appropriately involved in the broader program of facilitating a creative reorganization of the patient's inner psychodynamics so that life experience is enhanced and symptom formation is no longer necessary.

Semitism—'Jewishness' (as defined by the Torah and Talmud) is an anti-Christian, anti-Muslim creed/religion with the aim of enslaving non-'Jews' via usury (Central banks to rule over nations, finance to rule over individuals).

What is ir-rational about anti-semitism?
It is the laws against it that are ir-rational, and proof that we have been ‘occupied’, and are no longer in control of our own judiciary, legal, educational, and financial systems.

If psychosomatic symptoms are an attempt by the non-conscious mind to communicate something, to ‘express’ it, so it can be incorporated into the conscious understanding, then Freudian psychoanalysis can help the expression slip past the conscious mind’s filters, and become expressed directly, making the symptoms no longer necessary... the ‘message having been received loud and clear’...helping client reach ‘insights’ into the ‘meaning’ of the communications, resolves them...they dissolve...the were merely ‘messages’...now ‘heard’ and ‘understood’...

But NLP seeks to bypass the ‘understanding’, simply displacing and replacing the symptom with something positive... and telling the unconscious that it is free to deal with the ‘problem’ in any creative, generative way it sees fit, without needing the ‘permission’ of the conscious, and thus without needing to ‘convince’ it of anything via ‘argument’ i.e ‘communication’...

NLP was largely modelled on the work of brilliant, effective therapists like Milton H Erickson, who bypassed the conscious, and communicated directly with the unconscious...using two-level communication, words and metaphors with many connotations and implications, so that while the patients' conscious frames of reference are receiving communication on one level, their unconscious is processing other patterns of meaning contained in the words. He used mythopoetic processes such as analogy, metaphor, puns, riddles, jokes, and all sorts of verbal and imagistic play to communicate in ways that bypass or supplement the patient's usual, limiting, definitions, frames of reference, noetic structures, etc

the effectiveness of these approaches may be in their appeal to the right, or nondominant, hemispheric functioning. While the left, or dominant, hemisphere is proficient in processing verbal communications of an intellectual or abstract nature, the right hemisphere is more adept in processing data of a visuospatial, kinesthetic, imagistic, or mythopoetic nature. Since the right hemisphere is also more closely associated with emotional processes and the body image (Luria, 1973; Galin, 1974), the view has developed that it is also responsible for the formation of psychosomatic symptoms. These symptoms are expressions in the language of the right hemisphere. Our use of mythopoetic language may thus be a means of communicating directly with the right hemisphere in its own language. This is in contrast to the conventional psychoanalytic approach of first translating the right hemisphere's body language into the abstract patterns of cognition of the left hemisphere, which must then somehow operate back upon the right
hemisphere to change the symptom. That approach sometimes works, but it is obviously cumbersome and time-consuming. All too often the patient develops marvelous patterns of intellectual insight, yet the body symptom remains. Even if the intellectual insight to the left hemisphere is correct, it may remain isolated from the right hemisphere’s sources of symptom formation and maintenance. Thus, while the senior author developed the two-level communication approach long before our current understanding of left and right hemispheric patterns of specializations, we now believe that this working directly with the unconscious may be a means of communicating directly with the right, or nondominant, hemisphere, which is probably responsible for psychosomatic symptoms.

Sweating hands can correlate to sexual ‘wetness’ … be a symptom of sexual repression…if you can get the client to satisfy their sexual needs, the symptom of excessive hand sweating, as a symptom of sexual frustration / desire, is no longer needed… the client need never know the therapists assumptions…the therapist can test their assumption using indirectly sexual connotative language, imagery, metaphors etc, which the unconscious will respond to, even as the conscious mind ‘hears’ only the non-sexual meanings, and is not party to the real discussion between therapist and unconscious….way of speaking can convey the sexual meaning i.e speak as if speaking sexually, though using words that conscious mind won’t associate with sex…but the manner will ‘arouse’ the unconscious to recognition…conscious will take words one way, unconscious will take them the intended sexual way…if the problem is not sexually related, these ‘connotations’ won’t have a target to hit, the client will be none the wiser/ no damage done, and therapist can eliminate one possible ‘meaning’ of the symptoms…if therapist tries to directly address the possible sexual issue, clients conscious may resist i.e denial, shame, repression, genuine ignorance of own impulses/motives/desires…so attempt to address indirectly…client may ‘spontaneously’ become aware of sexual nature of problem, and bring it up themselves…sexual etiology… smiles, glances, tone of voice, subtly sexual in nature…arouse latent sexual associations without triggering resistance of direct assault … prepare via rapport and intense attentiveness, lead to client having positive expectation of some breakthrough / clinical benefit…induce trance by focusing on client’s special interests / passions / problems…depotentiate conscious limiting definitions / frames of reference / ways of seeing and being…i.e ‘shock’ them with some ‘trick’ that surprises them by defying their ideas / limiting beliefs of TROONATNOOR i.e what is possible, what is real…

Often client won’t connect the session and results with the ‘clearing up of’ what they consider an unrelated sexual problem…resolution of the real problem…by eliminating limiting beliefs, the person can reorganize their definitions of reality, of self, etc, in the process of which / outcome of which, the symptoms are no longer necessary / appropriate i.e rejected as inconsistent with the new and more valid awareness of TROONATNOOR
Example: Now the first step, of course, is to untangle your legs. And untangle your hands. Now what do you think I should do? … open legs, what do you really want? … :D

Opening the posture is more ‘open’ and receptive to new definitions etc i.e lowering resistance…posture associated with openness Vs defence…muscle memory, associations…

Idea of being ‘hypnotised’ is like rape fantasy i.e idea that ‘it is not my choice i.e I am not guilty, so can enjoy it, let it happen …let person give up responsibility for what is coming, so free to allow it / experience it without resistance…so unconscious impulses can be communicated directly, rather than indirectly through the symptoms… allows person to pass responsibility onto rapist in fantasy, in this case to the unconscious…very liberating…can ‘blame’ the rapist / unconscious ...(alternate multiple personalities probably produced by unconscious to facilitate this re-direction of blame i.e feelings of shame learned via religion / society etc…and mind control uses same principle of deliberately creating separate ‘selves’ i.e compartmentalized soldier and father, killer and ‘nice guy’…CIA etc…)

Get clients to ‘accept’ / ‘believe’ that non-conscious part of mind plays huge role in life e.g dreaming, … which can be activated / asked to perform tasks autonomously i.e without awareness of conscious mind i.e in ways they won’t be able to observe…but develop faith / trust in power to deal with symptoms…need to ‘open’ them up to alternative ways of being and seeing i.e open minded…to escape limiting belief sets…i.e ‘therapeutic frame of reference’ Vs limiting , conventional for them, habitual … can treat as metaphor i.e way of understanding how mind works in ways we cannot observe…see that non-conscious factors influence behavior…non conscious motives / desires / impulses…often repressed / denied…seek their expression unconsciously, often irrationally…

Arouse sexual connotations on non-conscious level by talking about X, but using words, imagery, associated with sex…e.g laying in bed dreaming is example of unconscious mind…and association with ‘laying’ ‘bed’ ‘sexual dreams’/desires…introduce ideas with sexual connotations…i.e ‘loaded’ terms…like Rohrshach tests etc…unconscious will direct eyes to ‘see’ sexual, even if conscious mind unaware i.e stimulated…

Develop trance via focus on favorite piece of music, a sensation, the problem client presents with…make as comfortable as possible e.g imagine hearing that piece of music, being in that relaxing place, or opposite … as long as deeply
engaged in particular i.e disengage from all other thoughts / environment, and fall into trance…hallucination of music, experience, memory…

Suggestions Bypassing Resistance: The Conscious-Unconscious Double Bind

E: And you don't really have to pay attention to me. You give your attention to the music, but your unconscious mind will understand what I say and understand things that you can't understand. First of all, I want your unconscious mind to give to you to give to you a most comfortable feeling all over. [Pause]

While her conscious attention is focused on her inner music, another part of her mind is registering what you are saying without comment or resistance. an example of the conscious-unconscious double bind? Because she does not know what her unconscious mind can do or is doing (because it is unconscious), she can only agree with you. She has no basis for denying what you say. Her "unconscious understanding what her conscious cannot is another double bind that depotentiates consciousness by greatly limiting the sphere in which it can understand and make judgments. Relieving consciousness of the need for action.

Double Tasks and Confusion for Bypassing Conscious Attention

And the next thing I want is for your unconscious mind to know that there is a very significant purpose for it to listen to me. And while your unconscious mind is listening to me, your conscious mind will be very busy listening to music of all kinds. Particularly phrases of music from here, from there, contrasting. But your unconscious mind is going to be listening to anything that I say to it. And it is very meaningful to your unconscious mind. [Pause] Now your unconscious mind knows that you can consciously lift your hands and move them. It is an urgent solicitation for her unconscious through her conscious mind.

Her conscious mind will not pay attention; it won't even bother to remember, because I've assigned the music to her conscious mind. You can use a double task to depotentiate consciousness. Confusion as well as assigning an absorbing task are both ways of getting consciousness out of the way, …a compound sentence that begins with the suggestion your unconscious mind is listening to me. The unconscious listening is then reinforced by the second half of the sentence, your conscious mind will be very busy with listening to music of all kinds - when she does, in fact, get engaged with her inner music. …no matter what she hears, it will be within your suggestion. Then even while the conscious mind may be busy contrasting different phrases of music, you suggest her unconscious will be listening to you.
Double Negative to Depotentiate Conscious Sets

But your unconscious mind knows that you don’t know that it can lift your hands. This is a truism in double-negative form, the not-conscious (the unconscious) knows that you don’t know, which tends to confuse and further depotentiate her conscious sets.

Therapist develops relationship with client’s unconscious that client self does not have…i.e communicates with it directly…

Limiting Conscious Understanding

And your unconscious mind is free to limit itself to things that I say. [Pause] I want to teach you something very much. Your hands are resting on your thighs, and your conscious mind is going to leave them down there. Utilize the sexual connotations of thighs and down there.

Unconscious muscle movement is different from that of the conscious mind. And you are not going to know which hand is going to lift. You will have to wait and see, but you'll be uncertain. The mere tendency, first one hand and then the other, perhaps both, then one, then the other, perhaps both. Sooner or later an elbow is going to bend a bit, a wrist is going to lift up, a hand is coming up. [Pause] And it is going to be very pleasant to wait. And you've got a lot to learn about your hands. It is well worth the time, too. And your unconscious mind is already beginning to explore. That's right.

It's lifting. A bit more. And sooner or later begins a minor jerk. [X's hands begin minor jerking movement up off her thigh. Much facial frowning is evident.] That's right [X's right hand begins momentarily to lift higher.] It doesn't necessarily mean it is that hand. It may be the other. It is still too soon for you to know. Up it comes. That's right. That's a beautiful unconscious movement. [X's hands are lifting with the slow, very slight, and apparently spontaneous bobbing and upward jerking movement that enables an experienced observer to distinguish it from the smooth lifting that is more characteristic of conscious voluntary movements.] That's another and another. You're really learning. That's right. And the wrist, and the elbow. That's beautiful.

And now the right hand, indicating that it wants to join the left hand. I don't know if it will. That's right. Up toward your face. Elbows bending. And there is a bit of accommodation between the hands. Which one will reach your face first? Left hand began first. Is moving faster. (accommodating the conscious resistance / desire to reject idea of unconscious i.e direct competitiveness to this competition between the hands, distracts from wanting to reject / compete with suggestions that it is not in control i.e unconscious is… and impulse to compete / prove therapist wrong i.e oppose therapist / notions of unconscious being in control…Now your left hand is approaching your face, but the nice thing about it is that your unconscious mind won't let your left
hand touch your face until you are really ready to go very deeply in trance and to do everything that needs to be done. Everything, even though you don’t know what everything is. This is an implied directive that facilitates deep trance: Her unconscious won’t let her hand touch her face until she is ready to go into a deep trance. You are relying on the patient’s own unconscious to determine the moment for entering deep trance; you are utilizing the patient’s own internal, autonomous mental mechanisms to facilitate deep trance. You have also made the suggestion to enter deep trance contingent on an inevitability: Her hand is going to touch her face from the way it is moving. The phrase and do everything that needs to be done is a very important all-inclusive suggestion that is hitchhiked onto the above in the form of a compound suggestion. Even though you don’t know what everything is depotentiates consciousness further, so that the unconscious can work in its own way without the limiting preconceptions of her conscious sets.

She is being maintained in a state of exploration and expectation rather than being prematurely fixated in the simple conviction that one hand is lifting. You are preventing her from forming a final and closed frame of reference around which hand is lifting. She does not realize it, but you are giving her an experience in maintaining a state of open, creative flux. This open state tends to facilitate the possibility of creative moments wherein she may break out of her old symptom-bound frame of reference to achieve a more adequate and therapeutic means of experiencing herself.

The Negative to Displace and Discharge Resistance

E: And yet your left hand is moving up toward your face irresistibly, but it won't touch your face until your unconscious mind is really ready. And irresistibly it moves closer and closer. [Pause] And even though your left hand is very close to your face, that doesn't mean the right hand cannot beat it to your face. [Pause] A mere two inches to go, and I still don't know if your unconscious is going to lift your right hand to touch your face first. And that left hand less than two inches away. And now your unconscious mind is showing a desire that you don't know you have. That's right.

R: The use of the negative but it won't touch your face until your unconscious mind is really ready is very interesting. If she has any resistance your use of won't may pick up hers and redirect it in a constructive manner. Your use of the negative tends to displace and discharge the patient's resistance. Inner

one of Erickson's basic approaches to hypnotherapy. He first sets up a therapeutic frame of reference by emphasizing and letting patients have an experience of the difference between the conscious and unconscious mind. With the process of hand levitation she is able to experience the difference between the voluntary lifting of the hand and the involuntary movements of the unconscious. While she
is open to unconscious experience, he initiates a process of two-level communication: On one level he talks about hand levitation, while on another level he is using associations with sexual connotations. If her problem has a sexual etiology, these connotations will tend to activate her own sexual associations. The Unconscious Resolution of a Problem.

The activated sexual associations may remain at an unconscious level, where during trance they are turned over to effect an apparently autonomous resolution of the patient's problem. It is possible that hypnotherapy can take place entirely at an unconscious level without the patient (and sometimes even the therapist) knowing the why of the cure. The patient only knows a problem has been resolved. No insight in the conventional psychoanalytic sense is involved. This is probably the means by which the miracles of faith healing take place. Somehow or other something in the faith frame of reference touches off the relevant unconscious associations to effect an autonomous inner resolution of a problem. Of the many who apply themselves for cures, however, relatively few experience these happy accidents. They are, indeed, so rare that they are called miracles.

With the two-level communication approach, however, the senior author is increasing the odds of a happy accident by making an educated guess about the sexual etiology of the problem. If he is right, then merely activating sexual associations during the relatively free and creative period of trance will increase the likelihood of a therapeutic interaction that can lead to an apparently spontaneous resolution of a problem on an unconscious level. The fact that the patient is in a therapeutic environment where cures are somehow effected by a not-too-well-understood process of trance tends to depotentiate her limited and erroneous conscious frame of reference and enables her unconscious to resolve the problem. This assumes that a therapeutic potential already present in the patient was blocked by the patient's erroneous frames of reference. Therapeutic trance is a relatively free period wherein patients can sometimes bypass these limitations so their own therapeutic potentials can operate without interference.

On its most basic level hypnotherapy can be effective simply by providing patients with a period of therapeutic trance so their own unconscious resources can resolve the problem. If the therapist has some understanding of the etiology and dynamics of the problem, then he may help focus the patient's unconscious resources by two-level communication. If the therapist is wrong in his assumptions, two-level communication is a subtle process that simply will not be picked up or acted upon by the patient's unconscious. It is thus something of a fail-safe procedure. The therapist is not likely to antagonize or bore the patient with erroneous and irrelevant ideas that may sound fine in a textbook but have little application to that patient.
A period of therapeutic trance with or without the help of two-level communication may stimulate associations to a problem that the patient wants to talk about. This route naturally leads to insight therapy. After an initial experience of trance the therapist may simply wait for the patient to bring up relevant associations. If none are forthcoming, the therapist may again review the nature and possible sources of the problem to ascertain if the patient now has more access to relevant associations. This was the course that the senior author began to explore by asking the harpist the details of her inner experience with music. Not much was forthcoming, and he felt the material was still too threatening for her to discuss it with the observers present; therefore, he again structures the conscious-unconscious therapeutic frame of reference and another experience of trance.

You are demonstrating to her conscious mind that the unconscious can control her behavior. This tends to depotentiate her habitual, everyday frames of reference.

Trance Reinduction by a Question: Initiating an Unconscious Search

E: Do you know that you will be in a deep trance when I touch your face? [The senior author touches his hand to her face. She closes her eyes and remains immobile.] Now rest very quietly. And enjoyably.

R: You are again making use of your earlier posthypnotic suggestion that she could go into trance all ways. This time you reinduce trance by suggesting a cue [touching her face] in the form of a question. Such question inductions are particularly effective because questions are a marvelous means of fixing and focusing attention inward. In this case the question obviously initiated an unconscious search and the requisite unconscious process to lead to the desired hypnotic response of trance. One of your most effective forms of hypnotic suggestion is to ask questions that cannot be answered by the patient’s ordinary conscious frames of reference. Questions that ask for an autonomous response [such as ideomotor signaling] on an unconscious level usually depotentiate consciousness and lead to trance experience.

Assigning the Locus of Therapeutic Change as Taking Place in the Unconscious

E: And you’re beginning to understand that your unconscious mind can develop control and take charge of so many things. Now in awakening I want you to do it easily and comfortably in your own way.

R: You are again emphasizing and demonstrating unconscious control over behavior and making direct statements about it, so she will have a clear understanding of it as the means of your therapeutic approach.
E: I say so many things to emphasize the plural.

R: That implies the unconscious can also take control over her symptom, too

Two-Level Communication

E: In a way that meets your needs. But I want your unconscious mind to continue to listen to me and to understand what I say even though your conscious mind may hear something different. Now take it easily and awaken. [Two-minute pause] Now. [Long pause for at least five minutes during which X does not awaken. The fingers of her left hand move as if playing the harp, she grimaces and frowns and has the appearance of being in a state of intense inner concentration.]

E: The plural here again with meets your needs. I'm actually talking about two-level communication without really explaining it.

R: That opens the way for two-level communication? E: That tells her I am talking on two levels.

R: That the conscious mind can understand one thing while the unconscious can elaborate many other associations. The unconscious can elaborate whatever associations are necessary and pertinent to her particular problem. You are again using general words that can be interpreted in as many different specific and personal ways as possible relevant to particular problems. The success of this approach is suggested by the fact that her inner absorption was so deep at this point that it took her at least seven minutes to awaken. The activity of her face indicates that inner work was certainly being done. She was not asleep!

: Her unconscious mind understood something different from the word awaken. What does awaken mean? Wake up to your opportunities!

No matter what the problem is, no matter what the therapist's hypotheses are, you are encouraging the patient to do her own work, inner work that is valid for her unconscious.

E: She is not limited or biased by my ideas.

R: So this is a most general way of facilitating problem-solving.

E: I don't need to know what your problem is for you to correct it.

R: Valid hypnotherapy can be done without either the patient or therapist knowing what the problem was.
many emotional problems can be solved more easily without conscious thinking.] I tell her she can leave the struggle because she does not have to fight that battle every day, every night. She can always return and fight another day.

R: Here you carefully break into whatever inner work was being done and let her know she can return to it after an interlude of conscious awareness.

Conscious and Unconscious Head Signaling: The Unconscious Personality

[X shakes her head no in an absentminded manner.]

E: And there was an I don't know head movement confirmed. Now I am talking to someone else, and she doesn't know to whom, only I know. [To the audience] Wasn't that beautiful?

E: Now when she shakes her head, that was an absentminded withdrawal to a trance state. If you recall, she was shaking it no very slowly.

R: A very slow head movement is from the unconscious, while a fast head movement is from the conscious.

E: Yes, and the unconscious response comes after a delay, while the conscious response comes immediately. I'm talking to her unconscious personality.

R: In talking to someone else, her unconscious personality, you are further depotentiating her everyday frames of reference about herself so that an unconscious search is initiated for this other aspect of her personality. This is, of course, an excellent approach for evoking multiple personalities or more repressed aspects of one's personality.

You could ask for ideomotor signals from the unconscious to determine if it was receiving things the conscious mind could not recall.

E: You can put people very deep, but you talk so there are islands which they can use as a highway. They are on the bottom of the deep ocean. They need to come up and jump from this island to the next.

R: There are variations in trance depth from deep ocean to conscious island that you utilize to give suggestions.
E: You say something they can hear in deep trance that they can relate to consciously. For example, a bit earlier I said, And there, can be an interlude of conscious awareness.

R: That suggestion brought up an island of conscious awareness?

E: Yes, something that can be seized upon.

R: How does that help them follow a posthypnotic suggestion? It raises them momentarily to consciousness where they can receive the suggestion?

E: It leads into consciousness.

R: Are you building an associative bridge from the unconscious to the conscious?

E: Yes, it builds a bridge between the struggle taking place on both conscious and unconscious levels.

R: In deep trance it is possible to place suggestions so deeply that there is no bridge to consciousness where they can be expressed. Those suggestions cannot be therapeutically effective.

E: That is why I build bridges.

You build up high tension with some provocative remarks that send the patient on some frantic unconscious search, and then you reassure and lower tension so that the unconscious process thus initiated can proceed in peace on its own.

E: Then I reassure her again with, I don't need to know them.

R: And you put the responsibility on her by saying, But you need to know them.

Dissociation and Rapport

X: I guess I feel kind of, sort of separate, even though it doesn't bother me that I am aware of.

E: No, you and I are together, and those people are outside. It is a very nice way of illustrating that we are here and [To R] you fellows are over there.

R: Yes.

E: And you did that so nicely, [To R] and I didn't tell her to do that.
R: Her sense of separation is a form of dissociation which indicates she has a separate and different relation with you than the observers? She has a special rapport with you that tends to exclude others.

E: Yes, Facilitating Hypnotic Phenomena: Double Bind and Questions to Evoke Immobility and Caudal Anesthesia

E: Now I am going to say something to you. You are not going to understand it consciously. Doesn't it surprise you that you can't stand up? [Pause as X looks surprised]

X: Can I try?

E: Oh, you could try.

[Pause as X makes a slight forward movement in her chair with the upper part of her body only and then stops] It does surprise you, doesn't it? Some day when you get married and are having a baby, you can use the same measure.

X: Oh, really?

E: Um hum. I just gave you a caudal anesthesia or a spinal anesthesia.

X: [Nervous laughter]

E: I don't lay on hands, I lay on ideas. That is kind of a surprise to know that you can't stand up.

X: Let me know when I can.

R: It is a beautiful double bind when you say you are going to say something to her that she is not going to understand consciously: She is bound to listen, but since she cannot understand consciously, she must respond on an unconscious level.

E: Yes.

preparation for having a patient experience visual hallucinations: You usually activate many trains of association regarding the subject of the hallucination before you try to evoke it.

E: Yes. Hypnotic technique is giving the stimuli that can be resolved by the subject into the hypnotic experience you wish her to have
When I tell her the sweating can have a superficial origin, I'm telling her that her sweating is not the scary thing she thinks it is.

R: This is a way you depotentiate her previous rigid sets and fears about her problem.

To the last puddler I saw I said, You really are ambitious, you don't like the puddle you are in. It pays well. You hate to give up all that pay. As long as you can lead a band in Las Vegas, you will have puddles. You can give up Las Vegas. Go to New York. Live by yourself in an apartment. Write music and arrangements. You'll be free. A year later he was turning out a lot of music and arrangements and free of his puddling. Now you weren't embarrassed by my talking about you, were you?

You don't like the puddle you are in is actually a pun relating symptom (sweating) to personality problem (ambition). Such puns may seem funny and even superficial to some readers, yet in one stroke they can fixate a patient's attention, depotentiate erroneous frameworks, initiate an unconscious search, and facilitate a creative moment (Rossi, 1972b) wherein startling insight may be achieved.

[Erickson now engages Miss X in a five-minute period of chitchat about her family and her general interests. He is apparently taking a break, allowing her to relax from the very intense period of trance work. Such alternations in the rhythm and intensity of conscious and unconscious work are important. There is a natural ninety-minute biorhythm of rest and activity, fantasy, intensity, and appetite that we all experience continuously (Kripke, 1974). It sometimes seems as if Erickson recognizes that natural variation in the patient's biological clock and adjusts his rhythm of alternating trance and conscious work to coincide with it.]

Part Three: Evaluation and Ratification of Therapeutic Change

In the previous section the senior author continued structuring the conscious/unconscious double bind and his two-level communication approach. He assigned the locus of therapeutic change to the unconscious and let the patient have a very intense trance experience during which therapeutic change could take place. He depotentiates her symptom and then notes that she has not, in fact, been manifesting her symptom during this session. The entire procedure has been so casual that she does not yet realize consciously just how much therapy has been taking place. The stage is therefore set for an evaluation and ratification of the therapeutic change. Demonstrating
Demonstrating a Therapeutic Change: The Double Bind in Try Related to Hemispheric Specialization

E: Do you think you could make a puddle with your hands now? Try it.

X: Try? I did make a puddle for some doctors once. This doctor told me it was the worst he had ever seen and he went and got a bowl. Four other doctors came around to watch me make a puddle. [X places her hand in position to create a puddle, but no significant moisture appears.]

E: I said try it! You are beginning to have some doubts?

X: About a puddle, yeah. I could give you a little stream.

E: Try it. Just a little puddling stream.

[Pause]

Looks like your poorest performance on the record.

X: I can't understand it.

R: Right after a short period of chitchat you ask a very challenging question to demonstrate a therapeutic change: Her sweating has decreased.

E: I said, try it, implying she is to make an effort and at the same time to negate it.

R: You had her in a double bind, didn't you?

E: Yes. MHR HE SAID 'TRY' NOT 'DO' I.E IMPLYING SHE COULDN'T...WAS NOT TO...WAS MERELY TO TRY/ATTEMPT I.E FAIL...THAT WAS THE DOUBLE BIND THAT FORCED THE ONLY RESPONSE OF NOT SWEATING/PUDDLING...

Ideomotor Signaling to Ratify Symptom Cure: The First Round

E: Lifting your right hand means yes, lifting your left hand means no. Does your unconscious mind think that you can make a puddle with your hands? Which one will lift? Wait and see.

[Pause]

You can even watch to see which one is going to lift.
X: I can watch?

E: Yes.

[Pause as her right hand lifts a bit, then her left hand lifts a bit too. She has been looking at her right hand.]

E: [To R] The fixation of her gaze shows her conscious action. She only shows one slight look at the other hand. We know what her conscious answer is. She doesn't know what her unconscious answer is. [To X] But your unconscious will suddenly give you a correct answer. [Her right hand lifts more strongly.]

R: You are now using ideomotor signaling as a further demonstration of symptom cure? You are trying to eliminate any further doubts about her symptom cure?

E: Yes, and I create a state of uncertainty by asking, Which one will lift?

R: That uncertainty tends to depotentiate her conscious (and problematic) frames of reference so her unconscious has an opportunity to respond.

E: Where a person looks in finger or hand signaling indicates their conscious expectation.

R: If you have no concrete way of demonstrating symptom cure in the therapy situation itself, then this sort of ideomotor signaling is a good substitute (Cheek and LeCron, 1968). She finally lifts her right hand more strongly, indicating that her unconscious believes she can puddle her hands. Yet she cannot actually do it. How do you explain this discrepancy?

E: She knows from long experience that she can puddle. I haven't taken anything away from her.

R: By lifting both hands she is saying that you haven't taken anything (her symptom) away from her; the capacity for the symptom is still there.

E: Yes, the capacity is there, but there is no longer fear.

Depotentiating Conscious Doubts About Symptom Cure: The Double Bind

E: And now you are seeing a demonstration of what it means when people say it is hard to believe. All past experiences made only one answer possible. But the unconscious is going to give a forcible answer.
[Pause]

It is difficult to change one's set frame of reference.

[Pause]

And you are afraid to know the answer.

[Pause]

It is perfectly all right to think one thing consciously and to know exactly the opposite unconsciously.

[Pause]

And does it put a strain upon you? And yet there is no sweating in spite of the strain. So now you will have more courage.

[Pause]

That really takes a great deal of courage.

E: I'm using folk language to express what people feel.

R: It is hard for a patient to really believe a long-term symptom can disappear so quickly. By giving voice to this inner doubt you are depotentiating it.

E: Yes. It is difficult to believe these changes have been made.

R: She is afraid to know the change has really been made, lest she be disappointed.

E: That's right.

R: Here you are allowing room for conscious doubts, but reinforcing the fact that the unconscious recognizes there has been symptom change. This is another use of the conscious-unconscious double bind. Then, even though the ideomotor signal of the right hand lifting means she still has the capacity for sweating, you point out that at present there is no sweating in spite of the strain. You then give strong ego support for the courage to believe, but you don't actually say believe, since that would imply doubt.

Posthypnotic Suggestion
E: I am going to ask you to awaken, and I'm going to tell you an apparently meaningless story. But your unconscious mind will understand. Now awaken now. one, two, etc. to twenty, nineteen, eighteen, seventeen, sixteen, fifteen, thirteen, nine, eight, seven, six, five, four, three, two, one. Awaken.

R: This is an interesting form of posthypnotic suggestion whereby you are able to later give her unconscious a message that will not be meaningful to her conscious mind. In this way you may be able to bypass the limitations or doubts the conscious mind may have.

Until: Posthypnotic Suggestion for a Continuation of Psychotherapeutic Work on Symptom Cure

E: You know the comic strip of Mutt and Jeff? Do you know them?

X: Yes.

E: One day Jeff was searching his pockets desperately, and Mutt was watching. Over and over again Jeff searched his pockets. And Mutt asked him why. And he said, I lost my wallet and I looked in all my pockets except one. I can't find it. And Mutt asked him, Why don't you look in that one? Jeff answered, Because if it ain't there, I'll drop dead.

[Pause]

When did you decide I would be the last hope?

X: I know my unconscious knows what that story means.

R: This is one of your favorite anecdotes to deal with the patients' conscious doubts about symptom cure. You depotentiate their conscious doubts with bits of humor and simple acknowledgment of the doubt.

E: Yes, that is a perfect example. I've also said to patients, And you are going to doubt it all the way home until.

R: Why do you end the sentence with until?

E: Now you want to know the end of the sentence, don't you? The patients who doubt symptom removal will doubt all the way home, and then they start looking
for the until. Until something happens, you see. They start looking for what it is that will tell me that it is gone. They are expecting.

R: You have them looking for and expecting a confirmation of symptom cure.

E: Yes, I'm setting them up for that.

R: So when the patient walks out of the office he is still doing psychotherapeutic work. This is a form of posthypnotic suggestion to search for convincing proof of symptom removal.

E: All the way home until they know.

immediately distracting her from the posthypnotic suggestions you have just given, lest her conscious mind starts to argue or interfere with them. This is highly characteristic of your approach - you make a suggestion and then immediately distract before consciousness can take issue with it.

E: My remark, And promise not to forget it refers back to my earlier question, How soon will you forget me?

R: That tends to reinforce the earlier suggestion while structuring an amnesia for all that took place between the two statements.

For the unconscious, symptoms have an important value. You are letting the unconscious retain the value of the symptom (now diminished to hands producing a mist rather than ‘dripping puddles’) by displacing that value to another concrete function: A mist is good for house plants. This kind of displacement works in the literal and concrete unconscious, even though it is absurd from a conscious rational frame of reference.

n.b for musician (harpist like her) too-dry hands a problem, so may fear if stop puddling / excessive wetness, will become totally dry…

Your hands have been overperspiring for a long time. Let's give them at least two hours to learn the right amount. And you can already see that they have been doing a lot of learning. [Long pause]

R: Is it a double bind when you ask if she wants the freedom to let her hands get wet again? It is a peculiar reversal when you tell her she can get wet hands.

E: I'm giving her freedom - even to get wet hands!

R: But if she is free to get wet hands, that must imply she has dry hands. So you've used implication to give her a suggestion for dry hands.
E: Since there is no restriction on wet hands, it also means there is no restriction on dry hands. She is not put into any rigid situation - there are situations where wet hands are acceptable. Until she met me, all wet hands were horrifying.

R: You are giving a positive value to something that was all negative before. You are helping her recognize the positive value of the physiological function that was formerly only a negative symptom.

By the way, how many times have you been in a trance today?

X: I was just trying to figure that out. [Pause] I don't know. I'm not sure.

E: More than once?

X: Yes.

Why do you ask how many times she has been in trance today?

E: She cannot know for a certainty whether this idea came while she was awake or in a trance state. If you are going to hunt a deer, you had better know which field it is in, because you can't kill it in a field it is not in. She can't direct any resistance to any idea until she knows whether it was in trance or waking state.

R: So you are again depotentiating any possible expression of resistance here.

E: Future resistance! To resist any idea she first has to define it as trance or unconscious.

R: So you are making it difficult to determine whether the important suggestions were placed in the conscious or trance state. You are essentially using a confusion technique to protect your suggestions from her conscious resistance. Asking her this question about the number of times she has been in trance can put her in a doubtful position about her unconsciousness. Thus it is very valuable therapeutically if patients do not know whether or not they were in trance. That confusion stops them from holding onto therapeutic suggestions in a way that allows them to repudiate them.

E: Yes, it is very valuable.

Hypnotic Immobility Conditioned to Try

E: Try to sit down.
X: I can't.

E: Are you in a trance?

X: I don't know.

E: You don't know. That's right. You don't know. That's why you don't know how many times you have been in a trance. Now you can sit down.

[She sits down]

X: Oh, I see.

R: Being in a trance without knowing it?

E: Yes. If it were a boyfriend who told you you could not sit down, you would wonder if he was in his right mind, wouldn't you?

X: Yes.

R: Is this inability to sit down due to a momentary trance?

E: If I can put a trance in her hips, she has to recognize I can put a trance in her hands.

R: But why were you able to put it in her hips? She was in the normal awake state when you asked her the question.

E: 'Try to sit down.

R: The word try uttered in that soft and doubting way you have is a cue that she could not. You had conditioned her to immobility when you use the word try in that way.

E: Yes, the hypnotic response hits her hips or her hands, and she knows that. I have also gotten across the idea that she does not know whether she is in a trance or not.

R: What is your actual belief about being in or out of a trance without knowing it? If we had a machine that could detect trance, do you believe she would be going in and out of trance throughout the session?

E: Yes.
All these demonstrations of the effectiveness of the unconscious to control behavior are to convince her conscious mind that her unconscious can also control her symptom? This is your basic approach to dealing with symptoms by hypnotherapy. You don't directly suggest symptoms out of existence. You arrange a series of experiences that demonstrate the potency of the patients' unconscious. You give them an opportunity to witness the therapeutic control their unconscious minds have over their symptom and then leave it to their unconscious to continue its therapeutic regulation. These are the actual dynamics of indirect suggestion.

Open-Ended Suggestion to Cope with Problems

E: Now think of a few more of the things that you would like to have your unconscious take charge of.

X: Short of my hands?

E: Other than your hands.

[A comfortable chat now takes place about family matters and apparently unrelated topics for about ten minutes. He is giving her another rest.]

E: Here I'm getting at any other problems she may have.

R: This is an open-ended suggestion to let her unconscious resolve other problems the therapist may not even know about.

Your unconscious can know the answer, but you don't have to know the answer. All right.

The senior author now tells a clinical case history of how he helped an eleven year-old control her bed-wetting. A major point of the case was that symptom control comes about gradually.

You now acknowledge her conscious doubts and bring them out into the open. You openly acknowledge the truth about her inner situation. She responds with an affirmative yes. You have thus also opened up a yes set. She is in an affirmative mood. You then immediately follow up with, It is nice to watch growth, which is a direct reinforcement of the fact that her left hand did go up, that she is changing and in the process of giving up the symptom.

After a while you will have a drought on your hands. Now and then it rains even in the desert.
R: You are utilizing time for symptom cure.

E: Yes, and giving her permission for failures. All the failures will prove an improvement.

R: The failures will prove the improvement because they come after increasing lengths of dry times.

I want you to get some good physiological rest. You have done a lot of work. Far more than you know. You have altered a lot of your brain pathways. You have set up new ones. You need to sleep

The next day X returned for another two-hour session with Erickson. Her friend L is present as an observer. The session begins with the spontaneous admission of her enduring feelings of confusion about yesterday's therapy. Such confusion is characteristic of the patient's mental state during the initial and middle stages of therapy with Erickson. Confusion is an indication that the patient's habitual frames of reference and generalized reality orientation have been loosened so that their psychodynamics are now in an unstable equilibrium. A process of deautomatization is taking place wherein many of the patient's erroneous sets that have been responsible for symptoms and maladaptive behavior are loosened to the point where new associations and mental frameworks can be formulated to achieve therapeutic goals.

Erickson begins by giving her some mental warm-up exercises: He requests that she recall in exact detail the furniture of the place she slept the night before and then all the things she saw on a shopping tour yesterday. All of this may seem irrelevant to the patient, but Erickson is thereby warming up search operations in her mind with nonthreatening material. These search operations will be used later in the session, when she will need to seek and express insights. undoing repressions in a variety of ways. His object, as always, is to help the patient loosen the rigid mental frameworks that are responsible for symptom formation, so that the unconscious can restructure a better reality. He utilizes ideomotor signaling, analogies, stories, and other devices to move her associative processes continually toward introspection in critical areas. Here we witness Erickson at his best as a therapist facilitating the process of insight. He continually offers one approach after another, like a locksmith trying different keys until the patient finally unlocks her own repressions. After a great deal of initial resistance, X experiences a flood of insights about her family dynamics and the reasons for her symptoms.

When she says, My mind seemed confused, you recognize it as a typical effect of the initial stage of your therapy. It is a good sign, since it means that her
conscious frames of reference have been depotentiated and her unconscious has had an opportunity to reorganize itself along therapeutic pathways.

Training in Thorough Mental Examination

E: Name the items of furniture in the house.

X: Well, in the living room there are giant pillows instead of furniture, but there is a rocking chair there, too. There is a couch in the kitchen. There are tall bar stools in the kitchen. There are three bedrooms, so there are three beds. Two regular and one water bed. There are three dressers. I think that’s all.

E: No other objects? You haven't named a table yet.

X: OK, there is a table and four chairs in the kitchen, etcetera.

E: Now, any special thing you did yesterday?

X: I went shopping by myself for about an hour and was sort of wandering around in a daze, just taking my time. Other than that, no.

E: Where did you shop?

X: A little place, well not little. It is a giant conglomerate department store.

E: What objects did you look at?

X: Food, cheese, meats, flour tortillas, wine, tomatoes, beans, pants.

E: Any other things?

X: No.

X: The pants that I bought were men's pants, but I looked at a pants suit that would be for a woman.

R: What's the purpose of this seemingly irrelevant question about house furniture?

E: When you think about a thing you think inclusively; don't exclude anything.

R: Oh, that's the implication! By having her think in extreme detail about her friend's house furniture, you are training her unconscious to go into something very thoroughly without telling her conscious mind what you are doing. You don't directly say, I want you to thoroughly explore your problems. Instead you
put her through another task in a thorough manner. You then expect that process of thorough examination to automatically generalize to her own self-examination of her personal problems.

**In training a rifle team** for the international shoot, I told them to let the sight wander back and forth, up and down, all over the target. You don't know just when you'll squeeze the trigger.

R: The conscious mind will not know just when, so the unconscious will have an opportunity to intrude and squeeze the trigger at just the right moment. You are taking pressure off the conscious mind and giving responsibility to the unconscious. Did you explain that to the riflemen?

E: I did not explain it to them. I said to them they might not even know when their finger squeezed the trigger. It takes all the pressure off because it is not necessary for them to know. The only necessary thing is for the bullet to hit the target.

R: The conscious mind need not know the precise moment. You are allowing the unconscious to play a bigger part in the response.

E: And the conscious mind can be more comfortable because it isn't pressured to do it at an exact moment. A small child always asks, Can I do it when I want to? The feeling of comfort and freedom is very important. You don't have to know the exact time.

R: You allow this freedom for the unconscious to make its own response in its own way in its own time. You depotentiate the erroneous sets of the patient's conscious mind that presumes to control everything and thereby open freedom for the individual's creative unconscious.

Serial Posthypnotic Suggestion for a Negative Hallucination Training

E: Shortly you will awaken, wondering where the others have gone. [Pause] It will rather surprise you. Why did they leave? Was there any purpose? Now slowly awaken. [Pause as she opens her eyes and reorients to her body a bit.]

R: You feel it is usually more effective to give a posthypnotic suggestion in a serial form where the posthypnotic behavior is integrated with ongoing waking behavior or typical patterns of waking behavior (Erickson and Erickson, 1941). In this case you don't directly suggest she won't see the others when she awakens. Only the very best hypnotic subjects would be capable of such a strong negative hallucination this early in their training. You give a more subtle form of
suggestion that can utilize many already existing mental patterns like surprise, and questions about why they left, etc.

Before awake from trance, introduce distraction i.e talk of favorite something, so will ‘forget’ preceding trance when awake from it…

Paradoxical Suggestion and Distraction

E: Now what you want is more control of yourself. If you relinquish control in relationship to your hands, you have relinquished control in your relationship to what you call claustrophobia. But you can now have full control. You didn't even tell me to go to hell.

E: You give a seemingly paradoxical set of suggestions when you tell her she can have control, and yet if she relinquishes control of her hands, she relinquishes control of her claustrophobia. You mean that if she allows her unconscious to deal with her hand problem, it will also deal with the claustrophobia. But you don't state it in a clear, rational way for left hemispheric understanding, as I have here. You present it as a seeming paradox of having control yet relinquishing control. Such a paradoxical presentation will momentarily jam her critical faculties so her unconscious again will have an opportunity to interfere. Then, before she can recover her critical faculties, you are off with another provocative statement about telling you to go to hell. This now distracts her further, so your suggestion about the connection between sweating and claustrophobia cannot be dealt with consciously and must remain within, where only her unconscious can receive and work with it. Trance

The effect of your double depotentiation of her unconscious sets with paradox and immediate distraction is that she is sent on such an intense inner search that she is, for all practical purposes, in a trance

fear of revealing herself. There is sometimes a tendency for the hypnotherapist to err in the direction of uncovering unconscious material too quickly. You carefully avoid this danger by emphasizing that patients need not tell until they are ready to do so with a feeling of comfort and safety.

X: I never did want to be a harpist. [Pause]

E: What do you want to do in relationship to the harp?

X: Play just for myself.

E: And whose idea was it that you be a concert harpist?
X: I always blamed my Dad, but it might have been mine. I think originally it must have been Dad's.

E: Now why did you have wet hands?

X: I know why. So I wouldn't have to play.

E: As an excuse.

R: When her self-revelation does come, it is surprisingly free of emotional trauma. Not wanting to be a concert harpist seems to be such a simple pragmatic fact, yet for her it is giving up an identity built up over a lifetime. One of her major mental frameworks about herself has been altered. A fifteen-minute conversation takes place wherein X now experiences a flood of insights about her family's psychodynamics and her symptom of sweating.

R: Now begins a flood of insight and conviction about the source and nature of her problems in her family. You are here utilizing the classical means of insight therapy to support the reorganization of her psychic economy so that symptom formation is no longer necessary.

Now why do you think you have claustrophobia on the plane? Let your unconscious mind answer this question, and you just wait if you don't know the answer. Your unconscious mind will answer with a head movement after it has digested my question. Can you in any way say anything to indicate why you have claustrophobia on the airplane? [Long pause as X closes her eyes] Either a nod or shake of the head involuntarily. Do you know what it was?

Does your unconscious mind know it? [Pause as her head nods yes very slowly] Do you consciously know it?

X: Yes.

E: What was it?

X: When my brother and I were little, we fought like cats and dogs, and one day when I came home from school I was angry with him about something and tore a page out of his stamp collection book. He hauled me into a closet and nailed it shut with a cat inside with me. I don't like cats either. It was on St. Patrick's Day.

E: There is nothing bad about knowing it, is there?

X: No, I'll beat the hell out of my brother when I go home [laughs
N.B fear of flying could be claustrophobic side-effect i.e closed space of plane is problem, not flying per se

Each psychotherapeutic encounter is unique. Erickson continually comments on the theme that every hypnotherapeutic endeavor is a creative exploration. This is so because behavior, whether in the ordinary waking state or in hypnotherapeutic trance, is not necessarily logical, well-ordered, properly pertinent, or even reasonably appropriate to the situation or conditions evoking it. It may be logical, illogical, meaningless, irrelevant, random, misdirected, nonsensical, metaphorical, humorous or whatever. It is usually impossible to predict with precision just what an individual's response will be in any therapeutic encounter because the simplicities and complexities of behavior and its reasonableness and idiosyncrasy derive from many permutations of unknown experiential factors in the person's lifetime of learnings. At the very most, only broad generalizations can be made. All too often, however, these generalizations break down or are lost in a maze of complexities when a particular therapist faces a particular patient at a particular time and place.

There is no rigidly controlled or scientific method of eliciting the same behavior from one or more patients under the same conditions at different times. Even when the range of responses seems to be greatly limited, totally unpredictable behaviors may occur.

Psychotherapists cannot depend upon general routines or standardized procedures to be applied indiscriminately to all their patients. Psychotherapy is not the mere application of truths and principles supposedly discovered by academicians in controlled laboratory experiments. Each psychotherapeutic encounter is unique and requires fresh creative effort on the part of both therapist and patient to discover the principles and means of achieving a therapeutic outcome.

He was able to evoke and utilize the particular patient's motivation and repertory of experiential learning. The most remarkable hypnotic effects could be evoked because of the nature of the transference relationship and the importance of these hypnotic responses for the patient's much desired therapeutic outcome. The failures, particularly those involving the hypnotic effects that the senior author was most experienced in evoking in experimental settings, were likewise accounted for by their apparent irrelevance to the patient's real needs. Although the senior author used some standard routines in setting up hypnotic experiences, he was perpetually tuning into and utilizing the patient's own mental frameworks and idiosyncratic association patterns.

Demonstrating Psychosomatic Asthma with Shock to Facilitate Symptom Resolution and Insight
A basic hypnotherapeutic approach to psychosomatic symptoms is to demonstrate clearly and unequivocally how they are controlled and maintained by psychological processes. Such a demonstration breaks through limiting preconceptions about the organic nature of the problem and usually puts the patient in touch with the psychodynamics of the problem. If it is correct that psychosomatic symptoms are more closely associated with right hemispheric functioning (Galin, 1974), an hypnotic demonstration of the psychogenic control of the problem may be making contact with the actual hemispheric sources of the symptom, since trance itself is considered to be a right hemispheric activity (Bakan, 1969; Hilgard and Hilgard, 1975). This helps us understand why it is that spontaneous insight into the sources and psychodynamics of the problem frequently follows closely upon a demonstration of the psychological control of the symptom. The trance experience opens up common pathways between the psychodynamics and the sources of control of the symptom. The following case, written by the senior author, is a typical example of how this approach can be used. Psychosomatic

Psychosomatic Asthma

Mrs. G., aged thirty-five, married ten years, with one child aged nine, sought a psychiatric consultation. This was in protest to the repeated diagnosis she had received from a half-dozen different allergists to the effect that her chronic asthma, lasting from November through April, of ten years duration, was largely psychological. The pertinent history obtained was that the excitement of her wedding had been followed within two days by the long-expected death of her bedridden mother. The mother had left no will but, as a wedding present for her daughter, had extracted from the father a solemn sworn promise that, when she died, he would dispose of the farm, give the daughter half of the proceeds, and then, if he wished, he could retire on his half.

After the funeral the father told her that his promise to the mother was meaningless and that she would receive only half the yearly income until he died, when she would inherit everything. She and her husband angrily took their departure to live in another section of the country. Within two months the couple became reconciled to the father's actions and initiated a friendly correspondence in late October. The father replied, and his first letter found her in bed with a severe cold. Her recovery was slow, and this was attributed to a pulmonary reaction to atmospheric impurities resulting from the mining industry in that town. Asthma developed as a complication, but with the advent of warm weather this vanished. In June they moved to the San Fernando Valley, but in November, presumably because of the smog, she again developed asthma, which persisted until May. In June they moved to San Francisco, but the following November the asthma reappeared and persisted until May. Further moves were unavailing. Wherever they went, the asthma redeveloped in November and ended in May.
Inquiry about the father disclosed that he had continued farming but in a peculiar part-time fashion. He planted the crops, cultivated them, and harvested them. This done, he turned the entire management over to an employee and spent the winter in a somewhat distant city in ease and comfort. With the advent of spring, he returned to the farm and worked hard until the last harvest was completed. Immediate inquiry about the frequency of her father's letters disclosed that in the summer he was always too busy to write and that he reserved his weekly letter-writing for the leisure of his winter life. The patient failed to recognize any possible connection between her asthma and her father's weekly letters.

She was asked if she were willing to have the writer prove definitely that her asthma was either psychogenic or organic. She emphatically replied that, in either case, she would be tremendously relieved, but added that it was unquestionably organic since it had begun with a cold, had been aggravated by the atmospheric impurities of the mining town, and only occurred during cold weather. Furthermore it always disappeared with the advent of warm weather. Also, it had to be organic, since in ten years she had never had a single attack in the summer, and she was the same person psychologically in both cold and warm weather. She was told that hypnosis would be useful as a diagnostic aid, and she consented readily to be hypnotized.

She proved to be an excellent subject, developing a deep trance easily. She was given rapid training in posthypnotic suggestions. She was then instructed during trance that at a specified cue (when the writer tapped his pencil three times) she would be given a memory task, a most important memory task, which would be defined at the proper time. She agreed to follow all instruction and, also, to go to sleep whenever another specific cue was given (when his cigarette lighter was dropped into his ashtray). She was awakened with a comprehensive amnesia for the trance experience. After a few casual remarks, further inquiry was made about the possibility of summer attacks of asthma. She was most positive in her denials.

Mention was made that the clock indicated the time as 2:17 P.M., and she was reminded that it was a very hot July 8th in Phoenix, Arizona. Then she was asked if she thought she could develop a severe attack of asthma exactly at 2:37 P.M. She declared the idea to be most ridiculous. She was assured that if her asthma were psychogenic, it was both possible and probable. However, if it were organic, she need have no fears. Somewhat puzzled, she waited for further elaboration, but the writer merely directed her attention silently to the clock.

At 2:25 P.M. she was asked if she felt comfortable. She replied that she was merely puzzled, because watching a clock certainly could do nothing to her. At 2:34 the comment was offered that only three minutes remained before she would or would not develop an asthmatic attack. She only smiled in reply. At 2:37 she
turned expectantly to the writer. Immediately the writer tapped his pencil on the
table three times (this was a cue for the posthypnotic suggestion to remember)
and said, Remember fully, completely, just as if you were reading it, the content
of any letter your father has written to you. A violent asthmatic attack ensued.

During it she was told, The day is hot. It's the 8th of July. It is summertime.
There are no fumes or dust or cold. You have not a recent lung infection. You are
having a severe asthmatic attack. It began at 2:37, twenty minutes after I said it
would, if it were psychogenic. It will stop when I say so. It is psychogenic! Shall
I remove it at 2:45 or 2:47, because I can. Do you see this cigarette lighter? That's
all it is. It is neither medicine nor magic. But when I do a certain thing with it,
your asthma will

disappear. Watch it carefully. Be sure you know, really know, that your asthma is
psychogenic. Now watch. Immediately the lighter was dropped into an ashtray. A
deep trance state ensued, and she was told to sleep deeply, comfortably, and to
awaken free of her asthma and with a full recollection of everything. This she
was then to relate to the writer.

She responded fully, and upon awakening she began to verbalize freely and
comprehendingly. Her recollections may be summarized as follows: Her mother
had long been bedridden because of paralysis, cardiac disease, and accompanying
respiratory distress. Her father had never treated her mother or her very kindly,
and he was tremendously guilt-ridden. Shortly before her first attack of asthma,
she had received a letter from a friend, hinting strongly about her father's undue
interest in a woman known to be promiscuous. Her asthmatic attack followed her
father's first letter. Thereafter she dreaded from week to week his next letter, but
felt duty-bound to answer each letter. His return to the farm each spring gave her
a sense of relief because she knew he would be too busy to engage in undesirable
activities or to write to her.

When she had completed her summation, she was asked what she intended to do.
Her reply was that she would think matters over thoroughly and decide on a
course of action. Subsequent reports disclosed that she had visited her father,
discussed the situation with him, engaged a lawyer, and intimidated her father
into executing legal instruments ensuring her control over and eventual
ownership of her share of the farm, and giving him his freedom to do as he
wished with his share. Since then the father has handled her property well, but he
has been slowly dissipating his share.

He still writes regularly each winter, but the patient has had no further asthmatic
attacks since the one induced in the office on July 8, 1949. She was last seen
casually in late June 1954.
There is an initial period during which the patient consults a number of physicians for the organic treatment of the problem. Since this repeatedly fails or results in only short-term placebo effects, the patient is reluctantly told that it must be psychological.

The patient arrives at the psychotherapist's office with much inner confusion and tension, still protesting that it cannot be psychological. In spite of these protests confusion is an indication that the patient's original frame of reference of the organic nature of the problem has been shaken and depotentiated at least in part. Confusion is a sign of being lost between having to give up the organic framework and not yet really understanding the new psychological framework. Confusion is thus an important psychological prerequisite for therapeutic change; it signals patient readiness for change even though they do not always recognize it.

The regular association between the patient's symptoms and her father's letters. When the patient failed to recognize any possible connection between her asthma and her father's letters, the senior author recognized a possible block or dissociation that could be a factor in the formation of the psychosomatic symptom. At this point, when all the facts are clarified, some patients do recognize the connection. They gain insights and work them through with the therapist's help to a final resolution of the problem. No hypnotherapeutic intervention is necessary. But otherwise hypnotherapeutic intervention follows thusly:

The senior author approaches these unrecognized sources of the symptom with a hypnotic demonstration of the psychological control of the asthma. He first trains her to experience trance effects and to follow posthypnotic suggestions. As is typical of his general approach to symptom problems he (2) demonstrates with her own experience how her unconscious can control her behavior and thereby indicates that the locus of therapeutic change will be within her unconscious.

During trance she is given careful suggestions to respond with an important memory when given a specific cue. She is not told what the memory is to be about, since that might only arouse further conscious resistance. Her unconscious, however, will probably respond to the obvious implication that it will have something to do with her asthma by activating its relevant unconscious search programs in that area. Implication is a most effective means of (3) evoking searches and processes on an unconscious level that can be precipitated into consciousness when given a specific cue.

Before proceeding the senior author added a safety measure. After giving her training in following posthypnotic suggestions, he instructs her to go to sleep - that is, to enter trance - whenever a specific cue is given. Thus any behavior or
symptomatic processes that threaten to get out of hand could be immediately attenuated by having her enter trance.

He then gives her unconscious time, from 2:17 P.M. to 2:37, to align itself to produce an asthmatic attack on cue if the asthma is in fact psychogenic. The unconscious does not work by magic. Time is required for it to do its own work. The senior author judged it would take at least twenty minutes to work through the inhibiting limitations of the patient's conscious sets, which declared the idea to be most ridiculous. An expectation was given for an asthmatic attack at 2:37.

The senior author then allows expectancy and tension to build for twenty minutes. At the appointed time, 2:37, she turns (1) expectantly to him; her readiness is apparent. He then gives the expected posthypnotic cue (tapping his pencil three times) and gives her the critical memory task of recalling the content of any letter your father has written to you. A violent psychogenic asthmatic attack ensues. She is thus precipitated into a (2) state of shock during which her habitual mental frameworks and patterns of defense are momentarily depotentiated.

During this critical period the senior author simply states all the obvious facts regarding the psychogenic nature of her asthma. When one's habitual mental frameworks (the generalized reality orientation) are so shaken by (3) shock and surprise, one tends to grasp onto any suggestions or belief system that will reestablish security and comfort. The facts about the psychogenic nature of her asthma are then reinforced through the security and comfort that follow from the posthypnotic cue (lighter-ashtray) to enter a deep and comfortable trance state from which she can awaken free from her asthma with a full recognition of everything. The senior author thereby (4) demonstrates her release from symptomatic behavior while opening the possibility of (5) her gaining insight into the sources and psychodynamics of her problem. She gains these insights and makes her own plans about how to settle her problems.

Symptom Resolution with Catharsis Facilitating Personality Maturation: An Authoritarian Approach

This case illustrates how hypnosis can be used effectively even when the patient is a difficult and unresponsive hypnotic subject with whom only a light trance state is possible. Three two-hour sessions were required to achieve even that light trance, but it was enough to present the basic suggestion: Your unconscious will know what to do and how to do it. You will absolutely yield to that need and give full expression to me. When finally that has been done completely, you can then recover from your present problem. Although the senior author could not evoke any of the classical hypnotic phenomena with this patient, the above suggestion was enough to assign the locus of therapeutic change to his unconscious. The...
patient's unconscious was given time to incubate until the next session, when his usual conscious frameworks were suddenly depotentiated with the shockingly authoritarian demand to, Shut up with your conscious mind and its foolish requests for medicine, and let your unconscious mind attend to its task!

That was enough to precipitate an unusually violent and prolonged catharsis that proved to be the vehicle for the resolution of the patient's psychosomatic symptom and a striking change and maturation of the total personality. The periods of the patient's intense catharsis could be looked upon as altered states in which personality reorganization could take place. But scientific conceptions cannot do justice to this happening; it is essentially a love story. It is presented as written by the senior author more than a generation ago

None of Your Lip!

Pietro, in his mid-twenties, had been forced to give up his position in a symphony orchestra because of an inexplicable swollen lower lip. This had developed suddenly after an altercation with the orchestra conductor. The swelling was so severe that his lip was a full two inches thick. During the three years that this swelling had persisted,

he had been treated by more than one hundred doctors, and the measures employed ranged from physiotherapy, hot compresses, medication, and bed rest to infrared and X-ray therapy. No benefit was derived. Discovered during sessions that his orchestra conductor had repeatedly said 'No lip from you'...with each statement swelling had increased...at same time he wanted to marry woman his racist father didn't want him to...it had been his father's idea for him to become flutist...and in all things, his father never 'took any lip' from him or his siblings...father went to extreme measures since child to achieve...and had achieved desired outcome of father, but father wanted him to marry, and only an Italian girl ... very dictatorial but otherwise fair/loving father...too 4 sessions to get this info...took 3 further sessions of at least 2 hours each to achieve even light trance, after client demanded they move onto trance therapy, and stop digging up past... after three sessions of two or more hours' duration, a light trance was induced...This was utilized to suggest, as emphatically and as authoritatively as possible, that his swollen lip was of psychological origin, that it could be cured, that it was an external manifestation of a profound and compelling need for his unconscious mind to manifest and to express behavior which had been repressed, ignored, overlooked, and consciously forbidden over the years. He was told that his unconscious must express itself completely, however terrifying or irrational such expression might seem. Furthermore, his unconscious would know what to do and how to do it, and he would absolutely yield to that need and give full expression to the writer. When that had been done completely, he could then recover from his present problem. These posthypnotic
suggestions were given with much emphasis and repetition and in the most authoritative, dictatorial manner possible. At the close of the session he was curtly told to ask no questions, to go home, to let his unconscious mind prepare for its task, and then, at the next appointment, he was to appear promptly at the exact hour and to let his unconscious begin its task without delay or any conscious interference. This extremely authoritarian approach was deemed appropriate because it utilized the patient's previous life experience and current expectation that effective guidance always came in an authoritarian form. The senior author was simply utilizing his authoritarian expectation.

At the next interview he entered the office as instructed but immediately asked for some medicine for his lip. He was told emphatically, Shut up with your conscious mind and its foolish requests for medicine, and let your unconscious mind attend to its task! His reaction was one of intense, violent anger. He spent all his time insulting and threatening Erickson (as proxy for his own father, for whom he had so much not-conscious, repressed, unexpressed, pent up rage/fury. Finally one day, near the end of the hour, he made the breakthrough that he was talking to Erickson as if he was his father...Your unconscious has been talking to me, saying things that would help you to understand your feelings toward your father. Now that you have said all the things that have piled up in you for years and years, your lip can get well. You have given me all the lip you did not ever dare to give anyone, and which you kept to yourself. You are free, your lip will now heal. The only thing you need to do is to look at your father and see him as one man looking at another. You are grown up now. Tell your father simply what you want and feel and wish, limiting yourself only to those things he can understand. Things he can't understand do not need to be said. The client told his father he was now a grown man, and would no longer take orders from him, and that his lip would be healed soon. His father accepted this. Shook his hand saying 'I forgot you are a grown man, please forgive me’ i.e client had been physically ‘storing’ all the lip he had ever wanted to express literally...he’d expressed it towards Erickson by proxy...violently, nastily, racically, viciously i.e projection of all he wanted to express to own father onto Erickson i.e typical ‘scapegoat’ of racism even attacking Erickson for being of ‘Norse’ i.e ‘Viking’ descent...was really nasty and personal and violent in attacks...all he could never express to authoritarian father whom he loved, but also hated e.g preventing marrying girl loved was final ‘control’ he couldn’t bear...and then orchestra conductor had flipped switch ‘I’m not taking any lip from you’...i.e another authoritarian figure...within month lip was normal again...

**a classical hand levitation approach to trance induction can be used as a rich context for introducing many therapeutic suggestions** in a symbolic as well as a direct form. Therapeutic suggestions are introduced during those first moments
of initiating trance experience when patients' attention and expectancy are frequently at their highest pitch. In this unusually rapid approach the patients receive therapeutic suggestions before they realize what is happening. Their consciousness can be so fixated on the novel experience of hand levitation that they do not notice the therapeutic suggestions. The therapeutic suggestions are, therefore, received by the unconscious in a way that bypass some of the patients' conscious, habitual attitudes and learned limitations.

If we translate the terms conscious and unconscious into dominant and nondominant hemispheres, we may have the neuropsychological basis for describing a new hypnotherapeutic approach. Occupying the dominant hemisphere with a trance induction such as hand levitation which can be easily lateralized can release the nondominant hemisphere to receive therapeutic suggestions phrased in the symbolic language of the nondominant hemisphere. Part Two of this session is a demonstration of this approach which utilizes hemispheric interaction in trance induction and suggestion in an unusually clear form.

Seeds found with Egyptian mummies sprouted 5000 years after interred! Unconscious processes within the body will regulate penis erections just as they do other functions once he gives up the limiting and inhibiting effects of his conscious worry about it. He approaches trance with a very high expectation that his now very limited problem can be resolved with ease.

Anorexia Nervosa Paradox and Double Bind [The senior author originally wrote this case; the junior author has added commentaries for its current publication. ]

E: In all cases I have known of anorexia nervosa in children (about fifty, and all girls from ages nine to fifteen) there has always been a peculiar emotional relationship between the parents and the patient. It is one of concealed, repressed anger, resentment, and extreme frustration together with anxiety, concern, and fear on the part of the parents. For the patient the emotional behavior is most difficult to describe. There appears to be an underlying state of fear of all emotional involvement manifested by a submissive passivity, total lack of self-concern, the rejection of food to the point of death by starvation, a concealed fear of the parents, particularly of the mother, and repression of hunger feelings and all autocrITICAL faculties. Underlying all of this is a vaguely conceptualized religiosity suggestive of a poorly formed and often not verbalized identification with a messiah or a messianic purpose.

Tell mother politely and emphatically to 'shut up and let her daughter answer the questions'…I then proceeded to get general information from the girl. Then I told her most emphatically that her parents sent her to me to have me tell her to eat,
but I had no intention of doing so; eating was her own problem, and she could do as she pleased … In this initial approach you immediately establish rapport with the patient by telling her mother to shut up. You then facilitate the developing of a yes set by adapting yourself to the patient's own frame of reference, as you tell her you have no intention of telling her to eat. You then place the locus of therapeutic control within the patient by saying that eating was her own problem and she could do as she pleased. You apparently allow the patient to keep her resistances and you see to it that she has no need to defend herself against you. There is a paradox in all this and a subtle double bind. The paradox is that you are apparently on her side and doing the opposite of what you're supposed to be doing - making her eat. The subtle double bind is that by the very approach of not trying to control her behavior, you are actually establishing a rapport and relationship that will eventually bind her to therapeutic work you will soon suggest. The paradox and double bind together undoubtedly have the effect of depotentiating some of the conscious frames of reference so that she is now more available for whatever you suggest … I then pointed out that as a medical man I could give proper and competent advice about oral hygiene. I explained to the girl that regardless of whether one eats or does not eat, using the toothbrush on the teeth and on the gums is important, and that in a proper method of oral hygiene you use a toothpaste with fluoride with the understanding that there should never be swallowing of any of the paste. After the child agreed to this, I pointed out that there was further oral hygiene which, as a medical man, I was entitled to prescribe. This was the use of a mouthwash to be used before brushing the teeth to loosen the detritus on the teeth, and the brushing of the teeth should be followed by a second application of mouthwash with absolute instructions that there should be no swallowing of any of the mouthwash. I exacted a promise from the child that my instructions about oral hygiene would be followed. 

R: You now further detract her conscious frames of references by this indirect approach of focusing attention on what is actually an irrelevant problem - oral hygiene. You utilize her character structure of passive obedience to get her to follow some rather absurd and practically impossible suggestions

**Depotentiating a Messianic Complex**

E: In patients with anorexia nervosa, the messianic complex and their own religious demands compel them to keep the promises made. I prescribed as a mouthwash cod liver oil, emphasizing that not a single drop be swallowed. The child rebelled by whimpering at night and keeping the mother awake. After this happened a few times, I delivered a dispassionate sermon on the wrongness of offenses against others. I described it as bad behavior requiring punishment, and since the bad behavior was not against me, but against the mother - the mother being the offended person - she had the right to prescribe the punishment. The child agreed and privately I told the mother that nocturnal whimpering is not
desirable, and might be punished in any way that she chose so long as it was reasonable. The mother decided that scrambled eggs could be used as punishment. That removed food from the area of nonacceptability of the self-imposed ritual of rejection of food. Also, her body received nourishment, which, coupled with the taste of the cod liver oil, created a disruptive situation for her self-imposed passive self-destruction. Her passivity compelled her to accept food as punishment, and her messianic complex also required her to do so. Additionally, the bad taste of the cod liver oil aroused strong emotions of revulsion with consequent temptation to avoid using it, something her messianic complex and passivity precluded. Her only recourse was to rationalize or to forget something that would give her both satisfaction and guilt, all of which were destructive of her passivity and messianic complex.

She was queried just once about having secured the cod liver oil and her use of it. The mother had been instructed to oversee only the first occasion of its use, and I asked about it only once. The mother was instructed to remind the girl only once, and that was on the first overnight sightseeing trip in Arizona, to be sure to pack her cod liver oil, that it should not be forgotten for the trip.

Near the end of the treatment private inquiry of the mother disclosed that she had reluctantly purchased, in the company of her daughter, only a small bottle of cod liver oil (under 16 ounces), that she had become nauseated watching her daughter's first use of it, and that after the first two days the content level of the bottle changed very little; sometime later the bottle disappeared.

R: You accomplished a number of fascinating psychodynamic alterations at this point. Your practically impossible demand of using cod liver oil was accepted by her because her passive, messianic complex required that she accept unpleasant suggestions to assuage her guilt. Yet, since she could not follow the cod liver oil suggestion, the egosyntonic aspects of the messianic complex are shattered (Rossi, 1973b). She can only follow the cod liver oil suggestions minimally, and then apparently she engages in an outright deceit by making the bottle of cod liver oil disappear. In doing this she has to give up her messianic all good and obedient identification and begin to mobilize her own will to survive through different patterns of behavior. The impossible task thus shattered her messianic complex (depotentiated that frame of reference) and initiated her into an unconscious search for new and potentially therapeutic responses. The other marvelous twist in all this is that you manage to keep the mother as the dispenser of punishment - you still remain the patient's sympathetic supporter. She has been disobedient and requires punishment. Food, which was formerly a reward, is now changed into a punishment that she has to accept. This is all so difficult to follow that I almost get vertigo even trying to untangle the psychodynamics in an objective fashion. I can imagine how confused and helpless the patient's conscious mind must have felt trying to sort it all out. Obviously it could not, so
she was simply open to follow your suggestions. I know of no other way of treating anorexia nervosa patients satisfactorily and rapidly. My first measure, of course, is to make clear to the mother or father, or both, that the therapy is going to be socially oriented, that the emotional and social needs will be the prime consideration, and that while I may be seemingly offensive, there is a worthy principle involved.

To initiate this type of therapy you have to be yourself as a person. You cannot imitate somebody else, but you have to do it in your own way.

You're troubled by this itch. Naturally I don't know exactly what it is. I'm certain that you want your itch for accomplishment to be kept. Your itch to do things can be kept. In fact, there are a number of itches that you want to keep. Any itch that you want to keep - be sure to keep it! Also let's be sure that you get rid of any itch you are willing to lose but no more than you are willing to lose.

R: What itches could he possibly want to keep?

E: An itch for political power, political position, for wealth, for sex! Itch is a folk word with many connotations about human desires and motivations.

R: I see! If I try to take away his itch, it could be taking away an important aspect of his personality. He is a dynamo who works sixteen hours a day!

E: He has a big itch! Never forget folk language! You should always recognize how the folk language is related to symptom formation.

R: That's fascinating. He was actually referred to me by his girlfriend, whom I'm also treating for a similar problem of itching. She is a dynamo type also.

E: She must be another itch he has.

R: It may be that the folk language of itch is treated literally by the right hemisphere, which then translates it into a psychosomatic process.

A discussion of hypnosis for children was presented, and then the senior author turned to her to induce hypnosis. The technique employed was exceedingly simple. The lecture and the audience provided a background of prestige for her. She was told to extend her left arm at shoulder level, with a slight dorsiflexion of her hand so that she could see her thumbnail. She was instructed to fixate her gaze on it, to see it seem to get bigger and bigger until it filled her visual field, and then, as it grew in size, she was to bend her elbow very, very slowly, bringing her hand ever closer to her face. As her hand came closer and closer, she was progressively to go into a deeper and deeper sleep until finally, when her hand or fingers touched any part of her face, she was to be completely sound
asleep with her eyes open, seeing nothing, feeling nothing, hearing nothing, except the senior author.

Within a few minutes she developed a profound somnambulistic trance state, and the various phenomena of deep hypnosis were systematically demonstrated.

During the entire time after first seeing the girl, before the luncheon and during the lecture, the senior author had been frantically searching mentally for some kind of a therapeutic approach. Since the month was September, the thought of Thanksgiving, Christmas, and New Year's Day came to mind, and these suggested the possibility of a birthday. Hence, as she sat before the audience in a deep trance, she was asked if she would be willing to tell the senior author her birthday. She nodded her head affirmatively and said, Yes. She was asked to name her birthday, and she gave the date as December 29th. This date immediately suggested a feasible plan.

The simple statement was made that while she might have hopes, she did not, at so early a time as September, know what birthday gifts she would receive. She could hope and hope, it was conceded, but she could not possibly know what her birthday presents really would be. Yet there could be something awfully nice, just wonderful, something that she wanted very badly, something that would be very special, even too important for her as a person to be just a Christmas gift. It would have to be a birthday gift. Of course she might not get it because she would have to do a lot of awful good thinking so she would know what she surely wanted most of all. And what might this present really be? It might be something she could do herself, that she could learn, like the best marks of all the students in her school, or learning so slowly and carefully to knit a whole dress for herself, or how to sew a complete dress for herself. But it could be any special, special thing that she wanted, wanted awful bad. Certainly the senior author couldn't know - in fact, all that he knew was that he was very certain that her birthday would be her eleventh and that she would be leaving the little girls and becoming the kind of a big girl she wanted to be. Then, under the guise of merely presenting to the audience the topics of hypnotic amnesia and posthypnotic suggestions, a series of statements was made to the effect that posthypnotic suggestions, if there were a purpose to be served, could be given to a subject to effect a total amnesia for all trance events and experiences; that one could tell the subject who wished to achieve some particular goal of psychological or emotional importance that there could be an ever-increasing feeling of conviction, of certainty that the desired achievement would come to pass; that day by day, week after week, there could be a mounting feeling of unidentified expectancy, a feeling of intense, pleasurable tension to the effect that some change was slowly, progressively taking place within the self which would
become known and fully realized at any chosen time or on the occasion of some special event. All of these statements were presented as seemingly explanatory remarks to the audience, but to the subject's ears they were posthypnotic suggestions. Yet even her father, a professional man, and her mother, a college graduate, sitting in the audience expectantly awaiting some definite therapeutic suggestions, did not grasp the pointedness for their daughter of what was being said. After the lecture, with much concern, the father - in the absence of his daughter, who had been rather quickly dismissed following the remarks on amnesia and posthypnotic suggestion and who had left the auditorium in the company of her mother - asked worriedly when the senior author proposed to do the therapy. He was urgently admonished that the therapy had been done, that he must warn his wife not to discuss anything at all about the lecture or the meeting of the senior author by the daughter. Instead they were to follow a program of silent, watchful waiting. As was learned later, one month after her birthday, the girl gave her father permission to write to the senior author to tell him that she was no longer afraid, that after the lecture she got a funny feeling every time she was afraid that something nice was going to happen to her. This feeling grew progressively stronger until her birthday on which day she awakened early and aroused the entire household with almost hysterical shouts of It's gone, it's gone, whereupon she had put herself to test in a great variety of ways. He went on to explain that she had forbidden him to write the news to the senior author but that when a month had elapsed, she gave permission but forbade him to give any description of her problem. She insisted that, since it was over with, all gone, there was no reason even to think about it, that the only important item of news was the fact of her recovery. He pleaded with her to let him write more but she was adamant until he raised the question of telling the senior author a bit about her behavior from September to her birthday. After considerable thought she agreed but stated she would want to see the account before it was mailed. He began with the above account, stating that he and his wife had noted a slow progressive change in the girl's behavior. Her depressive behavior, her outbursts of anger, her general impatience and her tense anxieties progressively diminished. She began crying less until by December she had ceased entirely to cry at frequent unexpected intervals. Her extreme caution about clothes diminished and she began running to the door every time the doorbell rang or the postman came as if she expected something. They also noted that more and more frequently she would pick up chair cushions and look under them, feel behind the books in the bookcase as if looking for something. Whenever she was asked by her siblings what she was doing, she would answer, Oh nothing, I just thought maybe something was there. Her school behavior also changed progressively. She no longer had violent emotional outbursts if the other children accidentally violated her taboos - they had learned to avoid her through distressing experience ever since the sudden onset of her trouble, which had been in April of the year the senior author saw her.
To uncover a memory and return it to you is not likely to occur all at once. What is likely to happen is that you'll remember a little bit here and next week a little bit there. The following week some more of the first part. The following week it slowly builds up in a regular fashion. And then some day the whole thing will straighten out.

**Indirect Hypnotic Forms Preparing for Trance Induction**

E: All right, how do you think I will induce a trance in you?

F: Well, I know there is a way by counting one to ten, I believe. I know very little about it.

R: You begin this trance induction with an indirect form of suggestion: the question, how do you think I will induce a trance in you? This question already implies that you will induce trance; it's now only a question of how. The question tends to evoke whatever understanding she may have of trance induction so you could possibly utilize it. The question also respects her life experience and individuality; she has an opportunity to express her knowledge and possible preferences. As such, this question tends to mobilize her good will and an acceptance set for whatever follows. Trance

Trance Induction via not Knowing and not Doing: The Early Learning Set

Induction: Unconscious Conditioning

E: Will you sit back in your chair with your feet flat on the floor and your hands on your thighs. The hands not touching each other, and just look at one single spot here. You don't need to talk. You don't need to move. You don't even need to listen to me. Your unconscious mind is close enough to me to hear me. And that's the only important thing.

Now there are various changes that take place in you. Your heart is beating at a different rate. Your breathing has changed. Your reflexes have altered. And you are doing the same thing now that you did when you first went to school. You looked at letters of the alphabet. They seemed impossible to learn. But you did learn them. And you developed a mental image of the letters and the numerals. And you developed a mental image of each of them in various forms that stayed with you for the rest of your life. You have looked at that one spot long enough so you have a mental image, and you do not know where it is in your mind. You can close your eyes N...O...W

When she responds initially by sitting back in her chair with feet flat on the floor, she is saying to herself that she will go into trance. These initial adjustments allow her to make that important suggestion to herself rather than my telling her.
It's always much better to have patients make the important suggestions to themselves.

R: You now embark upon your favorite form of trance induction via eye fixation and a number of indirect hypnotic forms that are effective precisely because no one could really argue with anything you say. The patient is lulled into not knowing and not doing (need not talk, move, or even listen) to depotentiate her conscious sets. A dissociation is facilitated by your emphasis on her unconscious functioning as a subtle form of the conscious-unconscious double bind.

E: Not needing to listen to me is an indirect way of emphasizing that it's her own personal experience, not mine.

R: You then ratify the process of trance experience as an altered state by pointing out how physiological changes have taken place (heartbeat, breathing, and reflexes). You conclude this initial stage of trance induction with the early learning set (Erickson, Rossi, and Rossi, 1976) that tends to evoke ideodynamic aspects of early childhood learning, when so much was absorbed on an autonomous or unconscious level. These early learning patterns may now be activated for learning trance experience, which must also proceed on as much of an autonomous level as possible. You then precipitate eye closure with the direct suggestion to close her eyes N . . . O . . . W said in a slow but quietly emphatic and insistent manner. This particular vocal emphasis now acquires the value of an unconscious conditioned stimulus. The next time you use that low tone of voice with similar emphasis and insistence, she will tend to enter trance but not really know why. If you later use the word now to awaken her, you will use a clear, quick, bright, and louder tone of voice that will acquire the value of a conditioned stimulus for awakening.

Trance Deepening via Contingency Suggestion: Pause as an Indirect Suggestion

E: And with each breath you go deeper and sounder in the deep hypnotic sleep.

[Pause]

Now you know why you want to go into a trance. You do not fully understand why some of that memory escaped you.

You are using a contingency suggestion when you now facilitate trance-deepening by associating deeper trance with an inevitable behavior - breathing.

E: I pause after telling her to go deeper and sounder" because that does take time. The pause itself is an indirect suggestion to do that now.
R: You then further motivate her for deepening trance by reminding her of her purpose in seeking hypnosis. You thus utilize her own motivation for deepening trance.

**An Associational Network Facilitating an Unconscious Search for Lost Memories**

E: But the mental images that you formed in kindergarten are still within your mind. Things long forgotten still have their mental images in your mind. You can lose learnings by the loss of brain cells. But you haven't lost the brain cells concerned with your delivery.

[Pause]

And those mental images belong to you, and you can enjoy getting them back. And I think the best way of getting them back is doing so by getting one small one and being completely delighted by it. Not asking for more, but just enjoying the pleasure and delight of that one little memory. And the next thing you know you'll get another little memory that will give you a great deal of pleasure and delight. And doing it this way you will build up your pleasure and comfort and ease very rapidly. Not rapidly in time but rapidly in force, in strength. And then some day you'll realize you really do have all of it. And when one uses the unconscious mind, one does it at the rate of speed that belongs to the unconscious. Your unconscious knows how fast it can work, how fast your conscious mind works. And your unconscious will know how to feed that memory back to you.

You emphasize the separation of conscious and unconscious to make sure she leaves it to the unconscious rather than try to work on it with the more limited means of her conscious processes. That is the essence of your hypnotic approach: depotentiating the conscious mind's limited means and reinforcing unconscious processes with their greater potentialities.

Hypnosis is not a means of directly programming people to do things in one way. With billions of neurological connections in the mind it is terribly presumptuous to try to program people.

E: It is a very uninformed way.

R: We are allowing the infinite diversity of the unconscious to come forth rather than trying to program one idiotic idea or point of view we may have. There are infinite patterns of learning and ways of doing things. Our approach helps people unlearn their learned limitations….
be willing to let your unconscious mind return that memory to you in the way it knows you should get it back. There is no hurry. But there is a pleasure awaiting you.

You continually suggest that pleasure and enjoyment will accompany the unconscious search and processes. This is in part a truism and in part a means of motivating her further. It would be a significant research problem to determine if, in fact, such suggestions for pleasure are ideodynamically mediating further reinforcement by activating the positive reward centers of the limbic system.

If there are any resistances or hidden trauma associated with these memories, I'm using a safety factor by suggesting that her unconscious will return that memory to you in the way it knows you should get it back. I then balance a negative and a positive in the next suggestion, There is no hurry . . . there is a pleasure awaiting you. The negative emphasizes the positive

**Separating Conscious and Unconscious Processes: Trance Awakening and Ratification: Training in Posthypnotic Suggestion**

E: I'm going to have you awaken shortly for a lesson in enjoying what your unconscious can do for you. When I awaken you, I want you to have a very profound feeling of comfort, as if you had been sleeping for eight hours. I want you to enjoy that.

[Pause]

Now you can start thinking about counting backward from twenty to one, waking up one-twentieth of the way at each count. And you can begin counting backward from twenty to one, awakening at one. And begin the counting now!

[Pause as Mrs. F silently counts to herself and opens her eyes and begins body reorientation in twenty seconds]

F: Hi! How was I? Oh, I felt like I went to sleep! You know? Like I went to sleep. That was strange.

E: A beautiful demonstration.

F: Did I go into a trance like I should have?

E: How do you feel?

F: It was sleep yet it wasn't sleep. It was like a borderline to sleep.

E: How do you feel physically now?
F: Much more relaxed. Much more at peace. I feel much more with it. I heard your voice, and it became a little fainter, but it was there in the background.

E: But you ceased to hear individual words and sentences?

F: Yes, just a voice.

E: Did you hear my cassette recorder start and stop?

F: No, I did not hear any other thing.

The dissociation wherein F could hear the therapist's voice in the background but not the individual words and sentences is very characteristic of trance.

E: My voice in the background is where I want it to be. It's in the background of her experience. Her own experience is in the focus of attention.

R: You evoke the patients' own inner experiences as the therapeutic factor so that they don't hear irrelevant things (such as the cassette recorder). This is the opposite of so many therapists who insist that the patients focus on the therapist's words and views.

E: I asked her, How do you feel? because I did not want her thinking. You are always careful to avoid anything that would cause disbelief and a loss of faith in the validity of whatever you say

Close your eyes and go to sleep. And you can really feel pleased, and happy, and rested.

You now give a very open-ended posthypnotic suggestion to leave her hand there if she wishes. This open-ended approach is fail-safe and tends to evoke an acceptance set by allowing the patient to express her own individuality. It is also a means of further assessing to what degree she is willing and ready to experience further hypnotic phenomena.

You never waste a good skill on unimportant things. You use it only on important things. You would not use hypnotic anesthesia for a pin-prick, but you would use it for childbirth, surgery, for the pain of a broken leg. Now do you want to see what you have learned? You respond to her request for what amounts to autohypnotic training by first cautioning her to use trance only on important things. Why? ...E: I'm forbidding any unimportant experimentation. The important thing is to get her memory back - not to see if she can levitate her hand. Trivial experimentation tends to blur the distinction between the trance and awake state and lessen the dissociation between them, which in turn lessens the effectiveness of trance.
Above all, hypnosis is experiential learning rather than intellectual or abstract knowing. It is one of the most common misconceptions of hypnosis that you lose all your control and faculties. Hypnosis is actually a very selective form of attention. R: In one of your earliest research programs you demonstrated that it was not possible to force people into destructive behavior with hypnosis (Erickson, 1932). Do you still believe that is so? Does the unconscious always protect the person? E: Yes, but often in ways that the conscious mind does not understand.

**childbirth with hypnosis …caudal anesthesia…** The general discussion about childbirth seems innocent enough, but it's actually a means of structuring a new mental framework through indirect ideodynamic focusing; by discussing childbirth in the most general terms her unconscious will automatically initiate many ideodynamic processes she actually experienced in her recent childbirth experience. These include, of course, a caudal anesthesia induced by chemical means. Her unconscious has a record of this experience, and when you ask her the question, did you know that you could produce your own caudal N ... O ... W? you are using two indirect hypnotic forms to induce trance and initiate an unconscious search and process that may help her reexperience her caudal anesthesia as a hypnotic response: 1) N ... O ... W spoken in the slow, low, insistent manner tends to reinduce trance as an unconsciously conditioned response; 2) the question initiates the unconscious search and processes for the ideodynamic memories of her chemical caudal anesthesia. This all happens automatically (hypnotically) even though her mind doubts, that would take a lot more time though, wouldn't it? E: You did not recognize the element of surprise as a third factor

**Surprise and Vocal Cues for Reinforcing Anesthesia**

E: Now you listen to me because you are going to be very surprised because you can't stand up.

[Mrs. F looks a bit startled, and her body remains perfectly still for about fifteen seconds as the senior author continues.]

E: You don't know how to stand up, do you?

F: Well I did when I came in here.

E: You've got a caudal!

R: Since she did express some doubt, you then reinforce your suggestions with more emphasis on the surprise aspect of unconscious functioning (particularly since she earlier appeared to like this surprise aspect), and your slow, low,
insistent vocal cues (in italics) which are by now well associated with hypnotic responsiveness.

**Removal and Ratification of Hypnotic Response**

[Pause as Mrs. F remains motionless for another fifteen seconds, then Erickson removes it as follows.]

E: Now you can move!

F: [She looks a bit incredulous and finally shifts her lower body a little.] Is this a joke or is this real? Because with the caudal the only thing I could move was my big toe.

E: That's right. You see, I know what a caudal is, and when I give a hypnotic suggestion that you cannot stand up, you lose the ability to use your leg muscles.

F: Oh, boy! What an education I've gotten today!

R: You let her remain immobile for only eighteen seconds. Is that because you sensed she doubted her hypnotic response and may have broken out of it by testing it too much?

E: You develop a sense for these things. I do know that I wanted to stay away from any dispute about her big toe.

**Protecting and Further Ratifying Hypnotic Responsiveness: Unrecognized Posthypnotic Suggestion Via Generalization**

E: Now don't try to explain your learnings to anybody. They belong to you and they are special, and when your child starts growing up and hurts his arm, you can remember how I told you gently, You can't stand up. And you couldn't. You can tell your child he is going to feel all right now. You say it and you mean it. Your sincerity and your expectancy will cause that child to accept the suggestion, and his arm won't hurt. [The senior author now tells a story about how he taught a physician to use the surprise technique of anesthesia.] A farmer came into the emergency room with a serious wound, shouting over and over in a state of panic, Doctor, you've got to help me! Doctor, you've got to help! The nurse tried to get the farmer seated, but he just kept pacing back and forth and shouting. Finally the doctor said, Shut up! Sit down! Stop hurting! I had told the doctor he could do that, and he tried it out. Ordinarily you don't talk to a patient that way. The farmer was so surprised that he did sit down and stopped hurting. That is the surprise technique.
She remembers 6:40 very well, and that can serve as a foundation for the recall of more memories. It’s a marker around which she can organize her memories. When she lost her memories, she never really tried to restructure her recall as I’m now suggesting. Slowly - this has been a very slow process like you said it would be, it wasn’t overnight. Very slowly the whole sequence of the delivery came more and more to the fore of my conscious mind. It was very slow over quite a few days. A little more sharper and a little more sharper. And it all seemed to hinge on two days when my mind decided to pull out certain memories or thoughts somehow.

The senior author recounts clinical examples of how the natural process of personality maturation can be blocked by traumatic experiences that result in amnesias, since the life experience has not been integrated. The deeper meaning of her request to recover her lost memories is now evident: These memories are important for her current and future personality growth and maturation.

DO YOU WANT TO GO INTO A TRANCE TODAY?
F: Yes.
E: N...O...W?
F: Okay.

Self-Protective Mechanisms of the Unconscious

E: But I do want you to appreciate the ability of your unconscious mind.

[Pause]

The ability of your unconscious mind to perceive things. And to release them to the conscious mind in whatever detail the unconscious considers best.

[Pause]

And now there is a question I asked you. And I'm going to try for an answer now.

Before the episiotomy, perhaps subsequent to it. But I wonder if before the episiotomy you had some overlooked, forgotten feeling in your breasts. You don't need to tell me.
[Long pause as her hand now levitates to about two inches above her thigh very, very slowly]

Your unconscious seems to be telling me,
not letting you know.

[Long pause as hand continues levitating very slowly]

E: As I get closer to anxiety-producing material dealing with the episiotomy her hand levitates more as a protective device by deepening trance.

R: This appears to be a clear example of the self-protective aspect of the unconscious that you frequently talk about. The unconscious is deepening the trance to protect the conscious mind from knowledge it's not yet ready to receive.

E: Yes.

**A Cautious Open-ended Exploration of the Traumatic Aspects of Memory**

E: Before you went into the trance, your unconscious endeavored to tell me the same thing.

[Long pause]

And as far as I can judge, your unconscious has not yet made up its mind whether you should know or not.

[Pause]

As I told you last time, records are made with the brain cells. The only way to lose those records is to lose the brain cells. And whether you find all the memories now or later, it is not important. The only important thing is for your unconscious to see to it that you really feel comfortable with all the memories you do have.

[Pause as her hand continues to lift, but her head and body slope downward]

I think it was a surprise to you to find out that you slowed up maturation in your need for a more vivid memory. Your unconscious has done a beautiful job of giving you that maturity.

[Pause as her head and body slope further down]
Now slowly lift up your head. Still higher. And slowly tense the muscles of your back until you're finally sitting up straight in the chair.

[Pause as she slowly realigns her body, with her hand levitating still higher]

It's perfectly all right not to know that about your breasts. It's also perfectly all right to recover it later. It's perfectly all right for me to be mistaken.

[Pause]

And you can look with comfort upon that shock connected with the episiotomy and the forceps. You need have no regrets about that. In fact, it is delightful to know that you could have shock, surprise, and resentment about your hands being tied down.

E: I'm taking all the resentment away from a particular thing (the episiotomy) and I'm focusing it on her hands being tied down.

R: You're giving her unconscious a series of cautious, open-ended suggestions to permit the memories and understanding of her situation to proceed in their own way and time. You also protect her from any misconceptions you may have with your remark about its being all right if you are mistaken. You're giving her own system the authority to declare what is valid for her own experience.

You then make an interesting statement of what may be the essence of psychological trauma: The mind recording something it does not or cannot organize because it's a first experience that is overwhelming in some way.

A Careful Awakening with Posthypnotic Suggestions of Comfort

E: Now straighten up still some more. Still more. Still more. Still more. Even more. Even more. Let your head be slowly upright fully. And now, as you slowly awaken, I want you, as you awaken a bit at a time, to increase a bit at a time your sense of comfort and pleasure. Enjoy life.

[Pause as her head lifts and she awakens, reorienting to her body]

The background fades into the background and the relevant matters take a sharper focus?
E: That's right. And psychotherapy would be much easier if everybody realized that.

R: A major function of psychotherapy is to let unimportant things fade into the background and only the relevant things come to the foreground. That's what hypnotherapy does par excellence.

E: That's right. And I didn't take hold of all these background things. R: You let them be background.

E: I let her render them into the background. She didn't know why it happened, she just knew I said something that really hit the point.

R: There is a recording consciousness that is independent of a knowing and understanding.

E: Yes.

R: She describes very well the absolute chaos that led to her traumatic experience and the effect of your suggestions in dimming that chaos so she can now focus on a heightened awareness of what was happening to her. This is an excellent example of your basic thesis that hypnotherapy can lead to a resynthesis and reorganization of unfortunate life experience.

Why did you have to get the same commitment while awake and in trance?

E: Unconsciously you don't have to do what you consciously say you will. In everyday life, you may accept an invitation for dinner, and later your unconscious lets you forget it

Commitment on a Conscious and Unconscious Level

E: I requested an absolute commitment from Mrs. A that she must agree to do anything I asked. I made her verbalize a promise to do anything I asked - good or bad, the worst or the best. You are a woman and I am a man. Even though I'm confined to a wheelchair, we are of the opposite sex. If you only knew how grudgingly she gave that promise; she did not enjoy giving it, but she gave it. She thought about it for seven or eight minutes and finally said, no matter what you do to me, it couldn't be worse than that awful fear. Then I put her in a trance and went through the whole thing again until I got the same promise when she was in a trance.

R: Why did you have to get the same commitment while awake and in trance?
E: Unconsciously you don't have to do what you consciously say you will. In everyday life, you may accept an invitation for dinner, and later your unconscious lets you forget it.

R: So this is an example of a mental mechanism in everyday life that can interfere with therapy unless you make provision for it as you do here. You aroused quite an emotional storm in her; she was really affected by your demand for an absolute obedience, which is rather unusual in modern psychotherapy.

E: Yes. It took an awful lot of courage on her part. Now why did I ask that kind of promise? She said she had an airplane phobia, but I knew she didn't because it was only when the plane was in the air and she had no control over anything that she had fear. As long as the plane was on the ground, there existed a possibility of getting out. But up in the air she was in a state of absolute commitment.

R: So her problem was in giving a commitment?

E: Yes, and I made her give, a commitment, a total commitment. The thing is, you couldn't do therapy with her except with the actual problem present. You can't remove a wart unless the patient brings the wart into the therapy room.

R: That's the dynamics of the situation; you had her reify her fears and bring them into the therapy session.

E: That's right, made her fears a reality I could work on, a reality I could then put in that chair she was sitting in and leave there.

R: By making her give you a total commitment, you brought her fear of total commitment into the therapy situation. By hinting about sex between you, the therapy situation became as fearful as her phobia.

E: That's right, there was a body threat in both. I had to make it so that it might all turn out terrible. I could not get a commitment by just asking her to imagine herself in a locked room. It had to be this room, something that would be truly horrible.

R: She might have been stuck with a dirty old man.

E: That's right.

R: You have guts to pull off these things.
E: She had to have her psychological problem with her at the time that I treated her. She then went into a trance quite easily. She was actually committed to do anything. She had no freedom of any kind. She was in a state of total commitment. Once in the trance state I had her board a plane and ride through a storm in her imagination. It was sickening to see; she actually went through a kind of convulsion. It was horrible to watch.

**Concrete Displacement of a Symptom Outward**

E: I let her go through that plane trip with great air turbulence, and then I told her that she would soon feel comfortable and at ease. She would then suddenly find that all her fears had slid off her onto the chair she was sitting on. She was then awakened. She immediately leaped out of that chair! I called in my wife and told her to sit in the chair. As she started to the patient yelled, No, no, don't! and physically prevented my wife from sitting.

I gave her an opportunity to validate that the chair contained the fears.

I then gave her a **direct posthypnotic suggestion** that she was to actually take a plane trip in reality to Dallas. She had given me her absolute promise. I then told her it wouldn't be necessary to see her again until after she returned from Dallas. You'll take a plane from the Phoenix airport. Of course, you'll have some question about it. When you get back to Phoenix from Dallas, you will have discovered how beautiful it is to ride a plane. You will really enjoy it. When you reach Phoenix airport on your return, call me up and tell me how you enjoyed it.

Before terminating that trance, I gave her other posthypnotic suggestions as follows: You have lost your phobia for planes. In fact, all your fears and anxieties and horror are sitting in that chair where you are sitting. It's up to you to decide how long you want to sit there with those fears. You should have seen how she jumped out of that chair!

Posthypnotic suggestion does not necessarily function because an idea is deeply imprinted in the mind during trance. Rather, posthypnotic suggestions are always in dynamic process and as such require outer and inner stimuli and cues to evoke and reinforce them. That's why it's so useful to associate posthypnotic suggestions with some inevitable patterned behavior the patient will experience after trance.

E: She followed those posthypnotic suggestions, and when she returned and called me, she said in an ebullient tone of voice, It was utterly fantastic. The cloud bed below looked so beautiful I wished I had a camera. Months later, when she had occasion to return to the same room, it was ridiculous how she avoided that chair and prevented others from sitting in it.
Resolving an Early-Life Trauma at the Source of a Phobia

The senior author developed a number of useful approaches to dealing with emotional trauma and facilitating an appropriate balance between intellectual and emotional experiencing. The most basic of these appears to be a separate experience of each before their final integration...often people cannot face the meaningfulness of an experience. People cry and do not know why they cry, they feel suddenly elated and know not why. In using regression therapeutically you first recover the emotions in trance to help the patient recognize them. Then put the patient back in a trance; this time leave the emotions buried and let the intellectual content be recognized. Then put them back in a trance a third time and put the cognitive and emotional aspects together and then have them come out of trance with a complete memory.

R: You have them experience emotions and intellect separately and then put them together to integrate the now totally recovered memory.

Trance Induction and Facilitating Posthypnotic Suggestion

E: One, five, ten, fifteen, twenty!

[Pause]

Very deeply in trance.

[Pause as Mrs. A closes her eyes and becomes quietly immobile with a relaxed face. She evidently has entered a deep trance very quickly.]

E: Now A, after you awaken I will ask you casually, Are you awake? In a moment you will say yes, and as you say yes, there will come over you all the horrible feeling that you experienced.

Sometime before the age often, feelings about something that you can talk about to strangers, but you'll have just the feelings. You won't know what the thing is that caused those feelings. You will just feel feelings, and you won't know what is making you feel so miserable. And you will tell us how miserable you feel.

[Pause]

Get a firm grip on those horrible feelings. You won't know about them until after I ask if you are awake and you say, yes, and at that moment those feelings will hit you hard. Do you understand now?
A: Um hum.

E: All right, twenty, fifteen, ten, nine, eight, seven, six, five, four, three, two, one.

R: This is a basic approach for facilitating posthypnotic suggestion. You request a simple response like the answer yes that is almost inevitable in response to your question, Are you awake? You then associate that very easy response with another, vastly more complex and difficult posthypnotic suggestion to reexperience horrible feelings before the age of ten without any awareness of the cause of the feelings. You are facilitating the reliving of an old emotion by dissociating it from an awareness of the cause of the emotion. The easy yes response tends to initiate an acceptance set (Erickson, Rossi, and Rossi 1976) for carrying out the more difficult posthypnotic suggestion that is to follow. If you had noticed that a particular patient tended to nod her head yes in everyday life, you would utilize that head nodding as a vehicle to facilitate the more difficult posthypnotic suggestion. By requesting responses that are already high in a patient's response hierarchy, it is more likely that you will be successful in facilitating an initial post-hypnotic response, and most importantly, you thereby initiate an acceptance set for the more difficult posthypnotic suggestions associated with it.

E: Yes, that's a beautiful wording. Notice I emphasize that she is to get a firm grip on those feelings. Then when I count down I skip from twenty to fifteen to ten, but then give an impressive countdown from ten to one by single digits as she gets a grip on the feelings that are to emerge.

**Trance Reinduction When Carrying Out Posthypnotic Suggestions**

A: Oh, I like it. It is so restful. I didn't want you to count.

E: Are you awake now?

A: Yes.

[Mrs. A looks a bit startled and becomes quietly self-preoccupied for a moment or two. Her face frowns, and she obviously begins to experience some internal stress.]

R: Her slight startle and quiet self-preoccupation are actually indications of the momentary development of another trance as she begins to carry out the posthypnotic suggestion (Erickson and Erickson, 1941). Although talking and acting as if she were awake, she is probably in what you define as a somnambulistic state as she experiences the fearful emotions recorded in the next section.
Emotional Experience Without Intellectual Insight

E: What's the matter, A?

A: I don't know, I don't want to look. There is something I don't want to see. I don't know what, but I don't know what to tell you.

E: Talk about your feeling. Tell me what you are feeling.

A: No, I'm afraid. There is something there that I don't want to see, and I don't want to look. I'm afraid of what it is, and if I look . . I don't want to look.

E: You don't need to look. Just talk to me about it.

A: It is just fear. I, I want to forget. It will go away if I don't look, OK?

E: I don't think the feelings will go away.

A: Yeah, because . . . because I'm just afraid. There is something I... I don't know what to tell you about it, but I am afraid, I'm afraid

Reinducing Trance Comfort With Posthypnotic Suggestion for Intellectual Insight: Protecting Patients in Trance: A Feeling Approach

E: One, five, ten, fifteen, twenty. Now you feel comfortable.

[Pause]

And you will again, now, can't you?

A: I'm beginning to.

E: That's right.

[Pause]

Now the next time I awaken you, A, I have a different kind of task for you. When next I ask you casually if you are awake, you will say 'yes,' and then there will come to your mind something that could have scared you years ago. But you won't feel any emotions at all, is that all right? It won't scare you, is that all right?

A: I will remember, but I won't be afraid?

E: You'll just remember, Yes, when I was a little kid I was scared. That's the way you'll remember it. You will be able to laugh about it and take an adult person's
I'll be cautious, A, to make certain whether or not you should identify it, OK?

A: All right.

A is rather hesitant about going on. It's therefore important that you reassure her by letting her know she will be able to laugh at it from an adult person's point of view. Most patients are vulnerable in trance; they need the therapist's protection. Therefore you let her know that you will be cautious and make certain it will be OK for her to identify her experience. If it was about to become traumatic, or not the sort of material she could share with strangers, for example, you could easily shut it off by distracting her, telling her to stop, or giving her the counting signal to reenter trance... E: My approach is very casual even with this difficult material, and that makes it easier for her. It's hard to say no to a casual easygoing approach.

R: This illustrates how you often work on a feeling level: Intellectually a person might want to say no, but that seems ridiculous on a feeling level where you are so casual, warm, and permissive. It feels wrong to say no!

**Trance Awakening with Intellectual Insight: The Transformation of Painful Affect: A Genuine Age Regression with Adult Perspective**

E: Twenty, fifteen, ten, five, four, three, two, one. Not a restful trance.

A: Not as restful as before.

E: No?

A: No. I, I feel an apprehension. I don't know why, and I don't know what is causing it, but I feel apprehensive.

E: Want to ask Dr. Rossi? Are you awake yet?

A: Yes.

[Pause as Mrs. A looks a bit puzzled. She is again apparently experiencing a momentary trance as she begins to carry out the posthypnotic suggestion for recall without emotions]

E: Would it be all right to tell us?

A: What is in my mind is a void. It is, um, a void, I don't know how to describe it, but it is like looking at, un... Oh... yes! Fantastic! I know what it is! Shall I describe the scene to you?
E: Oh, yes!

A: Oh, yes, it is a bridge. Do you remember when I told you before I was afraid of bridges? The scene is coming up a bridge . . . as you come up you see nothing of reference, but a void. The car or whatever I am in, and it must be a car, I'm sitting in it in such a way that I see nothing. I don't see the superstructure of a bridge if there is any, or the hood of a car. I am looking out and see nothing all of a sudden. Where I was looking at before and seeing - trees or grass or something, pasture, that I can relate to. All of a sudden there is a void and I see nothing to give reference. And it is a bridge. I know where the bridge is. I am aware of where this bridge is. I can't relate to how old I am or whom I am with or anything like that. But, yeah, OK.

E: Tell me something about the bridge.

A: Where is it? Well, it is on the way to my grandparents in northern California. And it is a bridge that has a very steep incline so that as you are driving up, you then reach the top and you break over so that as you are going up, you are not aware of anything, there isn't anything. You can't see anything to relate to unless you are looking out at the side, but if you are looking straight ahead, there is nothing until you break over onto the top of the bridge.

E: How soon do you think you will discover your age?

A: I don't know because I have gone on that bridge many, many times as a child. Eight comes into my mind, but I don't know why eight. Because I could have been any age, going over the bridge so many times, not just one time.

All negative affect has certainly been dissociated from the memory, however, and she does indeed experience it with an adult person's view, as you suggested. The fear and anxiety she experienced as a child have been replaced by the curiosity and fascination she can feel about the experience as an adult.

When she speaks of car . . . I am in . . . I'm sitting in it in such a way that I see nothing . . . it is in the present tense, which indicates she is really there.

R: That aspect was a genuine age regression in which she was actually reliving an early life experience rather than simply remembering it.

E: Then I ask her to tell me about the bridge, and she experiences a transformation of the trauma into a more adult recollection. First she was an adult being a child reliving a past experience, then she is an adult and understands it. She is in two identities simultaneously; child and adult are working together, becoming integrated.
Trance Reinduction and Comfort

E: One, five, ten, fifteen, twenty. Now you have done beautiful work so far today, A. Very good work. Now

this time I am going to awaken you, and I want you to feel really comfortable, very rested, very relaxed, feeling as if you had eight hours of rest. You will be surprised when you look at the clock and notice the time. And again I'll ask if you are awake. Immediately after You will say yes.

R: You now prepare her for the final task of integrating the emotional and intellectual aspects of the experience by suggesting that she will first feel comfortable and relaxed as if she's had eight hours of rest. This is another example of giving an easy and much desired posthypnotic suggestion to initiate an acceptance set for the more difficult posthypnotic suggestion you will associate with it. It's also a way of rewarding and reinforcing her for the work she's already done when you tell her she's done beautiful work so far today, A. Very good work.

E: Suggesting eight hours of rest also utilizes what we experience in everyday life: You frequently sleep on something in order to deal with it.

Usually it's best to have patients experience the emotion first and later the intellectual, because after they have experienced the emotions so strongly, they have a need to get the intellectual side of it.

The Utilization Approach

E: The alterations I'm going to suggest, the first is this: homework is tedious, tiring, exhausting. I think homework carries with it a sense of something well done, well accomplished, and the feeling it is going to be done, is being done, and has been completed will carry with it a very partial feeling that will enable you to concentrate better, learn more rapidly, and enjoy the entire process.

[Mrs. A nods her head yes in the rapid, abbreviated manner that is characteristic of a conscious intentional process]

You think it over, don't nod or shake your head yet, think it over.

E: You don't want the patient to agree with you too soon. It's nice to think it over before you buy a house.

R: As is highly characteristic of your style, you begin by first accepting her own frame of reference, homework is tedious. This opens an acceptance set. You then
add your initial suggestion, homework carries with it a sense of something well done."

Your suggestion is a truism - anyone would have to agree with it - and that further establishes the acceptance set. To this you finally add the easy-to-accept suggestion, a very partial feeling that will enable you to concentrate better, learn more rapidly, and enjoy the entire process. You don't directly command her, you simply state truisms about better learning and associate them with her own inner experience in such a way that she cannot deny them. She accepts them as valid for her own experience and thus she receives and accepts your suggestions. You do not add anything new with these suggestions. Rather you evoke and utilize her own real-life experience; anyone who has ever, at any time, done their homework (or any other kind of learning) usually has had a feeling of accomplishment, and this is invariably associated with a very partial feeling that they can learn even better some time or other. Your suggestions about better concentration and more rapid learning thus reinforce aspects of her own experience which you have evoked. You (1) establish an acceptance set and then (2) evoke aspects of her life experience that you can then (3) utilize to help resolve her current problem. This is a typical example of your utilization approach to therapeutic suggestion. She accepts this so quickly with a nodding of her head that you must tell her to think it over. You want to let her unconscious have enough time for a thorough search of the relevant inner processes that can implement these suggestions.

E: I let her have a little taste of a good thing with a very partial feeling, so she will soon tell herself that she wants the whole thing. It's a common life experience to take a taste and then want the whole thing. A mother says, Just take a little bite. But our patient didn't even hear me say, Just take a little bite."

Generalizing a Learning Frame of Reference to Restructure a Phobic Problem

E: The other alteration is this question of flying. The initial apprehension that can be transformed possibly into a sense of the task, the responsibility of doing the task. One can always be apprehensive about a task. You always know that you can fail, then you are hooked and realize you've done this sort of thing before. You have enjoyed it before and you can actually enjoy starting out on new assignments. Instead of boredom there is a time when you enjoy being within your body, a feeling of resting, feeling of comfort while your mind's eye is exploring the things that really give you pleasure.

By associating this academic problem with the phobia problem you are implying that they can both be resolved by the same process of learning to adopt and maintain more open and adaptable frames of reference.
I worked out this plan. I borrowed six novels from the library. I grew up in a home where there weren't many books and I knew my knowledge of literature was very poor, and so I would sit down and read fifty pages of one novel, study hard in chemistry for twenty minutes, shift into another set of gears and study physics for twenty minutes, and another fifteen minutes on my English assignment, read part of the next novel, and keep going around from novel to textbook, perhaps another novel, another textbook, all shifting gears. Because every time you shift from one pattern of physical activity, you rest from the previous activity. On the farm I learned to pitch hay right-handedly and left-handedly. When my right arm got tired, I rested it by using my left hand. In chopping wood - right- and left-handed. Always resting first one arm and then the other. Alternating in hoeing in the garden, I did the same thing. In studying chemistry, it is so different than reading a novel. Reading a novel is one kind of an exercise, and a chapter from a psychology book is another kind of exercise, so I was always working at top speed at each of the things that I was doing and resting from all the other things. Now working all day tires you. Studying your homework at night is also tiring. But to untense that part of your body fatigued by the day's work and work with the rest of you on homework. Listening to lectures is one thing, doing paid work is another thing, and studying is a third type of exercise. You alternate them and understand that you can rest the lecture-receiving apparatus while you're doing homework, and rest from homework activity when you are doing office work. Because it all requires different sets of patterns of functioning

utilization of trance as a state of active learning. She is confused about how to generalize her acceptance of a more adequate approach to academic learning to her phobia for flying. Her confusion, of course, is itself proof that she is in the process of giving up an old, less adequate frame of reference for a new one that she does not yet understand. You now take advantage of this situation to facilitate more openness in her frames of reference in the following sections.

**Mental-set breaking problems.** He writes the number 710 and asks Mrs. A to read it in all possible ways. Most people are not able to break the number set sufficiently to read it as OIL when they turn it upside down. Erickson typically reveals the answer by first asking the patients to make an S near the upside-down 710. If they still don't get it, he has them make the S right in front of the upside-down 710 so it reads SOIL. At that point most people succeed in shifting from the number to the letter set… i.e framing as numbers, then as letters… The most important thing in therapy is to break up the patients' rigid and limiting mental sets
R: This was a typical example of another of your approaches for depotentiating a patient's habitual mental sets to introduce the possibility of experiencing more flexible frames of reference.

Phobia as a Limited Frame of Reference. Phobic behavior comes about from the problem of using an old frame of reference inappropriately in a new situation. The old frame of reference really doesn't fit, and this lack of fit gives rise to the anxiety, negative affect, and avoidance behavior so characteristic of phobia. The anxiety and avoidance behavior is actually an accurate signal indicating that the patient's old frames of reference need to change. When the patient does not recognize the signal aspect of the anxiety, it is experienced as a negative affect without any appropriate intellectual component: The patient experiences anxiety and fear without knowing why; she has a phobia. We can infer that when a phobia develops in an apparently familiar situation (such as school phobia, agoraphobia, etc.), it means something has changed in the patient's relation to that situation, but this change is not recognized and the appropriate inner adjustments (modifying old frames of reference or creating new ones) have not been made. Phobia is due to a too-limited frame of reference. Its permanent resolution requires insight and expanded frames of reference. This is essentially a new theory of phobia that is inherent in your work.

I tried hypnotizing myself in a situation and I can't concentrate. Like when we hit turbulence. E: Try to count from one to twenty. A: Right now? From one to twenty? [Mrs. A closes her eyes and evidently goes into trance momentarily. She then opens her eyes, shifts her body, and is obviously awake again.] E: You didn't get all the way to twenty did you? A: No. E: That's right. [Pause] And now future accomplishments are future accomplishments. [Pause] And they can be enjoyed. [Pause] A: I was just thinking. I can't wait to get out of here and fly.

Her residual fears about flying are apparently resolved when you give her the tool of autohypnosis with which to help herself. If trance is conceptualized as an altered state or shift in frames of reference, we can understand how autohypnosis can be particularly useful for phobia or any situation where the patient needs to cope with difficult emotions. Her momentary autohypnotic experience here was enough to let her know that from within she is experiencing a high degree of therapeutic expectancy - so much so that she can't wait to get on a plane!

In this matter of uncovering techniques I think one of the most important things is to recognize that if your patient has something covered up, she's got it covered up for a very good reason, and you'd better respect that fact. You ask the patients to respect the fact that you personally do not think it needs to be covered up but that you are going to abide by their needs, their actual needs. Now you've told them
you will abide by their needs, but they don't hear you qualify it to their actual needs.

This is an example of indirect suggestion through two-level communication. The first portion of your statement about abiding by their needs is readily accepted by a patient's conscious mind and tends to open a yes or acceptance set for the qualification that follows regarding their actual needs, which may be very different from what they think they are. The unconscious does pick up this qualification (which may be subtly emphasized with a slight vocal intonation or gesture), however, and uses it to initiate an inner process of search for actual needs. This search on an unconscious level may finally result in new insights that will depotentiate the patient's previously limited frames of reference and thus facilitate therapy.

Yes. You actually have two issues here: Does it need to be covered up? Can it be uncovered? You then point out to a patient that there are various ways of remembering things. Undoubtedly, when we cover up a memory, we usually cover up a lot more than the memory itself. That is, trauma of a shaved head might be covered up as an uncomfortable memory, but along with that would be covered up the room in which it was done, perhaps the address of that particular place, and other things that happened that year. Does the year need to be covered up? All the other things that happened that year? You thus emphasize that the patient undoubtedly covered up many things that didn't need to be covered up. So why not uncover every one of those things that are not safe to uncover and be sure to keep covered up the things that are not safe to uncover? You then define the situation as one from which the patient can withdraw at any time. You point out, Suppose you did accidentally uncover something you didn't want uncovered. How long do you think it would take you to cover it up again? That is the little bit of assurance that you always give your patient.

You then point out to a patient that it is perfectly possible to remember the intellectual facts of something but not the emotional content, and vice versa. You point out that once, when you felt downhearted and blue, you couldn't for the life of you figure out why, but there must have been a reason in the back of your mind. You experienced the emotions but you didn't have intellectual content. In recovering a traumatic memory you can uncover deep emotions and not intellectual content. If you want to, you can remember the actual intellectual content; you need not remember whether you felt sad, mad, or glad. It will be just a memory, as if it happened to somebody else.

You can put a jigsaw puzzle together in two ways: You put it together right side up, and then you will know what the picture is; you can put it together reverse side up, and there you have just the back of the jigsaw puzzle. No picture on it - just blank-ness and no meaning, but the puzzle would be together. The picture of
the jigsaw puzzle is the intellectual content - the meaningful content of the 
repressed memory. The back of it is the emotional foundation, and that will be 
without any picture. It is going to be just the foundation. Now you can put that 
jigsaw puzzle together by putting two pieces on one corner together, two pieces 
in the middle together, two pieces in another corner together, two pieces in a third 
corner, two pieces in a fourth corner, and then, here and there, you can put two or 
three pieces together. You can put some of the pieces together face up, some 
pieces together face down. You can put them all together face down, put them all 
together face up, but you do what you want to do.

What did he want to do? I didn't know, but that question left the burden of the 
responsibility upon Bob - namely, that he had a jigsaw puzzle of a repressed 
memory that he needed to recover and put together meaningfully. I asked Bob, 
Well, you don't really know what to do. Suppose you haul out from your 
unconscious just a few little pieces of that unpleasant memory. Bob thought a 
minute and then perspiration began to form on his forehead. I asked, What is it 
Bob? He said, I'm feeling sick in a funny sort of way. I don't know what kind of a 
way. I said, That's fine, so you're feeling sick in a funny sort of way; you don't 
know in what kind of a way. All right, forget about it. With that Bob developed 
an amnesia for the material that was making him feel funny. I then continued, 
Suppose you reach down into your repressions and bring up a few pieces of the 
picture. Bob did essentially that and said, Well, there is water and there is 
something green. I suppose that is grass, but that green isn't grass. I said, That is 
fine, now you shove that down. Now bring up some more pieces of emotion. Bob 
brought up some more emotion and then said, I'm scared, I'm scared. I want to 
r

run, and he was really perspiring and trembling. I said, Shove it down again. Let's 
bring up a few other picture pieces.

We alternated in that fashion for a while; getting a few associations and then 
repressing them when the emotion became too threatening. As we got more and 
more material, Bob began digging up bigger and bigger pieces of emotion so that 
I would have to bring him out of the trance and let him rest. Bob would take a 
deep breath and say, I'm all worn out. I don't know what is happening to me. I'm 
awake, my shirt is all wet, my trousers are wet with perspiration. What has been 
gothing on here? I assured him that the medical students in the class were just 
about as sick as he was of seeing that perspiration spurt out on Bob's forehead 
each time he'd experience an emotion.

Finally I suggested, Let's put all the blank sides together again and do a complete 
overhaul. So he put it together again, and you should have seen him trembling 
and perspiring. He was actually shivering, so periodically I gave him a suggestion 
to blank it out and rest: Take another deep breath and look at that blank reverse 
side of the jigsaw puzzle with the amnesic traumatic experience. He said, 
Whatever is on the other side of that is something awful - it's just awful. I then
told him to forget the entire emotional side. We'd turn the jigsaw puzzle over and see it intellectually only, without emotions. He described, Two little boys, about eight or nine years old, they looked like cousins - they're playing in a barn, they are wrestling. Oh! Oh! One is getting mad with the other. Now they are hitting at each other. Now they grabbed some forks, they start stabbing at each other. Oh! Oh! One of them stabbed the other in the leg. That one is running into the house to tell. The one that stabbed him is a little bit afraid. He runs along, too. The boy's father isn't mad; the mother isn't mad; they are calling the doctor. The boy's father makes him sit on a chair to wait. There is the doctor driving in. The doctor is going to stick something in the boy. Oh, my goodness, what a funny thing. Look at that boy's face. He is lying there.

His face is swelling up, his eyes are swelling shut, his skin is turning a funny color, his tongue is so thick, and the doctor is scared. He is getting something else. He’s got - it looks like a needle or a pump of some kind, and he is pumping something into the boy, and now that swelling in the boy's face is getting less, his tongue is getting smaller, he is opening his eyes, and everybody is breathing deeply. The father grabs the other boy and takes him down to the horse trough. The father sits on the horse trough, hauls the boy over his lap, and starts spanking him, and he is really spanking him hard. The boy is looking down into the horse trough and he sees that green slime on the water and he is crying. There is something awful bad about this, and I don't know what it is. There is something awful bad. I said, Well let one corner of the back of it soak through, and then another corner, let the back of it soak through, soak through, soak through. You should have seen poor Bob as he began uniting the ideational content with the affect. Shuddering, trembling, crying out, horrified, he said I can't stand it.

I again told him to develop a complete amnesia. Take a rest Bob. You have a little more work to do. Maybe if you rest five minutes, we'll have enough strength to do a little more of the work. Then about five minutes later I asked him to continue. He dropped the amnesia until he couldn't stand it any longer, and then another amnesia, a rest, and then again another recovery, until finally he said, That little boy that stabbed the other one is me. That's my cousin, and that was the fork we used for cleaning out the barn, and the doctor comes and gives him an antitetanus shot. He gets an anaphylactic reaction with all that edema, and everybody expects him to die including me. Then the doctor gave him adrenalin and he recovered, and then my father took me down to the horse trough and spanked me. I couldn't even stand the way my cousin looked, and there was my father spanking me and that nasty green slime on the water in the trough - that horrible green slime and that horrible color of my cousin's face. No wonder I couldn't study my dermatology. That was the end of that. No wonder he didn't like dermatology.

Is it necessary to develop a deep trance state for this particular type of thing?
E: It was with Bob, but it's not necessary if you get that state of indifference and ask the person to think of himself more or less as being in the next room undergoing a certain experience. Of course you can't see it, you can't hear it, but think of yourself as undergoing a certain experience - the experience of recovering a lost traumatic memory, and as you sit here you are not really in a deep trance, you're not really in a medium trance, you are in a light trance. You don't feel like moving, you don't really feel like doing anything, but your mind seems to be rather far away and you are thinking about yourself in the other room - remembering something, and I wonder what part of that memory you're remembering? There you are getting associations, and the patient can start remembering. Your request that the patient simply imagine himself in another room recovering a lost memory is itself an indirect approach to hypnotic induction. You (1) fixate attention with that request, and if the patient takes you seriously, you certainly have temporarily (2) depotentiated his habitual conscious framework. The patient is thereby engaged in a (3) search on the unconscious level, since the conscious mind certainly doesn't know how to do it. The trance induction is further emphasized with your suggestions, You don't feel like moving, you don't really feel like doing anything, but your mind seems to be rather far away. You are utilizing indirect suggestions in the form of not doing, and a dissociation between the personality sitting with you and the mind thinking about yourself in the other room. The patient's own associations and (4) unconscious processes then take over and mediate the (5) hypnotic response of recovering the lost memory.

The adaptability of hypnosis in meeting critical situations, the ease with which it can be used without altering natural physiological and psychological processes (as contrasted with pharmacological assaults and electric shock), suggest the desirability of its more frequent and ready use in sudden emergency situations.

Decondition a Hysterical Catalepsy... She sat there rigidly, staring vacantly into space, with fully dilated pupils, in a state of complete unresponsiveness to all stimuli. They were alarmed about the bilateral fixed dilation of her pupils because of uneasy feelings about intracranial injury, but felt a bit reassured because the pupils were equally dilated. They had attempted to reduce the pupils by the use of an extremely bright light, but she had stared unblinkingly into the light with no change in her pupils.

Conditioned responses can be effectively established even when the subject is not consciously aware of the stimuli !!!! MILTON ERICKSON'S EXPERIENCE...PROVES HOW POWERFUL / DANGEROUS MASS MEDIA MUST BE I.E PROPAGANDA...CONDITIONING...
Since the two physicians had, at the scene of the inception of the emotional disturbance, tried flashing a powerful light into the patient's eyes, the author decided to capitalize upon this fact. Securing a small blinking light (a child's toy), the senior author placed it at the opposite side of the office so that it would be within her field of vision. Seating himself beside her, he softly repeated a long series of brief, gentle suggestions, synchronizing them with the blinking of the light. (Past experience in research had taught the senior author that conditioned responses can be effectively established even when the subject is not consciously aware of the stimuli.) These suggestions were, Off in the distance, see a light. Now it comes, now it goes. Off in the distance, see a little light. Now it comes, now it goes. With monotonous regularity these suggestions were repeated for about twenty minutes. A slight quivering of her eyelids led to a change in the suggestions to the tripartite suggestion of as it comes - and goes - try harder to see, synchronizing the first and third part to the appearance of the light.

After about five minutes of this triple suggestion, her eyelids began quivering and her pupils started to contract. Further synchronized suggestions were given slightly more urgently: As the light comes, your lids will close; as it goes, they will close more. As it comes, your lids will close; as it goes, they will close more. Within two minutes the suggestions were changed to, As the light comes, so tired; as it comes, so sleepy; as it comes, eyes close, so tired; as it comes, eyes close, so tired; as it comes, soon asleep; as it comes, soon sound asleep; and sound asleep and sounder asleep, and sound asleep and now sound asleep; There followed, since she responded well, Staying asleep, resting comfortably, repeated a number of times. She was then instructed to rest comfortably, to sleep deeply, to relax so comfortably and completely, to feel so good, so much at rest, so ready to tell the senior author anything he wished to know about, but too tired to be worried, too sleepy to be scared, just softly to tell the senior author whatever he asked, and doing so, just understand everything.

Within forty-five minutes this patient related an informative account of her early youth, when she had seen a neighbor's wife develop an apparently causeless screaming episode that had terminated suddenly in a mute, catatonic, schizophrenic stupor with resulting commitment to a state hospital. She related this as a past unhappy memory that she had forgotten years ago. When she was asked to continue, she showed mild emotional distress and somewhat hesitantly related the circumstances of a quarrel with her husband about a vacation trip. This had caused increasing anger on her part. The trip, as she wished it, would have taken her to her childhood home, but her husband wished to go elsewhere. Realizing that he would have his way, she screamed in futile rage, and then the memory of that neighbor's wife screaming came to her mind. She wondered if I could stop screaming, and that scared me terribly and I kept screaming. Then someone - my husband, I guess - slapped me, and that paralyzed me. I just couldn't see and I couldn't hear. I was just looking helplessly at nothingness,
getting more scared all the time. Just thinking about it makes my skin crawl. It won't happen again, will it? She was reassured and asked to continue.

Well, nothing happened forever and ever it seemed, and then I thought I saw a little bright light and I began hearing a voice. At first I couldn't tell what the voice said, but it seemed that I began listening better, and soon I could hear better, and pretty soon I heard you talking to me. I know I didn't know you, but I was tired and sleepy, and some way I knew you would take care of me. You will, won't you?

Again she was reassured and she was asked what next she wanted. Tell my husband. She was asked if she did not think she ought to remember the entire episode when she awakened. Her reply was the inquiry, Will I get scared again? She was answered with, Not unless you want to be. I don't, was her earnest assertion. Accordingly, she was aroused and, with no further instruction, consciously retold the whole story with embarrassment and some slight distress about the extremes of her behavior. She was then asked if it would not be well for her to relate the entire story to her husband. Her reply was, Oh yes, or he will worry about me. She also agreed that her husband's partner could be present when she learned that he had participated in the situation.

Her husband asked, Were you thinking about that neighbor when you insisted on the vacation trip, including going to your old home? Oh, no! I haven't thought of her for years. It's just that I got a letter from Ann [a girlhood friend], that girl I used to know

that you didn't like, and I wanted to go back and see her. Further conversation and discussions were not significantly informative. Suffice it to state that the vacation trip did include her desired visit and that her adjustments have improved during the years that have elapsed. Her husband's comment on the correction of his wife's problem was, Well, I suppose it helps people to get things out of their system, but I'm not sure I would recommend starting it that way.

The entire therapeutic process for this patient required not over two hours, and the passage of about a half dozen years indicates that it was adequate.

Deconditioning Hysterical Catalepsy: Case Report Two

In the case of the second woman, aged thirty-one, with a personality structure very similar to that of the first patient, and also childless, the immediate emotional difficulty had arisen at the breakfast table. She had timidly told her husband that, on returning from a trip the previous evening, the car had collided with the side of the garage. She had bent the fender slightly and broken the headlight; because of the lateness of the hour, she had not told him because of possible unpleasantness. Her anticipatory fears were justified, as the husband
explained in accounting for her condition. I just ranted and raved like a prize idiot, and she got madder and madder, and so did I. She finally grabbed her purse and threw it at me, and it fell open and things spilled out. Her pocket mirror slid along the floor and stopped right where the sun was shining on the floor, and I could see how it reflected the sunlight so that it hit her right in the face. She froze instantly, just froze right like she was, with her face all mad, her eyes glaring, but she just seemed as blind as a bat and as deaf as a stone.

I yelled at her, asking what was the matter, but she didn't make a move. So I shook her and finally she limbered up a little and I brought her in. Did I make her lose her mind, and can you help her?

The man was reassured briefly and dismissed from the office. The woman, who had entered the office with her husband anxiously propelling her like an automaton, now sat listlessly, with her eyes open but apparently unseeing.

After studying her appearance for a few minutes thoughtfully, the senior author touched her gently on the shoulder to attract her attention. The effect was electrifying. Her body jerked to rigidity, and her mouth opened widely as if to scream. Her eyes were wide open, the pupils fully dilated.

The senior author, recalling that she had become frozen stiff when the sunlight had flashed into her eyes, decided to try a technique essentially comparable to the one used above.

Placing the toy blinking light within her field of vision, but keeping it obscured until the suggestions had been phrased, the author began the use of a technique of suggestions similar to the one used with the first patient. A bipartite suggestion was used, synchronizing the first part with the appearance of the light and the second part with the disappearance of the light. Also the two parts were said with distinct but different emphasis, the first part being emphasized as a fact, the second part as a reassurance.

For about fifteen minutes, in repetitious monotony, the senior author carefully stated over and over, You are frightened, but feeling better. As the minutes passed, the second part was more firmly emphasized, until finally she began to relax physically. Then the suggestions were progressively changed in the following fashion: You are less frightened, you are feeling better; you are less frightened, you are feeling better and relaxed; you are feeling still less frightened and more relaxed and better; less and less fright, more and more relaxed, better; just a light fright, so much better; fright going, going, gone, relaxed, comfortable; all better, ready to relax; to sleep, to relax, to sleep; and deeper, deeper and deeper asleep.
About ten minutes of this graduated change in suggestions resulted in a comfortable, relaxed state of deep hypnosis.

A new suggestion was offered: And now you can look back on last night as if it were last week or even last month - who really cares now? Just feel comfortable and just as if you were another person. Tell me what happened to that young woman in her kitchen that scared her.

With very light urging and only slight emotional display she answered, Light in her eyes, scared, she thought automobile going hit her. Scared, couldn't move. She was told, Now I want you to understand all I say. That young woman was you, and you were scared, but that's all over now. You are here, talking to me about it. Just tell me everything. Just remember I don't know a single little thing about it, so be sure to tell me all even if you think parts are not important (the italicized words were intended to minimize the whole event without doing so noticeably).

She told a story of a bitter quarrel with her brother and of striking him and turning to run, of how she ran into the street, of how her brother yelled, and then she started to look toward him. It was evening, and a car with glowing headlights was bearing down upon her. She was too paralyzed to move, and she stood staring helplessly even after the car swerved by her. She was forcibly hauled out of the street by her irate father, who soundly spanked both her and her brother. This incident had, to the best of her knowledge, been long forgotten, but the quarrel with her husband over a car, the associated headlight, her assault by throwing her handbag at her husband, and the mirror flashing sunlight in her face had all combined to revivify, in a violently emotional situation, a comparable emotional situation of long-past experience.

Hypnosis also offers the opportunity of dealing with the patient at two levels of awareness, so that the patient can safely approach a complete understanding of a traumatic experience that was previously repressed as intolerably painful - that is, at an unconscious level of mentation and then at a level of conscious awareness.

As everybody knows, it is impossible to hold a stop watch to time oneself and to avoid thinking about an elephant for one whole minute.

Now let me warn you about one thing that can stop you, that will surely stop you, against which you will be totally helpless if you are not warned about it in advance. Quiet now! Listen attentively because you need to know this if you really want the abortion, if you really intend to get the abortion. Now listen quietly and attentively. Are you listening? Both nodded their heads silently, expectantly. The senior author continued, You do not know an important thing, a vitally important thing. That essential information is this: You do not know whether that baby is a boy or a girl. You do not see, cannot see, the vital
connection between that question and the abortion you have told me that you want. Yet that question will prevent you from getting the abortion since you don't know the answer. Your personalities, your psychological makeups make that question important. You do not know why, but who expects you to know? Let me explain! If that baby were going to be kept by you, you, not knowing if it were a boy or a girl, would have to think of a name for it that would fit either sex, such as Pat, which could be either Patrick or Patricia, or Frances for a girl or Francis for a boy. Now that is the very thing you must avoid at all costs. Under no circumstances, not even once, after you leave this office, are you to think of a possible name for that baby, a name that would fit either sex. To do so and to keep on doing so would compel you psychologically to keep the baby, not to get an abortion. Hence, under no circumstances are you to dare to think of a name for that baby. Please, please don't, because then you won't get an abortion. Every time you think of a name, that thinking will definitely deter you from getting an abortion. You will be forced into taking the money you have and seeing a justice of the peace and getting married. You want an abortion, and you can't have it if you think of a name, so don't, just don't, don't don't think of a name, any name for the baby after you leave this office, because if you do you will keep it, so don't don't don't think of a name, any name. Now without another word, not one word, not a single word, especially not a baby's name, leave this office at once.''

Thereupon the senior author took them by hand and led them quickly to the door to hasten their departure. Several days later they returned smiling in an abashed fashion, stating, After we got married - because we just couldn't help thinking of dozens of names, and every name made the baby more precious to us - we realized that all you did was bring us to our senses before we did something awful foolish and awful wrong. We had just lost our heads, and our parents didn't help either - that's why we acted like such awful fools in your office.

that technique of suggestion subtly transformed the problem from we must get an abortion to we must not think of a name for the baby… Negative suggestion; Posthypnotic suggestion tied to behavioral inevitabilities.

There is no such thing as pure or classical trance behavior: Everyone manifests their own individual pattern. Certain behaviors like body immobility and altered eyeball behavior are typical, however.

It is a state similar to the hypnotic, and you can rest, you can be comfortable. You can paint. You can trust your unconscious mind. Her description of these spontaneous trances suggests that for her, at least, there is an equivalence between trance and the REM stage of dream sleep, since she comes out of trance refreshed as if she had been asleep.

Consciousness does not have available all the knowledge that is in the unconscious, which actually governs our perceptions and behavior.
You can induce trance most subtly and easily by simply letting a person focus on what is of most interest to them. Trance is initiated when they become absorbed in something they are really interested in. This is the basis of all indirect induction of trance.

Why do your subjects become so absorbed in their interest areas that trance behavior is evident? We all talk about what's intensely interesting to us in normal conversations every day without falling into trance.

E: Because I stick to that one thing!

R: The conversation does not jump to something else. You focus on one thing, you intensify that absorption, and that's what trance is.

E: I don't let the conversation jump to anything else. Yes, trance is a focusing on one thing. Watkins has written a paper describing a trance as dropping all the peripheral foci and narrowing it down to one focus. I agree with that.

E: First you let the patients know they have a wealth of time so they will do all their work. Then you distort the time so it can all be done in a short time.

R: That's your approach to utilizing time distortion: Give a lot of time, then let it pass quickly so the work is quickly done.

E: Implying there was a lot, of which she should share only a bit. You then validate further by confirming her fatigue. You keep validating your suggestions as you go along.

How he cured one of his daughters of bedwetting before it became a real problem. The daughter began bed-wetting when her younger brother was born. After a week of this bed-wetting, E told his wife to tell his daughter that after she had a dry bed for a week, she could go to E's office and say she had to give her a quarter but he could not know why. It was a secret. Daddy could not know why he had to pay her a quarter because it was her secret. After a week of dry beds she came in and demanded her quarter. She got it with no questions asked, so her secret remained intact. She came in the next week for another quarter. The third week she forgot to ask, and she has had a dry bed ever since. She had accomplished her own secret wishes since she didn't like a wet bed either.

You could actually, under certain circumstances, facilitate a person's psychological development by asking them to keep a secret. By telling a child to keep a secret, for example, you are telling that child to put certain defenses under conscious ego control, to develop creative tact, etc.
An infant has a fragmentary memory: A hand lifting is only a hand that is lifting. There is no arm involved. It takes some time to connect the hand to the forearm, the upper arm, the shoulder, the self. And to discover that the hipbone is connected to the kneebone and so on. Some time to discover it. Adults seldom realize the learning process that is involved.

One of his baby daughters, who screamed for days because people walked and she knew she was a people. She finally got up and walked her first hundred steps with no hesitation.

You want to do something. You control yourself. You focus your efforts.

One of the nice things about it is this: You don't know what you are going to discover, but you are going to have a delightful time discovering it. For anybody to watch you and interpret your behavior can be looked upon as futile as that of looking at an infant in a crib who really doesn't know what she is doing. But she is doing something. An infant can repeatedly reach for one hand with its other hand, and each time not understand what is happening as the hand moves. The adult watching the infant is puzzled that the infant is making this continuous reaching movement.

The source of psychopathology in the inhibition of self-exploration due to parental and societal structures.

One of your first steps with a new patient is to initiate some self-exploratory programs. When you introduce trance with these self-exploratory programs, you are actually laying down a foundation for future deep absorption in trance.

E: Yes. You encourage patients to do all those simple little things that are their own right as growing creatures. You see, we don't know what our goals are. We learn our goals only in the process of getting there, I don't know what I'm building, but I'm going to enjoy building it, and when I get through building it, I'll know what it is. In doing psychotherapy you impress this upon patients. You don't know what a baby is going to become. Therefore, you wait and take good care of it until it becomes what it will.

Life isn't something you can give an answer to today. You should enjoy the process of waiting, the process of becoming what you are. There is nothing more delightful than planting flower seeds and not knowing what kind of flowers are going to come up.

R: So you were setting Jill on a self-discovery program without knowing what she was going to discover. That is very characteristic of you and your work. You can carefully engineer things, but you also enjoy blind exploration.
**Engrams**. I think you know that word. Imprints for various learnings and experiences

The most self-evident criterion for genuine creativity or psychosynthesis is that the patient's world view, attitudes, and behavior do change. Anything less than this simply means the patient is only paying lip service to the therapist for whatever insights are purportedly developed.

E: When do patients have a good time? When something has been cured!

R: So having a good time, positive affect in a patient under these circumstances, means something is being healed.

E: That something desirable is occurring no matter how unpleasant it may be.

R: So positive affect is another important criterion of satisfactory work.

There seem to be at least three basic types of therapeutically useful trance: (1) The self-absorption type like this, where the patients are so absorbed in self-exploration that they are seemingly oblivious to the therapist; (2) the more popular conception of trance, when the patients are very much in rapport with therapists and responding to suggestions and (3) somnambulism, where the patients' eyes may be open and they may talk and act as if awake, yet respond hypnotically to the therapist's suggestions.

E: In practice you have all kinds of admixtures between them, but those would be the extremes between which useful trance work can be done.

I think I must have, but I don't feel I did, indicates a clear dissociation between thinking and feeling. It's interesting to note that her ego consciousness associated with the thinking of her left hemisphere is retained as a part of her identity, while feeling that may be more associated with right-hemispheric experience is dissociated off.

E: All these questions and attempts at logic and rationalizing are highly characteristic of a genuine dissociative state.

R: It is as if her left hemisphere with its logic is trying to rationalize an act that may be outside its range of experience, just as patients with right-hemisphere lesions and deficits use their intact left-hemispheric logic to rationalize their behavior without ever recognizing its incongruities

Automatic writing is characterized by misspellings
To rest and be at one with the sun is okay. To get down again just slide down on a moon beam. The sun is not too hot to splash in. I love the sun and I am at one with the sun's center. We are the same and I leave the fire whole again, not burnt. And love is like the sun. Will the unfulfilled love of the new destroy my life? Is there a way to leave the center of the sun without jumping down deep into the fire and falling?

You are again using indirect associative focusing when you tell this interesting case about little girls to begin the process of activating her own personal associations and memories of her own childhood. She is entirely absorbed in your story; her attention is focused and fixated so she naturally begins to manifest the initial signs of trance.

As for you, Jill, you can be an objective intelligence off to one side, delighted to look at those little girls, that long line of little girls. And you can describe them as freely as you wish.

R: Here you give her consciousness the task of being an objective observer. Perhaps this is the best place for consciousness in this initial, uncovering stage of therapy. You allow the unconscious to do the uncovering via a series of images of girls that consciousness can simply receive. Consciousness is thus placed in a receptive mode (the ideal mode for trance), where it is not likely to direct or interfere with images emerging automatically from the unconscious. The phrase freely as you wish then gives a positive and reinforcing orientation to your permissive suggestion to describe her experience. You can be pleased, amused. You can empathize with the little girls, but you will be a detached intelligence. Telling her she can be pleased and amused facilitates the experience with a positive affect. Allowing her to empathize permits emotional flow and a possible catharsis while still protecting her with the objective observer. E: Pleased and amused evoke different aspects of the spectrum of her inner life. You can be amused by a bad girl and pleased with a good girl. So she has a tremendous amount of freedom to explore all these possibilities in her past - and all this by implication. Now being that detached intelligence you need not know that you are Jill. You are something separate. But a knowing something. You need not know that those little girls are a succession of Jills. And I would like to have you enjoy that experience tremendously. You see those girls as if they were tangible hallucinations or you can see them in your mind's eye or you can see them not knowing that they are mental images. You see them and think that they are flesh and blood. You depotentiate her doubts by giving her many possible modes of response.

Long experience has taught me to cover many possibilities of response whenever I'm exploring a patient's inner life...you can feel free to discuss that little girl or that slightly bigger girl or that much bigger girl. That is something that you can
do in a manner far better than you know. In a manner that will be a pleasure for you to learn that you can do it so well

Therapy should always be designed to fit the patient and not the patient fit the therapy.

Reinforcing the dissociation between the images of the two girls when you ask if the second knows about the first little girl.

E: Yes. This is another example of what I called a two-state dissociative regression (Erickson, 1965a). You can see things better in such a dissociative state. Dissociation helps you realize different experiential states. If these different experiential states do not know each other, the observation of them can be all the more objective.

E: I want to make clear to your intelligence that you will become those little girls and that they really are all the same little girl at different times. But you can see any other girl that you wish.

The objective intelligence can recognize that all the images are of the same person even though each image (or ego state related to a specific age) remains dissociated from all others.

E: The objective observer that sees and describes current realities can also alter and change earlier childhood realities.

R: This is really amazing! The mind is a self-improving system that can change past distortions and traumatic experiences from the more adult point view. I have described a class of healing dreams wherein this appears to be one of the constructive functions of dream experience. (Rossi 1972a).

There can be a freer recognition and recovery of many self-images if they do not have to recognize each other. The adult does not like to recall the experience of wet diapers of the infant or the running nose of the child

So the objective observer that relates them is detached even from her adult self.

E: In this section we also witness the shifting levels of her vocabulary and perceptions. Words like boulevard, delighted, huge, and fascinated belong to the adult. Yet they are used to describe childhood images in a childlike way, as when she speaks of Crazy Mama's huge behind and her question could it be true? that she put her father in a pot and ate him. The detached, objective observer can recover childhood perceptions with an adult's understanding. This is a valid characteristic of trance. The detached observer is a center pole and fixed reality about which the patient can explore many childhood experiences in adult words.
Memory is not all of one piece; it's always fragments of adult and child interacting.

**Posthypnotic Suggestion for Time Distortion Yielding Long Rest and Recovery**

E: Would you like to rest?

J: I am very tired.

E: All right.

Just close your eyes and rest.

Very comfortably.

Rest. And have a long rest. A rest that seems hours long. Hours long with hours of comfort.

[Pause]

And as the comfort builds up in your body that supports that intelligence, and looks at that larger number of little girls each named Jill, but a different Jill each time, feeling different, doing different, thinking different, and really different, yet always Jill. And soon this intelligence will renew its curious, fascinating looking at that long line of girls all Jill. None of which can see the other, all of which have only faint memories, partial memories of smaller Jills, and only partial ideas of what the bigger Jill is like that this intelligence can look in curiosity and interest and enjoy describing each one of those Jills. A feeling so rested now, as if you had eight hours of sound and restful sleep.

[Long pause]

It is going to be a pleasure to open your eyes and start talking about those girls.

E: I use time distortion here to allow her to adjust to the awake state, yet allowing her to retain all the memories of the different Jill states.

R: You are giving her a posthypnotic suggestion for hours of time distortion. We will see after she awakens just how effective the suggestion has been.

Questions about time established that she has experienced a form of lengthening or expanding subjective time that is very characteristic of trance (Cooper and Erickson, 1959.) Three hours of time distortion is more than usual, however, and
indicates that she is successfully experiencing your earlier posthypnotic suggestion to have a rest that seems hours long."

Double binds are dependent upon a patient's individual characteristics for their effectiveness.

You think that erectile tissue is in the genitals Just the genitals. But what does your body know? Just take your finger and thumb and snap your soft nipple and watch it stand right out in protest. It knows that it has erectile tissue. You have had that knowledge without knowing it for a long time. And where else do you have erectile tissue? In New York State you stepped out of doors in thirty degrees below zero and felt your nose harden. Naturally! It has erectile tissue! Why else would it harden? And watch that hot baby slobbering for a kiss from the man she loves and see her upper lip get thick and warm? Erectile tissue in the upper lip! [The use of crude adjectives is deliberate and intentional. The patient needs to accept the ideas. Therefore, to ensure acceptance, she is given something to reject, namely the crude adjectives. In presenting therapeutic understandings a little roughage, as in the diet, is essential. Therapists who insist that everything they present is good and acceptable - and must be accepted because it is always tendered in courteous language and manner - are in error. There is a need to give the patient an earnest, compelling desire to protect and to respect that which is accepted. Therefore, let patients reword the presented ideas to please themselves. Then they become the patient's own ideas!"

"So continue sleeping deeply, review carefully every word I have said to you, try to dispute it, to argue against it. Try your level best to disagree, but the harder you try the more you will realize that I am right.

And what good will it do for you? You! I mean you? Just stop and think! You enter a house! There stands a baby, dirty efface, tousled of hair, runny-nosed, wet, smelly, dirty, and its face lights up and it toddles to you so happily because it knows it's a nice baby and that you will be glad to like it and that you will want to pick it up. You know what you will do! So does the baby! You can't help yourself. [A negative statement with a positive meaning.] And then you enter another house and there stands a beautiful little child, hair combed, clean, neat, in a state of perfection, but its face says, 'Who, just who on earth would ever want to pick me up?' Certainly you don't, you agree with the child, and you want to find the parents and slap them around for mistreating that child, because you don't ever want to be greeted again, ever again, by that child in that manner.

Now put a look of starry-eyed expectation on your face, clothe yourself in an air of happy confidence. Romance for you is just around the corner [a crucial statement], I don't know which corner [a statement that leaves the question
undecidable and hence requiring further consideration], but it's just around the corner!

You continue your poetic approach with an incredibly rich flight of ideas, with particular emphasis on evoking ideodynamic processes of attitude transformation that reach into the childhood of personality (Santa Claus) and extend into her adulthood (husband, home, and children) and beyond (generation after generation). You use a blend of just about every approach to indirect suggestion and the unconscious that you have ever developed, including confusion, interspersed suggestions, and the apposition of opposites (male and female; brutal language with the poetic). You completely overwhelm her so that there is so much cognitive overload that her conscious mind cannot possibly cope with it. She is therefore sent on a furious inner search for meanings and frames of reference that could cope with your barrage. This inner search will naturally evoke unconscious processes of transformation in a therapeutic direction. You then abruptly stop and send her home in silence, lest her conscious mind be given an opportunity to limit and dismiss the process you have set in motion.

Much of my work has this seesaw rhythm, where deep hypnotic work alternates with light counseling on alternate sessions.

By carefully worded, reassuring suggestions a medium-to-deep trance was induced in about thirty minutes. This trance was used to give her emphatic posthypnotic suggestions to the effect that, in return for the senior author's listening to all of her fears and her accounts of her hallucinations for the rest of the session, she would listen attentively to many things he would have to say on the occasion of her next visit; that until then she would be almost painfully curious about what he might have to say. Many repetitions were made of this instruction in slightly varying terms to ensure full understanding.

**Direct Suggestions While Depotentiating Resistance**

She was told firmly to close her eyes and to listen, even to go to sleep if she wished, but listen she must. As she closed her eyes the author began a series of instructions: (1) She must move out of the maternal home and room with some other girls, doing this within the week. This was to be explained to her family as medical orders. (The family physician had agreed to confirm this, and he was indeed consulted.) (2) She was to bank her paycheck and pay her own bills. (3) She was not to receive any member of her family as a visitor in her new quarters. (Her spinster aunts patrolled that street nightly for several hours at a time for several weeks.) (4) She was not to visit her home nor to make telephone calls to her family nor to receive them. (5) Her contact with her family was to be limited to brief greetings of not more than three minutes at church. (6) She was to attend
the theater, eat at restaurants, go roller skating with her fellow roomers. (The family physician supplied much helpful information, including the actual possibility of two prospective roommates for her.) (7) She was to invite her roommates as a lark to go for a bus ride across town and back. (8) She was to come entirely alone on her next trip in two weeks to see the author. (9) One of the preceding instructions - one and only one - she could modify and thus violate it, but not too much, and this would comfort her and enable her to obey all other instructions completely and the modified one satisfactorily.

Over and over these instructions were repeated until she developed a trance state from which she was aroused at the end of the session. The instructions were then again repeated, and she was given another appointment in two weeks' time.

E: The purpose of the permission to violate and modify one of the instructions was psychologically to compel the acceptance of all the other instructions. Thus, by legitimately violating one, she could meet, at least in part, the author's authoritative instructions.

R: When you give direct suggestions, you are careful to provide her with some choices she can reject. You have spoken of this as the patient's right to success and failure (Erickson, 1965). Allowing the patient to reject some suggestions in effect depotentiates resistance so the others can be carried out.

E: When you allow the patient to violate some of your suggestions, they are now indebted to you to carry out the others.

She was definitely triumphant about her accomplishments and was promptly interrupted when she tried to offer an explanation of her mother's presence. (It was better for her to feel guilt toward the senior author than toward her family.) A trance state was immediately induced.

She was instructed in a medium-to-deep trance to execute the following tasks: (1) To travel in a private automobile with friends across the state line (which she had never crossed, although it was but a few miles from her home) and to dine with those friends in some restaurant at least fifty miles from home. (2) To travel by automobile with friends to a specified city, making a round trip of over two hundred miles all in one day. (3) To consider seriously moving from her home town to Phoenix, securing a new job, and living on her savings until the new position was secured. (4) To spend the next half-hour crying, trembling, shivering, dreading, fearing all these tasks, at the same time realizing that one task a week would have to be done and that in the fourth week she would have to come to Phoenix alone, prepared to
stay a week while she searched for employment and living quarters, and kept an appointment with the senior author.

During the previous visit and the present one no mention had been made of the voices. However, as this last series of suggestions was completed, she tremulously spoke: The voices------ only to be interrupted by the sharply voiced declaration, Neither of us have ever really believed in those voices. You made Dr. X believe in them, but I didn't. Now, you do everything I have told you to do or Dr. X and I will make you do right away what you are most afraid of. If you are obedient, we will let you build your strength.

a discussion, apparently without purpose or point, about the unpredictability of human history, human events, and the unpredictability of the acts and decisions of the individual human being, some of which would occur unexpectedly soon. She was finally given an appointment for the first of July and dismissed. She walked out too bewildered to ask permission to change into her dress.

R: Your apparently irrelevant discussion of the unpredictability of human events is actually a preparation for the shock and surprise you will use in the next session, but she does not know that yet. This discussion serves as a foundation for what will follow. Her previous life had been too predictable. Your discussion of life's unpredictability is thus introducing a new therapeutic frame of reference and at the same time it probably sets many unconscious searches in motion for whatever relevances it can possibly have. Her unconscious knows by now that nothing you do is really irrelevant. A high degree of expectancy and desire is thus aroused for the crucial shock of the next session.

**Indirect Induction with Early Learning Set**

A wholly indirect hypnotic therapeutic approach was employed. She was asked to choose which of three paperweights looked the most interesting. She chose an agate geode. She was asked to sit comfortably, hands in her lap, to fix her gaze upon the polished surface, to enjoy the various colors, to sit entirely still, to hold her head still, to hold her ears still, and to give herself over to an enjoyment of the colors in the layers of agate, not really being obligated to pay attention to what the senior author was saying. After several varied repetitions of this instruction, her face took on a rather fixed, rigid expression. She was then asked to think through the problem of learning a language - not German, French, Italian, but a much more complex language, the English language as learned by a baby. In a slow, gentle, almost murmuring fashion the senior author described a baby lying in bed, hearing sounds, not knowing what they meant, the progressive articulation of sounds by the infant, its slow physical growth, the change in its features, its hands and feet, new movements, new sounds, bathing, eating, elimination, sleeping, its struggles in crying, its delight in cooing, reaching for things, and so on. Slowly a general comprehensive foundation was laid for
extensive thinking by her about the physical growth of a child, its learning of phonetics, eating, elimination, activity, speech, locomotion, and all the rest during the first five years. Initially this was presented as a discussion apparently to illustrate some point to be made by the senior author, but unnoticeably the tenor of the comments shifted slightly. Then stronger and more direct suggestions were made that she lose herself in a wondering but intellectual appraisal of the multitudinous learnings she herself had experienced in the first five or six years of her life. Evoking

**Evoking Early Repressions with Catharsis**

Shortly, within ten minutes, it was obvious that she was in a profound trance and was now oblivious of the agate as well as the rest of her surroundings. Upon a request by the author she plunged into a systematic survey of the memories of her early childhood. This was governed and directed by the therapist by intruding such statements as: And in that first year what a wealth of fundamental learning, from diapers to pretty things and sounds and colors and noises; or, And then you come to the second year, creeping and walking and falling and using the toilet like a good little baby and saying little sentences; and, Of course, there comes the third year and language is growing, words, so many, the parts of your body, the little hole in your tummy, and you even know the color of your hair.

For each of the first six years this was done, bringing in each year some reference to elimination, stressing the "goodness of toilet habits, body curiosity, the goodness of food, of sleeping, washing, learning all manner of things, and of almost feeling herself doing all of these things. This was accomplished in about three hours of utterly concentrated work by the patient.

On the day that it was intended to progress to the next period, the patient entered the office jerkily, her face flushed, and her expression one of furious anger. Explosively she declared, I'm so mad at you I could slap your face. I just can't think of a name to call you that's bad enough.

Why not call me a stinking bastard of an S.O.B., since that is probably the best you can do, was the simple, direct reply.

I will, she shouted and did so, only to burst into a distressed, embarrassed laugh, saying apologetically, I don't know what made me say that, but in a funny way it makes me feel better.

She was asked, Since it made you feel better, do you want to repeat the statements, perhaps with improvement?

Oh, no, I want to tell you something I don't want to tell you. For two days now I've had a normal bowel movement and my stomach hasn't hurt when I eat, and
I'm embarrassed to death to say this to you. I'd have died before rather than tell you. I don't know what you did to me, but something is happening and I don't want to cry either. And that damn psychiatrist in Europe who said that awful obsession I had about the bathtub being filled with bloody water when I shaved my legs showing suicidal tendencies was all wrong. Some day when I ask you, will you tell me what that silly nonsense was? But not right now! But now can we go ahead and let me look at the paperweight?

Two-Level Communication

In accord with her request, as she spontaneously developed a trance, she was softly instructed to make a comprehensive search of all her real childhood memories and personal experiences from six to ten. (Real and personal were words intended to restrict her to self-experiences rather than experiences with others - in particular, with her mother.) Very few suggestions were offered to her, usually, Did you leave out anything belonging to you at seven? Vague mention was made of big girls, you can see when they are big, and women are like big girls, only different. References to elimination were made more guardedly, One keeps in good regular body health, and speculations were offered about little learnings that grow up into the language of life.

It should be borne in mind that the patient was doing this survey as an adult, viewing in vivid, feeling detail a wealth of experiential learnings. Thus, even guarded general suggestions could be freely translated by the subject into more complete, adequate detail. As was later learned, the little learnings that grow up into the language of life was translated by her in one of her trance states to refer to genital explorations and stimulation. When first heard, it had only a poetic sound, and then slowly I gave it a sex meaning, but I don't remember when.

R: This is an unusually clear example of two-level communication. It took time to develop because an extensive unconscious search was required, and she does not remember when precisely because it was an unconscious elaboration that slowly filtered into her conscious mind.

As she seemed to be reaching the fourteenth year, she was asked to take time out just to go back to the very beginning, to fill in overlooked self-learnings, to correct omissions, to note misunderstandings and partial realizations, and to view them well from the simple, rightful dignity of a fourteen-year-old, truly fourteen. That a risk was being taken in that she might not have begun menstruation until after the age of fourteen was fully appreciated, but the hope was entertained that such an error would be detected by observation and study of the emotional play on her face, which had increased progressively from the age of six. From the age of ten to fourteen the play of facial suggestions portrayed the change from a ten-year-old girl's face to that of a fourteen-year-old young adult.
Alternating Periods of Deep Hypnotherapy and Counseling

Following this review of the ages often to fourteen, she entered the office saying, Can we just talk a while without working? Upon assent she continued, Well, I've moved to a nice place, I've got a job, I'm not depressed. I actually am beginning to like me a lot. I'm not especially beautiful; I couldn't stop a clock if I tried. But I've got a nice figure. My mother would die if she had heard that wolf whistle I got the other day. That's the first one I really remember. And believe it or not I'm sorry for my mother. She is sick. It must be a painful sickness for her too, and my father is sick but not as sick as my mother. That five thousand dollars was really all he could give me. And they didn't try to make me sick. They just mistakenly did wrong things with good intentions. Well, mother wanted to keep me a virgin and she succeeded. But I'm going to take some credit for that myself. And that poor psychiatrist in Europe who thought I was suicidal because of my terrible obsession about a bathtub full of bloody water and a razor in my hand. What else could he think? I was taking a bath and I suddenly realized it was about time for my period and I was shaving my legs and I wondered what it would be like to shave my pubic hair, and then that horrible phrase my mother everlastingly dinned in my ears about being a good girl, and thoughts of masturbation, and then I couldn't think any more except of bloody water and the razor. It was awful then. I feel sorry for me then. Sounds funny to say it that way, but I do, I mean it. And I mean I feel sorry for my parents. I don't love them. They are just two people who tried to do me a kindness once, tried hard but failed. And it meant so much to them!

Another thing! I come to your office, I sit for a while, I go away, I do nothing. You said hypnosis was learning. I haven't learned any hypnosis. All that's happened to me is I feel different, I think different, I am different. I didn't mind telling you about my bowel movements. A couple of times before, I got up enough courage to go to a doctor, but I was too scared to let him do an examination. When I took the physical to go overseas, I got hold of sleeping pills so I could stand it. They quieted me down but didn't put me to sleep.

Genuine Age Regression with an Adult Observer

When I got that fear, I began remembering what happened in the office. I didn't know until then that I was in a trance in your office. I looked at that paperweight, and the next thing I knew I was a little baby crawling on the floor at home. And I was also a grown-up person watching me. I never thought about that until these memories came to me.

I did the whole thing over again. I watched me grow up. I heard my mother talk to me. The big me could hear you. The little me could hear mother - seeing, feeling, being little. I went all the way through all the things that happened in the office. I watched me that day when I talked things over with you. I felt proud of
me as I listened to me talk to you. Was I in a trance then? I was really so proud of all I had accomplished, and then the next time I walked in your office I had a feeling that I was going to say something important, and then I felt as if you had hit me with a horrible club. I saw everything stripped raw and bare. I knew that all you had done was just to uncover a horrible job I had to do. I knew I was the only one that could do it, and I hated you. I couldn't see how you did it, but all of a sudden I was right in the middle of the most turbulent and terribly deadly, hateful emotions. I wanted to die, but I couldn't. I got tired.

Then I heard you send me back to my room, and I kept thinking how tired I was and how good the bed would feel. I didn't see me come into the room or flop on the bed because the next thing I watched was what I did on the bed. I watched me go crazy with fear and desperation. Then I just reviewed everything.

All I can say now, Dr. Erickson, is that the job is done. The past is past, it belongs to me, it doesn't hurt, and I don't want to tell such unhappiness. But I probably will need some mature thinking and advice on how to plan my future.

The February Man

Creating Identity: Beyond Utilization Therapy?

Up to this point we have emphasized that hypnotherapy involves the utilization of the patient's own life experiences and that the indirect forms of suggestion are the means of evoking those experiences for therapeutic change. What happens, however, when the patient has been severely deprived in some basic life experiences? Can the therapist supply them vicariously in some way? Sensitive therapists have long recognized their role as surrogate parents who do, in fact, help their patients experience life patterns and relationships that have been missed.

In this final chapter we will present some of the senior author's approaches to supplying a patient with a personal relationship in a manner that anchors her within a more secure inner reality around which she can create a new identity for herself. This is the case of a young woman who so lacked the experience of being mothered that she gravely doubted her own ability to be one. Through a series of age regressions the senior author visited her in the guise of the February Man: A kindly granduncle type who became a secure friend and confidant. A series of such experiences enabled her to develop a new sense of confidence and identity about herself that led her eventually to a rewarding experience of motherhood with her own children.

The senior author has actually played the role of the February Man with a number of patients throughout his career. So complex are some of the details of his work in these situations, however, that he never quite completed any of his manuscripts
about them. The following case is thus a synthesis of several of the senior author's original manuscripts together with commentaries on them by the junior author.

The reader is invited to explore with us some of the approaches and issues involved in the work of the February Man. There is much about this work that is beyond our own understanding. The use of indirect suggestions to integrate hypnotic and real-life memories to create a self-consistent internal reality is an art that does not entirely lend itself to rational analysis. We do try, however, fully realizing we have fallen short and are in need of the reader's creativity to fill some of the gaps and to carry the work further.

At the next interview the patient was exceedingly fearful, anxious, and tearful. She expressed disconnected fears of hurting, neglecting, and resenting her child. She feared feeling tied down by it, of being overly anxious, of giving over compensatory attention to it, of making it a hideous burden in her life instead of a pleasure, of losing her husband's love, of never loving the child, and so on. She wept throughout the interview, and while intellectually she regarded her fears as groundless, she declared that their strong obsessional character was causing insomnia, anorexia, and severe depressive reactions that terrified her.

A session of approximately five hours were spent training her adequately as a hypnotic subject. Particular emphasis was placed upon age regression. Her intelligence and excellence as a subject made possible the elaborate training considered necessary for the planned procedure.

During the training slowly and cautiously she was regressed in time repeatedly to some safe past situation into which, in some fashion, the writer could enter directly or indirectly, without distorting the regression situation. Thus the first regression was to the first interview with her. In having her relive that interview, it became easily possible to introduce a new element not actually belonging to the situation but that could easily fit into it. In accord with her revivification of that interview the writer merely remarked, Do you mind if I interrupt and introduce a thought that just came to my mind? It just occurred to me that you could easily be a good hypnotic subject, and I wonder if you would mind closing your eyes and sleeping hypnotically for a few moments, and then arousing and continuing from where I interrupted? Thus an interpolated trance was introduced into that reliving of the first interview, in which no hypnosis had occurred.

R: The first trance has the effect of dissociating the patient away from the surrounding reality into her internal environment. When you then interpolate a second trance into the first, it effects an even deeper regression into herself. The basic purpose of the interpolated trance is to get the patient further removed from outer consensual reality. It's particularly useful for age regression.
E: In future trances she's going to have an amnesia for the interpolated trance, but she would have to go through it to get a complete memory of the first trance in which it took place. I gave her many positive supportive suggestions during the interpolated trance. This served to reinforce all the positive values of that initial interview.

R: It's like a feedback loop, where what comes later reinforces the positive values of what occurred earlier.

E: Yes, and it's reinforcing what happens now by virtue of the past that I've transplanted into the initial interview.

Rapport Protection: Indirect Suggestion and Contingent Possibilities

She was then regressed to an intern's party at which there was a number of the senior author's former medical students. In the process of regression the suggestion was implanted that she might meet him at that party or that someone would mention his name, and undoubtedly this would happen when someone approached her and attracted her attention by gently squeezing her wrist. Then, when this unexpected thing happened, she could make a full response to the wrist pressure and react in accord with whatever situational need developed. Primarily, this was to introduce a physical cue to permit ready induction of a trance state at any time, even during the reliving of past events that had occurred long before meeting the senior author. Various such regressions were induced, aided by special information that had been privately supplied by the husband. These were utilized to condition her for trance induction in any set of psychological circumstances.

E: I was building rapport protection with this procedure. I once regressed a subject at Clark University to ten years of age. While regressed, he explained that he was on an errand to buy a loaf of bread for his mother. We could all see the abject terror on his face because he did not know anyone in that room (where as an adult he was being hypnotized). I spent a wretched four and a half hours trying to get back into rapport with him because he was afraid of me and afraid of everyone else. That taught me that thereafter I'd have a secondary way of establishing rapport with the subject such as touching a wrist. It's an attention-attracting but otherwise meaningless cue. The subject cannot easily incorporate it in

R: You did not directly tell her that pressure on her wrist was a cue to enter trance or to pay close attention to what you were suggesting.

E: If I had said it that directly, she could reject it. Therefore I put it in an indirect framework of contingent possibilities: She might meet me. Someone would approach her; she could make a full response to the wrist pressure and react in accord with whatever situational need developed. These (the italicized words) are
all undefined. There is no demand or threat in all this, and therefore no need for resistance or rejection.

R: We usually don't reject undefined possibilities in everyday life. Rather, possibilities and contingencies usually evoke our sense of wonder, speculation, and expectation. Possibilities actually initiate pressures of unconscious search within us that may trip off useful unconscious processes. Whatever situational need also covers all possibilities, including whatever suggestions you give her. You give her the most general form of an indirect suggestion here.

E: A most general form that can be filled in by the patient's specific understanding. Interpolating to the age-regressed pattern of behavior.

**Interpolating New Life Experiences: The February Man**

She was trained to develop in good fashion extensive regressions that were made to serve merely as a general background and situation for new, interpolated behavioral responses. She was regressed to past situations, and that frame of reference was employed merely as a background into which new hypnotic behavior could be interpolated. When sufficient training had been completed to ensure good responses, she was regressed to childhood at the age of four. The month of February was selected because it was her birthday. She was oriented to the living room of her childhood in the act of merely walking through it. She had often walked through her living room. Since the state of regression was limited to that act, it would constitute only a frame of reference. The walking through could be arrested and new behavior introduced into that setting without altering or falsifying the situation. Thus the new behavior intruded into that situation could be related temporally to the events of that age-regression period.

As she roused somnambulistically in this regressed state, she was greeted by the senior author: Hello, little girl. Are you your Daddy's girl? I'm a friend of your Daddy's, and I'm waiting for him to come in to talk to me. He told me yesterday that he brought you a present one day and that you liked it very much. I like your Daddy, too. He told me it would soon be your birthday, and I'll bet he brings you an awful nice present. This was followed by silence, and the senior author apparently absentmindedly snapped open and closed his hunting case watch, with no further effort to engage her in conversation or to attract her attention. She first eyed him, then became interested in the watch, whereupon he held it to his ear and stated that it went tick, tick very nicely.

E: Hello, little girl assigns her a hypnotic role.

R: In that first second when she opens her eyes in somnambulistic trance you immediately reinforce the age regression so there could be no doubt about it. Is
she going to see you as Dr. Erickson or as someone she does not know in her past? Your opening remark orients her into the past.

E: And there have been people in her past who have said just such a thing.

R: You then attract her attention appropriately by playing with your watch. This is just about right for a four-year-old; you do not introduce yourself in a direct or demanding way. You behave very much as a visitor to her house might when she was a child

Wrist Cue as a Nonverbal Signal for Metasuggestions Orienting the Somnambulistic State

After a few moments the suggestion was offered that she might like to snap the case open or to listen to the watch. She nodded her head shyly and extended her hand. Taking hold of her wrist as if to help her, the senior author handed her the watch. She looked at it and played with it. The suggestion was offered that if she listened to it for a little while, it would make her very sleepy. This was followed by the comment that soon the senior author would have to go home, but that some time he would come back, and, if she wished, he would bring his watch so she could open and close it and listen to it.

She nodded her head, and her hand holding the watch was guided to her ear. Her wrist was slowly squeezed, and trance suggestions were given accompanied by suggestions that maybe next summer the senior author would come again, and maybe she would recognize him.

E: I had to get out of her house. I ended that interpolated life experience with the wrist cue in an appropriate way (guiding her hand with the watch to her ear) and suggesting she would get sleepy as she listened to it.

R: Having her go to sleep is fairly appropriate behavior for a four-year-old listening to a watch, and her sleep allowed you to leave. It also enabled you to give her the posthypnotic suggestion about seeing her again next summer maybe, and maybe she would recognize you. These possibilities are appropriate for her age because a four- to

five-year old child might not recognize a friend after a year. But why did you give her the rapport cue by squeezing her wrist as you added these suggestions?

E: Although she was in a somnambulistic trance, further hypnosis would be needed to effect an alteration of that state to induce other phenomena.

R: I see. Even during a somnambulistic state special rapport is needed to effect important suggestions. The wrist cue is an orienting signal for the
metasuggestions you will use to guide the somnambulistic state; it tells her important suggestions are coming. I have had the difficulty of working with some subjects who were so obstinate during the somnambulistic state that I could hardly get a word in edgewise. Like self-centered children, such subjects would soon take over the situation and simply live out an inner experience without my being able to relate to them. This may be valuable for cathartic purposes, but it does not permit the therapist to interpolate new experience as you are doing here.

Classical age regression has typically been a simple reliving of a past life experience. A catharsis or process of desensitization is relied upon as the therapeutic means of resolving pent-up emotions of life traumas.

E: That does not add anything. Here I'm adding to the past.

R: That's the object of the entire procedure. You regress her to establish a frame of reference into which you can interpolate therapeutic life experiences. You are adding new experiences to her memory bank; you're adding new elements of human relating that she missed in reality.

E: You can add belief to something that does not exist if you repeat it often enough. That's why I had to give her many experiences with me as the February Man. I'm adding reality to a nonexistent thing.

R: It becomes real in terms of internal reality. With this approach you can alter a patient's belief system; you cannot really change her past, but you can change her beliefs about her past.

E: You can change beliefs and values. It's not really that we can believe lies; rather, we discover more things. Patients believe their limited reality until they discover more reality.

Structuring circumstances that allow her to evoke and utilize inherent (species-specific) behavior patterns that must be expressed for normal development.

Continuing Experiences with the February Man: Ratifying the Historical Reality of Age-Regressed Experience

She was then permitted to experience about fifteen minutes of profound hypnotic sleep. This sleep was a passage of time during which my departure and eventual return (as had already been suggested) could take place. Her wrist was then again gently squeezed, and suggestions were offered that she better be in the yard because the flowers were blooming for the first time since her birthday last winter, and perhaps her Daddy's friend might come again. At all events she could really open her eyes very, very wide to see the flowers. She opened her eyes and was apparently enjoying her visual hallucinations when the writer, from behind,
addressed her. Hello, little girl. Do you remember me? She turned, eyed him carefully, smiled, and said, You're Daddy's friend. The reply was made, And I remember your name. It is R. In this way the senior author became established as an actual figure in her past life without impinging upon realities or distorting them, but merely by adding to them by a simple process of temporal association. Thereupon a casual conversation was initiated at a childish level about the red and pink and yellow flowers (she said they were tulips), whereupon she reminded the writer about his watch, and essentially the same course of events ensued as had previously. Many more comparable instances were developed to ensure the possibility of the writer's intrusion into her past without invalidating the regression state. She was given extensive experience with the February Man, a figure that became more and more established in her life history.

I would further ratify the historical aspects of the experience by pretending to have an unclear memory of my previous visits with her. How clear does anyone remember an experience of a year ago? Two years ago? Four years ago? I also introduced changing views. As she gets older, she gets a different perspective on things. I'd say, That first doll you had was really very nice. Remember your enthusiasm for that first circus? I might make such remarks to the ten- or twelve-year-old girl about the six-year-old girl.

R: You built associative bridges between the trance experiences at different age levels that established the historical reality of your visits with her

Indirect Posthypnotic Suggestion

Finally she was placed in a profound trance and given extensive posthypnotic suggestions to ensure a comprehensive amnesia for all trance events and to ensure continued cooperation. I'd gently squeeze her wrist and say You have now completed that task. I want you to go into a profound trance at this time. I want you to enjoy resting, I want you to feel fresh after you've awakened, comfortably enjoying the feeling of being wide awake, prepared for a new day's activities.

E: That latter suggestion, prepared for a new day's activities, implies that she will be ready for more work; we are just beginning.

R: That's how you also imply a posthypnotic amnesia without directly telling her she would not remember. You could then put her back into trance for another experience with the February Man.

Time for Hypnotic Work

In subsequent sessions, usually of several hours' duration, essentially the same procedure was followed.
E: I had to have several hours in order to let her have an experience with the February Man at one age level, rest, and then another experience at another age level. Time is expandable and compressible, but a certain amount of real clock time is still needed for careful work. Initially you really don't know what the patient's capacities are. Time is needed to explore them.

Integrating Hypnotic and Real-Life Memories: Creating a Self-Consistent Internal Reality

A number of hypnotherapeutic sessions now took place following this same pattern. She was regressed to many different periods of her life, usually in a chronologically progressive fashion, taking care not to let the created situation impinge contradictorily upon the actual realities of the past. For example, on one occasion, regressed to a nine-year-old level, she manifested intense astonishment upon opening her eyes and seeing the senior author. Cautious inquiry disclosed that she was visiting a distant relative for the first time and had just arrived the previous night. A few questions elicited enough information to orient the senior author so that he could claim a business friendship with her relative. This laid a foundation very necessary for the subsequent ubiquity of him in her life experience. Aiding in the acceptance of his ubiquity was the fact that both of her parents traveled extensively and often unexpectedly, and that they had innumerable acquaintances and friends. Hence it was easily assumed that the same was true of the senior author as Daddy's friend. Also of importance was the February Man's knowledge of various cities she had visited and the fact that he, as well as she, had studied psychology, all of which provided a wide background permitting her to accept him unquestioningly. As the procedure continued, the technicalities of securing responsive behavior became minimal, and a dozen regressed states could be developed in an hour's time. These were all utilized to secure a report by her of things and attitudes current to the regression period, as well as an account of expected or anticipated events. Anticipated events served admirably in enabling the senior author to direct regression states to safe periods. However, care had to be exercised, since anticipations were not always fulfilled. Frequently, however, the visit was devoted to an account of what had happened since the last visit that is, the preceding regressed state. She learned to look upon the senior author as a recurrent visitor and as a trusted confidant to whom she could tell all her secrets, woes, and joys and with whom she could share her hopes, fears, doubts, wishes, and plans.

From time to time it became necessary to induce comprehensive amnesias, obliterating various of the senior author's visits, and to regress her to an earlier age and to go over an already partially covered period of her life more adequately. Thus, some sudden change in her life, not anticipated at an earlier age regression, might
have become established before the period of the next age regression, thereby creating a situation at variance with established understandings. On such occasions the last age regression would be abolished by amnesia suggestions, and a new regression to an earlier time would be induced to permit the securing of pertinent data.

R: You made a very careful and extensive effort to integrate hypnotic and real memories so they were molded into a self-consistent inner reality. This would ensure the permanence of the new attitudes you were facilitating in her. If there were contradictions and a lack of consistency between the hypnotic and real memories, self-corrective processes within the unconscious would have tended to gradually eliminate the hypnotic suggestions as foreign intrusions. This may be why so much hypnotic work in the past has had only temporary or partial effect. Direct suggestions made even while a patient is in a deep somnambulistic state are not programmed within the mind forever in a rigid way. The human mind is a dynamic process that is continually correcting, modifying, and reformulating itself. Inconsistencies are either worked out in a satisfactory manner or are expressed as problems (complexes, neuroses, psychosomatic symptoms, etc.). There is thus nothing magical or mysterious about the effectiveness of your approach: It is based on very careful, thorough work integrating real memories with hypnotic experience.

Facilitating Therapeutic Attitudes: A Therapy of Life Perspectives: Dreams and Hypnosis

The consistent and continual rejection she experienced from her mother presented many opportunities to reorganize her emotions and understanding. By this procedure the senior author’s role became one of friendship, sympathy, interest, and objectivity, thereby giving him the opportunity to raise questions concerning how she might later evaluate a given experience. Thus, in expressing her grief over breaking a cheap little china doll her father had given her and which she treasured, she could declare that, when she grew up and became a mother and had a little girl who broke her doll, she would know that it wasn't something awful but that she would know just how her little girl would feel. Similarly, a fall on the dance floor in her teens was regarded by her as an utterly and completely devastating experience. Yet she manifested a readiness to understand the senior author’s comment that she should rightly appreciate it as such in the present but that at the same time she could also understand how, in the future, it could really be regarded as a minor and completely unimportant event, perhaps even amusing. Her first adolescent infatuation, her jilting by the boy, and her tremendous need to understand herself in relation to that event were dealt with. Her resolution to leave the finishing school, to enter the university, her choice of studies, her scholastic struggles, and her limited social life were all covered. The meeting
with the man who became her husband, her doubts and uncertainties about him, the eventual engagement, and the mother's attitude toward him, toward the marriage, and toward the subsequent pregnancy were all detailed to the senior author in current accounts of what was happening to her. Numerous other instances of rejection, neglect, and disappointment by her mother and father were relived and discussed with the February Man. Real happy memories were also relived and integrated with the hypnotic memories to ensure a comprehensive integration of them.

Whenever she had a traumatic life situation, she could now discuss them with her father's friend, the February Man. In effect you became a therapist at such times. This is a curious state of affairs, you as her current therapist became a therapist in her past, helping her deal with her difficult life situations as they occurred.

Some patients seem to relive their past in dreams but correct the traumatic aspects of their past with their current adult perspectives (Rossi, 1972a; 1973c). This again points out the self-corrective aspect of the psyche; it is in a continual process of reformulating or resynthesizing itself to achieve a more integrated pattern of functioning. You utilize and facilitate this resynthesizing aspect of psychic functioning with your role as the February Man. You are doing hypnotically what frequently happens naturally during dreams. Dreams are auto therapeutic processes that help the mind correct and integrate itself. I also believe we are synthesizing new phenomenological realities in our dreams that become the basis of new patterns of identity and behavior.

Finally, as she progressed in this regard, the topic of hypnotic anesthesia for the delivery of her child was mentioned increasingly by her while she was in trance.

The termination of therapy was accomplished rather simply. She was regressed to the time of preparation for her first visit to the senior author's office. She was assured by him - still in the role of Daddy's friend - that her trip would be fully successful in many more ways than she really expected. The scene was then shifted to the office, and she was much astonished to see the February Man. The senior author was also astonished! She was puzzled at his presence, explained that she had come to see Dr. Erickson. She was assured that she would see Dr. Erickson and that he would meet her wishes fully, but that, for a few minutes, she should sleep most profoundly. During this trance approximately one half-hour was spent instructing her so that after she awakened she would recall from the beginning, in chronological order, every trance experience she had had, together with all insights and understandings that she had developed up to the date shown by the day's newspaper on the desk. At the close of the interview she was told to spend a few delightful days reviewing her memories, making certain that she understood, remembered, and accepted all her past in an adjusted fashion. As for
the hypnotic anesthesia, she would be certain of it, but the minor details would be arranged in the next interview

R: This was a final summation for a final conscious integration of all her therapy. She now finally learns how you played the role of the February Man, how you reversed her realities, and so on. Yet this does not undo the effectiveness of the new attitudes and frames of reference you helped her develop. Why doesn't it? After all your incredibly complex efforts to develop a new frame of reference, integrate it, and deepen it, why do you end the therapy with this complete denouement?

E: Because I may have made some errors. She may have made some errors. Let's make sure we get the whole set of errors corrected.

R: You are not afraid of undoing your therapeutic work because you actually, have helped her develop new frames of reference and understandings that have therapeutically altered her emotional life. This case contrasts sharply with those cases in which you like to maintain an amnesia for all hypnotherapeutic work. What is the difference?

E: Some personalities need amnesia, some do not. It's a matter of clinical experience to distinguish them.

R: Those patients whom you judge to have destructive conscious attitudes toward the therapy might do better with an amnesia.

E: This patient was actually left with some amnesia for the negative emotions she experienced in relation to her mother. My final posthypnotic suggestion to her was to spend a few delightful days reviewing her memories, making certain that she understood, remembered, and accepted all her past in an adjusted fashion. This precluded any regression into the catastrophically negative affects and anxieties she was experiencing before therapy.

Training for Obstetrical Analgesia: A Two-Year Followup

At the next session some days later she stated that she had been interested primarily in thinking about her hypnotic delivery. After much discussion with her husband, during which he was primarily the listener, she had decided on an analgesia if it were possible. She explained that she wished to experience childbirth in the same fashion as she had, as a child, sensed the swallowing of a whole cherry or a lump of ice, feeling it pass comfortably and interestingly down the esophagus. In a similar manner she would like to feel labor contractions, to sense the passage of the baby down the birth canal, and to experience a sense of distension of the birth canal. All this she wished to experience without any sense of pain. When questioned about the possibility of an episiotomy, she explained
that she wanted the sensation of the cutting without pain and that she wanted to feel in addition the suturing that would be done.

When asked if she wished at any time to experience any feeling of pain merely as a measure of sampling it, she explained: Pain shouldn't have any part in having a baby. It's a wonderful thing, but everybody is taught to believe in pain. I want to have my baby the way I should. I don't want my attention distracted even a single minute by thoughts of pain. Accordingly, as a measure of meeting her wishes, she was taught to develop complete hypnotic anesthesia. (Usually the procedure is to proceed from numbness to analgesia to anesthesia.) Since in this instance an analgesia was the primary goal, anesthesia was induced extensively and then systematically transformed into an analgesia. (That a complete transformation of anesthesia to analgesia could be effected is doubtful, but the patient's wishes could be met in this manner, and whatever anesthesia remained would only supplement the effectiveness of the analgesia.)

When she had been trained sufficiently to meet various clinical tests for analgesia, extensive training was given to her to effect the development of a profound somnambulistic posthypnotic trance with that degree and type of analgesia you have just learned, so that she could enter into labor without any further contact with the senior author.

Additional instructions were that she would awaken at the completion of labor with a full and immediate memory of the entire experience. Then, when she returned to her room, she would fall into a restful, comfortable sleep of about two hours' duration, and thereafter she would have a most pleasant hospital stay, planning happily for the future.

About seven weeks after the delivery she and her husband and baby daughter visited the senior author. They reported that, as she entered the hospital, she had developed a somnambulistic trance. During the labor and delivery her husband was present. She had talked freely with her husband and the obstetrician and had described to them her labor contractions with interest. She had recognized the performance of the episiotomy, the emergence of the head from the birth canal, the complete delivery of the baby, and the suturing of her episiotomy—all without pain. The expulsion of the placenta caused her to ask if there was a twin because she felt another one moving down. She was able to laugh at her error when informed it was the placenta. She counted the stitches in the repair of her episiotomy and inquired if the doctor had cheated by giving her a local anesthetic because, while she could feel the needle, it was in a numb, painless way that she associated with the numb feeling of her cheek after a local dental anesthetic. She was relieved when informed that there had been no local anesthetic.

She was shown the baby, looked over it carefully, and asked permission to awaken. She had been instructed to be in full rapport with her husband and the
obstetrician and to do things as needed to meet the situation. Hence, inexperienced in the situation, she carefully met the need of abiding by the situation by making sure it was in order to awaken. She again looked the baby over. Then, upon telling her husband that she had full memory of the entire experience and that everything had occurred exactly as she desired, she suddenly declared that she was sleepy. Before she left the delivery room, she was sound asleep, and slept for one and a half hours. Her stay in the hospital was most happy.

Two years later she announced to the senior author she was having another baby, and asked that she be given a refresher course, just to make certain. One session of about three hours in the deep trance sufficed to meet her needs. Much of this time was used to secure an adequate account of her adjustments. They were found to be excellent in all regards.

MHR so need to establish eternal life, potential for freedom, death not serious etc so can free people from mind-control of religion / propaganda of all sorts e.g we are free, happy, good, in danger of others that hate us for being free, happy, good…

MHR trance state about proving point to unwilling/denying client…could try to argue and demonstrate point logically, but trance behaviors more compelling for most i.e placebo effect of own mind, but seen as ‘proof’ where compelling arguments and logic would usually fail…

MHR…the conscious mind can block re-programming by insisting that the current belief system is ‘true’ and defending it from any contradiction…preventing the computer from re-calcultating based on new definitions… survival about immediate threats / opportunities and apparent patterns related to these… computer could operate without the conscious mind…i.e age old question of ‘why consciousness?’ when a cybernetic system can work without it i.e if ‘survival’ and ‘reproduction’, which can be achieved without consciousness, automatically, makes consciousness redundant, why have it? Can load definitions, and have automatons behaving exactly like we do…showing all ‘emotions’ as we do, but without their being any consciousness…any ‘experience’ at all… in fact consciousness can be seen to interfere with computer…which would perform better without being ‘filtered’ and ‘censored’… what are the layers of programming and interfaces … unconscious as computer with a bios and hard-wired programs … ‘instincts’…definitions…cybernetic feedback loops… if deterministic, then no limit to number of ‘experiencers’ having the experience…or components of system having their own experiences…all pleasure and pain is feedback about survival of individual and species and life per se…i.e pro and con…don’t need
the pain or pleasure, could be simple signaling i.e more or less pro or con…simple scale…without any pain or pleasure being experienced…

MHR-notion of ‘control’ absurd given lack of free will, and power of not-conscious processes of mind…scares many so simply will never ‘admit’ to self that they are NOT in control i.e will assert lie of free will/control…But can view not-conscious as a computer your conscious mind uses, a form of A.I, automated systems, that frees up conscious mind…

Neuro-Linguistic (un- & re-) Programming

The ‘Jews’ often joke among themselves that ‘There’s no business like Shoa-business’. ‘Shoa’ is the term the ‘Jews’ use to refer to ‘The Holocaust’. After running the world’s central banks, international bond markets, money laundering, and manipulating the share and derivatives markets, the ‘Jews’ biggest earner, in terms of direct money, military aid, (including free submarines from Germany), a ‘blank check’ for committing war crimes and effective genocide in Palestine (in emulation of their ‘origination story’ described in the Old Testament), and a ‘victim’ status, a ‘get out of jail free’ card that can be ‘played’ any time anyone dares criticize, or direct the public’s attentions, onto any of the various ‘crimes’ of ‘The Jews’.

‘The Holocaust’ is as real as hijacked planes being flown into the WTC and Pentagon, and somehow completely destroying them. The ‘reality’ television program called ‘911’, along with Hollywood Nazi’s, form part of the Zionist’s total spectrum propaganda campaign.

They employed the same full spectrum mass media campaign that demonizes Donald Trump, and forgives the Clinton’s any crime, lies about any Clinton health problems, and has tricked you into paying interest on every dollar they ‘loan’ you, and into fighting horrific and unconscionable wars all around the world, and into paying a ‘Carbon’ ‘tax’ to fund their ‘Jew’ World Order, to trick you into simply accepting, without bothering to research for yourself, that ‘The Holocaust’ happened as depicted by Hollywood Jews, that global warming is real, and man-made, and that a bunch of Arabs are responsible for all the
destruction of 911. Hey, they even managed to survive flying passenger jets into the WTC.

The ‘Jews’ have most of us in a ‘trance’. And not a therapeutic trance. A thrall. A mind prison. A prison in which you don’t realise you are in a prison. Like in Plato’s ‘cave’ analogy. You think you are free. You think the flashing images you see on the walls of your prison cave are reality. You never think to turn your head to the side, to see the puppet masters, the Wizard of Oz, behind the curtain.

You are so convinced by the shadows you take for reality, the mass media images and talking points presented to you, 24 hours of every day, that when someone comes to the prison-cave door to rescue you, you lash out at them for disturbing you.

For being ‘Conspiracy theorists’. For pushing you out of your comfort zones. You have become used to the cave. The prison. To the shadows dancing on the wall. To this manufactured, constructed, fake reality show. You want the ‘Conspiracy theorist’ to take all their facts and just leave you in peace. To enjoy your prison. Your shadows on the wall.

In fact you are happy that these ‘disturbers of the peace’ are locked up, punished, fined, and yes, if necessary for the good of ‘society’, to ‘the peace’, killed.

All animals, including humans, are conditioned or ‘programmed’, to define reality, to define themselves, and to define what is possible and desirable, in particular ways.

The programming and conditioning we have experienced up to this moment is mostly sub-optimal.

The programming we have had forced upon on, from our birth, is directly limiting our potential for directly and accurately experiencing The Reality Of Our Natures And The Nature Of Our Realities.

We end up experiencing lives much less satisfactory than what they might have been, had our ‘programming’ been more optimal.

And so we all stand to benefit from de-programming. And then active, voluntary, self-directed, re-programming.

And so Neuro-Linguistic re-Programming offers us a huge potential for achieving a superior holistic, mutual, optimal life experience.
At the personal level, and thus, necessarily, at the collective social level.

For, reflexively, ‘The strength of the pack is the wolf. And the strength of the wolf is the pack’.

If ‘man is wolf to man’, then this holds even truer.

Trying to benefit at the expense of other sentient beings is doomed to failure. Whether they are of the same pack or belong to a different species.

In the past, all ‘Moral codes’ were limited to one tribe. One pack. At best one ‘nation’. They were exclusive of ‘outsiders’. They constructed fictitious ‘races’. In fact the Mosaic Law went much further than that, claiming that only ‘Jews’ were human. So Mosaic Law is actually a form of ‘speciesism’, rather than mere ‘racism’.

The ‘Mosaic’ law, for example, calls for ‘Jews’ to treat only other ‘Jews’ as ‘human’, and deserving of the ‘human rights’ Moses demanded each ‘Jew’ grant their fellow ‘Jew’ freedom from their aggression, theft, rape, and murder.

This was based on the assumption that humans could not be lead to restrain from murder, rape, theft, and the enslavement and opportunistic exploitation of other humans. So the gratification of these urges would be limited to being expressed on ‘Goys’. The ‘cattle’ that appeared in human form.

For practical leaders, with no real moral ambition, who merely sought immediate social cohesion, and the ‘health’ of their tribe, and formation of a ‘society’ where the members reluctantly refrained from the opportunistic satisfaction of aggressive impulses to commit the violence of theft, rape, and murder upon their fellow ‘Jews’, this was an efficacious choice.

By defining all non-‘Jews’ as ‘Goys’, and thus not human, one tribe, one ‘society’, that of the ‘Jews’, was granted internal freedom from the violence’s of theft, rape, and murder which would otherwise fragment and dis-integrate it. This group would be motivated to act as a group by the promise of the theft from, and rape and murder of, all the ‘Goys’.

Now the ‘Jews’ could express all their ‘anti-social’ urges on ‘Goys’. They could do all the nasty things to ‘Goys’. And never need to fear being the victim of it in their own ‘group’.

The ‘Goys’, the ‘Jews’ were taught, had been conveniently given ‘human’ forms by their god, for the sole purpose of making them useful to the Jews. Useful as sex ‘objects’, and slaves.
The ‘Jews’ were taught that each one of them was ‘created in the image of God’. Their destiny was to live in houses they didn’t build, to eat food they had not grown, and to enjoy the bodies of the ‘Goys’ for sexual satisfaction, for expression of destructive impulses to harm and kill, and as the ‘means to their own ends’.

No legal contract with any ‘Goy’ was considered binding, although the ‘Jew’ was to pretend that it was. Any time a contract could be reneged upon, to the benefit of the ‘Jew’, it should be.

The ‘Goys’ were to be divided and kept at war with each other. War was a great motivator to keep the ‘Goy’ working hard, and innovating. The fruits of this labor and these innovations would then be, according to the Law, appropriated for the good of the ‘Jews’.

To this end, the Jews fabricated the 5 world religions known as Judaism (as the basis for the next 2 religions), Christianity, Islam, Marxism, and man-made global climate change.

By inventing a financial system based on illusions, the ‘Jews’ could trick the ‘Goys’ into ‘borrowing’ a thing called ‘money’ from them. The illusion that this ‘paper’ was of value allowed them to ‘trade’ this worthless paper for real goods and services. And to ‘loan’ it out at ‘interest’. In this way the ‘Jews’ would come to ‘own’ all the real assets that the ‘Goys’ produced with their own effort, sacrifice, risk, sweat, and blood.

This is the ‘New World Order’ you hear about, in vague terms, made explicit and concrete.

You have been conditioned and programmed since birth, by the ‘Jews’ hegemonic dominance of the mass media. It forms the basis of their propaganda machine. The propaganda began with Moses.

You have been conditioned and programmed to accept the ‘system’ that the ‘Jews’ have put in place as ‘the best of all possible worlds’.

You have been programmed to define the social world you were born into as natural. As normal. As ‘God-given’.

You have been placed in a thrall. A fear that carries over beyond this life. To the next. The ‘Jews’ have instilled ‘religion’ into you. Guilt and fear. In your unconscious mind. Irrational. And therefore more powerful than most people will ever guess.

It is all Neuro-Linguistic Programming.
The result is history as we know it.

And a terrible future that is just over the horizon.

A future that will be realised if you do not act now.

I cannot help you. Only you can help you. And then together we can help each other.

We can free ourselves of this ‘construct’ we call ‘reality’.

But first we need to re-program ourselves.

To free ourselves of the conditioned, reflexive, unconscious limits that have been placed upon us.

The first step is to make these unconscious ‘programs’ conscious.

So read ‘Religion’ immediately. Email me for a free copy. Free to you that is. It has cost me a lot to write and publish.

My books cost me so much already. They will probably cost me my life, or much worse, my freedom.

This guide limits itself to the very basis of the Neuro-Linguistic Programming that the ‘Jews’ have used to enslave you. This enslavement has been unobtrusive up to now. But soon it will be very obtrusive. We are talking total martial law, work and re-education camps, and complete loss of all of the ‘freedoms’ that, according to the Mosaic Law of the ‘Jews’, should only, rightfully, and properly, be enjoyed by the ‘Chosen People’. The only true ‘people’. The only genuine ‘humans’ on this planet. The ‘Jews’.

I understand the ‘knee-jerk’ reaction you have been conditioned and programmed to have to such statements of fact.

But you can read all these facts in the Bible, The Torah, and The Talmud, for yourself. You can then read my books, and the documents I refer to in them.

If you are not willing or able to do these simple things, then I guess the ‘Jews’ are right. You are worthy only of the ‘rights’ and ‘freedoms’ that your superior ‘Jewish’ masters decide to grant you as ‘privileges’.

All non-Vegan ‘Goys’ consider it there right to opportunistically ‘animals’, due to their ability to do so. Surely, they argue, nature has intended for the more powerful to dominate and exploit the less powerful. For the more intelligent and
cunning to exploit the less intelligent and cunning. Isn’t that how evolution operates? It is an age old, respected tradition, right? We have such traditions to thank for our ‘progress’ as a society. As a species in fact. No?

Might is right, isn’t it? We were given the ability to enslave other animals, and thus it is what nature, what ‘God’, intended. Correct?

Well the ‘Jews’ have, in a limited way, based on the laws of evolution, demonstrated their ability to enslave you, and thus their ‘natural moral right’, even ‘natural moral obligation’, to do so. By having conditioned and programmed you, using their superior, limited intelligences and cunning, they have proven a moral right to do so.

If they can, they should. Right? Slavery is as traditional as rape, theft, and murder. Most of the world’s greatest historical monuments were built by slaves. By slaves and wage-slaves. Bonded workers. Indentured workers. And then destroyed by the same, employed as ‘soldiers’. And then re-built. And each time the ‘Jews’ profited. Gained greater power. Greater influence. The ability to ‘buy’ political leaders. To buy entire political parties. To control the entire political process, indirectly through their mass media empires, and directly, through ‘pay for play’ and ‘lobbying’.

If the ‘Jews’, using their closed ethics system could, as a tiny minority, gain control of the populations of the entire world, through mere intelligence and cunning, then haven’t they proven their ‘moral right’ to do so?

Isn’t your own ‘moral right’ to ‘earn’ more than a worker in the Philippines, or to eat animals, to enslave animals and steal their children, to treat animals as mere ‘means to your own ends’, based on your assumed superior intelligence and cunning?

You may have heard that ‘For as you do unto others, so shall be done unto you’? That’s Obadiah, from the ‘Old Testament’.

Maybe you’ve heard of ‘The Golden Rule’. ‘To do unto others, as you would have them do unto you’?

Or maybe ‘As ye sow, so shall ye reap’?

Probably you have not heard of ‘The Optimal Ethics Generator’. You should acquaint yourself with it.

I understand that the victim is usually no better than the perpetrator.

There are few truly ‘innocent’ victims.
Only the Vegans among you have any right to claiming that epithet.

And many Vegans are quite happy to opportunistically exploit their relative superior holistic inheritances, vis a vis other humans. Such as feeling ‘entitled’ to ‘rents’ arising from their inherited superiority in talent, beauty, health, intelligence, socio-economic-status position, or even nationality.

So really the ‘Jews’ are merely modelling their own behavior upon yours.

So there is nothing anti-Semitic about what I am writing here. I do not see any room for ‘free will’ in human actions. I do not hate the perpetrator of violence. I hate the violence, and the suffering it produces. Whether a ‘Jew’ or a ‘Goy’, or even a ‘Vegan’ is inflicting that suffering, is of no interest to me.

It just happens that if things continue as they have been going, I will, as a ‘Goy’, soon lose any of the ‘privileges’ I have been told were my birth-‘rights’.

‘Rights’ such as freedom of speech. Freedom of rejecting religion. Freedom of association. Freedom to choose the political representatives I consider most able to protect my rights in the democratic system of checks and balances.

The ‘New World Order’ is really the ‘Jew World Order’.

We face a crisis, as non-‘Jews’. Soon we will all be their slaves. The mere means to their ends. Any ‘rights’ we thought we have will, if we are lucky, be replaced by ‘privileges’ which our ‘Jewish’ masters will be free to arbitrarily revoke as they see fit. Including the privilege to ‘live’.

We are on the brink of the final crisis. The wave has peaked, and will soon crash.

I have no interest in sacrificing and suffering in opposing what is coming, unless I am at the same time going to be ushering in something better than what the ‘Jews’ have planned.

You see I am quite ‘conflicted’ with regard to the ‘Jew World Order’. It will probably force all the ‘Goys’ to become vegan, simply based on economic and environmental grounds. It would free up more resources for our ‘Jewish’ masters, and keep the natural world, which they will consider their own personal property, as you consider your own ‘garden’, clean and pretty.

The ‘Jews’ will only find value in keeping so many ‘Goys’ as their ‘pets’, ‘sex-objects’, and ‘slaves’. So the world’s population is bound to be reduced by about 90%, within this generation. Possibly over a period of weeks, as a result of biological warfare, or simply nuclear war, rather than due to infertility ‘treatments’.
Consider how we ‘breed’ our own pets for the qualities we find satisfying and pleasurable. Such as ‘beauty’. So we can expect a broad spectrum eugenics program which would ensure that only the most beautiful, sexy, and appealing ‘Goys’ reproduce, ensuring only the most pleasing ‘pets’ and ‘sex-slaves’ are produced for our ‘Jewish’ masters.

And as the purpose of ‘slaves’ is to produce value, and the most valuable ‘slaves’ are those with the greatest ‘gifts’, talents, and intelligences, we can expect the ‘Jewish’ masters will instigate a eugenics program aimed at producing, exclusively, such high quality slaves, all the better to serve as ‘means’ to their own ends.

Machines will soon be able to perform most other ‘manual’ tasks better than humans, and so there will soon be no value in having a large supply of less intelligent, unattractive, ‘serfs’, ‘peasants’, and ‘unskilled labor’. So we can expect the ‘Jews’ to ‘purge’ our species of the very biological basis for these traits.

However, until the technology produced by the eugenically produced ‘geniuses’ of the species is ‘on line’, the ‘Jews’ might deliberately ‘breed’ a ‘sub-class’ of ‘Goys’ designed to be just smart enough to carry out menial tasks, but never smart enough to pose any sort of threat, or to even ‘question’ the state of servitude they have inherited.

I am hoping that this crisis, which more people are becoming aware of, might prove a stimulus for a re-assessment of our ‘closed’ systems of ethics. A system of rights closed to those defined as ‘non-members’ of a particular ‘race’, ethnicity, nation, or species.

I am for a truly ‘open society’. One where all sentient beings enjoy rights appropriate to their natures, independent of the species, or group, they, by pure chance, happen to have been born into.

I have no particular ‘love’ of the ‘race’, ‘nation’, ‘ethnic group’, or even ‘species’ I happen to have been born into.

I probably have more in common with most ‘Jews’ than I do with the ‘Goys’ that those ‘Jews’ would identify me as.

Most of us ‘Goys’ do unto others pretty much what the ‘Jews’ have planned to do unto us.

If we are going to treat life as a competition, then surely the winner should take all?

The ends justifies the means, doesn’t it? What’s good for us, is ‘good’. Right?

So I guess you will have no problem with what is coming, for you and yours.

Enjoy reaping the harvest of what you have sown.

Or start planting a new harvest. Based on ‘The Optimal Ethics Generator’.

MHR

Intuitive action / autonomic / automatic / trance / without inception-deliberation-intention-will e.g walking is automatic, talking is, when you have muscle memory then dancing is...playing guitar...unconscious handles the details...can operate in trance without attention to...perceive the action...as reaction, as intuitive...like amoeba attraction to food, repulsion from predator, without consideration / calculation / conscious deliberation / decision or even conceptualisation...

Leibniz's 'monads' are each a mirror of the universe a-la hologrammic a-la Indra's web (Buddhist)

Infants learn to localise their 'self' in their bodies...conditioned...this is NOT their initial / immediate perception...they must first learn to locate the source of pain i.e a pin prick is felt as pain, but the source, the location where the pin is pricking is not self-evident...same for all tactile impressions...initially global rather than local...it is an idea...initially sense of 'one-ness' with universe and omnipotence...hence Yahweh-worthy temper tantrums...and probably source of actual Yahweh metaphor i.e jealous, angry, limitless in fury and vengeance Yahweh as infants temper tantrum...knows no limits to self or own power... but 'learns' to localise 'self' around the 'locus' of its body...as individual and separate from universe...self as locus of perception / experience
N.B that the same electrical impulse travels down the different nerves to produce sight, sound, taste, pleasure, pain...it is a question of the receiver...the receptor...the senses have inputs, but the transmission is the same electrical impulse...with electro-chemical transitors and receptors...apply the same electrical impulse to an optical nerve, an auditory nerve, etc, and get different 'sensation' / impression / experience i.e vision, sound...wires can become crossed and so the person 'hears' light, or 'sees' sound as colors...can 'taste' a color or sound...Synthaesthesia...

POssibly an un/non-extended self merely projects the ideas of a body, brain, material world ... this nuomenal self, without form, as the only objective reality...all the subjective 'world' mere illusion ... no space /extension ...idealism...all subjective and generated by mind...a projection / illusion ...Vs realism, which insists an objective reality exists external to mind...a reality independant of the nuomenal...MHR an objective reality exists, but we can never know it...pure matter-energy-consciousness that we construct our experienced reality from...i.e our experience is ideal, but based on a real external reality...but if we are the same 'stuff' then it is reality producing/construction an experience...i.e the experience is ideal, the stuff real...only it is just electromagnetic soup of no interest in itself i.e WE are electromagnetic soup...the hologrammic part of the whole...we being both part and whole...everything being both part and whole...filtering out the 'other' to construct multiplicity of 'selves' and 'others' to experience per se...

Tension and EXtension...Contraction and expansion...duration of vibration i.e of cycles of extension/expansion and contractions/tension...wave forms...made by particles colliding and bouncing off each other...particles produce 'wave' i.e the particles transmit their 'energy' to each other...producing a 'wave' of energy...with the particles NOT travelling far...but transmitting their energy/reproducing the 'wave'...so that the original particles remain in original locus...but transmit their energy to the last particle that receives it...depending on how you look at it you 'see' a wave or a particle...the wave is the energy...the particle the carrier.../vector...

Physics and Einstein...time does NOT exist...does NOT flow...there is no discrete unit, finite, limited, fixed, smallest unit i.e instant of time, distance, duration etc...
Maths is the science of magnitudes...quantity changes quality...

Quality is function of perceiver...receptor e.g same electrical impulse produces audio or visual or tactile sensation in mind... MONAD as white noise / white light...mind as reductive / eliminative EQ sculpting...frequency bandwidths ... each 'perceived' as sight, sound, touch, smell, pleasure, pain, ... brain decodes /constructs as per programs...sense of 'direction' or 'taste'...quality is function of the perceiver...

Quality is pheno-menal...Quantity is Nuo-menal...i.e only quantities objectively exist...the 'quality' constructed from them is Phenomenal...subjective... pattern/quality/meaning/duration all properties of phenomenal ... all require 'memory'...result in phenomena of space, time, past, future, taste, colors, notes, harmonies, touch, sound etc...the objective 'quantity' is 'white noise', 'white light'...

mind experiment...line up every moment in history, present, and future i.e stand 'behind' time, and all you see is one point...like any 'line' seen from its inception point if it is perfectly straight...all you'd see is a point...you'd see the 'thickness' of the line...no 'succession'...no successive points in time, or in the line...in 'length' or 'duration'...just the first moment...the first point...until you change your p.o.v all time is simultaneous and without duration...just a 'moment'...all distance is the actual point without extension...

duration requires memory...i.e idea of past and present...to have 'endured' through time... instants have no 'meaning' or 'pattern' or 'extension'...

Our motives for action are all affective / emotional / pleasure / pain / hope / fear ...

Trance therapy uses Buddha's 'displacement' of a negative symptom e.g. fear, with a positive one, e.g. calm ... don't fight total syndrome, merely replace final stage with positive symptom e.g. allow patient to go through typical / habitual process,
then trick unconscious / reprogram final stage...so replace 'abject fear of dentist' with 'total head numb' ... or 'in my favorite-special place'... also offers nominal 'options' and 'questions' which all lead to same destination, but 'stun' 'confuse' 'shock' e.g zen whacking stick...out of habitual / typical / previous program ... generate 'gap' in stream of mental noise / habitual cycles ... and place new positive program in the gap...during 'trance' state...i.e intense focus/concentration/attending/immersion in/on anything e.g voice, gestures, own pain/emotions/state/muscles...breaks the 'train of action'...leaves window of opportunity...‘opens’ the 'doors of perception' to something new / different / alternative to displace existing learned behaviours/responses/reactions/affects/symptoms with alternative suggested by therapist, or by the metaphor actor immersed in / focussed on / in trance to / in thrall to...

Mirroring / pacing another person's breathing pattern, and timing your words to match their inhaling and exhaling, and pace i.e speaking faster / slower, can induce trance i.e by unconsciously getting client to become absorbed in their own feelings / breathing pattern / emotions and then your words / guestures i.e intense absorption like cornering on motorbike i.e Zen moment...this is trance...not about 'relaxation' but about 'absorption' i.e becoming lost and immersed in the now, with no past or future, no 'mental noise'...i.e use the symptom as the lead into trance by intensely focussing client on the symptoms at hand...allows you to 'enter into' i.e enter into-it, to intuit, what parts of your action i.e words, language, metaphors, story, guestures are working to induce trance i.e note as client enters more deeply into the moment i.e trance...fugue...focussing on the here and now...being here, now...

Our awareness / senses are equivalent of EQ sculpting in Audio engineering...Subtractive synthesis in synthesiser design i.e take a total and filter out parts / elements, to generate 'new' sounds, like white light contains all the colors ... Newton's experiments...by subtracting parts of this full visible light spectrum, we generate 'colors' ... from a whole that is pure white or black (no light reflected from a surface)...take white noise generator that produces entire human perception audio frequency 20Hz-20Khz a.k.a 'White NOISE' and subtract frequencies, and generate 'new' sounds...like red, green, blue, etc from 'white' LIGHT...so we get colors, and the sounds of different musical instruments ... our 'minds' filter out parts of the total, the whole, to give 'experience' of a
whole spectrum of 'beings' ... idea of individuation / sense of 'self' ... in reality our mind/senses filter OUT rather than 'perceive'...it is about NOT perceiving than perceiving per se...e.g red is 'seen' by NOT seeing all the other 'colors'...the synthesisers 'sound' is 'heard' by NOT hearing all the rest of the 'white noise' that is filtered OUT... and so our 'experience' of color, sound, and individuation , of all our 'life', is more about NOT perceiving i.e FILTERING OUT, than it is about 'seeing' or 'hearing' or 'perceiving' i.e very active, very selective, very limited...thus can imagine / entertain idea that we are all part of ONE entity...one consciousness...a consciousness that has set up artificial 'boundaries' between self and 'other' simply by placing filters within itself...so that the new 'parts' of itself are ignorant about this having taken place, about their unity with the other parts, and now unable to 'perceive' what the others percieve 'individually', or as a whole...so now there appears to be a 'you' and a 'me' and a 'them' and an 'other'...lots of them...simply a division of the whole into artificial parts by use of filters...by filtering out what one part perceives of the whole...of each other...so now we have colors, sounds, individuals...but all that there is in reality is white light, white noise, white energy-matter-consciousness, electro-magnetic soup containing every possible frequency... the frequency at which your consciousness resonates determines what it perceives as 'real'...where it places 'boundaries' between 'you and I', between 'self and other'... for what it feels empathy and 'love'...

MHR but are experience engines the product of, or producer of, impressions / feelings / pleasure / pain / emotions / affects / desires / motives...

To give impression of authority, trust, rapport, speak from throat (visualise sound coming from throat rather than mouth), stand balanced equally on both feet, use positive tone

Three 'positions' of NLP...First is own p.o.v, Second is others p.o.v, third is 'society's' p.o.v ... which would give my own TROONATNOOR Four positions i.e 'objective reality which we can only speculate about!'...

NLP is about how particular subjective perceptions generate a particular reality for each position i.e self / others...can change these perceptions / model and produce/ lead to more optimal models / perceptions/ ways of defining, seeing, being...more satisfying, more generative/creative, more resourceful, in terms of
both processes, and motives/objectives/outcomes... NLP all about process...about 'do-ing' it is NLP-ING...like Zen...no masters, only practitioners...everything you are doing is NLP...it is not about 'having attained mastery' but about 'do-ing'...every 'correction' is a sign that you are actively doing...correct-ing...practising more optimal ways...heading towards more optimal forms...no 'idols' i.e fixed goals...cannot know the goal...only the path...only now...cannot guess what will be revealed... cannot imagine what is attainable...limited to current p.o.v...so limited...idolatry about 'fixing' goals as if you can know now, what is ideal...as if you can know any-thing at all with the limited 'mind' available to us...the limited consciousness...but action plan...observe happy, satisfied, successful, creative, content, complete, etc people / organisations and interrogate them, to see what elements are contributing to these positive phenomena...see if can identify elements that can be applied by self / others, in similar and different situations...that can be translated into other situations...that can be employed by us all, to improve our subjective quality of life and objective conditions...find more positive meanings / definitions / ways of interacting / social forms / organisational forms / interaction forms / strategies / approaches / including 'self-talk' i.e how talk to self, how relate, how interpret, how respond, to increase our efficacy, efficiency, creativity...to increase quality of processes and outcomes in all areas of life...

My own Eden Protocols, and all my books, especially my 'Optimal Ethics Generator' are all about 'Meta-rules'...they are rules about how rules are to be made...the higher principles that must guide all the practical rules and decisions...to ensure the entire system has integrity of parts...that all rules and decisions reflect back, or out like a hologram, the fundamental meta-rules, the foundation principles...for reality appears to be hologrammic...the parts contain the whole...and anyone willing to see will be able to see how this is clearly the case in their daily lives...we cannot expect a mish-mash of conflicting rules / motives / decisions to produce the optimal outcomes...they will produce friction rather than harmony...conflict rather than generative peace...you cannot have one rule for you, on one day, and another for another, in another situation...this has been tried...and it fails...in fact many will see most social organisation as a deliberate tool employed by a few powerful elite members of the current 'beneficiary class' to ENSURE that the masses are constantly in a state of conflict, stress, warfare, etc a.k.a 'divide and conquer'...playing parts off against each other to ensure that the masses never achieve unity, and then turn on their slave masters...all the while the slave masters are accumulating ever greater benefits from all the wars, conflicts, 'protection rackets', terrorism, 'big government' etc...
If we consider the proposed meta-rule of anarchism i.e do no harm, we can see that ideally we would need very few laws, apart from deciding what 'harm' is in principle, and then ensure it is applied to every 'particular' case without distortion... but there's the rub...there's the devil in the details...people appear incapable of this... the irony is that if govt. only exists to protect the many from the few 'bad eggs', then it must be clear by now that the govt. itself tends to attract the very worst of the 'bad eggs', making govt. untenable...unless you do, as I have done, eliminate all the possible ways in which 'bad eggs' can 'abuse' govt. to their own selfish ends... of course the idea of the 'noble savage' is laughable...for if people were all good, then they would never have needed to invent govt...which they have done over and over, after every revolution in which an existing 'state' was 'abolished'...it was merely replaced by another...and if people could 'agree' on the meta-rules, they wouldn't really need much in the way of 'convincing' and 'education' and 'social control', let alone 'policing' and 'deterrents / punishments'...so it appears we do need to have meta-rules handed down and enforced 'from above' to bring out the most noble of aspects in the savage, and prevent the 'savage' nature from doing too much damage...

Kant put it well enough, to act as if your own action / decision were to be a law unto everyone... and vice versa would be at least as important...to only allow others to act / decide in ways you would be happy to be treated yourself...the old golden rule...problem is that people all consider their own situations and selves to be 'exceptional' and 'particular' and exempt themselves from the limits, while seeking to gain as many possible benefits...feeling they deserve more benefits than others (I'm prettier, smarter, taller, had richer parents) while feeling exempt from the burdens (that work is for the slaves, not fit for the likes of me, I'm special)...and even worse, the uglier, dumber people attempting to 'avenge' themselves on the smarter, prettier using the tools of 'society'...to 'cut down the tall poppies'...

Once you have meta-rules (or doom yourself to trying to get others to accept them and act on them with integrity), you need to design meta-games...i.e how to design games / interactions / conflict resolution / economies... we want win-win positive sum games where everyone who plays comes out a 'winner' compared to before they began playing...e.g the true businessperson (vs speculator / criminal bankster) organises a business so that the people working in it all benefit, and end up better off than before the business person arrived and organised their labor, and the business person also ends up better off...thus each are rewarded for their participation...the problem is that usually the businessperson feels a sense of entitlement to an extremely unfair part of the benefits...simply because they were
born smarter, richer, connected, etc... of course all participants, in the 'fair' meta
game, will receive benefits proportional to their time, effort, sacrifice, and
risk...including benefits for all the 'invisible' time, effort, sacrifice and risk related
to education, training, travel, learning a trade, learning a business...often
entrepreneurs fail over and over before succeeding (most never do), and so the
entrepreneur (in contrast to the mere opportunistic speculator bankster), to
ensure they are 'fairly' rewarded/compensated for ALL their time, effort,
sacrifice, risk, must receive a much larger share of the benefits when they
actually do succeed...than the other participants who had not invested the same
time, effort, risk, sacrifice e.g a worker paid a regular wage after leaving school,
taking little risk, making just enough effort to keep their position, taking no
exceptional risks at work, or in terms of in time dedicated to study / hit and miss
attempts at the business / living without income for years / decades to devote
themselves to study / training / travel / experimentation etc, is NOT justified in
demanding 'equal pay' for themselves and the entrepreneur...for if only one in 100
entrepreneurs succeeds, we must pay that one success AT LEAST 100 times the
average workers pay...or something along those lines...I suggest that
entrepreneurs, writers, musicians have their 'pay' back-dated to when they first
began trying to succeed at what they finally succeeded at...then adjusted for the
additional risk, effort, sacrifice etc implicit in working without any guaranteed of
reward...and then after enjoying the fruits of their success and being applauded
fairly for it, any excess should be placed in trust for them to live off while they
continue pursuing their art, craft, experiments etc and to be free to employ in
those experiments to cover the costs etc...for the future...i.e not be taxed unfairly
for hte one big hit they managed, after society had left them unrewarded for
years, decades before, and then will leave them just as unrewarded if they
continue pursuing their art / craft / experiments / business...it is a question of
allowing the most able the greatest access to resources for the benefit of
all...imposing some fair limits to personal consumption (while rewarding past
unrewarded effort risk sacrifice today and ensuring the continual efforts will be
rewarded with the trust fund)... but not allowing people to 'take advantage' of any
holistic inheritance i.e reward effort, time, risk, sacrifice Vs pure luck...

N.B today the private sector gain huge public financing for their projects, while
taking no real risk themselves...but then greedily assuming ownership of hte
profits (while leaving the failed venture debts to the taxpayer), loudly
proclaiming 'they deserve it', they have 'earned' it...'that is capitalism'...that is
NOT capitalism...that is crony capitalism...that is corruption...that is lobbyists
buying politicians as the employee puppets of their big business puppet
masters...the biggest business being finance...the banksters ultimately gaining
ownership of all the 'real' assets and businesses without ever adding any value,
ever 'earning' anything, ever 'producing' anything...
So the current system is definitely 'rigged' and 'corrupt'... a game in which a few cunning beneficiary class elites play off the masses against each other... so the masses gain nothing, and the elites gain everything... the games are not FUN... they are rarely generative / creative... they are not designed to be... they are designed with the interests of a very few in mind... the elites... the banksters... the Zionists... if you will allow me to be more precise in the face of the overwhelming conditioning propaganda you have been placed into a 'trance' with... the externalities of every action / decision favor these elites... no matter how hard it is for the average person to 'join the dots' between what is happening, and how the elites could possibly benefit from it... e.g. war for the average person is destructive, costing lives and money, and bringing nothing good... but of course if you own the corporations making the bombs, re-building the destroyed cities, operating on the maimed soldiers and civilians, and gaining control of the resources of the defeated 'enemies', you are going to enjoy HUGE profits... the elites don't have to worry about the masses saying 'no deal', 'we won't deal with you on your terms', because they own the govt that makes the laws... it is not a 'game' or a 'negotiation'... it is LAW... obey or go to jail, have all your property confiscated by 'the state', do slave labor in a work / FEMA camp, or be killed... THAT is the meta-game of the Zionists... THAT is the game you are 'playing' right now... is it fun?... can you decide NOT to play?... what will happen to you and your family... ??? Want a better game to play? I offer it to you... But do you really WANT a fair society? Or just to somehow get in good with the 'masters' so they will reward you, and maybe one day you can sit at their table and enjoy their 'good life' at the expense of the masses?

You can work out who is in control of any game by who 'wins'... who 'pays'... where the positive externalities a.k.a 'profits' end up, and where the burden of the negative externalities, the costs, the sacrifices, the risks, the health damage, the war suffering, the poverty, the environmental damage ends up i.e who lives with the negative outcomes and who enjoys the positive outcomes... sure, for a few decades there was real improvement in the wellbeing of many people... but this was just giving the slaves a false sense of promise, to trick them into believing the system was working for them, just long enough until the masters could put a bridle on the horse, chains around the ankles and wrists of the masses, and chains on their MINDS... soon the masters will come out laughing at us fools... by then there will be nothing the masses could do to oppose them... end-game... game over... guess who won?... is THAT the game you thought you were playing? probably, to be honest, only you somehow imagined you'd be at the table with the big boys, enjoying the benefits, and not down in the pit with the masses... or?... time to be honest... for 'as you do unto others, so shall it be...
done unto you...time to be honest with yourself...what sort of game do you REALLY want?...a fair one for all...or just a good deal for yourself and yours?...if so, you are going to lose, because you have a losing hand...it is time either to start a new meta-game and new meta rules, or accept that you have been 'hoisted by your own petard', and become the victim of a 'clever game' you expected to win and benefit from...

Key to NLP and negotiating / conflict resolution / daily interaction management is to be able to entertain / acknowledge conflicting viewpoints / positions and so be able to re-state each parties positions without 'agreeing' with either i.e to be able to 'entertain' the most extreme positions, seek to empathise with them / enter into their positions and see them as they do, and then re-state them in productive / generative / creative ways that might lead to solutions, or at least defuse dangerous / volatile / emotionally charged situations...

Rapport is key to all 'winning friends and influencing people' from sales, to mass trance, from the 'bedside manner' of an efficacious doctor, to the 'aura' of a 'Shaman'...sympatico...sympathy...convergence of words with all other forms of communication e.g body language, facial expression, tone of voice, rhythm of voice, timber of voice, warmth of expression, eyes, lips, posture,... must present a compelling / convergent / consistent / believable / emotionally convergent / 'product' i.e a 'whole'...

Build rapport by mirroring back posture, tone, and even words, without being too obvious...mirror their emotions and arguments, as if you are in agreement with them at some level...this works consciously (by agreeing on something) and unconsciously (by appearing to share the same emotion / mood / tone / feelings on the matter e.g 'this weather sucks' i.e it is bad (agreement on the 'facts') and you don't like it (agreement with feeling about this fact)...should be subtle enough not to be obvious...they must feel understood, and that you care too, and agree with them, before they will be willing to trust you and interact with you...as an
ally they can open up to, work with...rather than an opponent they need to defend from / keep secrets from etc...paraphrase their own arguments so they feel understood, and mirror their emotional investment in the 'facts' i.e 'before people will listen to what you have to say, they will have to believe you care about them'...never start out contradicting anyone...never attempt to correct someone from the get go...first mirror / empathise / gain rapport, and then gently 'lead' them in more productive / valid / generative directions...i.e start off angry at what they are angry at, and validate what you can of the facts, or at least re-iterative and paraphrase their grievances...once you have some rapport / trust you can start gently trying to get them to see alternative points of view, de-escalate the emotion ... like first becoming them, in all their fury and rage and anger, seeing the situation from their eyes, ears, and emotional center...then once you have 'entered into them' you can gently 'lead'...like literally entering into their body, matching it to gain entry, and then gently leading from the inside...Vs trying to force things from the outside...the key is that they feel understood, that their grievances have been heard, understood, felt, empathised with...that they have 'communicated' their position ...that you have 'heard' them...really...not just superficially...that you are 'on their side' or at least not their 'enemy'... ask anyone to whom the 'truth' has been denied about how it feels to be told 'no, your reality is NOT real'...especially victims of injustice...it is telling them ' it did NOT happen' , you have NOT suffered...imagine how that feels...being blamed for something you didn't do, being told that what someone else did to you did not happen...that your victimisers are nice people who wouldn't do such things, that you are either maliciously lying, a bad person, or mentally ill...for that is what it means to anyone in any situation to have someone leap in and trying to 'contain' or 'prevent' conflict without first gaining rapport, validating the reality of the situation with an open mind, taking no sides, looking for the truth rather than just defending your 'colleagues' or 'vested interest group'...people often think they have defused a conflict by denying it...all they have done is re-set the timer for a much larger explosion at a later date...or corrupted the entire system and dooming it to rot and crumble from within sometime in the future...

One way to let a client or other interlocutor to really feel that you ‘hear’ them, and understand, is to paraphrase them. Like you do to convince a university tutor that you have understood the material you have read. So paraphrase your client’s expressions back to them. If you want to increase your tips, as a waiter, then simply repeat back your customer’s request, as verbatim as possible. The feeling of being ‘heard’ is a powerful one. One that tends to lead customers to tip more heavily than they otherwise would have.

Paraphrasing also helps focus the client’s mind on their own thoughts and feelings. One way of entering trance is to become deeply absorbed in your own
feelings and thoughts. Like when reading a really captivating book or watching a really engrossing film. Or simply watching other people interacting. Anything that captures your fascination. Your attention. Anything that focusses your conscious mind on a very narrow area. Even a patient’s pain, or problems, can be a way to focus their mind. Better still, get them focused on something pleasant. Their own body. Their breathing. The pressure of the chair on their back. A pleasant warmth. A pleasant memory. Till they are totally absorbed in a narrow experience. Until their locus of attention becomes very narrow. Freeing up room for the creative unconscious to become active.

Teach client that they can control their own responses to situations. They do not need to experience frustration, irritation, anger, fear, or pain. They can dictate to their own mind how they want to feel and think. With practice. And develop new, more profitable, more creative, more productive and positive habits. They can move from fear to calm, from frustration to pleasant expectancy, from pain to pleasure, from oversensitivity to bliss.

Hyper vigilance is a sort of free floating fear or anxiety without any narrow focus…need to get client to focus on something …

Hyper awareness leads to tension…need to become more detached, relaxed…

Therapist must avoid own performance anxiety…i.e make it clear that it is not what they themselves say or do that leads to the outcomes, but what the person’s own unconscious mind does, when allowed…i.e therapist not responsible for outcomes…so no need to over exaggerated importance of what do or don’t do, say or don’t say…remain open to reading patient, and going with what works, and moving on from what doesn’t…

Time condensation is where you feel you have less time than you actually do, leading to frustration and irritation that things are going too slowly, that you need to achieve more, faster…things seem to be taking too long, leading to anxiety

Can induce trance by getting patient to intensely focus on current state of mind and feelings…to really focus on them…describe them…feel them
deeply…express current impressions from environment e.g what can see, smell, feel etc…even their emotional state…even focus on the tension in their own body, in their neck and shoulders…by ‘validating’ all these things, the therapist builds rapport…a shared reality…and trust… ‘they get me’…they validate me…they can understand me…we live in the same reality…we share the same reality…and thus communication is possible…the sharing of realities…of ideas and feelings…aim for an intense focus of all attention on this instant in time, this moment…right now…escape the chain of becoming…just BE…in the now…very Zen…very blissful…be here now…present…break the cycle…break the chain of becoming…be…now…here…escape history…be free to write your destiny…start afresh…be born again…now…

Hearing yourself repeated, your feelings validated, in another person’s words, produces a feeling of convergence…validation…as what you hear converges with what you feel and say…very powerful…

Magic is basically employing words and guestures to achieve a desired outcome…namshubs…NLP tools…the tone, rythm, style, positive expectations, authority of the actor, willingness of the participants to 'accept' i.e trance state equivalent to what was previously referred to as 'self-hypnosis' and 'hypnotic state' and 'susceptibility' etc…can sway, manipulate, suggest, lead, influence, convince people of something, including that they have been 'healed' or the 'shaman' has 'power', or to perceive actual reality in alternative way, or perceive things that are not present except in the imagination of the participants…i.e you can use NLP tools to enter the consciousness at a point between the sense organs and the brain centers where 'perceptions' are constructed from the input of the sense organs…i.e add or subtract from these inputs…while black magic works in opposite way i.e dark thoughts, moods, music, impressions, and negative self-talk, self-sabotage…n.b propaganda and marketing manipulate on both levels e.g construct fear of non-existent threats, make people feel vulnerable and weak and therefore needing 'protection' and 'security' from 'the state' etc…willing to give up privacy, freedom, lives, money, in return for this 'protection'…can direct at conscious and unconscious levels i.e construct actual real threats, but then build on them, extend them over time and space e.g blow up WTC then expand 'threat' to entire nation, every moment…
Ideal of NLP and all spiritual / zen ideas is to move towards, ever closer, to the person / being you'd chose to be if you had a magic wand / magic toolbox...affirms need to put own oxygen mask on first / take log out of own eye, before seeing to 'helping' others...idea of holistic / ecological approach i.e congruence of all parts, integrity of all actions / thoughts / being / seeing / doing / defining MHR this is weakest point of all systems i.e they must be applied to humans for whom integrity / principles / holistics / ecological thinking is alien and not even desired i.e people latch onto any 'promise of personal benefit' and shrink away from carrying any 'fair' share of any burden / cost / sacrifice...all wish to be free riders...opportunistic rather than committed to any principles...will become legalistic and always see own advantage as a 'special circumstance' deserving 'special exceptions to the rule'...so that soon any idealistic / principled / ecological / holistic principle becomes atomised, fragmented, legalistic, and the simple 'golden rule' becomes endless tomes of 'legal codes' written to allow 'loopholes' for 'special interests' and 'privileged groups' i.e written by and for the beneficiaries of the loopholes...soon any aware person bound to become cynical about 'law' and 'morality', seeing all the incongruities of the supposed 'principles'... an ethical principle can only guide us if all the parts of our systems re-inforce it...are mutually reinforcing, without 'exceptions' but always with compassion and goodwill...patience...but 'victims' are human and desire 'revenge' rather than 'justice'...and for each person, they and theirs are 'special' and 'more' deserving of 'justice' i.e case law, precise exceptions that grow and grow as more and more added...

integrity is the difference between a smoothly running motor and a messy, oily, smelly, useless heap of bits of metal...

Harmony of parts i.e all integrated into whole, produces 'ease'...Vs 'dis-ease' of internal inconsistency i.e same as 'compelling' arguments...incongruence / lack of integrity, dooms machine to destroying itself via friction and resistance...as it dooms a person to dis-ease and death, a social system to collapse ... at first appears as lack of efficiency in organism / organisation / system...then resistance of parts now no longer moving as a whole, in harmony with each other, lead to the machine destroying itself...to organism cannot fight off pathogens that are usually no threat to its survival and health...and the society ceases 'functioning' i.e the parts stop servicing each other, lubrication dries up, friction and grinding occur, parts break, other parts dependent upon them also break, and soon the entire system / machine grinds to a noisy halt... for a time the other parts can work harder and push harder and try to compensate, but the system was dependent upon internal co-operation and harmony, and the surviving
mechanisms cannot take up the strain for too long, they are over-burdened...like a noetic structure or belief system or society...double-binds emerge i.e conflicts between what people have been told is true, and what they experience...what is 'necessary' and what appears 'unnecessary', AND undesirable...cognitive dissonance emerges...people first deny the conflict of 'knowledge'/conditioning and their actual direct experience...or conflicting 'views' being expressed around them...e.g the government is there FOR us, vs the govt. is now our enemy...vaccines are to protect us VS they are being used as a vector/delivery system for pathogens / toxins etc...

where objectives / actions within a system are incompatible, they produce conflict, and strain and weaken the system...produce costs and reduce benefits...

Must remain open to new ideas, perspectives, views, points of view, and keep total system OPEN rather than dogmatic i.e to gradually adjust to new information rather than deny it, and try to push on despite it, merely delaying the need for change, and often delaying it till the conflict is so great that crises begin exploding...and so the change will occur, but at a much higher cost than it could have been dealt with if acknowledged earlier, dealt with, incorporated, accommodated i.e a re-adjustment of an existing whole, rather than a destruction of that existing whole at huge costs of suffering, losses, lost benefits, etc...and the requirement to build again from scratch...with every likelihood, due to a rigidity remaining from before, and a the notion of 'the end of history' and 'this is the perfection of society' and 'I am the last prophet', that the cycle will continue repeating...nothing having been learned from the earlier experiences...everything being blamed on a 'those ignorant past people' or a 'failure to properly execute otherwise valid principles correctly' i.e same old shit, new faces...it's not the idea but the execution that was to blame...some 'evil' people 'corrupted' an otherwise perfect system...so the same thing will happen over and over...with new beneficiary classes emerging, or just the same old ones, with new members...same old shit, new slave masters...

To have 'authority' and become 'trustworthy' 'rapport' must be built up / established / strengthened / continued / expanded in time and space e.g one 'miracle' or 'success' can be extended into a 'god-man' status...requires integrity of all parts i.e cannot risk sending any message / signal that contradicts 'authority' i.e figure must be seen to be right at all times in all contexts...perfect...your propaganda / marketing message must be consistent and 'perfect' i.e ads with perfect people, perfect weather, perfect solutions without any conflicts or
tensions or doubts e.g 'the end of history', a final solution ... the product or person being presented in the same context as the solution and by association becoming unconsciously linked to that solution, and hence one with it...finally appearing to be the solution incarnate...the saviour...the godman, the leader, the prophet, the messenger of angels/gods/spirits, ...

Focussing on outcomes leads to bridge between what is and what you want to be...i.e seek resources, act resourcefully and generatively to generate solutions / means to attaining outcomes i.e purposeful action...must define desired outcome so know when it is attained...and when moving in right direction i.e need to recognise each step in attainment, reward each step, break down objectives, so know when on right track, rewarded and motivated to continue especially when final desired outcome will take a lot of time, energy, resources, sacrifices, risks etc... once established desired outcome, visualise it in detail...describe it clearly and concretely...so all share this vision as if it is already attained...i.e program unconscious to attain it...then work backwards ... reverse engineer from it back to present...

Key to convincing others is first having convinced self, without reservations, without doubts, without unresolved conflicts e.g guilt of success / leaving others 'behind'...etc...so you have complete integrity in your presentation...leaving no question or doubts as to your own commitment to the vision i.e confidence will be radiated, infective...but any inconsistencies / doubts etc will tend to ruin the perfection...you will unconsciously express them in your gestures, tone, face, posture, words...must resolve internal conflicts first...overcome any personal internal resistances,

The map is not the terrain...all our ways of defining can never be more than metaphoric...we must accept this and embrace it...not imagine we can ever 'Know' anything with certainty...thus avoiding 'dogma' and rigidity in our ways of thinking, and responding to the moment / 'reality' as it appears...we must seek, as I wrote in T, to draw the best maps we can, compare our maps, seek to improve our maps, and never confusing a map with the terrain...never assuming 'the end of history', that we can have a 'final prophet' or 'the last word', or the 'definitive' answer to any question...i.e true Zen...open-mindedness...question of models and heuristics, and programming our unconscious to become more and more convergent with 'reality', with more optimal models and definitions, heuristics, best practise, modelling of best practise, definition of more optimal outcomes...without ever imagining we can 'pin down' reality, and 'end history' or
'have the final word' on anything...Dogma must be identified as such, and labelled, and we must all treat dogma with skepticism, finally rejecting the idea that we can 'know' anything with certainty...remaining open minded to conflicting / different ideas, flexible, able to re-shape our noetic systems, re-model our models, adjust our perceptions, admit our errors easily and willingly as a sign of strength rather than a show of weakness which our 'enemies' will readily exploit to their own advantage...

Better to decide what 'enough' is, than to continually seek out excessive satisfactions, and find yourself eternally dissatisfied, expecting to find 'happiness' at the 'next level' of the hierarch, pay scale, weight level, level of attainment or achievement, degree, job, promotion, home, partner, child, etc...

Our minds can temporarily store 7 +/- 2 items of information i.e memories...so try to 'chunk' data meaningfully so you get more information in those 5 to 9 items that can be easily recalled from short term memory...held in short term memory...i.e bigger chunks...more value in each chunk...can 'chunk down' from whole to parts, if store whole, rather than parts...or 'chunk sideways' by association i.e remember one thing that will, by association, lead you to easily recall all the associations...using simile, metaphor, analogy, free association...

For affirmative willing to be effective, it cannot be conflicted i.e conflict between desired outcomes, and externalities of those outcomes e.g you desire success, but fear harming others self-esteem, or desire a career, but fear harming your children...have to make sure you have actually resolved these conflicts positively i.e do not let them linger in non-conscious mind where they can sabotage you...e.g ensure you fail, so that the undesired / feared outcome associated in reality or imagination with the realisation of a desired outcome, is never realised...this relates to 'guilt' of outdoing own father, or neglecting own children, of 'shining too brightly', and other fears associated with 'fear of success'...

Once have goals can affirm whole-heartedly, and have resolved the potential conflicts of interest, vividly imagine having attained the desired state / condition / outcome, with every sense...and then reverse-engineer the final state back into steps, breaking down the objective into attainable sub-objectives...and whenever face obstacles, return to that vividly imagined state / condition / situation in your
mind, to re-invigorate you / motivate / give a boost...make the vision real and motivating...

Remember that people who don't make mistakes make nothing...and that you have not failed until you have given up...define mistakes / errors / setbacks / failures as positive feedback that is redirecting your energy / focus / attention ...

Be disciplined in acknowledging every small success in some concrete way...reward yourself...so you enjoy the process, and have many small satisfactions to look forward to along the way

Must always be convinced, without conflict of interests, with complete integrity, that what you are trying to achieve is worth achieving (the vividly imagined outcome as motivation), that you are worthy of achieving it, and that it is achievable....

The unconscious, all the processes that you do not consciously engage in, either verbally or in some other form, only works on Positives...this accounts for 'target obsession' in which drivers manage to hit a telegraph pole even though it takes up maybe 5% of the space the car is moving towards...i.e when you focus on what you DON'T want, i.e imagine hitting the pole, and tell yourself NOT to hit it, the unconscious, which is responsible for co-ordination ALL our physical actions (just try to consciously manipulate the fingers of your hand, and don't confuse willing the action with performing the action...like a boss telling their workers what to do...) only 'hears' and 'sees' 'pole'...it does not understand Do NOT hit the pole...it is being fed only 'Pole' Pole...hitting pole...and so key to NLP is that we must frame all our thoughts in the positive i.e what WANT, rather than what do NOT want...like Buddha suggesting we replace negative thoughts with positive ones, rather than trying to deliberately erase negative thoughts i.e displace negative with positive, rather than trying to stop, avoid negative...e.g don't think 'I will stop smoking', rather think 'I will be healthy' and 'I will take a walk or listen to some great music when I need some satisfaction / a break from work i.e replace one pleasurable desired activity with another one...framing all desires in the Positive...what you DO want...not what you DON'T want...so that you don't confuse your unconscious mind with images and outcomes you do NOT want...
In sales they train you to 'overcome objectives' of the potential buyer...you need to do this with yourself...to ensure you are not conflicted...i.e you want to do something which would take you away from your children for some time...you feel guilt at this ... this is an objective you must overcome...find a solution that allows you to achieve your ends, without sacrificing your children , losing satisfying family time or relationship time...make a realistic plan of how to optimise...to ensure you get the best of both worlds...you can't have everything, but you can find the optimal which allows you to satisfy conflicting desires...and produce a positive sum game from the conflict i.e externalities that are desirable and undesirable exist in all decisions...

Make the positive affirmation that 'I am becoming more and more like what I want to be...I am getting closer and closer to where I want to be...rather than feeling depressed because your goal seems so far away...break down the climb into stages, and reward yourself and celebrate your achievement of each stage along the way...

Buddha spoke of 'remembering' rather than 'learning'... NLP talks of acting as if you have already attained the desire, and feeling all the positive associated feelings...and thus programming your mind to generate all the requirements for attaining the condition in reality...like deliberately trying to march ends up with you 'square gaiting', and worrying too much ruins your performance (stage fright), or overthinking something ruins it, or has you missing a 'shot' you can easily make when you are relaxed and let your unconscious muscle memory do the work for you...you can sabotage your unconscious...confusing it with negative and positive desires, fears and hopes...it cannot distinguish between the two...it exists 'beyond good and evil'...it does not know the difference between the images you construct for it...it just sees the images...it does not understand NO, and DON'T, and BAD...if you fixate on the pole, you will hit it...so fixate on the gaps between the poles... in everyday life this means always thinking in the positive...not being a mindless optimist and lying...but finding the positive way to frame any thought. e.g I hate this noise Vs I love it when it is quiet, how can I get some quiet around here...I failed Vs I learned what does NOT work and can now change my approach or 'I gained some valuable experience which I can employ towards getting what I am aiming for'... i.e always be authentic, don't pretend you love your noisy neighbour, or love failing...don't distort reality...be real...just find the positive way to respond to things, rather than knee-jerk frustration / irritation / negative / destructive reactions...
You have to program yourself to believe in yourself...in your aims...in their value...in their desirability...in their attainability, for your unconscious to believe in it, and to accept that you really do want it...so you cannot be conflicted...send clear messages...I will get that job / promotion / diploma, and I will ensure I have time for my family by doing X and Y...then the unconscious is clear that it is good and desirable and not confused...like rubbing a puppy's face in the mess it has left, the unconscious has no idea of BAD...better to reward the puppy any time it does it's business where you want it to...animals are more unconscious than we are, so think of that puppy when you are neurolinguistically programming your own unconscious for success...

You cannot afford self-deception...it will fail...you must be honest about your goals, the costs, the benefits, how you will deal with any undesirable consequences...convince yourself that it is good and do-able...you must eliminate all forms of cognitive dissonance i.e conflict between what you are doing and thinking and the goal...

NLP originated from attempts to find out how successful people became successful, their habits of mind and action, in order to model them, so that others could copy these habits, and attain the same success...e.g achieving the same level of ability in a sport, business, or your romantic life...the idea that some people are 'born naturals' and that if we pay close attention to what they do, how they do it, how they think, their daily habits, etc, we can all model our own behaviors on them, and, through work and effort and application, achieve the same levels of success in whatever field e.g sporting ability, sales, winning friends and influencing people, business, etc etc...

But NLP also encourages us to use our own previous successes as models...if we achieved the desired outcome once, how did we do it? How are we doing it differently this time? What did we do the times we were successful? or felt happy? or felt satisfied? And then model our behavior on our 'hits', making those behaviors habitual...like Plato / Socrates, disciplining ourselves to learn and practise good 'habits' a.k.a 'ethics' i.e behaviors and ways of doing and seeing and being that produce desirable states / outcomes / conditions / relationships...

Note that many people from working class backgrounds have been conditioned and even explicitly told not to brag, not to express joy at their own achievement
or good fortune, for fear of offending others, arousing envy, and the malice of their peers... the idea that a tall poppy / tall timber casts a shadow on those around them... blocks out the sun for all... makes others feel inferior, damaging their self-esteem... etc... so many of us are conflicted about success... sabotaging ourselves unconsciously... for we have conditioned our unconscious mind into an aversion to success, for fear of the negative consequences of envy, etc etc... even of 'harming' others by succeeding... Freud saw this fear of being more successful as your own father as a basis for sons sabotaging their own success, unconsciously... or at best feeling consciously conflicted about success, without understanding the basis of it... it reduces to the infantile desire to 'replace' the father in his role as the mother's lover a.k.a Oedipus complex... and thus unconsciously is associated with murdering the father... which the unconscious will avoid by sabotaging the son's success... so those of us from such backgrounds where success is frowned upon at some level, have to re-program our unconscious... and consider that while bragging about our own success may be in bad taste, and potential harm others, that does not mean we are obliged to put ourselves down, or exaggerate our weaknesses / failures...

The origin of the word 'Education' is from 'Eduso', meaning 'to draw out'... akin to the Buddhist idea of 'remembering' Vs 'learning'...

NLP recongnises TROONATNOOR... that we construct all our meanings... that some objective reality exists, but that is is merely the ingredients we combine to form our own subjective experiences... our subjective and social realities... and thus ALL LANGUAGE IS METAPHOR... we can NEVER describe objective reality... we say and feel that is is so and so... we consider all things metaphorically... we must always keep this in mind... we can only relate to our own perceptions, feelings, pleasure, pain, affects, emotions... we must try to empathise with others views / experiences of the world... and never dismiss those that conflict with our own, out of hand, just because we cannot relate to them... we must seek to relate to them... and know that we can change both ours and theirs... this is the basis of NLP... to construct more positive personal and social meanings / relationships / ways of being and seeing and doing...

NLP distinguishes between binary (digital) and analog... binary is either or, Vs analog which is '50 shades of grey' i.e a continuum, flowing, smooth, constant Vs discrete moments / locations / properties... we have to operate in the analog... and avoid the binary... as Nietzsche would say 'move beyond good and evil'... the apple in the Eden story fixated us with ideas of good and evil which do not occur
in nature, but only in our own minds / emotions...i.e good is pleasure, and that associate with it...bad is pain and that associated with it...

Digital/Binary is made up of zeros and ones, presence and absence, something and nothing, either / or...we all know that films are made up of still frames, and yet we allow ourselves to perceive flowing, continuous move-ies...many of us know that digital recordings are made up of discrete 'samples' of a waveform at a particular time in its development, or that our computer images are made up of discrete pixels and visual 'samples'...rather than being continuous...a major question for philosophy / mathematics / science is whether we can reduce any analog continuum down to a 'smallest unit'...memory is key to our experience...short-term memory...and long term...to recall where something WAS is key to the idea of movement, it now being somewhere ELSE...but how does it get from A to B? What is the smallest unit of time? of movement? of space? is there one?

We perceive change...and we perceive it as continuous, when in fact all our recording and reproduction techniques involve breaking down analog continuities into discrete, dis-continous 'samples', whether as frames in old analog film, seconds on a clock, or 'samples' in the digital age.

We need to develop 'safe rooms' in our own minds...by vividly imagining / recalling states of mind that are desirable e.g favorite memories of times you were happy and felt free and calm...or imagining future ones...so vividly, as a matter of habit, that at any moment you can recall them, with all their associated muscle memories, and thus remove yourself from a negative mindset to that positive one...during moments of stress / irritation / frustration and even crises, like the buddhist monks on fire, but perfectly calm...these joyful 'places' can then be entered at will, no matter what the external environment or 'objective' reality...for in reality all we 'know' and 'feel' as 'real' is subjective...inside our minds...and we can use this knowlege to our advantage, rather than disadvantage...first we must replace negative 'unsafe rooms' in our minds house, with positive, safe rooms...by reprogramming our unconscious...to break old cycles that are destructive and self-defeating...those learned in infancy...for those of us unfortunate enough to have had less than ideal early experiences of life, and others, which programmed us to see ourselves and the world in sub-optimal ways...in this sense NLP is RE-programming...and learning how to optimally positively program our next generations...
Even a steamroller can kill you, slow as it is…first it ‘fixes’ you on the spot with awe / fear / terror…catching you in a ‘trance state’…distracting you from the obvious need to move…then it has an item of clothing, and you cannot escape…then slowly it crushes you

Currently dysfunction symptom (in context of present situation), was in fact (the best, at the time) functional response to a past situation…the situation has changed, but the ‘symptom’… the ‘response’ which has become a habit…remains…and has become, reflexive of the changed situation…dysfunctional…remind self ‘you survived that’…but now situation changed…regress to time before the ‘situation’ arose…then work through that situation with all the resources you now have, as an adult, and with the tools and awareness, the ‘potential responses’, now available to you…re-live and work through that past interaction / situation with more successful strategies…don’t blame ‘actors’…in fact empower the actors whose actions so damaging to you with the same resources, so that when you re-live the experience, this time THEY also behave more functionally, appropriately, and so you now have a positive outcome … and so ‘flush out’ the engram…or more importantly, as a Buddhist would say, ‘REPLACE’ the negative engram with a positive one…one which is a resource rather than a liability…an asset…a history of success to build on…reverse its charge / valency from negative to positive…and become the person you would have been, had you and the other actors had the resources they had then lacked…communication skills…understandings…educations…etc…

In any case must recognize that you survived…you are here now…so your response was functional…just not optimal…so re-define what you define as a ‘failure’ on your part, as in fact proof of your ability to survive, to overcome…you are a survivor, and not a victim…you are a success, and not a failure… but now you have more optimal tools, resources, understandings, and ‘habits’ to replace the ones that let you ‘survive’, in their ‘Beta’ stage, but which you can now safely update to a more optimal ‘You 2.0’.

Mirror a ‘patient’s’ breathing pattern at first, then subtly ‘lead’ them to a more optimal breathing pattern of relaxation…

We all have a basic need to feel we have been ‘heard’…to express ourselves…no longer alone…that we can express our genuine, authentic self, and still experience approval and acceptance…. We harbor unconscious fear of rejection and abandonment…loss of face…loss of status…loss of benefits of social
interaction... ideally we will experience validation / agreement ... so therapist must first enter into the other...experience interaction from their p.o.v, validate it from this position, understand it...empathise with patient...so now in position to tailor insights towards how they experienced, and experience, the world...now in position to actually communicate... ‘validation’ of their experience is about ‘entertaining’ their p.o.v as valid...giving their p.o.v a real chance at being ‘reality’...never dismissing it no matter how bizarre it appears in relation to your own experience...entertain rather than believe...suspend disbelief...be on their side...see it as they see it...entertain their own definitions, emotions, responses, ways of interpreting and experiencing what they are sharing...validate the reality of their experience for them, rather than imply they are distorting, lying, cheating, manipulating, spinning, from the get go...need to get in step with them...let them feel ‘heard’ and validated, and still approved and accepted...like mirroring breathing, posture, tone of voice, how loud or soft they speak, their agitation/excitement/anger/frustration/irritation... then gradually lead into more productive, positive, generative alternatives, by offering resources, skills, insights...

Trance is a natural extension of daydreaming, getting lost in a reverie, a fugue, being totally distracted from the previous chain of existence so that you exist outside of it ... very Zen...mindlessness...emptiness...so focused on something of interest that you lose all sense of ‘self’ and ‘history’... therapeutic trance is about deliberately constructing/choreographing such moments so the patient can escape a ‘negative cycle’, to ‘de-potentiate’ the current dysfunctional ways of being and seeing...to break the cycle...break a dysfunctional habit...and introduce new, more functional, positive, productive, generative habits... in this state, the unconscious is free to remodel the mind...you can access the power of the unconscious...you’ve broken the continuum...formed a ‘free space’ where anything can happen...something different...rather than continually reproduce the old cycles...the old habits...the old definitions...the old ways of being and seeing...often this is why a genuine ‘crisis’ in someone’s life proves to be the positive turning point in their lives...it pushes them to give up the old and, as the old doesn’t work...forcing them to consider something new...to try something new...to take a leap into the unknown...

Fear of this unknown usually makes the known more acceptable, tolerable...better the devil you know? ...we often hand onto past bad habits for fear of the unknown...also the habit, the neurotic, psycho-somatic symptom may have originally brought with it positive outcomes, like the attention of our parents, or avoidance of something unpleasant / undesirable...like being sick forces parents to pay attention to you, and gets you out of a school exam, or some event you don’t want to participate in...even being overweight and so on can be
an unconscious avoidance strategy...we need to ensure any changes we seek to make integrate well...are consistent...e.g. we will need to overcome a fear of being sexually attractive before dealing with any weight issues...or are we punishing ourselves for some perceived sin of the past by making ourselves unattractive?... And what if we have clung to the hope that 'when I'm slender, everything will be great', and fear testing this belief...what if after I'm slender, I still feel this crap...I will have lost that hope I once had, that I had clung to...the light at the end of the tunnel that made life bearable...tolerable...gave me hope...then I would be completely hopeless...what if my problems are much bigger, even more unmanageable...if I remain overweight I won't have to face that situation...

Therapeutic trance is evolution of 'hypnosis'. Not the same thing. Hypnosis misunderstood by most people.

Have to be warned about 'false memories' being produced by 'suggestions' from the therapist... 'leading questions'... desire to please therapist by 'agreeing' and then later 'believing'...

Patient is always in control...they decide when and if and how deeply to enter a trance...therapist is there to facilitate the patient into entering a trance, so their own unconscious can work its magic...nothing can happen without the patient's agreement...it is not what the therapist says or does that determines the outcome, but the patient's own unconscious mind...the patient is at all times free to accept or reject the therapists suggestions...it works only with the patients consent...reassert patient of this fact...they will do nothing they don't unconsciously want to do...no need to fear abuse / mind control ???

MHR have to generate expectations of success... faith in power of own unconscious mind to generate unexpected / novel, successful, positive outcomes for self...have to give patient belief in power of unconscious mind...so use 'tricks' to 'prove' or 'establish' this as fact...as belief...tell therapeutic stories / full of therapeutic metaphors... in which the narrative demonstrates the power of the unconscious to achieve dramatic results...reveal nature of mind itself...e.g. how two different 'personalities' in a 'split personality' person will experience the world differently, e.g where one has allergy to a thing the other not allergic too...i.e establish power of unconscious to work without conscious awareness of
what it does, or understanding how it does it…that belief in the efficacy of something often, ‘magically’, produces the desired outcome e.g placebo effects…30% of people will respond to a sugar tablet as if given morphine…and a certain percentage of people won’t respond to actual morphine, as they don’t ‘believe’ it will work for them??

The process is the outcome…no Zen masters, only Zen practitioners…ethics is about optimal habits…reproducing more optimal habits…replacing sub-optimal habits with new, more optimal ones…habits of thought e.g beliefs, self-talk, definitions of good and bad etc…habits of actions…in both cases often unconscious and once made conscious of, brought to your attention, e.g you don’t pronounce ‘th’, you say ‘f’…empowered to replace old habit with new habit…make a new thought, definition, way of being and seeing, and acting, habitual…unconscious…like a sportsperson learning a more optimal way to hit a ball, pass a ball, kick a ball…so that it becomes a new, more optimal, habit…learning habits of successful people…more efficacious people…happier people…more capable / resourceful / creative people…

To determine if a person is more kinetic (touchy feely) or affective (emotional) or logical-rational, or auditory, or visual, … etc…listen to how they describe things…their posture…their ‘accessing cues’…what senses appear to dominate their recollections of past events…what makes something more or less ‘real’ for them…get them to compare something everyday and normal that they are sure happened…like this morning they shaved…and compare that with something they only imagined…like this morning they shaved…and compare that with something they only imagined…keep that imagined action within the range of normal, likely, common, consistent (with their normal lives, personality etc)…so if they wouldn’t normally do X, don’t ask them to imagine that…get them to imagine something that could easily have really happened, but didn’t…e.g imagine that they had a third cup of coffee this morning (if they often do that, but in fact didn’t, this morning)…and then watch them as they ‘remember’ / ‘recall’ the real and the imagined…and ask them what makes the recollection of one seem more real than the other e.g lack of smell recall, lack of recall of heat…i.e one ‘memory’ is only visual, without any other sensory recalls…whereas other full of details like heat, taste, smell, burn’t tongue on coffee, felt good…worried about having to use a toilet on the way to work etc…now you can establish which senses dominate this person…which you can appeal to most strongly to unprogram dysfunctional habits of thought, behavior, response etc, and then to re-program with more functional / generative ones…to allow unconscious mind to do this… Once you have established their dominant way of perceiving the world,
you can tailor your communications to this dominant sense…e.g when they imagine music, do they hear it, or imagine a dancer? …

All this is to develop ‘rapport’ or ‘empathy’ with the client…to gain their trust…to make them ‘open’ to what you have to say…open to the ideas you suggest…it will be up to them to choose which ideas / suggestions to act on / accept…but first you need to break the constant stream of the past habitual, unconscious behavior / thought / emotions…

(MHR use world client rather than patient, as doesn’t have that power assumption i.e doctor patient, passive active, master servant…

Communication is about ‘sharing’ ideas and experiences, as far as possible…so the idea / feeling / impression in one mind is mirrored in the other’s mind…shared…in common…

‘Tells’ are visual cues gamblers use to tell if someone is bluffing…and unconscious action a person takes, such as rubbing left ear, when they are bluffing…a ‘False tell’ is where you try to fake such a ‘tell’, consciously, leading the other to believe that action is unconscious, and that you are unaware of it. You never want another gambler to know about their own ‘tells’.

So current symptom, at time it emerged, actually reflected the best coping mechanism the client’s unconscious mind could come up with at that time of early development i.e this is why early childhood, and stressful times of puberty, most ‘fertile’ source of unconscious habits…a.k.a ‘symptoms’ such as ‘phobias’…so try to identify in what way a current dysfunctional habit of thinking, feeling, or behaving may have been a functional (if not optimal) response to some critical crisis experience during a person’s formative years…when they were developing their unconscious ways of dealing with life…their unconscious ‘habits’…note that we tend to rationalize our ‘habits’ and that these conscious rationalisations are often way off the mark…and that even ‘memories’ can be ‘veils’ our unconsciousness erected to prevent an experience from overwhelming its (then current) capacity for processing it / dealing with it…expressing it…so we cannot trust our initial ‘feelings’ about a ‘memory’…

Child may resist over-controlling parents by refusing to eat…the only ‘resistance’ open to it at the time…at time it was a solution…offered sense of ‘independence’ from parent’s control…which is healthy in general…but if parents don’t allow a
child to express this healthy impulse in healthy/positive ways e.g. by choosing own clothing, own food, own friends, own school subjects, own interests, own religion etc... then the child may be forced to express this otherwise healthy stage of growth by refusing to eat... as this is the only possible form of 'rebellion' and establishment of a personal, independent 'self'... and the person can get 'stuck' in this adolescent stage of emotional development, (a.k.a 'arrested development) and retain the 'rebellion' in the form of anorexia, without being conscious of this motive/ reason for their eating disorder... by regressing to the point before this rebellious habit was established, and dealing with the problem more creatively (re-living it with new communication skills, and new skills given to parents in the re-creation), the person can be freed from that 'engram'... they can 'unstick' their emotional development, and allow it to continue... requires 'age regression therapy' to return to the source of the problem, and deal with it, with the therapists help, new tools, from a position of strength and safety... at time they got stuck... didn't have the tools required... the support required... the insights... but now they can return, and this time resolve the conflict more optimally, more creatively... more successfully... and move on with their emotional growth... find more optimal ways of dealing with such situations of 'control' in current life... i.e. may be trying to assert control over new factors in own life, and the eating disorder re-appears from nowhere... as the 'old' coping strategy... the old response... the old way of dealing with self-assertion... like the old way of 'being sick meant I didn't have to do something I didn't want to do, and got my parents to pay attention', can suddenly re-appear at a stressful moment in later life, as a response/attempt to achieve the same things e.g. get partner to pay attention, avoid job hate i.e. get sick as unconscious avoidance strategy, and way to get attention/affection/love etc...

The symptoms that re-appear later in life can be seen as the unconscious mind's way of trying to resolve that crisis, now at a later time when it feels that the conscious mind has the resources and safety required to face the old demons...

So we regress back to a time before the trauma occurred, to which the current symptoms/habits were a response... Therapist can even enter into the experience as a new actor who was not present before... someone who they can turn to for advice... can establish a 'relationship' from much earlier than the trauma took place, as in the case of the now famous, 'February man'.

Hypernesia is where you remember things in too great a detail e.g. hold a grudge for a long time for something petty... obsess over a past 'failure' e.g. you got your period in a public place, or you did something really embarrassing i.e. a 'fail', so that it appears hugely more important than it really was, and you assume
everyone present noticed every little detail, and felt as badly about it as you did
i.e overestimated the ‘sanction’ and ‘shame’ and ‘embarassment’ attached to the
event i.e hypersensitive to rejection / abandonment i.e assume everyone noticed
and cared and rejected you for it…building up the incident to be huge, when most
people probably didn’t even notice… like square gaiting, when you feel all eyes
are on you, critically waiting for you to fail…so cannot walk ‘naturally’…cannot
focus on anything, overwhelmed by fear of failure/ embarassment…everyone
watching and waiting for you to fail…can become fixated with an experience,
attaching much too much importance to it…to every little mistake or
imperfection…as if others noticing, taking account, and maliciously ready to ‘cut
you down’…pre-occupation or obsession with particular incident or even
physical attribute e.g large nose, big butt…mannerism or flaw in appearance /
demeanour / skill etc…

Opposite is amnesia, where you are completely unaware of something that is real
and present. Like overlooking your keys…you can’t find them…or your
sunglasses that you are already wearing, or put on your head…you don’t see what
is there

Then there are positive hallucinations, where you see things that are not there.
For example you construct a ‘girl’ from the ‘gestalt’ of a curtain in a window…

There are degrees of all these, where you obsess over some detail no-one else
notices, or exaggerate the importance of something, or only vaguely notice
something, or interpret things incorrectly…

Trance induction is about focusing a person’s attention on something so deeply
they are distracted from all their habitual, current, previous thoughts and
ideation…By limiting their attention to a narrow focus, all other thoughts and
attendings are displaced…replaced by the very narrow attention…thus breaking
the continuity of the past…breaking the cycles…escaping the past…allowing
room to begin constructing a new future, in the present…rather than merely
reproducing the cycles of the past…the past ways of being and seeing, of
defining and acting…to break with the past…to break negative, destructive
cycles…to give the person a chance at something new…to free their mind of the
prison of past limitations…to allow the person’s unconscious mind a chance to
show its resourcefulness…to open a door for change…to allow something new to
enter from the unconscious…to offer alternatives…to consider new ideas and
ways of interacting … to open the parachute and slow our descent…to give our
wings a chance to unfold, now that the air pressure is reduced enough to allow
this…to spread our winds and fly…to empty our mind of all the baggage that has
weighed us down…to get off the freeway to destruction … to take the off-ramp to the scenic tour…the side-roads…to relax…to take a break…to re-consider our options…to consider new resources…new approaches…to reject old, sub-optimal habits, and begin forming new, more optimal, more productive, more generative, more creative habits…habits of thought and action…habits of emotion…

What if a difficult birth made conserving your breath a matter of life or death…you were born blue…then later in life, in moments of stress, you don’t breathe deeply…you get migraines… you struggle … you react to future stress by struggling, and not breathing, and you get stress migraines etc…or maybe the only time your mother ever caressed you was when you had a flu, and could barely breathe, and she came to you and rubbed ‘Denco-rub’ on your chest. And that was the only memory you have of your mother ever showing any affection towards you?

Build up expectancy of success i.e faith in efficacy of process, by telling stories of other people’s success…either directly or by analogy, metaphor etc…i.e target unconscious mind with metaphors and stories which distract the conscious mind and thus allow the conscious mind more room to act…and side-step the conscious minds rejection of the idea of the efficacy of the process…i.e do not try to convince the conscious mind…it has so many ‘objections’…don’t try to overcome them…don’t try to storm the castle…appeal to the unconscious…awake the dragons under the castle…

So a story, a metaphor, a myth, a legend, can all appeal to the unconscious and produce positive results, without ever engaging the possible resistance of the unconscious mind. It never gets a chance to oppose. To formulate resistance. To ‘object’.

We condition the conscious mind with stories which indirectly impress upon it the efficacy of the unconscious. ‘How do you manage the complex set of movements required to walk upright?’ i.e reveal how most of our actions are extremely complex, and over-thinking often leads to ‘square-gating’ i.e our conscious actions getting in the way of our unconscious achieving the goals we set it.

Impress how unconscious only deals in ‘positives’. ‘Target obsession’ is where we focus on what we do NOT want to happen. But our unconscious only sees the image we are forming of what we don’t want to happen, and thus realises it…and so we hit the telegraph pole, rather than the much larger gap between the
poles...so we have to learn to re-formulate all our ‘desires’ as positives i.e the state we DO want to experience, rather than the state we want to ‘avoid’.

Use Buddhist notion of ‘replacement’ / ‘displacement’ of a negative with a positive i.e don’t think ‘I don’t want X’, think in terms of what you do want i.e ‘I want Y’. So replace a negative ideation with a positive one. Replace the imagined feared outcome with a desirable outcome. Something you would want for yourself or others, or for an outcome.

Replace the desire for food pleasure with some other form of pleasure. Don’t program your mind by saying ‘Don’t eat’, as all your unconscious can recognize is the ‘Eat’, and you will feel hungry. Think ‘Do exercise’. Imagine yourself happily walking, feeling fit and healthy. Imagine yourself enjoying a good book, movie, game with friends, a nice relaxing bath, an exciting masturbation session. Don’t make any of your ‘pleasures’ dependent on others. They will be more convincing and motivating if they are completely within your own power to enjoy. Not dependent on outside factors.

Consider that if your mind can produce ‘phantom pain’ in a non-existent limb, then it can produce phantom pleasure.

If your mind can produce stress in your neck, then it can produce a pleasant feeling in your foot. Or if you are convinced you must experience some sort of pain, then experience it somewhere most convenient. So when you are at the dentist, your hand becomes very sensitive, and experiences a little pain, but not your mouth or teeth. A discomfort much easier to deal with, and much less threatening.

Our experience of time is subjective. We have all experienced time expansion (when we are bored, or fearfully awaiting something), and time dilation (when we are having so much fun that time just ‘flies’).

One strategy for dealing with boredom is to immerse yourself deeply in imagining, with all your senses, a time when you were totally inert, such as laying in the warm sun on the beach, but felt really good about this inertia. So that you transform your negative associations with waiting, such as frustration, and irritation, into pleasurable ones of pleasurable relaxation.

Note that relaxation is not a pre-requisite to trance. People can fall into a trance due to extreme stress, such as a mother seeing her child in danger, and achieving normally impossible feats of strength and endurance. Like cats racing into the inferno of a burning building to rescue her kittens, even as her fur and flesh are
burning. Or a frustrated car driver stuck in traffic, who enters a fugue of road rage, forgetting themselves entirely, being lost in their rage and irritation.

Or the motorcycle racer pushing the limits of their machine, and entering a ‘zen’ moment that lasts forever, forgetting everything except the feeling of being one with the machine, and the actions they are engaged in.

In battle soldiers often report observing themselves in a trance, not really feeling part of the action, until they ‘come to’, during heavy bombardments and the like. Or carrying out acts of extreme ‘bravery’ without any thought. Acting as the expression of their pure will. Often achieving physical feats beyond what they or anyone else could have expected.

The patient is responsible for the trance…an ever deepening trance…not the therapist…teach them to do it themselves…

During therapy, always turn anything the client reveals to their advantage…spin as a ‘strength’ or ‘positive sign’, reassure that ‘this is a great sign’, that ‘this is a good thing’, ‘this is really on our side’, ‘this is a good sign for you’. Set up positive expectancy of success…and self-fulfilling prophecy…note that we are aiming to open up the conscious mind to change, and to stimulate the unconscious mind to produce that change…leaving it in the hands of the unconscious, which is responsible for all our actions…also such positive expectations open up client to trance induction.

Can begin therapy using pre-written scripts that have worked with other patients…use as resource…to ‘seed’ a trance …en-trance client by making the metaphors and stories you offer relevant to client’s interests and situation…can use ancient myths, current movies, real stories, made up stories…draw them in with a rhythmic cadence and inviting tone…speak of ‘forks in the road’ where there is a chance to change the path the client has been on…new opportunities calling for new strategies…involve them as hero of own story…the stories directed to unconscious…stimulating it, encouraging it, to seek out new strategies…stories about ‘others’ really about ‘us’…universal archetypes…speak to us through tales of ‘others’…legends, parables, fairy tales, funny stories, jokes, poems, songs…unspoken sub-text matched to the patient’s symptoms…can have sexual connotations while on surface being prosaic / unthreatening i.e target sexual related condition / neuroses without appearing to be talking about sex, to avoid conscious mind rejecting / denying out of hand i.e it is the repression of
some taboo sexual desire that is producing the symptom, so cannot directly speak to that sexual desire, so use jokes, double entendres, innuendo, associations e.g. ‘hand’, and ‘touch’ relate to masturbation etc… ‘fish’ and ‘water’ etc relate to sexual arousal of female…use free association…try to access all sexual associations without mentioning sex…

Must encourage client to have confidence in power of unconscious to solve problems…to heal…so use ‘trick’s to demonstrate power of unconscious e.g hand levitation, ‘hand glove anaesthesia’…once client has experienced power of unconscious to numb a hand, they are open to putting their faith in it to ‘cure’ their symptoms / solve their problems…self-fulfilling prophecy and placebo fx producing confidence in outcomes…e.g quite smoking, control weight (girth control pills)…

Cataleptic = stuck…arrested development…remain at the emotional age associated with a traumatic event …

Client’s natural resistance due to reassurance/comfort/security of the known Vs the unknown…fear of change / threat / challenge / discomfort of new… even if current situation dysfunctional…better the devil you know…

Offer client illusion of control / freedom / choice

Pacing / mirroring…discover their dominant sensory impression and focus on that level…mirror breathing, swallowing, posture, use the sort of metaphors appropriate to their interests e.g. sport, music, politics, religion, for framing of analogies, metaphors…

Reinforce rapport…feeling that ‘you get them’…you understand them…you hear them…

Intuition is about getting into-it…

Anxiety due to fear that don’t have enough time, resources, i.e fear failure

Can use pre-written scripts, even read from…sometimes appropriate to seek their permission, and other times to authoritatively instruct….

Get client to recognize when symptoms emerging, and to form new habit of having this recognition trigger automatic breathing exercises and visualization exercises etc…practice exercises…make even forgetting/ failing to do them a good sign i.e awareness / remembering, even if too late, proof that you are making progress i.e about becoming zen practitioner, not ‘master’…make sure client understands it is about forming new, good habits, and not about perfection…no ‘mastery’ in this world…only the impeccable intention and
constant practice of new habits…till become habitual, and replace / displace old dysfunctional reactions with new, more optimal, more creative, positive responses…which in time become the NEW reaction…automatic…have faith in unconscious…once you’ve modelled what want from unconscious…and ensure it is realistic and you have eliminated all ecological conflicts i.e that your total has integrity of parts…all consistent…cannot fight self i.e must acknowledge costs and benefits…of current symptoms, and of eliminating them…e.g if serve avoidance / attention functions, won’t really be committed to eliminating them, until you work through your avoidance / attention issues…

Use metaphors, images, etc appropriate to client’s interests and dominant way of perceiving world e.g tactile, visual, auditory, i.e dominant sense perception…so as vivid and real to client as possible…keep all ‘instructions’ to unconscious positive…what DO want…never in terms of negative i.e what DON’T want re: target obsession…

To ensure initial ‘success’ choose predictions / programs that are inevitable outcomes … so can build upon…increase confidence in efficacy of unconscious mind…and expectations of future success…of NLP…increase faith in own power of own unconscious mind…in own resources…in resourcefulness of unconscious…produce self-fulfilling prophecy/placebo effects…which increase client’s commitment to process…to participating actively…to vividly experiencing future states desired in imagination, and thus providing unconscious with clear, vivid, real instructions / program to realise…thus therapist implants / suggests easy / inevitable / predictable / open-ended / vague / general / baby steps, so to-be-expected experience in future can be interpreted as a ‘success’, as a ‘realisation’ of the NLP…as proof of the efficacy of the NLP process…so focus on expectation of marginal improvements e.g 1% which client can easily ‘spin’ out of own experience…provide with history of successes…give sense of own power to break cycles of past…to begin displacing / replacing old with new habits…

Awe / dumbstruck / shock etc produces momentary trance…like a joke…the pause before the laughter begins, as the client ‘gets’ the joke…

Symptoms often avoidance strategy, to give concrete, objective excuse to avoid what fear … so have to work out what fear … what you are trying to avoid, by experiencing a particular symptom…and find alternative ways to avoid it, or
courage and resources to face what fear…even fear of success…of losing friends…of doing better than own parents…

Work out what ‘symptom’ is communicating…what it reflects…what it is a ‘solution’ to…self-punishment?…avoidance?…attention? … then use as trigger to identify, and face, real problem…often trauma earlier in life…current symptoms represent habit formed at that time in response to trauma…way of dealing with…or of avoidance, gaining attention, or punishing self for guilt…find what feel guilty about…challenge validity of guilt given current understanding and resources…e.g. sexual guilt, fear of out-shining friends, family, own father etc…

Aim to ‘regress’ to the original ‘trigger’ that this symptom was a response to…then find more productive way of responding, that makes this symptom no longer necessary…new coping strategy…new understanding … new definitions…of situation and of self…choose new response…can even replace one symptom, a ‘tactile’ / ‘kinetic’ one e.g. pain, with pleasure, or numbness, or move it from an inconvenient position to a more convenient one, as a preliminary to reducing it, to manageable proportions, if mind won’t accept total cure / pain-free state as possible / acceptable…aim to form new associations with situations / conditions experienced then, and therefore now … re-organise the mind…

Aim of therapist is to invoke appropriate state of mind / condition, in which client can enter a trance of their own volition…i.e. self-induced…facilitated by therapist…give skills…pre-conditions, initial stimulus…make possible…empower…nurture conditions for possible change to emerge…give change room to take place…a clearing in the mind to let in the sunshine of growth…to bloom…don’t force…let client determine the pace…provide client with ‘food for thought’…

Immerse client in stories…from own life…other’s lives…history…the context of the stories are mere window dressing…a hanger to hang the message on…story is the message…theme should correspond to client’s own dilemmas, challenges…make client hero of drama…success of hero is there success…unconscious identification with hero / protagonist must be produced…so make relevant to client’s own life / experiences / situation…so resources and solutions of hero in story become client’s…access client’s unconscious resources…new strengths…expand view of self to encompass more options…increase trust in self, in own unconscious, in own resourcefulness…confidence in self and life…

Observe client’s unconscious expressions e.g. changed rhythm or pace of breathing, posture, eye movements, as they ‘connect’ with hero in story i.e. make the unconscious connection…identify with…make story appeal to
client...absorb their attention...so they ‘enter-into-it’ ... become the hero...of their own story...

Ideo-motor signaling e.g finger signaling i.e suggest particular finger will rise if...as a ‘tell’ that the unconscious mind has accepted a proposition / is working toward the desired goal...the change...the new habit formation...the new self...the more optimal response set...

Indirect post-hypnotic suggestion...define something that is bound to happen, in advance, as success...or something you can easily ‘define’ as having happened...something vague, general, or predictable...offer as proof NLP working...that unconscious is working towards goal we have set it...proof of efficacy of unconscious...of process...including a typical ‘habit’ you have observed in the client...so that when inevitable occurs, client will interpret it as sign, as success...and hopefully shock / stun / surprise client out of limiting beliefs / unconscious / habitual habits...open door to new possibilities...new hope...new confidence...

Use loaded statements with success implicit...e.g ‘it’s going to be a great feeling when you realise you are free of ...’ ...i.e assumption of success...just question of when...how fast...

Use true-isms to gain initial agreement and rapport...yes-sets...make self more agreeable...process more agreeable...increase rapport and agreeableness, which is a pleasant experience the client will want to maintain...they will thus want to keep agreeing...they will be unconsciously predisposed to agreeing with your next suggestions...willing to agree...to be suggestible...amenable to suggestions...open to agreement...then use double binds like ‘we can X, can’t we?’...‘you don’t have to X, do you?’...in which only a positive response is possible...i.e in order to maintain agreeable state, have to agree...a.k.a ‘leading questions’ which are banned in court, as answer is implicitly being suggested by way of apparent question...

As most conditioning unconscious, at emotional, pre-rational level, only unconscious de-programming and re-programming can resolve conflict...

When confronting trauma, when approaching it...give client ability to ‘layer’ the experience e.g to only ‘see’ it, without having to ‘feel’ it, at first...to make it less threatening...when gets too extreme / traumatic / threatening...remember it WAS too much to handle at the time...symptom was response...including ‘shutting down’...arrested development etc...have client view as uninvolved observer at
first…even place a plexi-glass shield between action and observer…so totally safe…or have client ‘take your head and shoulders out of the room / to the other side of the room / to the other side of the plexi-glass…etc…

Get patient to leave body…’you are in the other room now, doing X/Y…feeling X/Y…

Use shock, awe, surprise, disbelief, narrow focus, to open up gap in continuous stream of habitual becoming…to de-potentiate current mind-sets / definitions of self and world…to introduce better more functional, positive, productive, creative ‘solutions’ that the ‘symptoms’ originally were intended as / emerged as…

For avoidance scenarios, one solution might be to ‘allow’ self right to avoid…i.e without need to justify with sickness / phobia…or find alternative ways to get affection…alternative ways to ‘solve’ problem that the ‘symptom’ was originally formulated as solution to…

Re-spin / re-define all symptoms as ‘you have a talent for this’…i.e this ‘symptom’ which is now a problem, actually represented successful reaction to situation it emerged as solution to…saved you…but now situation changed, you have better alternative responses at your disposal…more resources…can solve problem more functionally, at lower cost, etc…

One indicator that a symptom, phobia (including that phobia of the immune system known as ‘allergic reaction’), psycho-somatic pain / discomfort / limitation, is that when the person is asleep, or distracted by surprise, shock, fear, or pleasure, the symptoms lessen, often completely disappearing.

There is the famous story of how one therapist used this phenomena to their client’s advantage. They suggested the patient experience the presence of a hungry, extremely dangerous tiger. The fear of that hungry tiger distracted them from their pain. And so, when the client’s nurse came with an injection, she responded, to the nurse’s amazement, ‘Oh, I don’t need that, there is a tiger under my bed’. She had come to the therapist in desperation, after the pain killers the
doctors had at their disposal had proven unable to provide any real relief from her pain and suffering. (Don’t believe that old lie that all pain is manageable, and therefore voluntary euthanasia is never to be considered a ‘reasonable’ and ‘humane’ option for patients).

If the ‘source’ of the symptom was really the supposed ‘trigger’, and that trigger was still present in the person’s body, or environment, then there would be no reason for the symptoms to diminish.

At the same time, stress, anxiety, frustration, and irritation are often associated with an increase in pain, distress, and other symptoms.

And so we have reason to suspect that the real etiology of a symptom, or set of symptoms (a.k.a ‘Syndrome’), is psychological, rather than physiological. Or at least that psychological factors, well within our ability to ‘correct’, are contributing to the patients suffering to a significant degree. Which offers us an opportunity to apply NLP principles in a therapeutic way, to the benefit the patient.

At the very least we can allow conventional treatments a greater chance of success. At best we can eliminate the symptoms completely, without recourse to pharmacological or surgical interventions.

Most of us have experienced how a child, if distracted from the pain of a fall, will tend to forget about it. But if attention is directed towards the painful spot, it will tend to increase.

And so we comfort the child and distract it from the spot that hurts.

We can often ‘forget’ the pain of a headache, migraine, cluster headache, sinus pain, and so on, by a movie that completely captures our attention...we can become so absorbed in the action, drama, or fun, that we ‘forget’ to pay attention to our pain...we become distracted by positive impressions which displace the negative impressions...

That old joke of ‘Hey, I can make you forget the pain in your tooth!’ ‘Oh, how?’ And the interlocutor steps on the other’s foot’. It works. The pain in your foot makes you forget the pain in your tooth!

Another phenomena many of us are familiar with is ‘referred pain’. Where a problem in one area results in pain in another area. Such as tooth pain being ‘referred’ to the ear. The person presents to the doctor with ear pain, which is the result of a tooth that needs the attention of a dentist.
Trance therapists often use this phenomena to program their client’s unconscious to refer pain from one area, where it is particularly inconvenient, to another. Such as having a dental patient feel sensitivity in their hand, rather than their mouth. If they assume they must feel some sort of pain during a dentist visit, then at least you can move the pain to the hand, where it is much easier to deal with, and won’t interfere with the dental treatment.

Or a cancer patient that has lived with pain for so long they cannot imagine it possible to totally eliminate all the pain. So the therapist panders to the clients ‘reality’ and replaces all the unbearable pain with a very bearable and manageable discomfort in a hand. This defers to the clients unshakable belief that it is impossible to eliminate all the pain. Maybe a deep religious neurosis or other form of programming underlies the belief that ‘life is painful’, or ‘cancer if painful’, which would be extremely hard to ‘break’, and the best compromise, given the clients direct, immediate needs for pain relief, is to pander to that neurosis, that belief, and accommodate it with some very manageable discomfort.

One way of looking at this is to view it as a ‘re-interpretation’ of pain. The same electro-chemical signal can be interpreted by the brain differently.

Note that the ‘meaning’ associated with any impression, painful or pleasurable, can amplify or diminish that sensation.

For example the pain of childbirth compared to the pain of cancer. Chronic pain versus fleeting pain. Recurring pain versus a temporary pain. Pain you associate with some life-threatening illness, pathogen, or injury, as compared to pain associated with something trivial, passing, and of little consequence. There will be much less anxiety, stress, and psychological trauma associated with the one compared to the other.

And having a ‘history’ of chronic pain can lead to despair that that pain might ever disappear or lessen. This is expectations theory. Self-fulfilling prophecy. It programs the client, consciously and unconsciously, to expect future pain. To give up hope of ever gaining relief or freedom from it. So trance can be effective in ‘breaking the cycle’, and ‘escaping history’, breaking the continuity, opening up a space for a different experience…a new experience…the experience of relief or freedom from pain.

Ecology refers to the ‘holistic’ relationship between a symptom, and benefits or costs the mind consciously or unconsciously attaches or associates with it.

For example if you consciously believe that X would lead to you losing some benefit, or incurring some cost, you will define X as bad. Undesirable.
There are many documented cases of patients ‘hanging onto’ a symptom due to the perceived benefits of maintaining it, despite the costs. Or the feared costs, despite the benefits of successful treatment.

This can be conscious. Where a person is aware of having received more positive attention, affection, support, and other benefits from their partner, friends, or family, due to an illness or other symptom.

Or unconscious. At a much earlier age, the client may have learned that being sick was a way to avoid something, or attract more attention from their parents. An unconscious association (causal relationship) was formed between being sick, say getting an asthma attack, an allergic reaction, or even getting in trouble, and gaining more attention, sympathy, and affection.

Then consider how often teachers and parents ignore a child until that child does something ‘wrong’ or ‘bad’. If a child learned that ‘getting in trouble’ and ‘behaving badly’ was the only way to get their parent’s or teacher’s attention, they may come to, unconsciously, adapt to this realization. They may then develop apparently uncontrollable behavioral problems. These will be diagnosed by pharm companies on the lookout for profitable new products as ‘ADHD’ and so on.

The problem was that the parents and teachers had failed to offer the student more positive alternative ways of getting attention. Not all kids can be adorable, cute, funny, brilliant, talented, and so automatically ‘earn’ out attention. But all kids need it. So you go figure what’s going to become the ‘norm’ for many children. Becoming the ‘class clown’ can be a way for a child who is not good at sports, or not popular for any other reason, to gain the approval and acceptance of their classmates.

And imagine the double motivation to misbehave if you not only got something you desperately needed, but also go to avoid something you feared, like appearing stupid because you cannot manage the work, which was either badly explained, or targeted too high above your current ability, and either way doomed you to frustration, and feeling, and, you feared, looking stupid, in your own eyes, those of your teacher, those of your class-mates, and those of your parents, friends, and siblings…so surely, from this perspective, some of the worst ‘symptoms’ you can imagine, from allergic reactions, to ADHD, to asthma attacks, all offer an abundance of rewards…surely you could forgive your unconscious for providing you with these symptoms, given the bounty they produced in the world for you? For the increasing numbers of kids suffering from asthma, allergies, and ‘new’ illnesses like ADHD? In fact unprecedented and ever increasing. As classroom sizes increase, along with unrealistic expectations being placed on students and teachers re: all students are equally capable…all students have the same needs…all students will respond to the same challenges.
positively...all students have the same abilities...or even worse, that one teacher, facing 30 students, is able to provide for all their different, individual needs, with different lesson plans targeted at the different ability levels, within the one class...simply because the ‘authorities’ insist ‘all children are equal’ and ‘students should progress by age cohort, and not based on their mastery of the material they have been given to learn (often completely irrelevant, poorly designed, poorly conceptualized, under-resourced in terms of materials and teachers, and ‘one size fits all’ approach)...

Geometric diminution is one strategy where you set the ‘bar’ for ‘success’ so low that the patient is bound to be able to interpret something that is going to happen, as a sign that the therapy is working. A sign of success. A signal for hope and faith in the process. A light at the end of the tunnel. A break in the continuum of despair. If you suggest a 2% improvement, which may take a range of different forms, then it will be hard for the client to prove the therapy is NOT working. They will ‘interpret’ things that were bound to happen as evidence of the efficacy of the process they have begun. This will motivate further hope, and confidence. Compliance with the therapeutic suggestions. This will open up a gap for the unconscious to enter and begin its work.

By ‘proving’ the therapy is working, the client is likely to become more open to suggestions. More open to belief in the efficacy of the process. A sort of ‘noble lie’. A priming and conditioning to expect improvement. A relief of anxiety and fear of chronic pain and symptoms. Telling the unconscious that ‘hey’, I don’t NEED this symptom. There are alternatives. Better ways to be”. The unconscious takes this as a cue to start the process required for re-defining responses to stimuli...to finding alternative ways to get what the symptoms were intended to achieve... pain or other symptoms that were the product of the unconscious can now be deleted by the unconscious...the unconscious will have been given new instructions...

Consider an unconscious that was told, by ‘authority figures’ that ‘you are bad’, ‘everything you do is bad’, ‘you were born into original sin’, ‘life is a vale of tears’, ‘don’t shine or be happy as others will feel bad as a result’, ‘don’t succeed as that will make others feel like failures’, ‘don’t enjoy sex as it is a sin’, ‘don’t enjoy food, it is a sin’, ‘don’t enjoy life, life is meant to be hard’, ‘god will punish you for enjoying sexual activity’, ‘do better than your friends and they will leave you’, ‘do better than your father and it is like stabbing him in the eye, how could you?’, ‘disobeying your mother is a sin’, ‘you are killing your mother/father by doing that’... What directives are implicitly...what programs are being ‘written’ for the unconscious to carry out? If having an ‘allergy’ means avoiding
something, or gaining something, then isn’t the unconscious being programmed to induce allergies? Phobias? Symptoms?

Clients can be empowered to self-induce a trance state at will. They can then leave their body behind in the dentist’s chair or operating theatre as they go and attend to something else. The therapist might suggest, ‘take your head and shoulders out to the television room and watch television for the next hour’.

Pavlov noted a decrease in saliva production in his dogs when food was ‘paired’, in their minds, with different associated sounds. He found that if he took the sound they were least responsive to, he could completely eliminate the stimulus-response reaction to that sound. And in doing so, eliminate their stimulus response reaction to the sound they were most responsive to.

NLP practitioners refer to the ‘foreground’ and ‘background’ stimulus. The foreground stimulus being the one we tend to pay the most attention to. Like the dogs with bells. And the ‘background stimulus’ being the one we react least to, in the case of the dogs, it was a buzzer.

If you work on the least powerful stimulus, you can get the dog / client to stop reacting to it. And then by association, they dog / client will stop reacting to the stimulus, the bell, that had the greatest effect.

Admit memories unreliable, distorted, augmented...suggestion and leading questions can ‘produce’ memories...so hypnosis not admissible in court...(MHR can get actual evidence dismissed by lying and telling police / judge that you had a hypnosis session between the ‘incident’ you witnessed, and do not want to give evidence of, and the interview with police / court date...so that your ‘evidence’ will be made inadmissible...so won’t have to ‘rat’ on your mates, risk retaliation of criminals...etc...or serve corrupt court system...possibly be rewarded by those you are ‘protecting’...i.e your ‘testimony’ will become inadmissible...you won’t be called to testify in court...save appearing in court...
MHR part of conditioning is that poor feel guilty if enjoy good fortune, taught not to ‘shine’ as it makes others feel bad…while rich conditioned to have sense of entitlement, to deserve more than others…more wealth, privilege, opportunities etc.…even without ever ‘earning’ it i.e doing anything to ‘deserve’ or ‘earn’ it…

Trauma can ‘fix’ a person at an emotional age, at a point in their own history…arrested development… ‘freeze’…need to ‘un-freeze’ them… hit the ‘pause’ button again…by returning to moment ‘pause’ originally hit by unconscious…to feel, see, sense, experience that moment again, as an adult, with adult resources…what unconscious defined as too dangerous at that time…N.B Freudian concept is that our ‘symptoms’ are really our unconscious minds attempts to draw out attention back to that ‘engram’, to re-address that experience and work through it…now that it feels we are able to face the trauma, and process it fully…our symptoms all related to that trauma…it ‘cycles’ through hoping to get our attention…we can take ‘mask’ off the ‘actor’ i.e the ‘shield memory’ and symptoms…see what them as they really are / were…

Hypervigilance, anxiety…over sensitivity…fixation on possible negatives…worry…neurotic level … phobia… need to learn that can replace anxious response with relaxed, positive response…like engine idling too high…revving at lights…put in neutral…no need to always be ‘in gear’…learn to adjust idle…keeping high revs for appropriate times of need…why feel constantly at risk / in danger / facing threat…i.e constantly imagining threats / reliving…

‘Affect Bridge’ is ego strengthening history of success…gives confidence…positive expectations…can always fall back on positive experiences memories

Get client to recall moments of calm…how felt…re-immerse in…re-create…empower to ‘return’ to these moments any time typical habit has been to experience anxiety, worry, frustration…

Dis-association is not ‘owning’ some part of your experience, self, body…represents the skill of amnesia…need to spin as positive…and then re-employ this skill to positive ends…
Ideo-motor signaling...request unconscious of client chose a finger to lift to answer Yes...aim to contact unconscious mind without suggesting anything, introducing artefacts...avoiding false memories...leading questions...contamination... 'when your unconscious is ready to do X, it will raise a finger. Will it be the index finger or the ring finger? On the left or the right hand? ' etc i.e questions with only positive outcomes as answers i.e will be one or other...suggesting...

To ensure positive outcome, suggest unconscious can finger signal for 'NO', or 'not sure', so bound to get SOME response i.e autonomous finger signaling, to prove to client that the unconscious exists, and will respond...can perform actions requested of it...can include these in post-hypnotic suggestions...e.g ‘when you feel this craving, you will put your hand to your chin to remind you to automatically replace your new learned positive response in place of old, sub-optimal automatic response...e.g you will practice a positive visualization and deep breathing, or go for a walk, or talk to a friend, instead of your old habit of smoking, drinking, eating, getting upset, getting frustrated / angry / depressed...take a warm bath, watch a funny film, instead of...gives unconscious unobtrusive way of signaling / communicating, other than the neurotic psycho-somatic, habitual and dysfunctional symptoms, phobias, anxiety, migraines, cramps, etc it has been using to date...

Therapeutic trance begins with first contact...build rapport / trust / empathy / confidence / authority...i.e placebo effect potential...pace and lead potential...for a re-programming...de-programming and re-programming...replacing existing dysfunctional response with functional / more creative response...to the life experience / trauma / chronic crises / threats have produced...meet...induce and then deepen trance...gain access to unconscious...so you can re-program...optimally program...install new definitions ...new operating systems...upload 2.0 to replace current Beta...for the new optimal you...

Catalepsy = stuck in pattern of behavior / cycle

Use language and imagery appropriate to sensory preferences e.g visual, kinetic, auditory,
Can start by focusing intensely on the symptoms, as locus of focus...absorb client in...to induce trance...

React to a symptom as if it is a great sign 'oh, this is great, you’re gonna do great...this is a great sign...be convincing...as if you really see it...need to make your belief contagious...encourage as great a placebo effect as possible...especially needed if patient depressed / hopeless / despairing of ever being 'cured' / feeling better...need to give hope / faith...light at end of tunnel...lift spirits...start re-programming unconscious to anticipate success...good things...positive experiences...empowerment...self-efficacy...belief in self...in world...must experience actual success...so give them success...re-define and interpret anything available as a ‘success’ and ‘great sign’ of ‘successes to come’...positive expectations...define future experience that is sure to happen, in advance, as success...as a sign of positive developments...so client begins anticipating success, and progress...to stabilize client to prevent further negative development, shore up, give little successes to build up history of success from...need to begin a new journey with hope, positive expectancy...faith...self-fulfilling prophecy (MHR need client to feel you have the ‘tools’ to achieve the desired outcomes)...

Corrective regression: go back to just before symptom appeared for first time...usually relates to a traumatic experience, or realization, or comment from significant other, or unconscious association...(MHR often need to work through screen memories to actual trauma)...idea is to work through traumatic situation / interaction with resources not available to person at the time...also to re-enact, giving the significant others in the interactions more resources...so they behave differently, and you can respond differently...so no longer repressing / denying / suppressing / avoiding / expressing as symptom...i.e symptom as 'flag' placed by unconscious so that at later date, with more resources, can come back and fully process and 'express' the trauma, and dissolve the 'engram' / 'block'...

Give patient faith in power of unconscious to solve problem...use stories of other people ...explain how complex daily actions coordinated by unconscious...most bodily processes amazingly complex, from walking to digestion, which no way conscious mind could coordinate...

MHR social reality...positive hallucination and negative hallucinations e.g gods positive i.e see what not there...and cruelty inflict on animals / others not 'real' i.e fail to see it / feel it...only Vegans see and feel it ...propaganda combination
of both … problem is when combine both…so have a non-Vegan interacting with Vegan…the non-Vegan will assert that Vegan is hallucinating…deny reality… and ‘conspiracy’ revealists / investigators defined as ‘hallucinating’, ‘nuts’, made, paranoid, by those who don’t see what IS there, and thus unwilling/unable to take next steps i.e skepticism about what can’t yet prove, but which seems reasonable, given what they do know / have been able to admit to selves…i.e inability to ‘suspend judgement’ of more extreme ‘theories’ and ‘entertain’ them at all…just dismiss…because not accepting reality of clear facts right before their eyes…or deliberately consuming ‘spin’ and ‘re-interpretation’ e.g as ‘natural’, necessary, unfortunate but unavoidable, unexpected consequences Vs deliberate part of plan…of actors as ‘well-intentioned’ and ‘on our side’…got to crack a few eggs to make an omelet, no living in perfect world…define deliberate acts as ‘accidents’…blame acts on ‘terrorists’…etc…

Lose self in metaphor, story, identification with protagonist / victim etc…development of deep trance…give therapist access to unconscious mind…make more amenable to suggestions…positive alternatives to the ‘film’ that was running, 24/7, in the client’s mind, up to that point…to suggest more positive, productive, creative responses to situations i.e to replace / displace negative dysfunctional symptom with something more functional / positive / adapted…e.g replace allergy with self-assertion of right to ‘avoid’ activity’ don’t want to participate in, or face feared thing avoiding, or deal with the feared thing constructively….acknowledge fears and avoidance and the ‘value’ of the symptom e.g it prevents me from… it lets me …. It provides value X…

N.B can lose self in any intense absorbing thought / idea / feeling … good or bad…relaxed or very excited…intense focus on emotion…feeling…idea…becomes locus of being for that time…displaces / replaces previous ‘stream of becoming’… ‘cycles’… ‘narratives’… noise in head … represents opportunity … like the ‘dead sea’ parting…offers opportunity to advance to ‘promised land’…during ‘trance’… moment of ‘being’…in the now…totally immersed and absorbed in ‘one thing’… which ‘pauses’ the 24/7 stream of ‘my life’…that has been replaying so long … imprinting… the definitions of what ‘you’ are, what you ‘can’ do and ‘can’t’ do… you can cross to another shore…the you that you want to be…the more optimal you…the more resourceful you…the ‘trance’ is a ‘pause’ in the cycling of your ‘life movie’… what Tibetan Buddhists call a ‘Bardot’… it brings you into the ‘now’…even if ironically through being absorbed in something negative, or the story of someone else…but you identify with that hero / protagonist / victim so it is really YOU you are focused intensely on… like Moses at the moment of crisis, intensely
absorbed in the here and now…there, on that shore, facing imminent death…focusses the mind in a Zen fashion…and stops the flow of the water…the tide…offering an opportunity to escape history…to escape the ‘self’…to imprint a new self…to add or delete parts of the self that are no longer optimal…to move forward…to escape the slavery of the continual reproduction of a the previous cycles… pain / symptoms / despair are the Pharaohs army, advancing upon you…forcing you to ‘be’ in the here and now…to stop the flow of becoming…to step out of the cycles…to cross into the promised land… N.B this same metaphor repeats many times in the bible…Crossing the river Jordan, The Dead Sea (possibly misnamed ‘Sea of Reeds’ which was more a muddy swamp which pharaohs chariots would have become bogged down in, like the French knights in the mud at Agincourt…

Get patient to regress to time before symptoms began…or first time remember having experienced the symptoms…maybe parents etc can provide this information…aim is to look at what associated with symptoms emerging…an incident?… a realization…an interaction…what could symptoms be a way of avoiding e.g school, sport, dance (child with stomach ache, migraine, allergy, period cramps) i.e child had ‘learned’ that if ‘sick’, can use it as excuse to avoid something…e.g girl learns that ‘period pain’ is an accepted excuse for not having to do something…or just getting more attention / affection … having to mow the lawn (husband developed allergy to grass) … what a ‘phobia’ is really ‘protecting’ you from i.e what are you avoiding, what are you really scared of…what happened that you could not face at time i.e process i.e which phobia distortion of…

Buddhist idea of replacing / displacing one tactile sensation with another one … e.g replace pain with positive visualization … e.g warm day at beach Vs frustrating wait in queue… replace period pain / migraine with positive experience … replace frustration / anger with pleasant memory (can be fake memory constructed just for this purpose, which is compelling / absorbing)…can ‘take your mind to a lovely place, leaving body behind’…

Frame all suggestions to unconscious in positive i.e what do want…never what don’t… so do not visualize NOT hitting pole…visualize ‘hitting’ the gap between them…
So visualize a successful outcome, rather than avoiding a negative outcome…what do want…how you want to feel…how it (would) will feel when you get what you want…

Key is same as Expectancy theory of motivation…need to clarify objectives / outcomes … fill them out with every possible sensory impression i.e how it will feel, taste, smell, what you’ll be thinking, how others will respond, as if really living the experience you want to have… then ‘overcome objections’ i.e holistics…ecology…search for unconscious fears associated with ‘success’…i.e if I get X, what will it mean for Y…externalities can be negative, even for positive outcomes…. e.g if I succeed and get promoted, my friends might abandon me….I may have to move to a new office … if I lose weight men might start chasing me… if I can’t eat for pleasure, what pleasure will life have to offer me? … if I get rid of this problem, and I am NOT happy, I will be devastated, having lost the very hope of happiness…

Have to work through conflicts, find ways to deal with externalities e.g O.K, my kids will have to change schools, we can find them a great school…if my husband can’t handle me being a success, and attractive, then maybe he’s the wrong person to share my life with… I will deal with problems as they arrive, now I know I am capable and competent…its exciting, the unknown… I have new resources to deal with anything that comes my way…

Don’t think ‘stop hurting’, instead visualize / imagine a pleasurable sensation, or at worst a neutral one of being ‘comfortably numb’…

View ‘solutions as buried in symptoms’… which turns symptom into an asset…like the ‘X’ that marks the spot where treasure is buried…or the ‘dragon’ guarding the treasure cave…

When did hair pulling begin? In response / reaction to what situation / condition / interaction …
Constipation as age fixation i.e as child sought to assert independence in face of controlling parents…only way to assert was by NOT doing what parent wanted…and controlling bowel movements was only option available, given the power imbalances…even becoming ‘sick’ can be a power play…a healthy assertion of independence ‘I will NOT’… ‘I will’… but sadly using the only resource available, which was dysfunctional…or would lead to formation of dysfunctional habits later in life…when so many other options for self assertion available…so go back to time when symptom emerged, with those resources, and re-live the experience … assert independence in some other way…empower the parent to be more sensitive, and less controlling… fake it till you make it real…

A.K.A RE-IMPRINTING … i.e chick sees ping pong ball as first thing after leaving egg, ‘imprints’ that this is its mother…that it is a ping pong ball…when reaches sexual maturity will try to ‘mate’ with a ping pong ball…

So we take client / self back to the ‘imprinting’ moment, where the ‘symptom’ became ‘imprinted’… the self-definition became established…the label firmly attached…the definitions of reality, of self, of life, became rooted…imprinted upon our unconscious…unconsciously… as a survival mechanism…well-intended… a ‘glitch’ in a program or sub-program or sub-routine of our unconscious… below the level of our conscious awareness… an attempt to deal with a situation, especially a traumatic one… which represented a ‘success’ at the time i.e achieved its objective of avoidance / benefit / survival … if the world tells you you are ugly and stupid and unlovable, and if you don’t submit to the will of the priest, your parents, or other people with power over you (perceived and/or real), you’d better submit, to avoid the pain, the threatened and actual punishments…your unconscious saved you from something by developing habits / symptoms / ways of being and seeing consistent with survival…but now you know the priests are fucking insane or selfish deceivers, and there is no hell, and masturbation is great and sex is great and you don’t have to do what the fuckers tell you, just because they tell you…just because it suits them…etc…

An adult who hates their job may negatively hallucinate i.e ‘I can’t find my car keys’, when there are exactly where they ‘should’ be, or right in front of them on the table…the woman who doesn’t enjoy sex will ‘get a headache’, even for real, so she doesn’t have to feel guilty about not being ‘raped’ by her ‘legal rapists’… the adolescent who doesn’t feel ready to engage in ‘sexual interactions’ may unconsciously overeat to gain weight, and reduce the risk of ‘sexual predation’…or avoid intimate relationships by dressing poorly, having poor personal hygiene, or putting on weight, all unconsciously…
Unconscious guilt can lead to ‘self-punishment’...avoiding pleasurable things...self-sabotaging own success and chances of pleasure / enjoyment...basis is oedipal guilt...guilt of ‘shining too brightly’ and making others feel less fortunate / less competent / less approval and acceptance worthy....inadequate...fear of succeeding and ‘leaving all your friends and family behind’...

Need to find solutions to externalities of desired outcomes before that desire will be facilitated by unconscious i.e conflicting desires...need to actively identify potential ‘negative externalities’ of otherwise positive outcomes...often not obvious...there is no bliss that is un-alloyed with some pain...etc...

Define ‘forgetting’ as a success...i.e the success of ‘not remembering’...stop cycle by ‘stop remembering to forget’...forget to forget...use symptom on itself...re-spin as positive, then employ to new objective of remembering...

Can regress back to state before symptom, where functional, happy...or project into future where desired end-state has been realised...either way escape the constant loop of becoming / repeats / cycling of old story / narrative...

Up to 20% of the general population can be placed in a therapeutic trance deep enough to make pharmacological interventions e.g pain killers, anesthetics, etc unnecessary e.g experience no pain during surgery, dental treatment etc...

Note that a certain percent of general population ‘immune’ to certain pain killers etc...

Question of what is ‘valid’ response...i.e how much anger, withdrawal, fear, hopelessness, sadness, grief, sensitivity etc is ‘appropriate’...reasonable ...normal ... functional...??

Traditional convention of bypassing empathy in relation to ‘enemies during war’, ‘criminals’, and ‘animals’...i.e ‘O.K’ to inflict pain and harm upon them for some reason...i.e closed ethics systems...why? What is the measure? Man? In relation to animals, yes. But ‘society’ in relation to ‘enemies’ and ‘criminals.
Trance ratification is demonstration of power of trance/unconscious mind i.e efficacy as solution to client’s problems...e.g induce full body catalepsy (can’t move), hand-glove anesthesia, raising arm without conscious effort, i.e parlor tricks...but effective at educating people on power of unconscious...role of unconscious...hidden potentials and resources available, in face of hopeless despair...

A ‘surprise’ or ‘shock’ or ‘crisis’ produces actual physical electro-chemical changes in the brain...a creative ‘moment’...a physiological reaction that prepares the brain for re-coding of information...for searching for new information...for accepting new information...new definitions...it makes the brain physically available for re-structuring...the mind is overwhelmed...suddenly focused on the here and now...to respond to this ‘crisis’...to ‘adapt’...to change...to evolve...the same applies to individuals as to societies and other forms of organization...crisis...shocks...surprises...force the mind/group to re-assess its current ways of being and seeing...its definitions...its assumptions...force it to consider alternatives...to actively look for alternatives...to update its definitions...to update its coping strategies...to update its entire noetic structure...to reformulate TROONATNOOR...to restructure...to reorganize...to actively seek to find new patterns in TROONATNOOR...the old patterns don’t fit any more...the crisis proves the past responses are not adapted...it forces a reevaluation of its ‘automatic’ pilot...it must, and therefore does, break up former ‘wholes’ in order to integrate this new experience into a new whole...by a new integration...with this new information...has to transform old ways...replace and displace habitual patterns with new, deliberate, newly formed and constructed patterns of response, behavior... ‘Won’t it be great when these symptoms/behavior/pain/limits disappear?’ ‘Aren’t you surprised at how the symptom has disappeared?’...‘You are surprised that your hand is lifting by itself’...(in this case in order to maintain agreeable state of agreement, client must lift hand, question implicitly assumes client’s hand will raise, and by agreeing with ‘surprise’ part of ‘question’, implicitly agree that hand is rising i.e two question/assumptions offered as a statement of fact)...’...note use of negatives itself confuses mind...30% harder to understand question posed in the negative, than a direct question posed in the positive...e.g ‘It is not unusual for...’ Vs ‘It is typical for...’...Use non-questions which are really suggestions/leading questions...to which the only answer represents an agreement, an affirmation of the underlying implicit
assumption...a form of ‘double bind’ where disagreeing would mean the loss of
the agreeable, pleasant condition...the ‘yes set’...effective at breaking continuum
of habit...surprise / shock ... like Zen ‘master’ whacking student with
stick...simply to shock out of reverie / habit / cycle / reproduction of past... to
bring into ‘present’...here and now... escape history...

Establish ‘yes set’ with truisms, and observations of client that the client ‘knows’
to be true and thus will readily agree with...including mirroring...client later
loathe to give up this pleasant agreeableness...will be open to being ‘lead’ in
order not to break this positive experience of validation / agreeableness...it is
agreeable to them...work with symptoms up to point, then gradually, or
suddenly, subtly, unobtrusively, re-direct / lead / change direction i.e break out of
habitual cycle of thought / feeling ...

Suggest that ‘when you unconscious is ready to incorporate this new strategy,
one of your fingers will lift all by itself. Will it be the index finger of your right
hand? Will it be the ring finger of your left hand? Will it be a thumb? We will
have to wait and see what your unconscious decides, won’t we?’ Maybe it will
be both. Maybe your left arm has to bend at the elbow first? Maybe your right
hand will jerk?’...the trick is to look for typical mannerisms of the client...what
sort of unconscious movements they are most likely to experience...and thus be
able to define as proof of the efficacy of the unconscious...that it is acting...that
things will improve...but never commit to any particular movement...keep the
options of what the client can define as ‘proof’ open, and flexible... ensures you
won’t be contradicted / proven wrong...aim is ideation of movement... suggest
idea of movement to unconscious...encourage impulses already latent /
habitual...

Suggest that the right hand wants to move, and while doing so move your own
hand... if you’ve been ‘mirroring’ the client, they will tend to reciprocate,
unconsciously...pay attention to any movement, and then ‘go with that’...encourage it... ‘it feels good...up it comes’... ‘will the left hand join it?’...act as
if you expect it to...so client expects it to also...

Opening up a moment of creative flux offers chance to ‘break out’ of habitual
patterns
Where client is unaware of, e.g., the sexual nature of a symptom or syndrome, therapist speaks indirectly to unconscious, offering language and metaphors, double entendres, jokes, word plays etc that have a sexual connotation, without directly denoting anything sexual… like advertisers selling sex without explicitly appearing sexual… give unconscious freedom of response… observe latent tendencies in client… what client prone to doing… unself-conscious movements… ‘mannerisms’… e.g. where ‘hand washing’ fixation / compulsion probably sexual in nature… clearly conscious not comfortable with this fact, as it hides it / denies it / represses it… therefore don’t challenge consciousness with the fact, it will just deny it, and shut down / resist your therapy… appeal to unconscious… let the conscious ‘guilt’ / taboo ‘off the hook’… don’t overwhelm it… accommodate it… bypass it… don’t engage it and lose agreement… simply by speaking in a sexual way, hesitating, talking about ‘fingering’ and touching your inner thigh unobtrusively, will all evoke sexual nature of comments implicitly… without being explicit, and making conscious uncomfortable… mind knows what we are talking about, but it is ‘let off the hook’ i.e. its ‘hangups’ and ‘taboos’ won’t be activated… can pretend talking about something ‘harmless’ like ‘fingering a book’… sitting with open posture i.e. arms open, and legs open, suggests sex to unconscious… raising and lowering thighs suggests sexual excitement / arousal… faster breathing… tone of voice… breathiness of voice… two level communication addresses unconscious without triggering consciousness to block / deny / resist… can talk about a different ‘passion’, using language that associated with sex… conscious can pretend NOT about sex… no direct references… can maintain denial… repression… no threat presented… while indirectly engage unconscious… introduce suggestions that sex is good, healthy, appropriate, easy, enjoyable, good for you, you are free to enjoy it, really enjoy it… lose self in it… unconscious mind will understand that these are sexual suggestions… but bypass direct resistance… fixed ideas… existing dogma… limits… beliefs… rules… programming… use phrases like ‘down there’, or ‘between your legs’, ‘thighs’, heat, wet, out of breath, peak, coming, release, explosion, rushing, pumping, in and out imagery, trains, wet clay through fingers, bananas, … bypass self-censorship… censors… refusal… rigidity… fixed ideas… self-imposed limitations… taboos… guilt complexes…

Suggest to unconscious that it may take over control of the hand, etc., to resolve the problem… re-pattern its experience and habits etc.

MHR PY-thagoras i.e phi... El-la... All-ah... alles... alle... Yah Weh... why... Alchemy, Ka-ba-la... ab-ra-kad-ab-ra... Bab-El-On... L. Ron Hubbarad...
If client conditioned by life to expect the worst...that painlessness impossible...at best can expect bearable discomfort...then pander to this...accommodate it...don’t try to force issue...‘allow’ patient to feel some discomfort...don’t try to eliminate all pain, even if think can...just offer an acceptable (to their noetic structure) level of discomfort in the most convenient place...e.g itching on sole of hand?... suggest a 99% improvement... replace feeling of pain / discomfort with a tingling or warmth as ‘feedback’ alternative where pain is serving therapeutic / warning value ... i.e gentle pressure / sensation as bio-feedback...to draw attention to ...

It is a truism that we all ‘sometimes’ ‘forget’ to feel pain i.e are distracted by something else e.g Theo cutting leg badly, didn’t feel at time...or war-time injury in heat of battle...or cat searching through fire for Kittens... and that we often don’t hear things because we are thinking of something else...like suddenly realizing phone has been ringing, or person has been talking, and don’t remember what they have been saying i.e fade in and out of awareness... or of how a great movie or book distracted you from a pain you were feeling...

MHR ‘feeling’ Vs ‘suffering’...

‘Isn’t it surprising how the pain disappears when I touch your nose?’

Replace old associations with new ones ... i.e replace old symptoms with new positive impressions / sensations / habits ... replace pain with pleasure, discomfort with comfort, frustration with calm, fear with ease, ...

Find time and place in person’s history when they felt fine, no pain, at ease, calm, comfortable, happy, relaxed ... ‘What was your favorite activity as a child? Your favorite place? Recreate that place / time / feeling from memory... Never suggest ‘forget X’, instead suggest ‘remember Y’ i.e always frame as positive...what want...re: target fixation...think of Y, of good, intensely, to replace / displace X... call upon this past experience of calm, relaxation, comfort...
Call upon memory of foot falling asleep, or where you were distracted from pain by something...i.e. experience of having forgotten pain...as proof that it is possible...

Suggest client feel itch in foot, rather than NOT feel pain in hand...etc...then replace that itch with numbness...then move that numbness around body...direct around body...then finally, unobtrusively, direct that numbness to the problem area...

It has been proven that ‘the morning is wiser than the evening’...that if you pose a question to a person, their unconscious will go on seeking to solve the problem, answer the question, long after the conscious mind has ‘forgotten’ it...

‘Which finger will levitate first?’. ‘Will it be on the right hand? Will it be on the left hand?...’ etc....

Use of negatives displaces and discharges client’s conscious and unconscious resistance to a suggestion

Always keep in mind that it is the patient’s own unconscious that solves the problem...the onus is on their unconscious...means no need to ‘sweat it’ about being perfect therapist, knowing ‘magic formula’ or ‘mantra’...therapist merely suggests, facilitates...so don’t agonize over actual wording / style / details of your behavior...therapists merely works to provide unconscious with an ‘opening’ and ‘opportunity’, a ‘break in the stream of consciousness’, a ‘Bardot’, to work with.

Offer post-hypnotic suggestion for maintenance of the new more functional behaviors / definitions...
Hand sweating indicates likely sexual problem... lubrication... a repressed sexual desire for masturbation or sexual interaction... after that sexual problem has been resolved via therapy, the symptom usually disappears...

Facilitate a creative reorganization of the clients noetic structure making old symptom formation no longer necessary/habitual... remove labels that ‘demonize’ some things and glorify others... welcome the messengers... treat them well... listen to their message... face your demons... embrace them... they are really your best friends... friends with messages that challenge you ‘wilfull ignorance’... sadly, most such friends are pushed away, and to justify not listening to their valid messages, you feel it easiest to demonise them globally, so you can ‘dismiss’ the message, along with the ‘evil’ messenger...

N.B need to locate images in ‘new-imprint’ new belief, in same place usually located in ‘real’ beliefs i.e existing ones...so inhabit same ‘rooms’ and ‘locations’ and ‘positions’ in your mind... so gain that ‘transferred authority’... like the priest invoking the god-man for authority... by placing the new belief, the audito-tacto-olfacto-senso-visual construct, in the same ‘position’, vis a vis all the modalities and sub-modalities of ‘reality’... i.e if X is real, it feels like this, smells like this, I see it in this position in my minds eye, it sounds like this, etc... so place ‘Y’ in the same context, immerse it fully, vividly, with as many sense categories and sub-categories e.g is the truth shiny? Is real hope sparkly and I remember it just to the top left of my minds eye, and I smell apples, and I feel comfortable shoes supporting my instep, and do I stand just so, with a little more weight on my left food, my head cocked slightly up and to the left, my eyelids positioned just so, with that certain feeling in my stomach, my chest, my jaw relaxed, ... identify every possible ‘indicator’ you would use to ‘test the reality’ of something, of a feeling, a memory, to decide if it was real, or imagined...so you can ‘fake it till you make it’...till there is no difference between the ‘feeling’ and ‘impressions’, on every level, for every sense, every feeling, every emotion, you have about what you are ‘certain’ you ‘know’ is ‘real’, and the new imprint / belief you want to believe...that you want to be real... (probably the basis of most ‘authentic religious experience’ i.e church’s re-create the ideal basis for trance...soft light, shiny surfaces, quiet, calm, lots of images and statues all ‘suggesting’ certain states of mind, of rapture, of calm, of peace, to ‘lead’ you into a trance...the incense, the chanting, the repetitive shapes in the architecture, the ‘vaginal entrance indicating re-birth’, the entry into a ‘womb’... so that, leaving the church, exiting through the vagina, you are literally re-born...and consider all this imagery and sensory manipulation in the context of being repeatedly programmed from birth by religious dogma, stories, watching other ‘significant others ‘and ‘authority figures’ act as if THEY believe certain things...you are primed and conditioned from birth, and then triggered into a
trance state…where any sort of ‘experience’ can be suggested, and will be ‘accepted’ as ‘real’…

Please read my book ‘Religion’ for details, but basically the best motivations of religions (and there are mostly the worst motivations that corrupt these) is to induce a trance state, where the participants are open to suggestions…that there is hope at the end of the struggle…that there are reasons to try to be ‘good’ and fight your own negative impulses…and to have hope in the intercession of gods and angels etc on your behalf…will have the most powerful placebo effect…if a sugar pill associated with the ‘transferred authority’ of a mere medical professional can work wonders, giving relief from pain and symptoms for over 30% of people, without any other ‘props’, then image what ‘miracles’ the entire, birth to death ‘religious’ props, supports, beliefs in all powerful god-men and their consort ‘angels’ and ‘god-women’, and beliefs that these ‘priests’ can ‘channel’ that power on behalf of the ‘gods’, might have on psycho-somatic based illnesses (which are probably MOST of the ‘illness’ and ‘disease’ we suffer from today) … isn’t ‘confession’ the earlier form of ‘psychotherapy’? where the solution offered is to donate to the church and say hail marys i.e enter a trance state while fondling ‘beads’ and believing in the ‘power of god’ or ‘Mary’ or the three female consorts of Allah (oops, that wasn’t the angel Gabriel, that must have been the devil that inspired that association in Mohammed’s mind, so strike these ‘satanic verses’ from the official records, and kill anyone who refers to them…Islam is, after all, a religion of peace….apart from the constant calls to ‘find the infidel and kill them’, ideally while they sleep, as its easier than when they are armed and ready for battle!)

So, take an entire sensory experience that you ‘feel’ you ‘know’ is true…that you have total certainty in…and believe in… paying attention to the tiniest details…and then replace the content with the new belief you want to have…the belief that ‘I can do this’, that ‘I am O.K’, ‘I can relax now’, etc…

Simply repeating a phrase over and over can often be effective, like any propaganda, so that you ‘remember’ it is true… e.g ‘The Holocaust’ happened. ‘The earth is heating up, and it is because of us burning fossil fuels’, or any such nonsense totally debunked by scientific and historical analysis, and most people will ‘believe’ it, like most people imagine they ‘believe’ in ‘god’. But ‘believing means doing’, and most people do NOT behave consistent with what they claim to ‘believe’. When you truly believe and understand, you have a moral compass guiding your every action. A principle. A powerful motive. A powerful reason to over-ride conflicting urges, desires, and give you a reason to sacrifice temporary satisfactions… but it will be enough to base an institution on, to base a ‘Jew’ world order on, a new world religion, a new world order, a new tax, a new
restriction of liberty and freedom... it always works... but you still need ‘police’ and ‘tax collectors’ and ‘threats’ to get people to comply... whereas with true belief, the belief itself regulates the actor’s actions on every level... it is almost impossible for them to, repeatedly, in the longer term, act against these beliefs... which is why writers and reformers of all ages have risked, and endured, and suffered, fates worse than death... unable to contradict their true beliefs... their genuine, authentic, ‘knowledge’... beliefs, I mean real, true, honest, genuine, authentic beliefs, operate at the most basic level... people will rather die than deny these beliefs... they are fundamental... life is not worth living without them... and fates worse than death cannot even scare them into ‘submitting’ and lying to themselves...

I personally suspect that most of the ‘illnesses’ we suffer today are a result of us ‘lying’ to ourselves... that it is O.K to exploit people and other animals less fortunate than ourselves and ours... less intelligent, less educated, less informed, less capable, less talented, with fewer resources to defend themselves from our opportunistic exploitation of our holistic inheritances of relatively greater power, in one form or other, in terms of financial, social, economic, status etc... of having to pretend... to live lives of lies... surely any system that depends upon parts communicating is bound to break down, and literally devour itself, or have parts grow monstrously out of control relative to their functional level (like lobbyists / politicians / corporations gaining too much control, growing like cancers, and destroying all the functionality of the ‘health’ and productive parts of the system...)

So any lie represents a potential breakdown in the system... false data... it is going to affect all other parts of the system... you lose the systems integrity... its ability to cooperate, to work together... imbalance... parts begin fighting with each other over misunderstandings, conflicting definitions... etc etc... all explained in my TROONATNOOR books...

You won’t ever be able to be healthy when you realise, at a repressed, unconscious level, that you are inflicting unnecessary pain, misery, suffering etc on other sentient beings. You will suffer for your ‘crimes’. Completely avoidable crimes that don’t actually benefit you.

So, to replace / displace an old, dysfunctional behavior / belief with a new / better / more optimal / more functional / more desirable one, you have to make the new one ‘feel’, in every way, as real as the existing one. The old ‘film’ and ‘script’ has to be replaced, along with all its audio, emotions, sensory stimulants, and impressions, and associations (very important to follow up all associations, and re-assign them to the new belief)... with the new film... the old program with the 2.0 version...
The process of identifying all the ‘cues’ your mind uses to define ‘reality’…to define a belief as real… ‘that is true’… ‘that really happened’… ‘that is likely to happen / sure to happen’ … requires great attention to detail… most of the sub-modalities, even some of the modalities, are mostly unconscious…the connections / associations the unconscious makes with one mental image / recollection / feeling … have to be identified… which is not a typical, habitual process for most people… they stumble through life half awake… paying as little attention to the (painful) world as they can get away with… hoping for a painless death as reward for enduring a pointless existence… (how else to account for the excessive, empty, consumption of ‘junk’)…

So we want to go back and work out how your current beliefs were original ‘imprinted’ and became your ‘reality’… like working out why you ascribe to a particular ‘religion’ or ‘political view’ or ‘belief’ about yourself, your potential, what you ‘should’ be, ‘should’ do, and shouldn’t / dare not / couldn’t possibly…

Most of what you ‘believe’ will prove to be as reliable as the mass media reports of Donald Trump, or even the ‘analysis’ of an Alex Jones. Some lies come from ‘true believers’ like Jones, others are merely ‘paid comment’ and ‘perception engineering’… I won’t remind you who ‘The father of lies’ are. Who is behind the whole ‘Madison avenue’ advertising industry, Hollywood, the mass media television and cable corporations, the world banking system, the central banksters… who managed to get both Lucifer and Hitler demonized and ‘taboo’… who managed to trick you into thinking you should pay them interest on paper they printed for nothing … who managed to trick you into genuinely ‘believing’, without any real basis, that ‘The Holocaust’ happened, that ‘Nazi’s’ were of the ‘Hollywood’ variety. That farting literally produces typhoons and earthquakes …

Once you realise how easy it is to be conned, to be tricked, by ‘con-fidence tricksters’, in your daily life, you will be more open to accepting that most of your beliefs are ‘junk’, and that it is quite easy to replace them with valid truths about TROONATNOOR. So you can stop suffering and dieing from cancer, allergies, arthritis, debt, fears of death… and all the wars and conflicts arising when you put lies into a system of communication that requires truth…

So work out your own ‘reality tests’… compare an imagined experience with a real one… they superimpose the content of the fake over the real… until they occupy the same emotional, auditory, sensory, tactile, ‘impression real estate’… the same height, width, depth, smells, sounds, feelings, and connect to the same associations with other things ‘real’ to you… so they become consistent… gain the ‘transferred authority’ of the ‘real’…
Because the difference between ‘real’ and ‘fake’ is the difference in how vivid an impression is… how the imagined or ‘real’ impressions formed at end of the various nerves in the body, are then ‘encoded’ and ‘decoded’ to form the ‘experiences’ you have in your brain… the reality is in the brain…the experience… you can bypass the other ends of your nerve endings, if you activate them in your imagination, so that they produce the exact same electro-chemical impulses in the brain… you can work backwards… from the brain out… you don’t need the nerves at all… but you were born with them… you’ve structured your ‘reality’ out of them… so you need to use the same final products they produce in the brain… you control your brain… your experience… this is why Buddhist monks, protesting against the repression of Buddhism in Vietnam during the U.S supported French-Catholic occupation, and their own military invasion of Vietnam, could calmly douse themselves in petrol and set themselves alight, and burn to death, without flinching in the slightest… because please and pain are all in the brain… our entire reality could be fabricated inside our brain… we could be, as Descarte suggested, brains in vats, like in the ‘Matrix’ movies Descarte’s arguments inspired.

Once you realise this, you are free to construct the optimal beliefs about TROONATNOOR that work best for us all… you can re-define your ‘self’… access your true potential… avoid unnecessary suffering… experience the full range of pleasures and satisfactions that could be the only possible, rational, logical, reasonable motive for the construction of these experience engines we call selves…

Or have we been tricked into them? Either way, we will be free. Freed to leave them and become ‘Operating Thetans’, or freed to enjoy their positive potentials, while paying attention to ‘pain’ as information, as a message, that we need to change something… that something is ‘wrong’… that our system needs a ‘re-set’… a ‘re-boot’… our noetic structures need to be interrogated and re-structured… we are doing something ‘bad’ for our organism, our ecosystem, our planet, our organization… we need to re-integrate, or newly-integrate new parts, or existing parts, into new wholes, or existing wholes, … we need to regain a new integration of parts into functional wholes… we must ‘purge’ our system of ‘bad code’, of ‘lies’, of ‘misinformation’, of ‘propaganda’, of ‘bad data sectors’, or ‘viruses’, … etc etc etc …

The point is that reality is a construct of your own brain… how closely it corresponds to any external ‘reality’ will determine your ability to ‘map’ reality and interact with it… if you can’t ‘really’ fly, but believe you can… well… you can guess what sort of problems might arise… so our aim is to entertain the idea that perhaps all of reality is only in our minds, and that no ‘external’ reality actually exists per se, while heuristically ‘calibrating’ our internal ‘maps’ of reality to the apparently external, objective, reality ‘out there’… so that we don’t
end up jumping off cliffs expecting to fly, or just as bad, never even try to climb up to the mountain tops, due to self-imposed, and ‘other-imposed’ imprinted, conditioned, programmed, limiting beliefs...those which say ‘that is not possible’, or ‘I shouldn’t’, or ‘I can’t’, when in fact you can, and if you did, would find life that much better for you and yours, and all of us... which leaves to you honestly look in the mirror and ask yourself, ‘if I could deceive others into believing anything I chose, what would I choose to trick them into believing?’

What could I gain by deception? What short term power, privilege, benefits etc could I accumulate, if only people believed anything I told them. I cannot be honest for you. You have to be honest. To put yourself in the position of the priest, the advertising executive, the person who owns the television station, the radio station, the newspaper, the film production companies, and the official ‘news’ outlets of the various levels of ‘government’...what lies could benefit me? What lies could make me rich? What lies could make it possible for me to model the world as I see fit. To make the world in my own image? To do as I pleased. Now of course you will define these lies as ‘noble’. As beneficient. As for the good of all. But of course, for the short-term, there may be costs and burdens placed on others as a result. But, after all, don’t all the ends you have planned justify ANY means...isn’t the glorious vision you have of a utopia based on your own plans and beliefs worth it? ... everyone is going to die anyway, right?...so surely if billions have to suffer, just to realise your ‘vision’, that’s justified, right? And in any case it will be ‘good’ for you and yours. So what do YOU have to lose? Right? Can you honestly tell me you wouldn’t ‘lie’ to the people you need to give you stuff, to do stuff you want them to do, to stop doing stuff you don’t like, to give you power, to justify your legitimate use of that power...to enrich you and yours...put you and yours in the positions of power and privilege...where would you stop? ... and what if at some point you realised you’d ‘fucked up’, you’d abused your power in moments of selfish delight? In fact committed crimes? Would you fess up? Admit to it? Or use your power to hide your sins. To re-define them? to destroy your enemies, those seeking to tell others the ‘truth’ about you? Really? You’d hand yourself over to ‘justice’? Or would you use the power you gained, through your power to deceive, to trick, to confuse, to convince, to keep the power you had, to prevent anyone ever administering justice...to prevent ever having to ‘pay’ for your excesses, your crimes? I mean, after all, isn’t that ‘utopian vision’ you once had enough reason to justify anything? Your lies, are, NOBLE, aren’t they? I mean, hey, sure, a few billion died, starved to death, or of some virus, the world is fucked up, right now, but hey, the ends justify the means, can’t make an omelet without cracking a few eggs right? Hey, not your fault...you are only human...but with the power to define other people’s realities for them...hey, if evolution hadn’t wanted you to do just what you did, then why would it have given you that power to do it?
So you still believe power cannot corrupt? That YOUR leaders wouldn’t lie to YOU? That lies are NOBLE? That you can trust other humans with the power to lie to you? Like your Pope? Like your U.S government that has, since 2012, passed laws making it legal for THEM to lie to you...use ‘propaganda’...their new ‘noble lies’, because it is for YOUR benefit? Do you see how your ‘leaders’ live? Their luxury? Their contempt for you. And yet you still believe they will use the power you have given them, to define reality for you, to lie to you, in YOUR Interests?

Are you fucking mad?

So your aim is to represent the ‘imagined’ thing as the ‘real’ memory is represented by your mind...the same symbols, encoding, images, sounds, tastes, smells, touch, feelings, associations...

To overcome bad ‘habits’, such as getting frustrated and losing your temper, or just patience, feeling tense, getting headaches etc ... by recalling such an incident, then re-visiting it, determined to respond differently i.e employ better resources... and re-living the incident in detail, as closely to real as possible, only this time responding more positively, productively, creatively, and ‘experiencing’ the positive outcomes you’d expect from that, as if they really were experienced...this gives you a new ‘muscle memory’, a new ‘knee jerk reaction’, a new response set ... to similar situations...you are replacing / displacing the sub-optimal response set with a new, more optimal response set...new muscle memories to activate automatically, unconsciously... Say you gave in to a craving to eat or smoke or drink, in reality...in some typical situation where that often occurs...so it has become a ‘bad habit’... revisit a recent example of this, but this time employ all your new skills and resources to respond more optimally...and enjoy this experience fully, as if it really happened...to imprint a new muscle memory / auto-response / stimulus-response set...i.e change your behavior, can change your beliefs... often does... e.g proven that if you get someone to do something nice to a person, they will find some way to justify it to themselves, in their unconscious i.e take racial supremacist jew and get them to do something nice for a ‘conspiracy theorist’ philosopher, and they will have to somehow justify it to themselves, to incorporate their behavior into their belief system, to make sense of it to themselves, to rationalize it...and so they will start thinking more positive thoughts about people like me... for the same reason
Israeli military trainers will get recruits to do bad things to Palestinians, for no reason, to trick their unconscious into ‘justifying’ such bad treatment by defining Palestinians as ‘worthy’ of being victimized i.e as ‘bad’…as legitimate victims…

Remember we learn more from our mistakes than our successes…we learn what NOT to do… what does NOT work…and thus avoid repeating a behavior in future…all you learn from success is what TO do…and repeated success means you can get stuck on a rail … less likely to diverge and try something new if what worked in the past keeps working for you… so it imposes limits on experimentation i.e no motive for…i.e investigating alternative options… evolution ‘advances’ through NEGATIVE selection i.e what does NOT work…and it is competition that drives evolutionary process / ‘progress’…if all organisms survive and reproduce, mutation / variation does not represent any benefit…it will not be promoted…evolution is binge and purge…that promotes variety…mutation is a ‘mistake’ that occurs when a cell does not reproduce itself precisely… innovation is ‘breaking a habit’ as mutation is breaking the past cycles of reproducing the past behavior / chemistry / cell organization / genetic code … without such ‘mistakes’ in encoding / reproducing the code, diversity might not exist at all..

Binging on options means if one variant ‘fails’ terminally , goes extinct, others that are different are more likely not to fall to the same predator / pathogen / failure … so if environment changes, there is more chance that at least one of the variants will still be adapted enough to the new environment to survive, and continue the process of evolution…retain life…go on to ‘innovate’ and ‘mutate’ to produce more variety again… so process of binge and purge, mutation, variety, is more successful in long run than one of ‘habit’, of ‘perfect reproduction of past successful plans / strategies / blueprints…

Our motive to innovate, to try and see, to experiment with ‘new’ things, new ways of defining, of being and seeing, of doing, of interpreting and behaving, new strategies, approaches, etc, is failure…the compelling NEED to discover new ways, new means, new approaches… rather than a mere love of novelty, which also appears fundamental to all living systems / organisms… accounting for our desire for ‘the new’ in every form, from music, to fashion, to diet, to partners, along with a competing desire for the comfort of the known, the ‘predictable’ and ‘conventional’ and ‘normal’ … i.e so we are a mix of creature of habit and curious-cat…

[not because evolution planned this…knowing in advance it was best…but because if you compare two systems, where one is not curious, is fearful of any change, and a stickler for reproducing ‘what worked in the past at least well enough to ensure we exist’, with one where there is a balance between working with what so far has worked well enough to secure our existence, and
experimenting with possible superior alternatives that might make our lives even
better, and all our lives, not just the priests, chiefs, and lucky few elites, in the
longer run the second group will innovate more, prove more creative, generate
more optimal ways of surviving, and actually enjoying life, and will soon prove
more successful…it will either attract all the like-minded people from the other
group, which will dwindle, as the new group expands and shines, until soon there
will be no ‘raison de etre’ for the ‘traditional’ group … they will be outdone
scientifically, and socially, and culturally…like comparing Australian Aborigines
with a Renaissance Italian.

It is ‘Necessity (and not curiosity) [that] is the mother of invention’, we are told.

The ‘new’ represents an ‘unknown’. This can be scary for many people. For
others it represents an opportunity. Perhaps based on their initial ‘imprinting’.
How they have been conditioned and primed by life’s experiences, significant
others, and their own innate nature. We all have different thresholds of comfort.
Many feel at ease with routine, habit, predictability. Others find such a condition
unbearable, and require ‘new’ experiences, changes of scene, intellectual
challenges, etc… The ‘unknown’ for them represents opportunity. They are by
nature or nurture innately expectant of positive outcomes…of good coming to
them… so they seek out the new, as they expect to benefit from it in some way…
so they are ‘curious-cats’.

‘Tradition’ is always appealed to by those who have somehow attained a position
of power, privilege, and enjoys the benefits associated with that position…they
wish to retain the benefits…thus they appeal to habit, convention, norms, mores,
tradition, ‘the known’ … as it suits them … but probably YOU”D be better off
under a different system…a different set of definitions and ‘should’s and ‘can’ts’
… the priest, the corporate chief, the ‘fortunate’ holistic inheritors, are all likely
to use their power to keep you focused on ‘tradition’ and ‘conserving’ the status
quo, and defining it as ‘ideal’, as ‘natural’, as ‘god-given’, or at best, ‘the best of
all possible worlds’…why risk rocking the boat and making things even worse?
How dare you put the elite beneficiary classes benefits at risk! What, they should
work for a living? How dare you!

So the owner of a ‘patent’ is not keen on someone else’s ‘new’ discovery, as it
represents a potential threat, a loss of benefits, accruing to the patent holder.

If you own all the oil in the world, you won’t be too keen on new ideas indicating
that we can generate electricity from everyday water, which they hold no
monopoly on. The priest of an existing religion will usually view any ‘new’
religion as a threat to their own monopoly, and the benefits accruing from
it…they will tend to demonize the competition…literally…
Diversity ensures that, when conditions change, one or more of the current population will still survive the changes...it may have been barely surviving before the meteor, but find the conditions created by the meteor entirely to its satisfaction...it was barely adapted to the old world, but finds itself perfectly adapted to the new....that is how evolution, as a process, ensures its success...randomly...the process that produces random mutation will be more flexible than the one that perfectly reproduces something that works well enough under current conditions...simply because conditions change...the ecological whole must be ‘adapted’ by being adapted to conditions that do not yet exist...

If thinking positive involves a physiologically different posture than the habitual negative cycle of thoughts, then the different posture will need to be practiced....until muscle memory makes it automatic, and it replaces / displaces the earlier negative habits... e.g ‘sit up alert, look up to the right, and think something very positive’ ... this actual posture may be so unusual for a negative thinking person that it is hard at first to maintain...we have to re-learn new postures to match our new, positive thoughts...so they are convergent...mutually reinforcing...consistent...until they become our ‘new’ habit...both of thought and corresponding posture...one without the other is no more ‘believable’ than a bad actor with the posture of a sad, lonely, despairing, miserable wretch delivering their lines ‘Oh I am so happy and confident’ on cue...the inconsistencies will ruin the delivery...the words just won’t be believable...convincing...which is why politicians have always employed ‘coaches’ and ‘trainers’ to choreograph their public presentations...to teach them how to lie more believably...to ensure the lie of their words is matched by an equal deception of body language, posture, fake ‘tells’, false ‘accessing cues’...in fact CIA operatives are routinely trained to ‘beat’ lie detector tests by matching their own ‘subjective reality’ to the lies they say...to make themselves believe the lies...to be so ‘congruent’ in form, and delivery, in accessing cues, in physiological response, to match their breath, heart rate, posture, and accessing cue / tells to the lie, that the lie seems real, even to the lie detector operator...all the ‘indicators’ being that the person believes what they are saying, and thus never betrays, in any way, that it is a lie...so Hillary Clinton has been well schooled in how to ‘appear’ caring, so well that in a blink, once out of the public eye, she can flip back into her nasty, mean, selfish, racist, sexist, ‘true’ personality...at the flick of a switch, as soon as she is aware of being ‘on public display’, she can adopt the body language, tone, appearance, gestures etc of a caring, loving, warm, empathetic soul... ‘And the academy award for best actor goes to...’

‘I can’t’, as in ‘I can’t sing’ ... really means ‘so far I have not managed to sing’

‘Elastic memory’ of metal analogy for ‘threshold’ i.e an imprint / memory / belief will return to its default only so many times, after which it remains bent or breaks
… so repetition of new ‘belief’ important element in de-programming…de-imprinting … new imprinting …

Don’t pretend… actually ‘step into’ the visualization… make it real… experience it vividly… vis a vis your typical ‘reality testing’… ‘New habit generator’… new belief generator … new experience generator …

Many of our most compelling, though erroneous, or sub-optimal beliefs were instilled by people with good and malicious intentions, before the age of 5 … e.g parents, significant others, television etc… so much of our ‘reality’ is erroneous… like ‘religion’…. And we tend to exaggerate, conflate, distort experiences … so we cannot trust out ‘memories’… a ‘false’ memory or erroneous belief can have a huge impact on our lives… we may base important decisions on erroneous beliefs we integrated into our noetic structures, about ourselves, our limits, the world, our place in it, etc… Oedipal guilt, religious guilt, taboo guilt, sense of responsibility out of all proportion to reality…

Your new beliefs must be consistent with your overall sense of ‘self’ … self-definition etc…

Remember something vs imagining something you know isn’t real … where do you ‘see’ the images in your minds eye? 

Looking down to left indicates internal dialog i.e verbalization … how talk to self in own head… what say to self… internal voice …

Looking up and to left indicates visual memory (actual memory Vs constructing something actively i.e lieing / making it up)

Looking down to right indicates accessing feelings

Contrast different memories / recollections / visualisations to see what ‘accessing cues’ they display, to see if they are consistent, and decide if person is really remembering or making it up…

Then practice / teach to develop same ‘strategy’ for things they want to believe e.g I can lose weight they use when they talk about / visualize things they already believe e.g I can play guitar… what is the difference in the two visualisations… get the desired belief to converge, in terms of how the person relates to the ‘beliefs’ and visualisations, until the desired belief ‘I can lose weight’ has all the same vivid properties / scope / qualities / compelliness as the belief they are already certain of… then get them to practice the desired ‘visualisation’ until it becomes both compelling and second nature / automatic the ‘habitual’ way of thinking / imagining / relating to the subject e.g I can play guitar and I can lose weight have equal compelliness and automatic
nature… including if they move both hands or one when saying / imagining / visualizing the two beliefs… observe them and then get them to gesture the same for the compelling belief and the one they want to believe…

Look for pattern in client’s responses to identify their accessing cues and thus what is ‘real’ to them, and what ‘imagined’… what they really believe…

Dieting is a struggle… hard… uncomfortable…

Observe when gestures symmetrical, i.e with both hands, Vs just one… to see if that is a good indicator of internal conflict

Imagine, in your mind’s eye, yourself coming to yourself for therapy, as your client, so you can visualize the situation… hear yourself describe things, watch yourself visualizing things, observe your own accessing cues, posture etc…

Visualise / feel yourself, in toto, when you ‘know what to do’ i.e are confident, have all the answers… then translate that totality of impression to the belief you want to have, the situation where you want to have all the answers…

Get into the ‘bigness’ of the feeling, or shrink it down a little, or give it a pulse and put it out there…

Go into feelings, then look up to left to visualize it / see it… then back down to the right to go into the feeling, then look down to left to dialog with self… etc…

Can zoom out and in… move right out to see self, and anything around you, from a distance, so see all factors playing a role in your belief… separate yourself from any part of the ‘picture’ that is holding you back from embracing the new belief…

Think of something you know you can do… that you are confident about… that you truly believe… compare this to something you wish you could do, and observe the differences… holistically… 5 senses… now take the holistic sense associated with what you can do, that you truly believe you can do, and transfer it onto / into the limiting belief… the uncertain one you want to become compelling and real… if something stops you doing this, work out what it is… make the limiting belief as much like the resourceful belief you can… identify anything interfering with the transfer of all 5 sense ‘belief’ elements from the resourceful belief to the limiting one… e.g past experiences that come to mind i.e ‘imprints’
that tell you ‘I cannot’, and limit you…significant past experiences that have molded your belief that ‘I cannot’…

Imprinting = introjection… significant / traumatic event at particular stage in development can ‘imprint’ beliefs about self, world, what ‘right and wrong’, so person ‘introjects’ a belief into their subjective reality…it becomes real… like duckling will take first moving object it notices after hatching to be its mother, and if that happens to be a ping pong ball rolling past, then when it matures, at mating time, it will attempt to mate with objects similar in shape to the ping pong ball, rather than other ducks…

So a child that is beaten, and told it is unlovable, undesirable, detestable, responsible for all the misery of its parents, (and by the priests that its sexual impulses / thoughts are ‘original sin’ responsible for all the suffering in this ‘vale of tears’, ‘imprints’ these beliefs as ‘facts’… introjects them into their self-definition / idea of self… models their behavior on significant others or significant incidents that really made an ‘impression’ i.e imprinted a belief upon them e.g the world is scary / dangerous, when you get angry with someone you beat them, that you are not worthy of success, love, happiness…

When you regress back in time, seeking out the traumatic / imprinting incident that made such an ‘impression’ i.e formed a fixed / limiting belief about the self and world, that is responsible for the imprinting of a phobia, symptom, etc, memory will fail…things will become hazy…this is the time to pay more attention…this is often the ‘veil’ protecting the conscious mind from the trauma of the incident…

Perfectionist parents fuck a person up…because it will never be enough to ‘get it right’…it has to be ‘perfect’, and every time…so you are doomed…anxious that next time you will fall short / won’t be good enough to earn their approval / acceptance / affection / love …. And be abandoned, emotionally (which is the same thing) and/or physically i.e the ‘feeling’ of rejection is so closely tied to actual physical abandonment, being ‘left to die’, that there is little real affective / effective difference in the ‘experience’ of the child… so the anxiety / fear will always be present…for who can always ‘get it perfect’, ‘every time’? The person is doomed. Bound to become totally neurotic about ‘falling short’ … fear of failure … implicit even in every success… ‘what about next time?’… this was so hard, can I manage it next time?’ … so there is really no joy in any achievement … you live in fear of the ‘next time’ with no real joy in ‘this time’… it is all a task with the unconscious desperate despair of ‘what’s going to happen when I fall short’…I will be rejected, abandoned…left for dead…left alone…
If you got love, affection, acceptance, praise, approval, support etc for ‘trying hard’ and for each little success, then each little success will bring you true joy...by association...you will feel competent at ‘earning’ approval / acceptance / love / affection / support ... you will be motivated to try hard, and the unavoidable ‘misses’ and ‘fails’ won’t weigh too heavily on you...you tried hard...and next time you’ll get there...and if not, well its not a matter of life and death, approval and rejection, abandonment and survival...is it? ... not for you...but for the poor perfectionist...who seems to have it ‘all together’, life is a constant struggle, a doomed struggle, immersed in fear and a ‘free floating anxiety’... wondering what ‘mantra’ to repeat, what ‘magical gesture’ to repeat, what god to pray to, to sacrifice to, what part of their ‘act’ is ‘letting them down’ and ‘threatening’ them...is it their hair? Is it something they said? Do people resent something? Are they talking about something about them? Do they go to the right church often enough, wear the right clothing, have the right opinions and views, have the right university degrees? Drive the right car? Live in the right postcode area? What part of their ‘perfect world’ is going to let them down...they are always on the lookout...always fearing they have displayed some weakness, said the wrong thing to the wrong person, always vulnerable...at any moment their perfect world can come crashing down, if they ‘fail’, if they ‘don’t get it right’...they might either retreat completely from the world as a recluse, or work harder at perfection, so hard it is no fun, there is no joy, no satisfaction...and any ‘competitor’ that might take the spotlight from them, that might ‘shadow’ them by even greater perfection is a real enemy...a real threat...

Some people simply ‘drop out’ at the last moment, for fear of failing...what if I fail? It will be the end...by never really ‘going the last mile’ and ‘pushing themselves to their limits’, always ‘holding back’, they can avoid failing, having given their all, and fallen short, which would be too devastating to imagine...and then what of those people who have ‘learned’ that if you succeed, you hurt your parents, siblings, friends, cohorts, or lose them, lose their approval and acceptance...will be abandoned as a ‘tall poppy’...working class people know this feeling all too well... ‘don’t get a big head now’... ‘don’t shine, as others will feel drab’ ...

Say a sibling was great at something that elicited genuine acceptance, approval, praise, pride from your parents ... and you feel you could never achieve that same level... so why bother at all?... maybe easier to get their attention by failing?

ANCHOR = stimuli that consistently produce the same internal state in a person...an external stimuli that becomes paired with an internal state (emotion/
feeling/state of mind) or set of representations e.g. sight, sound, touch, smell (a rich and vivid memory of something on several ‘sense’ levels)…a ‘trigger’… e.g. you smell something and suddenly you are transported by a vivid memory or an incident/s associated with that smell…or you hear a song, and are transported back to the first time you heard it, or the situations in which you often heard it, in your youth… these can be deliberately ‘set’ as ‘triggers’…as stimulus-response pairs…they can be used to ‘trigger’ and then ‘hold’ a particular state…e.g. pair a carefree, calm, happy memory with a touch on the shoulder…you can then trigger that memory, by touching the client’s shoulder, and as long as you keep your touch there, the client will remain in that memory…this is an example of a ‘kinesthetic anchor’…smell, however, is considered the most powerful, so it is often used in therapy i.e. achieve a desirable state, then ‘anchor’ it to a powerful perfume you give the client in a bottle, and then any time they need, they can open the bottle, smell the scent, and be transported back to that state…songs are also typical ‘triggers’… but particular images e.g. patriotic flag… or shapes e.g. sexual connotations or actual sexual images…

If person ‘drawing a blank’, offer a metaphor / story of people walking in fog, and still finding their way, using other cues…

Get person to relate anything that occurs to them…build up a memory from seemingly unrelated recollections, no matter how basic and apparently unrelated…sights, smells, sounds, tactile sensations, cold, heat, brightness, darkness…encourage exploration…until build up a memory from these scraps…

An imprint is an event / experience which produce a belief / group of related beliefs…what is key is not the content, but the impression/belief it lead to the person having… in NLP it is not so much about processing the trauma, but merely recognizing what limiting / dysfunctional belief it produced in the persons mind…

As with ducks imprinting on humans, other animals, or inanimate objects, what is critical is the timing…as the brain develops, it reaches critical points in its development…of course identifying ‘mother’ is a critical decision… a duck may hatch without the mother present, as it emerges from an egg…a problem most mammals don’t have…we may not be able to be sure of the father, but mamma is pretty easy to identify…

But it appears that people at least can be re-imprinted…re-programmed…if we can first identify the original imprint…to target it for NLP… to change core beliefs that shape our personality, behavior, and thus life outcomes…
If a parent / siblings / teachers encouraged/ supported / helped you, you will have developed differently to the child whose significant others mocked you when you failed, wanted you to fail so they could mock you, fearful that you might succeed and ‘steal’ their limelight / parent’s / peers affection/status/approval, gave up on you immediately and imprinted that ‘you can’t do that, don’t try any more’, who ‘gave up on you immediately’…who never nurtured any sparks, never tried to help you improve, never explained how to do something, just said ‘you’re too stupid, not worth my time trying to explain’, or simply left you alone, without a chance to learn anything... sure there are naturally gifted people who will end up shining no matter what life throws at them...in the end...but most of us require external assistance...tutoring...coaching...teaching...and have to go through a learning curve before attaining competence in something...of course some just ‘get it’ intuitively...the natural sportspeople, musicians, etc... but most of the people who appear ‘naturals’, like Mozart, and sportspeople, were intensely coached and trained from very early childhood, grew up in musical or sporting families, and had every spark nurtured to full blaze, by parents, siblings, coaches, trainers, tutors, etc... ‘The natural’ is often as much a ‘hot house flower’ as any orchid...

More to the point, we can never know what potential we are abandoning...potential not just for art, music, sport, etc...but for happiness, joy, a caring and sharing, secure, creative society... makes you wonder who might have an incentive to keep the world as it is...sub-optimal for most of us...but you don’t have to build huge conspiracy maps... consider parents who resent their own children’s talents, siblings who want to ‘sabotage’ the gifted sibling, peers who hate their betters...even teachers who hate to see some poor working class kid shining, while their own kids appear dull...especially if that kid is the child of some other ‘race’ or ‘nationality’... one the principals parents were ‘at war’ with... especially where those person’s fragile sense of self worth is based on the assumption that merely by belonging to a particular ‘race’, they were guaranteed the entitlement of feeling superior...etc...please read my other TROONATNOOR books.

‘I’m not good at sports’. ‘I’m not good at math’. ‘I can’t dance’. ‘Girls don’t like me’. ‘I’m ugly’. ‘I’m stupid’. All of these ‘global’ definitions can emerge from a key incident where they were imprinted as beliefs. A significant other stating, and then repeating ‘YOU are not good at ....’...‘YOU are stupid’... ‘YOU are ugly’... ‘YOU are unloveable’... YOU are guilty and don’t deserve to be happy’...After which the person never bothered trying to learn how to play, study math, dance, study, or socialize with girls. The motivation is gone to overcome the obstacles that all learning processes pose. And so the child with all the right
'imprints’, no matter their genetic potentials, will tend to outperform, in life, in happiness, the child with the best genetic inheritance, but the worst ‘imprints’…

These imprints, these beliefs, can become the ‘seed’ particle for their entire personality and life story. The basic assumption of their beliefs about themselves and the world. The blue-print. The basic sub-programs that all other programs will later be forced to adapt to, to accommodate. Later experiences of ‘success’ will not ‘imprint’ over the critical developmental stage ‘imprint’ of ‘failure’. Because the imprinted belief was ‘stamped’ upon the unconscious by the affects of the incident, at a time when the child’s mind was not capable of rationally, consciously, evaluating its validity...it just accepted it as real...as reality...and almost nothing that occurs later in life will ‘over-write’ it... because it exists deep in the unconscious levels...levels of affect...where ‘reason’ does not apply...so we have to go back to it... to ‘bleach’ the hard drive...to remove the original sin against that person, and replace / displace it with a virtue...the sin was committed AGAINST the child...it was not the child that committed any sin... the original sin was making the child feel guilt, for something there was no need to censure it for... but this guilt gave the organization doing this mind-control ‘imprinting’ power over that child for the duration of its life...

O.K, so read my original TROONATNOOR vol I and ‘Relgion’, volume III in that series, if you think ‘religion’ is ‘noble’. And good. And worthy of being reproduced. Or if you think it time to free yourself, and others, from its thrall.

Compare the bright, happy, active, optimistic, charming, determined, joyful child with the miserable, complaining, despairing, passive, unhappy, dull child. Then compare the adults they become.

One of them was ‘imprinted’ at the key stages of its emotional, intellectual, and physiological development with positive beliefs. I am loved. My status is secure. I am safe. I am approved of. I can trust people. Life is great. I can do this. I can overcome obstacles. I can learn. I am good. I sometimes do naughty things, but no-one is perfect, and no-one has to be. People will forgive me if I am honest and try to make up for what I did. I can work hard and be rewarded. Life is fair. People who work harder get rewarded more. If I try hard I can succeed. If I fail, it is O.K, I can just get up and try again. Or find something else to succeed at. It doesn’t matter. I don’t have to be good at everything. I don’t have to be particularly good at anything. I am O.K just being me. Trying my best. People like me. I will be able to have a good life, if I work hard, be honest with people, and take chances (and accept that a lot of the time I will fall on my arse, but
that’s O.K, people will still like me, accept me, approve of me, even if I fuck up…no-one expects perfection, I don’t have to bear grudges, I can forgive people. They will forgive me. If I ask for help, someone will help. Not every girl I like will like me, but I will find the girl that is right for me and we will be happy together. Life is an adventure. Don’t take it too seriously. But be responsible. Take some chances. Accept the risks. Take responsibility for what I want. Work hard for it. Take the hits and get back up like Rocky, and fight harder. But life is a game. Not a struggle. Life is meant to be good. To be interesting. To be enjoyable. No-one has the right to judge others. Judge their actions. Judge the outcomes of their actions. New things are interesting and exciting. New people are interesting and exciting. All people should be given the chance to shine. Etc etc… can you imagine all the positive ‘imprinting’ we could be doing…and all the negative imprinting that is being actively pursued by narrow vest interest groups like ‘religions’ and ‘governments’???

So you can be imprinted with positive beliefs, expectations, definitions of self and the world…or by traumatic, negative experiences which imprint you with limiting, negative, dysfunctional, destructive beliefs… and don’t for a minute imagine everyone is acting with the best of intentions…motivated by good will…and beneficence…accept that there is a lot of malevolent, jealous, envious, controlling, enslaving motivation out there…not everyone wants the best for you and yours…and often the ones who make the greatest show of it, to gain your confidence, are the worst offenders…remember that liars go to more effort to convince you, and win you over, than do honest people, who have nothing to gain from you believing them or not, for they are not seeking to opportunistically exploit you, later down the road, after having gained your confidence with ‘gifts’ and ‘flattery’, and false hopes of unrealistic outcomes…go back and re-visit all your own ‘motives’ in every interaction in your life…be honest and we all find less than desirable motives behind many of our actions…or at least recognize the destructive, negative, jealous, envious impulses that we had to overcome before acting in the way we considered correct and appropriate i.e we all had to overcome some vicious impulses to act virtuously…pretending we didn’t won’t help others do the same…

There is some ‘programming’ that is genetic…basic sub-routines…however a lot of it is ‘learned’ or ‘programmed’ or ‘imprinted’ during childhood, and even adolescence, and even later in adulthood. Though few people change much, as adults, in their beliefs, without a conscious effort, and lots of ‘prodding’ by life experiences.

So maybe the child of the mother who beat them has the same ‘genetic predisposition’ to become frustrated easily, and expressing that frustration as
violence, even upon their own, defenseless, child. But surely that experience, which imprinted the belief that ‘this is normal’, ‘if I don’t get my way with someone I am physically stronger than I can beat them, express my anger and frustration with them, and force them to do my will’, is going to increase the odds of that genetic predisposition expressing itself, while other more positive predispositions are not allowed to overcome the negative one. A child taught the resources of how to deal with frustration, anger, etc verbally, and with other more positive, functional strategies, is more likely to resort to physical violence at some point…they will not have learned how to ‘blow off steam’, and avoid the situation by communicating their needs/wants in other ways, finding alternative strategies to getting their kids to ‘behave’, and developing reasonable definitions of what is possible with kids, and not worrying ‘what the neighbours think’ or ‘what my friends think’ e.g the house is a mess, my mother in law will use this against me, the kids are listening to me, they are going to make me look bad, the little…. And so the volcano erupts, when at so many points in this cycle the outcome could have been avoided, by implementing various strategies…which sadly the mother never learned from her parents, or anyone else…

The mother may have regressed to her own childhood, and introjected herself into her own mother, into that mother’s rage and frustration, and began re-living the event as her own mother…like being ‘possessed’ by the abusive mother …

An adult may unconsciously feel ‘comfortable’ in abusive relationships, and unconsciously seek them out, and reproduce the earlier abused victim status…or introject the abusive, victimizer status… two sides of the same coin… so victims are much more likely to become victimizers… abused abusers… for genetic and social/imprinting/programming/conditioning reasons…

Two people with the same experiences, but different genetic predispositions, may respond differently, with one committing suicide, and the other killing someone else, as a result of the same experiences…but either way the outcomes are negative… though occasionally a genetic predisposition, with the right later life experiences, can lead one victim to transform their entire society…or at least that group of people they have contact with…and bring forth something marvelous and wonderful out of their tragic, traumatic experiences…

As most imprinting occurred early in life, we have to regress to that earlier stage of life to re-imprint…to over-write the programming…re-write the hard-disc…purge it…

Note that when you hit ‘delete’ you don’t delete the data, just the address to it…
The same is with imprints…just ‘denying’ it happened and ‘blocking it out’ does not delete it. You may not be able to remember it, having ‘deleted’ the address, but that ‘blank space’ in your memory is still active…still doing its damage…you have to re-locate the address, go back, and over-write the data…replace it with a new, positive imprint…

They say we ‘become’ our parents…which means we express the same qualities they expressed around the same age… we ‘meet’ our parents as children and teenagers, not when THEY are children and teenagers, so we define them as adults…and feel different…but it is just that we are them as children… and when we become adults, we become them as adults…which leads to the illusion of only ‘becoming like them’ as adults…it is literal…

But parents can ‘escape’ history and re-imprint themselves, to escape their own parent’s conditioning / programming / imprinting, and offer their own children much better role models, and more positive imprints…conditioning…if they stop reproducing what they were offered, and actively take steps to produce, consciously and deliberately, new models, beliefs, imprints etc in themselves…

So a generation can ‘break the cycles’ of the past…cease merely reproducing the past cycles…and start working on more optimal beliefs, definitions etc…which is what my TROONATNOOR books are all about…they were written for me, as my own reference materials…and offered to you so you can benefit too…and because there is no such thing as living free among the enslaved…living optimally among prisoners… even managing to maintain my own sanity and freedom among people conditioned to stamp out any sign of sanity or freedom in others…conditioned to hate those who are even trying to escape…why should THEY escape?... and so they cut down the tall poppies, blow out the lighthouse candles, cut down the tall timber, destroy their ‘betters’, … so life is ‘fair’ i.e everyone is equal…at the lowest common denominator…equally miserable, detestable, self-loathing, hate-filled, despairing, and vicious…

Working class people, where I grew up, were actively conditioned never to be happy, never to strive for anything but sporting achievement, never to shine, never to ‘get a big head’, never to try to raise themselves ‘above’ their peers…people in my family? Lets not even go there. But you can guess it wasn’t a positive, nurturing environment for any of us.

PLEASE READ MY OTHER BOOKS

One strategy to reveal ‘hidden’ ‘repressed’ memories i.e imprint experiences, the source of current limiting beliefs, is to have the client / self make up something, randomly, to fill the blank…this gives their unconscious a chance to express the
truth...in some form, that it felt too traumatic to process directly... that it ‘disassociated’ from... dis-owned... repressed... denied... to avoid the pain... the threat of being overwhelmed by it... or it is just too ‘taboo’... noting that ‘taboos’ carry unconscious threats of ‘fates worse than death’, thanks to ‘religion’ etc.

You can ‘anchor’ a powerful resource state like ‘courage’ or ‘fearlessness’ in a session, then ‘trigger’ it, with the appropriate touch/smell/phrase, at the time when the ‘blank’ is drawn, to empower the person to face what their mind is holding from them... the traumatic ‘too bad to face’ experience... the pain they unconsciously realise is waiting for them there, in that place... or powerful taboo thought... e.g. I want to kill my father to take his place with my mother... the ‘classic’ Freudian taboo experience/thought/source of sexual taboos/repression of sexual thoughts etc...

Metaphors are processed by the left and right hemisphere together, so they can be used to address reason and emotion, and often succeed where other attempts at overcoming resistance to facing a traumatic situation/memory/imprint experience fail... i.e. indirect approach... of classical ‘myths’, ‘parables’ etc... appeal to unconscious without directly challenging/threatening conscious...

Often need to ‘change positions with the significant other’ in a memory related to the imprinted belief, and ascribe positive intentions to them, or empower them with resources for dealing with them, the ‘victim’ or mere interlocutor... i.e. have them say the right things, do the right things, to produce a new imprint, which will replace the old one...

Looking up to left indicates person ‘accessing a memory visually’... ‘accessing a visual image’...

Having noted that the person is accessing an image, get them to make it more vivid, and access other sensory data, such as feeling... what began as a vague image can be developed into a 5 sense detailed, vivid recollection... of something repressed... e.g. divers fear of ‘murky’ water... first accessed visual image of murky water, and then accessed memory of ‘feeling something squishy’, which they had repressed, as they had walked on a dead body in a muddy creek, a very traumatic experience which had imprinted the fear of murky water in the child, which remained long after the memory had been repressed... facing the memory
relieved the diver of the phobia... once realized source of fear, can give client new resources to face the reality of what had happened, without repression, and without the fear of murky water...could learn to merely become appropriately ‘cautious’ around murky water, rather than fear it as such...

Imprint usually unconscious role modelling of others... i.e taking their words to heart, believing what they say e.g you are no good, unlovable, unwanted, will never amount to anything, guilty of X and Y and Z and fucking everything... or introjecting their behavior and making it your own e.g mannerisms, behaviors, beliefs of world and yourself... NLP about letting YOU define everything for yourself... go back and reject the definitions others forced / imprinted upon you... re-define your ‘self’ and reality for yourself... but be careful not to merely reproduce the same old shit... you’d better be honest with yourself... now you have this power... otherwise you may do even worse with it than others did with it with you...

When question client, aim is to ‘calibrate’ their accessing cues... to work out how they work out what is real... to know when something is real to the person i.e what tone of voice, posture, accessing cues, tell the therapist when the client really believes what they are saying... mostly unconscious on the client’s part... their conscious words etc reveal less than their unconscious ‘tells’ i.e ‘I really believe this’... so can later transfer all these ‘reality checks’ and ‘proofs’ onto the desired belief... put them in the same visual location in their mind’s eyes... have client in same posture, tone of voice, mannerisms etc... so ‘layer’ the new over the old, and replace it, in as many places as possible, on as many levels, dimensions, for as many senses, as possible... so it becomes as real, to the client’s mind, as the original... only with the new positive spin / variation / belief as the content... i.e taking all the original ‘impressions’ associated with the original content that makes it so real for the client, but superimposing them / applying them to the new content... so now the new content has all the transferred authority of the original... and the new content, the new imprint, the new belief, is at least as ‘real’ and ‘believe-able’ as the original...

Therapist as ‘guide’ / ‘travel agent’... where do you want to be (or is it go? i.e journey Vs destination?)... need to elicit details... N.B always change a ‘I don’t want X etc’ into ‘I want Y’ i.e get client to think in terms of what they WANT... in positives... to always convert a negative internal dialog, image, feeling they do NOT want to have, into its reflexive positive... so not ‘I will lose weight’ but ‘I will gain the figure I’ve always wanted’, not ‘I will not have these debts / pain / suffering / problems’ but ‘I will soon be financially independent / having fun / enjoying life / enjoying simple things / pleasures (i.e never refer to ‘pain-free’ or ‘rid of pain’, etc... as this is negative reflex, must focus
unconscious on the gap between poles, not the poles…the image / the language
will program the unconscious, which does not ‘get’ NOT… i.e beyond good and
evil… ‘the fruit of the tree of life, the knowledge that only good exists, evil / bad/
is merely communication / feedback…

Vividly imagine how you want to feel, with all senses…use own past experience
as model if can, otherwise construct completely from wish list… like clear
instructions for unconscious about what ‘reality’ to construct…so it can begin
working towards it...setting the wheels in motion…include posture, breathing,
accessing cues…all so can convince self actually there, having that
experience…which is why great if have model of past experience to use muscle
memory, compare ‘fake’ with ‘real’ … so ‘believe’...

Spin ‘no symptoms’, which refers to the problem, to ‘feeling good’…energetic…
happy…confident about future…looking forward to good stuff… feeling bright
and cheerful…feeling proud and satisfied … sense of achievement… feeling
deserve good things-have earned them, and are anticipating them...

Maybe imagine self doing stuff that indicates success, well-being, health,
vitality…e.g working out, jogging with pretty women, chairing a meeting, giving
a presentation, making a big sale, finding a solution…like in a dream, or stoned,
you can have a feeling with no content … or content based feeling i.e with props
associated with outcomes desire to ‘prove’ ‘you’ve made it’…you are healthy,
financially independent, have that job, have that relationship, … all framed in
what you DO want, and NEVER about what you don’t want...

Can see / feel / hear / taste / smell self interacting with people positively, joking,
laughing, flirting, feeling comfortable, at ease, not having any craving for food or
drugs or sex (whatever addiction you suffer from)... show self eating healthy,
having great relationships, taking breaks to read / walk / talk with people Vs
smoke / drink / shoot up etc…i.e the positive alternatives you want to have as
new habits...new responses to stress...new responses to
challenges...boredom...etc... so need to give client these alternative response
resources...positive resources...Vs destructive / temporary ‘fixes’...

Model visualisations of health issues...e.g of immune system and body
communicating better i.e identifying healthy cells, and passing them by...avoid
‘conflict’ models...seek out models where body is an ecological system, or
organization...a ‘team’ model...where it has learned to work as a team
better...got a better coach...is communicating better...on good terms... use
‘hairdresser’ metaphor for immune system ‘trimming back’ tumors / growths, all
in positive sense ... or sharing a burden with other team members....
The AIDs virus attacks parts of the body’s own immune defence system, leaving it prone pathogens / other viruses / infections… it infects the immune system’s ‘marker cells’ which plant ‘flags’ on ‘foreign’ cells to identify them to the immune systems ‘clean-up’ squads… to eliminate them… so they identify the wrong cells… it is a question of ‘propaganda’ and ‘communications’…

Exactly like the Jewish mass media… they define the patriots as terrorists, the friend as enemy, so YOU will target the patriots for elimination…

The ‘treatments’ available at present actually target your own defense mechanisms, to make them less efficacious, so they can, ironically, do less damage… but this also weakens your defences from other pathogens / infections…

Many people with the AIDs virus don’t have any symptoms… the ‘propaganda’ of the AIDS virus is not confusing their defence systems… they are not targeting their own healthy cells… the propaganda won’t ‘stick’… it isn’t ‘believed’ by the body’s immune system… the communication system is still working and the ‘lies’ of the AIDS propaganda won’t take… it fails…

One clue about the nature of many illnesses is that, in people with multiple personality disorders, one of their personalities can suffer from a disease, allergy, illness, phobia, and have totally different immune reactions to another personality. But they share the same body! So what does this reveal to you about the power of the mind?

There are cases where one personality has diabetes, and another doesn’t.

This highlights that the way we think about our ‘selves’, our ‘identification’ our ‘beliefs’ have a huge impact on our health. And so changing beliefs about your ‘self’ can result in major physiological changes… cures… immunities…

Blood vessels can be dilated (widened) or constricted by beliefs… or when e.g. asthma / illness is ‘rewarded’ with positive attention / love or avoidance… later in life this can become translated into constricted arteries and heart attacks / strokes…

Observe client when talking about some belief they have / can change, in their own view / belief, and beliefs they feel they cannot change e.g accessing cues associated with each belief set… then move the ‘can’t change’ accessing cues and physiology i.e. calibrate this during interviews… in the direction of the ‘can change’ ones, until they replace the ‘can’t change’ cues / physiology… e.g. ‘can’ evokes looking up to the right, and ‘can’t’ associated with pushing hand down to
left behind them’…etc…observe what behaviors, mannerisms etc associated with each belief set i.e the beliefs they can and have changed, and those they believe (feel) they can’t…

First replace ‘can’t change’ with ‘haven’t managed to change YET’…

Then vividly immerse in memory of something you have changed, some belief you have ‘corrected’ and replaced… or at least had the distinct feeling you would…i.e confidence…belief that you could change it…

Observe for patterns…wait until have discovered the pattern in their cues/physiology i.e their ‘tells’…don’t jump to conclusions…observe behavioral responses to different suggestions … identify 3 or more examples of the same nonverbal ‘tells’ / cues / reactions…consistent behaviors…around some ‘locus’ … e.g the ‘locus’ of ‘I can’ and ‘I can’t’…

Looking down to left indicates client ‘thinking in words’ i.e verbalizing thoughts to self”…

Listen for belief statements of a global nature e.g ‘Its always been difficult for me to get what I want’… ‘Life wasn’t meant to be easy’… ‘You’re no good at math/sport/with people’… ‘Internal terrorists’…

Ask client to search for source of that internal global definition / belief…when did it first emerge…where did it come from…what context…

Looking up left is ‘seeing in your minds eye’ what you are imagining…

Go with any emotion that emerges e.g anger and frustration…‘My life’s always been so hard’…

Frustration = have goal, but don’t know how to achieve it… you are frustrated in attaining some desired objective / object … a history of frustrated attempts / failures will limit what you are prepared to sacrifice, invest, risk in attaining future objectives…as soon as obstacles appear, and frustrate current attempts, they bring up this whole history, and the belief of their inefficacy…

Anchor the feeling of frustration by getting client to recall all their frustrating experiences as far back as they can recall…recollect… vividly…fully immersed and engaged in…then ‘anchor’ those feelings to a touch at a particular place e.g shoulder…

When client comes across ‘content’ doesn’t want to talk about, just get them to indulge in the emotions…the frustration, anger, etc…
If they are observing themselves from the outside of the situation, as a bystander / observer, get them to introject themselves back into the person they were back then, to become the actor again…to ‘enter into it’ … rather than merely observe…

Often fear becomes imprinted by some event that getting what you want is associated with trouble / problems / negative consequences…so you sabotage yourself from then on…feeling you don’t ‘deserve’ success…not ‘entitled’ to it…to getting what you want, to happiness, to success etc…guilty feelings about even wanting it… that if others knew what you wanted, they’d reject you…abandon you… or they’d come to some sort of harm… fear that the world will ‘get you’ if it knew what you wanted [come on, how Freudian do you have to get, the fear that if father knew you wanted mummy, and were willing to kill him, he’d surely hate you / reject you / abandon you / punish you / kill you !!!]

In NLP do not need to confront actual Oedipal desire, or any other content of situation…just need to immerse self in the feelings associated with the content, the event… ask client to identify any generalisations that are forming in their mind at the time of the event, as they are re-living it… e.g I don’t deserve what I want, I can’t get what I want, it is wrong to want it…it is dangerous to want…getting what I want is associated with trouble / danger etc…

Then remove ‘anchor’ i.e hand on shoulder, and return to present

Now get client to observe the same situation, from a distance, as an uninvolved bystander / observer…without entering into it…being watcher not participant / actor…like watching a film…the you in the film being someone else…so you are not emotionally invested in the content…passive observer… Ask client how that experience they are watching affected them e.g gave them feeling of guilt attached to wanting something…i.e ask ‘how has that experience affected you since then?’ … e.g feel guilty any time want something… that what you want is bad… you don’t deserve to get what you want… I’ll be punished by the world … free floating anxiety of punishment for desiring something / getting what want…what I want is bad… as underlying belief…globalization… generalisation …that becomes transferred to any objective / goal you want to attain…so sabotage self…give up…don’t invest enough effort etc… e.g Oedipal desire associated with general fear of success / self-sabotage…punish self so world/daddy won’t…guilt at own happiness/satisfaction…generalized from specific desire/guilt to identity / global / general belief underlying all beliefs / definitions of desire / want / success / satisfaction…a belief cluster / belief set…

This belief will be ‘confirmed’ by every experience after the initial experience that produced it…mind looks for patterns, to confirm what ‘knows’ already i.e
current beliefs…so there will appear to be a history of confirmation…so must reach the original experience when the belief first emerged… to avoid simply confirming the hypothesis it generated… and fixing it even more firmly… self-fulfilling prophecy… any setback, disappointment, bad experience will be used to ‘confirm’ the belief, while any experience that contradicts it will tend to be overlooked, or accepted as ‘exception’ that proves the rule…

So don’t even attempt to argue with the firm belief in the present… have to go back to when it emerged, and challenge it then… before it got rooted… when it was just a single event / experience, and not yet ‘confirmed’ by later ‘experience’ and ‘selective perception’ etc…

Our interest is not the actual event, but how it produced / established a belief… usually most prone to his before reasoning skills emerged to challenge imprinted beliefs… e.g infancy, adolescence… or some really powerful later experience…

By first verbalizing the realization, we begin a re-structuring of the brain… the noetic system… the system of beliefs… at least open it up to potential transformations… we start engaging the entire brain… involving it… activating it… escaping the pure cyclic habitual reproduction of the past beliefs… the pattern… engaging the unconscious…

[MHR good example… did you exercise this morning… i.e you usually do, but sometimes don’t, and sometimes hard to decide if you have or not, as it is such a routine habit… how do I determine if my belief that I did is correct, or the belief / doubt that I didn’t?]

[maybe Oedipal complex at base of ALL guilt… i.e ‘conscience’ … in humans … basis of most people’s observance of basic rules i.e fear Vs logic of ‘as you do unto others, they are likely to do unto you’ etc]

Beliefs are often generalizing / globalizing Vs specific i.e mind looks for patterns… accepts superficial appearances of pattern… calibrates psycho-cybernetic feedback systems to them… the earlier ones most powerful as mind ‘blank slate’ eagerly waiting to gather impressions and construct patterns / expectations i.e ‘define reality’ … key to survival… innate process… mind loves to find patterns… to construct them… hence music, architecture, philosophy … science is identifying and harnessing apparent patterns in world… keen to be ‘imprinted’… eager to discover a pattern… so often constructs from material given, prematurely… then conforms later experiences to that pattern, where they can be forced to fit / manipulated / distorted… when an initial imprint is reinforced e.g same parental behavior / imprinting, they become fixed / established… and where nothing contradicts the initial experience / impression,
the mind will work with the initial material exclusively, tend to distort vague / indistinct etc later experiences to conform to ‘pattern’ constructed at earliest impression… i.e the mind NEEDS a pattern to define reality by…to navigate by…

Initial experience of ‘I don’t deserve what I want’ may become ‘I can’t get what I want’… which is different…so if go back to original imprint can remove the ‘can’t’, and then continue to work on the ‘deserve’… so now person believes ‘Can’, just a question of overcoming the ‘don’t deserve’ objection… the fear of punishment…

The experience may have been confusing, even positive, at time… e.g the sexual pleasure of being ‘molested’ by a significant other… experienced orgasm pleasure, but associated with feeling ‘this is wrong’… or later the experience seemed ‘wrong’, due to how people talked about sex etc… as if it was bad… which re-defined the past experience, up till now neutral and just odd, or even pleasurable, as ‘bad’ and ‘wrong’ and somehow YOU are guilty because you participated passively, or actively enjoyed it…

And so after the event, a person may attribute meanings to it that were not present at the time… e.g participation in a sexual act, either as willing pro-active participant, or as passive, pleasurable participant, or passive neutral participant, or actively non-voluntary, forced participant in unwanted and painful act… i.e an entire spectrum of ‘molestation’… at time could have had one or more meanings very different to that later attached to the event / defining it… and the persons beliefs…

Later may feel guilty as wanted it, or allowed it to happen, or enjoyed it… or hated it but didn’t fight hard enough… very complex… no reason to make assumptions… and with NLP don’t have to deal with content… just with the belief that was formed as a result… Get person aware that this is when the belief was formed… and that they have a choice to form a different belief based on the same original content… to define it differently… as victim… as willing, pleasurable participant etc… i.e validly… it was what it was… no need to feel guilt either way… sexual desire good… being raped is a violent crime… etc…

Often the judgements made by significant others long after the events are as important as the beliefs you formed at the time… in fact the ‘unconscious internal terrorist’ is often the significant other… their judgments… which you accepted… internalized… introjected into your own… i.e accepted the guilt they projected / attached to you… can actually become stronger as grow up… affect you more as adult than as child… as you internalize other people’s values / judgements about the sort of thing you experienced…
Could be well intentioned ... e.g. brainwashed ‘religious’ dogma that homosexuality is sin ... so significant other believes they are doing you a service by demonizing your innocent informed consent homosexual interaction ... and you internalized their definitions and affects ... so learned to hate self, own sexuality ... define own actions as sinful ... fear god’s punishment ... so sabotage self to avoid it ... feel ‘unworthy’ of good luck / success ... if you were happy, god would punish you ... your role is now to punish yourself for your ‘crimes’ ... but can go back and empower that religious fucker with reason and enlightenment about ‘religion’, and have them accept and validate your choices ... your ‘desires’ as none of their fucking business, and completely natural and normal and legitimate as any other form of consenting sexual interactions ... or could be some other motive on the ‘judgers’ part ... either way, can re-imprint THAT interaction with that significant other that defined the OTHER interaction as bad, and formed the actual belief that ‘I don’t deserve to be happy’ or ‘getting what I want e.g. they wanted to suck that other guy’s cock and got a load i.e. got what they wanted ... so in such cases the actual imprinting event, the source of the limiting belief, was not the sexual encounter, but how a significant other later defined it ... so re-live THAT interaction, get them to define it as ‘O.K’, no problem, nothing wrong, congratulations you got to suck your first cock etc ... which changes the ‘meaning’ of the sexual interaction, and re-imprints a new belief ‘getting what I want is great’ ... ‘I can get what I want’ ... etc

The trick, though, is how to model that behavior, that new response, in that past significant other, convincingly ... so the client believes that significant other when this time they react more acceptingly / positively / constructively / helpfully ...

If significant other’s rejection / abandonment of you / client is issue then to re-live that experience but with that person’s acceptance, first need to find model of acceptance that you / client believes ... so you can introject that into the significant other whose acceptance you needed, but didn’t get ... try to recall an experience where you felt totally accepted ... then give this acceptance to the significant other to display towards you, while re-imprinting the event ...

When they are fully ‘in’ that feeling of acceptance, ... then say ‘Take this feeling’ as you anchor it with a squeeze of the client’s arm ... and give it to that person ... so now you can experience that person’s acceptance, and believe it ... have a new imprint of acceptance to replace the original limiting imprint of rejection ... so no the past experience has a new definition / meaning / significance ... a moment where acceptance was imprinted, over-writing the limiting belief ... now your dominant, default expectation will be acceptance ... you will feel that ‘getting what you want’ is good ... there is nothing to be feared ... bad things won’t happen just because you get what you want ... succeed...
Now imprinted with ‘it does not matter what I do, I will be approved of, accepted, loved, not rejected, abandoned… so no need to fear making mistake, falling short, failing, or succeeding… no need to feel guilty for own desires … sexuality … what you want … it’s O.K just to be yourself …

Now take that feeling and move forward in time, through life, and experience the difference it makes (would have made) … feeling good about yourself … feeling accepted, approved of, as your default / fundamental expectation / belief about yourself and the world …

Squeeze anchor again… remind client that at time they didn’t have this resource, but they have it now … YOU can ACCEPT YOURself… update your model of reality … I deserve good things … I am a good person …

Remind client that other people’s judgements are merely reflections of their own models of the world…their own limiting beliefs … even with best intentions can be wrong … so no need to introject / adopt their erroneous judgements about you …

Arm squeezing has ‘anchored’ the sub-modalities of the feeling of acceptance, so this ‘resource’ can be employed i.e squeeze arm any time need to feel O.K independent of other people’s judgements…

Now client can relive any experience, and you, the therapist, can squeeze their arm, and empower them with the resource of ‘acceptance’ i.e they will revert to all the sub-modalities associated with ‘acceptance’… and they will feel it as real … in the different experiences where they needed it, but didn’t get it…they can accept themselves, despite what significant others say or do i.e reject you / judge your behavior …

Note how the client’s physiology shifts when you ‘squeeze their arm’ to activate / trigger the ‘anchor’ of ‘feeling self-acceptance no matter what others appear to think/feel’…

Get them to remember the time they came closest to feeling complete self-acceptance, in the face of external criticism/judgement/rejection… e.g someone delivering criticism client felt /believed was totally unjustified, and felt good about self despite what other saying…then ‘anchor’ that feeling/physiology … then get client to explain how it felt, where felt the self-acceptance, then to take the imagery etc they use and expand it e.g a soft light, make it brighter, a circle around heart, make it bigger, to encompass totality of person…i.e emphasize that feeling and all its sub-modalities…so it is even more positive, powerful, clear, bright, global, general… then take that feeling and project it, with all its sub-modalities, back through the clients past…tell them to take that feeling, that image e.g a light, a warm glow, etc, and shine it onto themselves as needed, as
they go back through their life…get them to metaphor-ize the feeling as an image or light, so they can expand that image, brighten that light etc…totally immerse themselves in that light… ask them ‘What would that feeling look like? Sound like? Feel like? Find a metaphor to work with…so can visualize that metaphor and ‘shine that light’ on his past selves etc…make that light shine in the old selves, as it does now in the current self (the anchored self from the positive experience/belief)… so now empower the old selves to reject other significant other’s rejection / criticism / judgements of old self, so no longer imprinted with global feelings of rejection, replace with new feelings, globalized, of acceptance…self-acceptance no matter what others say or do or appear to think… so no longer affected by other people’s express or implied or assumed opinions / judgements etc of self…accept self…find self-acceptable …

Next step is to try to elicit positive attention, to replace significant other’s negative attention i.e negative judgements / rejection / criticism … during the imprinting events…

While regressed to time of an imprint, ask if client had desired positive attention of significant others in that memory / interaction… then ask client to recall any time in their life when they had gotten positive attention from someone (if not the same person they desired it from, then another person…a particular experience they can reproduce in their mind) … get them to regress to that interaction, and deeply recall all the 5 sense impressions connected / associated with that interaction / feeling of positive acceptance … i.e the sub-modalities and modalities….what saw, heard, felt, smelt, tasted… body posture … etc… a time client was at ease, relaxed, being around people, but just being themselves…chilling…being real… authentic… genuine… ‘just themselves’ … and got positive attention … when client has deeply immersed in this feeling / emotion / situation / regression i.e has all signs of looking, feeling etc at ease, happy etc, ‘anchor’ this entire set of impressions / sub-modalities by squeezing their shoulder … so this squeeze at this point has become associated with that holistic feeling / sensation / impression …

[MHR ‘anchored’ the earlier imprint on upper arm, this one on shoulder, so can now say, as squeeze both, ‘We’ll take these resources back to where didn’t get positive attention wanted/needed at time… i.e first anchor the ‘failed’ interaction with squeeze of upper arm, then get to relive positive experience and say ‘We’ll take this too’ and then squeeze shoulder, ‘ and take both of these back to the younger you’…]

Then once back in original ‘failed’ interaction ‘ Let’s take these two resources, touch both anchors, and shine the light over all those expectations back there and brighten them up . ‘Take this resource’, touch anchor of acceptance experience, ‘of acceptance back too. Make sure these resources are appropriate for all those
experiences. Let the light shine through like a beam, connecting all those experiences together…. then adopt a calm, monotone i.e hypnotic, suggestive voice …’You can be relaxed and secure, being calm and comfortable with yourself. Make it into a fun challenge to get what you want.’

Instruct client … ‘We have something important to do. So far you have been watching yourself, as an observer. I’d like you to now go back and put yourself into the experience. To be the ‘significant other’ e.g father / mother … experience it from their point of view, but with all the great new resources you have been given. Give these resources to them. See the young boy you were back then, through their eyes, and see what that boy needs / wants … give that boy the positive attention / acceptance etc that that boy needs (needed back then)…know that you can really pay attention to him and give him the support he needs to become accepting of himself…and others…take all the time you need…when you are ready, you can come back here…

N.B as time can shrink and expand, is subjective, client may almost immediately return, after having the sense of having spent ‘a lot of time’ doing what needed doing ‘back there’…

That boy needed to know that he was, fundamentally, at his core, as a person, globally, generally ‘O.K’ (even if did fuck up now and then like any real human or other animal)...that he could be relaxed and confident and be sure of getting the attention he needs ...

Step into the experience of that boy (touch all anchors set) and bring him all these resources with you … now relive the ‘critical’ ‘imprinting’ situation … have him look up into the eyes of the person he needed positive acceptance from, and who now has all the resources to give it…have it get it...then go back through all the other times in your life you / the boy, never got that acceptance, and this time get it, easily, just by being yourself… ‘grow him up’ through all those situations till he gets to where you are now. Here. Up into yourself, sitting here.

Take with you those new beliefs, understandings, and spread them through these experiences that in the past were experienced as evidence of inability, incompetence, inefficacy, proof you would fail, expectations of failure…of that global belief in your lack of efficacy…of anxiety…of fear of that failure you felt doomed to experience over and over… but now all those experiences are evidence of your efficacy, that you are capable, competent, that you will succeed, that people will accept and approve of you … beliefs at the base of a new confident, calm, enthusiastic self…a new you … founded on positive beliefs / expectations / confidence / calm…

Match own voice tempo to client’s breathing i.e rapport, mirroring…leading…
Get patient to imagine a speaker near their ear. They can program it to say what they want to think… ‘I am fine just the way I am, and if other people want to make judgements about me, that’s their problem’…so can replay that in every version imaginable, so it reverberates and resonates, with positive feelings of acceptance and self-approval, self-acceptance and approval…If you want to, any time, you can get positive acceptance from them… but you don’t need it…it is your choice…you determine how you feel, not others…

Note the clients skin tone, posture etc…get client to imagine themselves…how they now look i.e image should now be fuller, more vibrant, more vivid, more alive…and this will be reflected in their appearance i.e healthy, vibrant, glowing...

So process is to find imprint experience, then give all the participants / actors, the ‘perpetrators’ and the ‘protagonist’ the resources required for a positive outcome for the protagonist. So they can behave resourcefully, positively, constructively, ideally, optimally and re-imprint the negative experience as a positive one… to replace the limiting global / general beliefs about the self and other, about the world, with resourceful, creative, confident, positive expectancy, etc beliefs…

So no need to change other person, or actually deal with content associated with the impression / belief that was generated…just re-script the memory…re-live it as vividly as possible with the edits/variations/new lines, so that the belief that is formed from this interaction is positive…to replace / displace the current limiting belief that was formed during the original incident… we are working with beliefs…the ‘reality’ is irrelevant…we want to change our beliefs about ourselves…so we don’t ‘believe’ we need to be sick, in pain, suffer, fail, avoid, define ourselves as ‘losers’ as ‘bad’ as ‘sinners’… i.e opposite of what controllers want e.g controlling parents, priests, government, peers ‘friends’, ‘partners’...

MHR a new ‘impression’ will be rejected if not consistent with the existing ones. E.g a person with great self-esteem doesn’t ‘take to heart’ set backs, criticisms etc even where others make a real effort to ‘cut them down’… successful businesspeople go through bankruptcy with positive belief in self intact, to rise from the ashes, and succeed…even if it takes a dozen failures…most inventions result of 1000s of failures… evolution is optimistic in nature i.e forgets all the ‘misses’, its focus on the ‘hits’… like mad-men overlooking all the misery they have produced, their mind on the ‘prize’ of the utopia (at least for the few they care about)…
So no need to change what happened, or get others to admit to it (MHR my greatest wish and desire!)…all we need to change is the belief that arose from it… often repeated incidents all re-enforcing each other, and most early imprints… in other words can change the meaning, the definition the imprinting situation, without needing to change it…even just viewing things from the perspective of the ‘bad guys’ in the situation helps…it becomes about THEIR problem, THEIR failure, and not yours…it was THEM that had the problem…NOT you…but you ‘introjected’ guilt / responsibility for their actions… you ‘took on board’ and ‘took to heart’ their failed / inappropriate words and actions… this is what formed the belief, not their actions/words, per se…so all you need to do is acknowledge it was THEM that failed, not you…their efficacy is in question, not yours… so now you can ‘let go of’ the limiting belief…you didn’t ‘earn’ it… you just ‘accepted’ it at the time, because you didn’t know better…and the significant others didn’t know better…think like Socrates that if they knew better, they would have behaved better…and ‘why do stupid people say/do stupid things?’ …

So the limiting beliefs e.g I can’t, I will fail, I shouldn’t succeed, I’m ugly, I’m stupid, I can’t get what I want, I am a guilty sinner, I deserve to be unhappy, I don’t deserve to be happy, I don’t deserve to be loved, I don’t deserve to be accepted/approved of, I can’t possibly earn others’ approval and acceptance…etc etc …the client/you constructed about yourself, during such imprinting situations, can be de-constructed by you, and replaced, now, with hindsight, with better understandings, with more optimal beliefs about yourself, and the world…

This is the silver lining in the cloud…the ‘spin’ we can put on the curve ball…because all our beliefs are essentially generated by us, passively, we can re-program all our beliefs, actively… as adults…with the resources we have gained from life… at the time we survived…that is the most important thing for children… for infants… but once we have become independent, we can do even better than mere ‘survival’…

Run the ‘movie’ of a negative encounter with the new 3D touch feely smelly tasty technology you just got delivered by your favorite on-line shop…you can float around the experience, watching all the participants…then ‘enter into’ and ‘become’ the ‘other’ people…experience the interaction completely from their point of view…adopt their physiology totally, their excitement, their tension, their voice tone, feel their posture, their excitement, their breathing, how their shoes feel, what they see and hear, and sense… all the impressions that make up their experience, and make it real for them…experience the interaction from their points of view, then once again watch as an independent observer, with the new insights, then experience the situation again as yourself…with these new
insights...and see how your ‘definitions’ have changed...the ‘experience’...what it ‘means’...the ‘meaning’ of the interaction has changed...

Each time you first watch the interaction closely, then become one of the actors, then watch again, then enter into self, other, etc, until have experienced it as an observer, and each participant, fully...as real...each time building up insights...understanding how each person is experiencing the situation, and how that situation changes, in meaning, in significance, the more you have seen it from the perspectives, / experiences / meanings / definitions / beliefs of each actor...

MHR this is true conflict resolution...communication...if people genuinely interested in truth, justice, etc rather than just ‘playing’ as ‘players’ ... if people genuinely want to be worth of the trust of the others, or just trying to ‘con’ them, to ‘get the best deal for themselves’ etc...

MHR idea for movie where this tech used for conflict resolution...negotiations, conflict avoidance, ‘wise’ decision making processes’...maybe aliens or time travelers bring it, during crisis on earth... empathy generator...so people actually experience interactions from p.o.v of animals they eat / test on, other people etc...but of course assumes humans open to empathy...give a fuck about other’s suffering, and WANT justice etc...maybe movie can finally deal with this point...are there only a few vegans with this nature out there? Do we need to ‘purge’ of the other 99%?’ or is it a matter of prodding and pushing others, giving them ‘experiences’ of the suffering of others...to make it real...impossible to deny / ignore ???

Note victims of crime often suffer as much as a result of the beliefs formed, the ‘paradise lost’ , the ‘innocence lost’ the ‘goodwill’ lost, the ‘faith in others’ lost, the ‘positive expectations’ lost i.e confidence in self, others, world, the system...if one person/group did ‘this’ to you, then how can you now expect different from others? ... how can trust again? ... totally changes definition of world / of others... world now dangerous...threatening...bound to be imprinted with new ‘protective’ beliefs ... e.g don’t trust, keep vigilant, tense, alert, ... worried... and maybe re-interpret victimhood as ‘deserved’ e.g karma, religion, ‘I deserved it / did something to provoke it’ e.g so stop wearing ‘sexy’ clothing, or even ‘nice’ clothing, as this provoked the people to rape you, mug you, hate you i.e you made them feel bad reflexively by feeling good / dressing fine ... like rubbing their ugliness and failure in their faces... so stop dressing nice, stop smiling in the street... so part of the ‘victim’ experience are the beliefs imprinted by it... So there is a lot to be gained from applying this NLP to adult
experiences…like rape, mobbing, physical assault, robberies etc…any negative experience that imprinted some negative expectation / belief / definition that is now limiting you e.g you won’t go outside at night by yourself, you won’t trust anyone, you’ll get a lawyer to look at any contract before signing, you won’t be generous as people don’t reciprocate, you will reduce your social circle / interaction even to point of becoming recluse…you’ll avoid new things, places, people you feel might present some risk, and narrow your interactions to close friends and family…or avoid even them…you got mobbed, rejected, abandoned so why bother even trying to find a job? … what’s the point? … any moment everything can be taken from you by a dirty cop, a criminal, a drunk driver, a lying bitch/asshole, …

So you will want to empathise with the ‘victimiser’ without falling into ‘Stockholm syndrome’… which is the minds attempt to ‘reconcile’ what you want to believe about people in general, with what some particular person/s are actually doing to you i.e re-define / deny the bad … justify it…make it legitimate…even so far as feeling you ‘deserve’ to be raped by the Catholic priest, because, after all, you did masturbate that time didn’t you? And isn’t that a sin?… blaming you ‘self’ in past lives for the bad karma you are now suffering…etc…

So we must work on empathizing with the attacker, mobber, etc…to gain a full / correct / understanding of what happened to us…so we can decide what beliefs we would best imprint from the experience i.e we want to learn appropriate lessons / feedback, but not go to excesses e.g belief it is correct to take some care and precautions and not assume world totally safe / no threats … but if we go too far we can end up limiting our positive experiences of life more than necessary e.g compare becoming recluse, with full security system, who never leaves home, with person who takes precautions i.e avoids known danger areas at night, arranges to be with a group rather than alone when going out, i.e to limit excess risk / exposure only, and not limit self globally i.e ‘world too dangerous to enjoy anything’ Vs life involves risks, lets work out how to avoid what happened last time…was it avoidable at all? Or just bad luck / random event that we should NOT allow to influence our basic beliefs ???

So by entering into role of attacker, assailant, perpetrator, we can gain insights into what the interaction really ‘means’ in the context of the bigger picture…like working out ‘what NOT to do NEXT time’, what precautions can reasonably be taken without going to extremes e.g be a good-willed NSA worker VS a Jewish New World Order dictator … i.e what reasonable precautions can we take to protect ourselves, without making our lives barely worth living i.e reasonable cost-benefit analysis…what really happened…what can we do to avoid it happening again…. Vs jumping to conclusions and extremes…though human nature is biased towards this i.e survival mechanism…extremes more emotionally
satisfying, clear, simple e.g let’s profile and screen the most ‘likely’ travelers and all immigrants, VS lets put the entire population under 24/7 observation, stop and search everyone, anywhere, no matter what the probability is that they are a ‘terrorist’ or ‘criminal’ etc…

N.B whole ‘victim’ backstory you inherit as a ‘Jew’ is a basic belief of being ‘vulnerable’ and that ‘Everyone’ is ‘out to get you’, to ‘put you up a chimney’…and so you have a very extreme belief of persecution, requiring absolute, total control of everyone ‘not-a-Jew’...and thus you feel justified in ANY lie e.g ‘The holocaust’ (assuming you don’t actually believe it as part of your ‘victimhood’ imprinting) … I mean, if the whole world is out to murder you, then anything you do seems justified, from war, to 911, to imposing martial law on all ‘non-Jews’... just put yourself in the position of a ‘Jew’, told that you are the chosen people, with the destiny to enslave all other ‘animals’, including those animals your god put in human form to be of better service / use to you, as slaves, sex objects, soldiers etc…to grow your food, build your houses, fight your wars etc...and then being imprinted with ‘The Holocaust’ ... and then being offered the chance to ‘protect’ you and your fellow ‘Jews’ via the CIA, congress, mass media, finance, judiciary etc… I mean, if after putting yourself in their position, you don’t GET what is really going on in the world, and WHY, even if you are Alex Jones himself, then I mean…what should MY belief be about YOU?

Walking in another’s shoes isn’t about overlooking their actions, forgetting it, even forgiving it... it is about helping YOU get out of the situation with the lowest costs, the fewest scars, the most resources... and to do this, you have to see things from the perpetrators point of view.

It may lead you to being more tolerant / forgiving, but that is not the main point. The main point is YOUR interests in ‘entering into’ their experience. To understand their motives. And so be in a position to judge what your reaction should be e.g hate all men, or maybe work towards a world where men don’t hate women, where men can release their sexual frustration in more positive ways, i.e take responsibility where it is reasonable and due... not wear a burkha, hide yourself away, and hate all men...

My mobbers did what was easiest for them. Most convenient. And the legal system did the same. And so I learned that we need a different legal system. A socialized one. Where anyone can ‘afford’ a lawyer. Because people need ‘sticks’ to ‘do the right thing’. So I turned my experience to something good. All the world’s organisations and consumers lost me ... a real asset ... I could have done so much good for them... but I went from executive to advocate, as this being the only way to do good... i.e write books... for the few open-minded people of
good will... I won’t bang my head against the brick wall that is most humans, but seek to facilitate and empower the few ‘good people’ ... I learned to survive without the benefits of employment and work-mates etc... not ideal... but I didn’t give up... I did the best I could... I didn’t reciprocate the violence perpetrated upon me by so many people. I broke the cycle of violence. Hey, but soon they will all be reaping the harvest THEY have sown, in their daily lives, again, as usual, with the next big war...

So empathizing with the perpetrators is not Stockholm syndrome, but merely re-living an experience as real as possible, but with positive outcomes this time, and positive imprinted impressions and beliefs... to convince yourself the experience is real, you have to make the actions of the ‘other’ convincing...

Some of this of course applies more to parent-child interactions than rapist-victim interactions. But at some level it can all benefit you.

You don’t want to pretend you were not the victim of a real crime.

But you want to re-experience interactions with significant others that imprinted limiting beliefs upon you.

So if your rapist imprinted ‘you deserve this’, ‘you asked for this’, ‘this is your karma’, ‘god is punishing you in this way’, you need to completely reject that belief... but it only had any ‘traction’ because it connected to an unconscious belief that was imprinted in you much earlier e.g in your childhood, when you were imprinted with ‘you’re a dirty little girl, touching yourself like that, god will punish you’ etc... So you will need to go back to THAT imprinting interaction to escape the rapists attempt at imprinting you...

An action is something that happened. How you experienced it is up to you to decide, even right now.

You can be someone who was raped, mobbed, assaulted. Or you can become a ‘rape/assault/workplace victimisation’ VICTIM... they are two different things. You can let it ruin your life. Or you can minimize the harm done. Take responsibility only where it is due. Throw off unjustified false beliefs. Lay the blame where it belongs. Take steps to prevent the experience, without letting it totally ruin your life. Accept the real risks, seek to minimize their likelihood, but not at the cost of making your life miserable. Not worth living. A prison of fear, control, precautions etc... THAT is when you’ve become a VICTIM.

Real damage has been done. But we want to limit any further damage being done as a result. Due to the limiting beliefs. The beliefs that now limit us in our
physical expression, freedom of movement, privacy, clothing choices, the reasonable risks we are willing to take, etc… and how we globally define ourselves, others, and the world…

For phobias, unrealistic fears, we need to go back to before the irrational fear was imprinted…back to when the person still felt safe and confident. For a parent who did a nasty horrible thing to a child, we need to go back to before the first such incidents occurred. To give the actors the resources they needed back then, but didn’t get, which lead to their horrible behavior / actions later. Or to having the imprinting experience. Before forming the unconscious limiting beliefs / phobias / irrational hatreds / irrational prejudices / irrational beliefs…

‘Sandwich’ the traumatic imprinted state between times of ease / comfort / joy etc…So first go back to before the imprint occurred…when the person felt at ease etc… Preferably a resourceful state, but at minimum a ‘neutral’ state i.e preferable one full of hope, joy, positive expectation, but at least one where there was no irrational fear etc…

Seek ‘closure’ by going from good, to imprint, to good again…as if the experience is ‘processed’ and ‘done with’ and ‘over’… let it have ‘an end’… let there be an end to the suffering… replace the limiting belief cycle with a resourceful belief cycle… a negative reinforcing loop with a positive one… negative expectations with positive ones… make a clean break… replace / displace the limiting belief with a resourceful belief…

When regressing, allow client to be neutral bystander / observer when they get to the traumatic imprinting situation, then observe it without involvement / passively / as observer rather than participant, then continue back till find a point where the person was as yet unaffected by the experience… ideally happy, carefree, positive etc… i.e without any of the symptoms the traumatic event imprinted… i.e allow client to remain dissociated as ‘watch’ the traumatic event…

Freud would argue that you have to deal with the affect… re-experience the pain… process it fully… to find the true source of it… rather than the phobia etc it has become projected / displaced onto… i.e the irrational fear / hatred directed now at X, was really a fear / hatred directed towards some ‘inappropriate’ ‘other’ i.e not O.K to ‘hate’ your own father or mother, who loved you and looked after you… say you wanted to kill your father, to take his place as your mother’s lover… well you probably won’t remember it that way… the idea is ‘taboo’ and your conscious mind repressed it… even the imaginary ‘murders’ you carried out in your infantile consciousness… so Freud would say you have to uncover the
truth…what you are REALLY angry at, scared of… e.g father finding out and killing you in a rage…etc

But NLP seems to offer the chance to bypass the affects, the traumatic experiences, the fears, the guilt, and deal with the beliefs they produced directly…because what ‘happens’ is just the action of atoms, the ‘meaning’ they have for us is the action of our ‘mind’. We have total control of our mind. No matter what limits there are to our control of ‘atoms’. The impact of an experience is generated in the mind. It is a property of our defining actions. Our construction. Our active participation and construction. So we can deal with the really significant side of the equation i.e what our mind did with the impressions that reached our brain, how it ‘interpreted’ them, as pleasure, pain etc…what ‘guilt’ or ‘innocence’ we applied to ourselves…i.e what responsibility we rightly or wrongly assumed for what happened…

Consider that the ‘objective’ reality is just atoms in motion. What we ‘experience’ is what our minds construct from those atoms in motion.

So we effectively have total control of our subjective ‘reality’. Our ‘experience’.

It is the difference between ‘pain’ and ‘suffering’ that Zen practitioners like Eckhart refer to. The Buddhist, whose body is burning, does not ‘suffer’. They have control over how their mind ‘interprets’ stimuli, impressions, sensory inputs… the same way a person can sit in a dentist’s chair during serious surgery, and feel no pain…just pressure…

Consider the master lucid dreamer, who can ‘create’ any experience in their mind, while asleep, inert, in bed.

Soon you will get the idea of the power of the mind. That all our experience is constructed in our heads. We can chose to ‘interpret’ the same electrical signal being transmitted from our nerve endings as pleasure, or as pain. Once we have gained full control of our own mind. Like the calm, comfortable Buddhist, who is literally engulfed in flames, their flesh melting from their bones. If you think this is a one-off sort of thing, keep in mind that the same ‘self-immolating Buddhists’ have been documented in Ancient Greece, as well as filmed in Vietnam. In the one case it was a ‘demonstration’ by the Buddhist of the ‘truth’ of ‘reality’. In the other it was a public demonstration against the persecution of Buddhists being carried out by the Catholic Church in Vietnam, just before the U.S allowed the French to be defeated, actually re-arming Ho Chi Minh to guarantee the success of the Viet Cong, … of course later the U.S industrial military complex, Kissinger’s boys, invaded Vietnam to justify increased military spending, and as part of the longer term plan to ensure the entire world would, rightly, hate the U.S, and be happy when it collapsed into chaos, from which Kissinger and his ‘Jews’ could rebuild the HQ for their ‘Jew world order’…
So the NLP method uses association, disassociation-association...leaving the most painful affects undisturbed, un-experienced...because they are just ‘atoms in motion’...what is important are the beliefs the mind constructed from them...we are free to completely reprogram all the definitions and ‘meanings’, and thus the actual ‘significance’ or ‘experience’ of these atoms in motion...we do NOT have to hate, fear, suffer, feel frustration, anger, or hopelessness. Just observe the high diver. Even I dove off the highest board at Paderborn public baths...I had been using the lower board...had intended seeing if I could overcome my fear of using the middle board...that was closed off...so I climbed to the top board...how high? I can’t say. But it seemed extremely high to me...sure it hurt when I landed, mostly on my back, because I didn’t know how to dive, but I can promise you I felt no fear...I simply didn’t ‘register’ it...I didn’t let myself ‘interpret’ the height as fear...in fact Psycho-cybernetic instructions, like those in my other TROONATNOOR books start with a warning...you could end up fearless...of things that it is very healthy to be ‘scared’ of...

Once you have experienced the positive and negative powers of your mind, you understand that ‘pleasure and pain is in the brain’. That ‘out there’ is electromagnetic soup...reality is ‘in here’...Which means we don’t have to live with pain that is not functional. Like the pain of a hot flame which motivates us to remove our hand, and to avoid hot flames. Compared to the fear of open flames, which stops us enjoying campfires, gas cookers, gas hot water systems.

Sure, making a fool of ourselves can make a bad impression on a boss or would be lover...but it can be great fun...and if you are not willing to risk looking the fool now and then, you are going to rob yourself of most of lives best experiences...you don’t want to go out and provoke people into punching you in the face, but if you let people push you around, ruin your life, and hurt those you care about, because you are scared of a little pain and discomfort, well a lot of ‘sick’ people are going to use that ‘fear’ of yours against you, to their own malicious ends. Same goes for fear of ‘hell’. Or being ‘snubbed’. Most philosophers of any account faced fates worse than death as the price of their intellectual freedom. All reformers and ‘freedom fighters’ were people for whom life as a slave just wasn’t worth living. I mean, there are countless trillions of lives awaiting us all. So why hang onto some miserable life just because you are scared of a little thing called ‘death’. A little pain at dieing maybe. Compared to a lifetime of wretched misery as a slave?

NLP can side-step the actual incident which produced the affects, which are, after all, just a construct of the mind, and deal directly with the problematic belief that
arose from that affect, from that construct…like in games where you get to ‘skip 2 steps’ forward.

So the content is irrelevant. Just atoms in motion. Electromagnetic soup. What is important is what the mind did with those impressions. What beliefs it formed from them. What ‘meal’ it ‘cooked up’ using these ingredients. For one mind will come to a different conclusion, form different beliefs, cook a different meal, from the very same ingredients. Like the alchemist can form gold from the same atoms the smithy forms lead from. Like the ‘Jew’ can become rich from what impoverishes the rest of us.

One person will take their own suffering and become embittered, bitter, twisted, nasty, hateful, hurtful, aggressive, violent, and malicious.

Another will learn empathy for the suffering of all sentient beings. And become a true Buddhist. An enlightened, awake being.

So NLP doesn’t have to target the atoms in motion, the electromagnetic soup, or even the emotions the person constructed out of them … the pleasure and pain… the fear or desire … it steps over these, and deals directly with the beliefs that were imprinted as a result of these affects.

NLP works with the noetic structure directly. You can be in hell and believe yourself in heaven. It will ‘feel’ heavenly’. Yahweh has no power to ‘put you in hell’, if you can, like the Buddhist, experience it any way you chose…

Only pleasure and pain are real. The rest is illusion. For all intensive purposes. You ‘experience’ what is in your ‘mind’. NOT what might or might not be, ‘out there’. There may in fact turn out to be no ‘out there’, out there. Only ‘in here’. A facet of the same ‘construct’. A dimension of the one ‘reality’. All of it ‘software’. ‘Information’. Communication. We are, as Jesus said, ‘Beings of light’.

We behave heuristically. We pull back our hands from the ‘flame’ as it ‘hurts’. But does the flame exist ‘out there’, or only in our minds? All part of an ‘experience engine’. Maybe all reality is ‘virtual’. Because, in the end, it becomes virtual. The TRUE Hegelian dialect. (not the pre-Hegelian dialect that Macchiavelli used)... that of mind, becoming many minds, then ‘knowing itself’, and becoming one mind again…but with the experience of being many minds…one-ness and all qualities…I am you… but can experience you as ‘other’, all for fun…

So NLP can eliminate the symptom, the phobia, the pain, the limiting belief, and so rob the imprinting experience of its negative power…the affect of the incident
can remain, but it will no longer be the source of limiting beliefs...the beliefs it had imprinted have now been replaced and displaced by resourceful beliefs...

MHR by resourceful we mean creative, constructive, positive, optimal e.g you don’t deny you were raped, you will find the optimal way to deal with the basic facts...so they don’t hurt you more than necessary...and work out what previous ‘imprints’ have become activated by the experience, which make the experience so much worse in impact that it needs to be...

But most of our ‘beliefs’ are erroneous...religion, mass media...you may believe in ‘god’, or ‘The holocaust’, or ‘heaven’ and ‘hell’, or ‘karma’, or that masturbation is a sin...at some basic unconscious level...even if the adult you imagines it has ‘dismissed’ such ‘rubbish’...just see how quickly you accept the ‘notice of conscription’ for the next big war, out of fear of being rejected by your peers etc...or let someone’s ‘judgmental looks’ prevent you doing something harmless, like expressing your authentic sexuality, political preferences,clothing preferences, or ‘saying no’ to alcohol or cigarettes, or trying to ‘better’ yourself in some way...then ask yourself, who the fuck is pulling my strings? Really ... and now its time to practice some NLP on yourself !!!

Often the limiting belief is associated with a trauma...e.g woman’s fear of water...mother was beating her in the water...she tried to escape, and almost drowned...so have to look for multiple levels of a phobia/other symptom...So while can ‘treat’ the phobia, by replacing the imprinted belief with a more optimal one, this may not treat other symptoms imprinted by the beatings...in which case the unconscious has used the phobia to get the person to seek help for it, and thus address a deeper underlying issue, which may be responsible for other symptoms, sub-optimal life experiences/attitudes, relationships with others and self etc...

Say someone has a phobia of imaginary fleas...NLP can side-step the whole issue of how this neurotic symptom developed/its source, and go directly to ‘treating’ the ‘allergy’ for imaginary fleas. Without challenging the notion. Simply accepting the allergy as real, and treating it. Because it reality it is no different to any other allergy i.e a reaction that should not occur, physiologically, does, and has real psycho-somatic symptoms, arising out of some imprinted belief ... can treat the ‘allergy’ with placebos...then have to deal with all the ‘avoidance’ issues that the allergy had covered...give new strategies for coping/dealing with/facing daily challenges the ‘allergy’ had let her ‘avoid’ i.e had been excuse for avoiding...

N.B people loathe to give up a symptom that they feel defines them, or forms a large part of their identity...it is a sort of fear of death...
To find out what an image in the mind is really about, what the unconscious is trying to share, but which client / you afraid of... i.e an image or idea that haunts them, or is ever present, and undesirable... probably related to a childhood traumatic experience... what actual memory person is avoiding confronting... what traumatic experience avoiding processing... get client / self to project a small fuzzy picture of the image that bothers them onto the wall... so it is harmless, vague... far enough away to be dissociated from it... then to look at it, dispassionately, as an uninvolved observer with no connection to it... then focus more closely on the image, until it resolves into whatever image the unconscious has been trying to communicate... get you to face... N.B the 'recollection' may have been real, imagined, or a story that had been told convincing and accepted as real, at the time... by the child... Get person/self to run through the various possibilities of what it might represent, like a game, telling a story that might fit the image, a context in which that image might make sense... without judgement or need to affirm or deny any particular story... and then run through each version, as if it were real, and work with the client/self to find a solution to each scenario that would be a positive outcome, and eliminate limiting beliefs that such a scenario / experience might be expected to generate... what 'really' happened is not as important as feeling efficacious at 'handling' and 'dealing with' every possible scenario... therapist/client role is to work out what resource was lacking in each scenario, and provide it, so that if that scenario was the real one, the client is now empowered with resourceful beliefs, i.e carries away positive efficacious beliefs from the 'experience'... to allow them to re-experience a traumatic experience that imprinted the limiting belief / symptom but this time to come through without the scars, limiting belief, symptom/s, negative consequences... so that the original experience now MEANS something totally different to the client i.e what they LEARNED from it is positive... that they are resourceful, can deal with life successfully... they will be imprinted with new resourceful beliefs that replace / displace the original limiting belief... the symptoms that formed part of / were the expression of that belief, are now redundant, unnecessary, and can disappear... the content can remain... even untouched/unlooked at... unprocessed... because with NLP what we work on are the limiting beliefs associated with that content, not the content itself... the MEANING of the content / experience is changed for the person... it becomes a learning experience from which the person has gained new resources... which is the optimal way to treat any BAD experience... as a positive learning tool...

Re-imprinting process: identify the specific images, words, feelings, symptoms associated with a 'blank / hazy / fuzzy' memory i.e regress to this point where ‘I can’t remember anything’ etc... often client will feel ‘uncomfortable’ about idea of ‘going there’, and won’t want to ‘go there’. ‘Anchor all the modalities and sub-modalities you can access relating to that memory’. Squeeze a shoulder etc to
‘Anchor’ these ‘expressions’ e.g images, sounds, body posture, breathing rate, heart rate etc… Have person remain in this state, immersed in it, by ‘holding the anchor’ i.e keeping their shoulder squeezed…then regress back to the earliest recollection of having experienced this state… Once they’ve regressed, get them to verbalise the generalisations / beliefs formed during that experience … what did they ‘learn’ from it (in the negative sense, what we want to ‘re-educate them about)… Dissociate person from the experience so they become a passive observer, like watching a film of themselves, without being involved in the action / outcomes…having watched this ‘film’, get client to verbalise any generalisations or beliefs formed as a result of the imprint experience they just watched (beliefs are often formed after the facts i.e interpretations of what had just happened)… Find the positive intent or secondary gain of the ‘blocking of the memory’… and find the positive intent of any significant others to explain their motives for their actions. They can ask these people directly in the film / image….Identify and anchor the resources each player in the film needed but didn’t have at the time which you can give them now…have the client employ their new resources to change the experience…make it a positive one…Then ‘enter into’ each of the actors, giving them these resources, those we had earlier identified that they lacked, and re-live the experience, from their p.o.v, with such resources, so the ‘film’ plays out positively for them … for each ‘player’ in the ‘film’… then ask each player, in turn, as you run through the re-run with the new resources, to verbalise their new generalisations / beliefs they ‘learned’ this time around…Go through the new experiences enough times that it becomes as vivid and strong / lasting / imprinting / realistic as the original imprint, and thus replaces / displaces it… all the while ‘hold’ the resource anchor e.g keep the shoulder gently squeezed…Now maintaining the resource anchor, have client / self go forward from the imprinting experience, and re-live it up to the present…getting client to re-visit any later experiences where these resources could have made a difference, making her experiences of them more positive…so basically rewrite their ‘back-story’ up to the present, with the extra resources…with the constructive / positive / optimal beliefs…

Freud saw the ‘self’ as a bundle of conflicting urges, impulses, desires. Hume explained how the more dominant impulse e.g love, would ultimately absorb the affect of the less dominant impulse, e.g hate, making the ‘winner’ stronger, and eliminating the less dominant from our consciousness. In other words we may love and hate a person, but that hate ends up just making us feel even more love for that person.

We ‘learn’ different ideas of right and wrong from different significant others, throughout our lives. The messages are often inconsistent. Especially the ‘do as I
say, not as I do’ hypocrisy of most ‘authority figures’. You end up with incompatible ideas about what you ‘should’ and ‘shouldn’t’ do, feel, think etc.

Often you are ‘damned if you do and damned if you don’t.’ Like you cannot win, whatever you do. You can either make mum happy, and dad angry, and yourself miserable, and vice versa.

We tend to introject how significant other’s think and feel about things, and about us, into our ‘selves’…we adopt their beliefs as our own … often unconsciously through ‘imprinting’, repetition, and even brutal pain (parents that beat their kids are like CIA torturers in those infamous ‘MK Ultra’ mind control programs. They offer and withhold affection or other resources, inflict pain on the body, emotional distress, threatened ‘fates worse than death’, and death…they when you ‘comply’ they shower you with affection / praise / benefits … and when you ‘stray’, they hit you hard, drown you in misery and threats, until you ‘see things their way again’. E.G if they are ‘Catholic’ and you reject their beliefs…if you are ‘Muslim’ you may simply be murdered for failing to live up to THEIR beliefs, by your own family…so go figure how most children grow up to vote for the same political party, share the same religious ‘beliefs’, etc (after some early adult rebellion in many cases…but the ‘imprinted beliefs’ usually regain dominance, just like the MK ultra programming can remain dormant for decades, and then, triggered by some image the CIA place in a Hollywood movie, music video, or advertisement, or news broadcast, the programmed agent suddenly believes, very strongly, beyond all doubt that ‘I must kill X,Y,Z’. And so the similarly mind controlled child, as they grow older, become ‘just like their parents’. Go figure, hey!

Note that explicit advertising, including the implicit adds known as ‘product placements’ in movies and sports and television, at huge expense (which consumers end up paying, adding up to 30% to the price of brand item goods), is intended to ‘imprint’ beliefs that the product is great, associate it with success, sex, happiness, etc…from the cradle to the grave…repetition is key to this ‘imprinting’ process…which is why religions include ritual, daily prayers and other ‘ritual’ actions, to keep repeating their ‘imprinting’…. You can either imprint a belief in on big, traumatic, dramatic ‘hit’, like stamping a hot iron on a ‘Goy’ (cattle), or getting a man to kill another man, even women and children, and thus ‘commit’ to his leader’s political / war aims…or simply keep repeating a lie, until it is accepted as truth…keep repeating a subtle imprint that ‘smoking is sexy, will make you successful, attractive, sexy…that it is ‘satisfying’ and ‘enjoyable’…ditto for alcohol…or ANY product from deodorants to fabric softeners…so get ‘em young, and keep ‘em en-tranced’…rinse and repeat…over and over…gradually ‘imprinting’ the very firm, if unconscious belief, that ‘Coca Cola tastes better’ and ‘smoking is sexy, the pure taste of freedom’…
Unconsciously, we end up defining the world according to how our ‘significant others’, from parents (most current research indicates that your social group/friends have a bigger impact than your parents), television, Hollywood, school etc… define it… often these definitions are in conflict i.e what our parents say and what Hollywood say… e.g Catholic parents and Atheist Hollywood … what the facts say and what television and Hollywood say e.g ‘The Holocaust’ never happened, couldn’t have, was impossible Vs ‘The Nazis sent 6 million Jews ‘up a chimney’… Propaganda works on the emotional level, with dramatic movies and posters and sensational television ‘news’ (usually of faked mass murders carried out by ‘crisis’ actors and later embellished with special Hollywood effects e.g the fake planes added to the 911 and Pentagon explosions…) and also by pure repetition… there is no god but Allah… remember 911… Government is good… guns are bad… this political party is not only different to the other one (just ignore the strings and the men pulling them above each candidate i.e that it is the same people on the other end), but ‘better’ for you… that fluoride is good for you… that this war is ‘just’… that we are protecting you from ‘terrorists’, not imprisoning you’…

Few people really make any real life transitions, other than from child to parent (note I didn’t say ‘adult’… how many people really grow up?)… in this case they become their parents … but a few have to ‘climb the ladder’ to give the masses the impression they live in a land of opportunity, a classless system where anyone can rise up to the top…and these few often face a need to re-evaluate their beliefs from ‘those greedy capitalists suck the blood from the workers’ to ‘greed is good’… depending on where their material interests now lie… and so the ‘communist’ theoretician, offered a bit ‘payout’, often discovers a new passion for ‘free market economics’ and ‘freedom for lobbyists to donate as much money as they like to politicians and other decision makers… including… of course… people like ‘them’…

‘Success’ can represent a threat… loss of friends… friends feeling ‘threatened’ by your success… tall poppy syndrome etc… own father disowning you for being literate…

Parent can feel ‘selfish’ for putting their own needs first sometimes… even child that has introjected ‘responsibility’ for the parent can feel guilty for doing what THEY want… especially if child gifted, parents divorced and father ‘disappeared’ as infant desired therefore carries guilt for that … and then mother actually blames child literally, repeatedly ‘dad left because of you’… likely to produce unconscious belief in own efficacy, and sense of guilt for what have done, sense of responsibility for mother’s condition, for family’s condition….
MHR every person should do at least this one NLP exercise i.e to ‘exorcise’ the belief that ‘I killed daddy to have mummy for myself (as my sex object)’… i.e the ‘beliefs’ that the Catholic church build up a.k.a ‘original sin’, and mentally enslave their ‘adherents’ to whom the ‘imprint’ of ‘original sin’ has ‘adhered’ fixedly…unconsciously…as their primary belief…totally distorts their whole belief system i.e life is punishment, I deserve bad as I’m evil…I should serve the priests (god), not do what is best for me and my family…life was meant to be hard…a struggle…I don’t deserve to be happy…sex is evil…sexual desire is a sin…masturbation is a sin…etc etc etc through dramatic imprinting via ‘bible’ stories of hell fire and damnation, at a time when the child is at the most ‘impressionable’ age…in Sunday school…in church…from their own parents…from the ‘priests’…the ‘nuns’… the ‘sisters’ and their ‘Catholic school’ teachers.. and then constant repetition… ‘confession’ of their ‘sins’ i.e constantly re-defining their harmless actions as ‘sins’ deserving of eternal damnation…i.e to imprint the belief that these harmless desires, or at worst, typically human desires, are ‘evil’ and ‘damn’ the person to an eternity of suffering… so they behave exactly as it suits the priest beneficiary class, and their supporters, the ‘government’ and ‘nobility’… go to war, work, slave away, for your ‘pie in the sky’… YOUR life was not meant to be enjoyable…you are paying for your original sins…(which only works because of the Oedipal complex, in society’s with complex taboos regarding sexuality…

[MHR very interesting to not Estonia has world’s lowest ‘religious affiliation index’ … would be keen to see what it is about ethnic Estonians (as compared to Russians), in their basic make-up, is different, to account for this….what accounts for it? Churches all over the place. ]

A ‘mother’, whose kids have ‘flown the nest’ is faced with a crisis…what to do now? … if she had been ‘living for her family’…then shouldn’t surprise us if she suddenly gets breast cancer, now the nest is empty…for what is she living now?

And for the male ‘breadwinner’ or ‘provider’…once the mortgage is paid, the kids educated and ‘flown the coop’, what is his ‘raison de etre’ for living? Is it any surprise that men often die , fall prey to illnesses / disease, very soon after retiring…facing a life without purpose, meaning…because they had ‘lived for their family’ …

Often people find it hard to find meaning for their own lives…to ‘live for themselves’…

Conflicting desires e.g to travel, see the world and ‘to be a good mother, to be here in case my kids need me’ even after they’ve left home (these days even while they are babies), can produce physiological symptoms e.g one side of body different to other, expressing conflicting desires…even down to one ‘side of her personality’ using the left hand to gesture e.g talking about freedom and
travel…and the right gesturing when talking about ‘caring for the kids’ etc…i.e two separate, distinct, dissociated, de-coupled, discrete parts…like ‘split personalities’…and as in case of this syndrome, one part can display symptoms, allergies etc the other does not… maybe account for why cancers often asymmetrical as well!

N.B right hand relates to left hemisphere of brain, which in most right handed people with typical eye ‘accessing cues’ deals with relationships, and social contexts Vs the left hand / right hemisphere focused more on own individual needs/desires. Roughly social Vs selfish.

Guilt arising from the conflicting desires can make life unbearable, so much that death seems like a relief. A peaceful option. If her role models had earlier died of breast cancer, that option might seem a good one. A preferred one. To fighting with conflicting desires, constantly feeling guilty and overwhelmed, or finding no real satisfying purpose in life any more…never having learned that there is more to life than just work, marriage, and family…and never having found a balance between satisfying your own needs, and the needs of others you are responsible for (and often not at all responsible for e.g parents guilt-tripping their kids, partners doing the same…where one partner has a more developed sense of entitlement than the other…e.g submissive V aggressive in terms of getting what they want/need…

We need to develop new identities / beliefs that match our reality…as our life situation changes, we need to adapt our sense of self, our beliefs, our definitions…otherwise the tensions can lead to self-sabotage at work, in the social life, in romance, and even in health…ultimately resulting in illness, sickness, cancer, and death…

One part of our ‘self’ can inhibit or support the other. So the exciting, motivating, big ideas, might be ‘squashed’ by the other beliefs e.g life wasn’t meant to be easy / fun / enjoyable, ‘I can’t do that’… ‘I shouldn’t’…I can’t be happy or something terrible will happen to me…I can’t get what I want etc…

Can end up with two identities at war with each other…one seeking security, the other excitement…one wanting to take risks, the other fearful of negative consequences…one wanting freedom, the other comfort of the known… so end up depressed about what NOT doing, and anxious about what DO, i.e depressed at work, and/or anxious when quit to set up own business, or study, or move etc…

Each belief / expression will have its own physiology. E.g get someone wanting to start their own business/ quit their job and try something new, they may talk quickly with a high voice, while looking up to the right, and gesturing with their left hand…the same person, when talking about the security of remaining in their
current job and life, may use a slow, even voice, keeping their left hand in their lap. If both hands don’t move at the same time, when describing each option, both options, this can indicate an internal conflict... a red flag like a Scientology ‘E-meter’ needle movement, or other ‘lie detector’, indicating conflict between what is being said and what is believed... or conflict between beliefs...

The ‘Visual Squash’ is an NLP technique for integrating conflicting behaviors / beliefs / anchors (the modalities and sub-modalities associated with those beliefs)... but it doesn’t work in cases where the two beliefs are at odds/ conflict too much / are dramatically different-opposed... and/or where one part judges the other part negatively ... i.e rejects part of self i.e not whole... whole- y... holy... lack of integration... demonization... beyond good and evil etc...

If person had distinctively different / conflicting life periods e.g grew up poor, felt unattractive, overweight, anxious, fearful, worried, no friends, no acceptance / approval / love, no money... grows into confident, attractive, successful etc adult ... there will be conflicting beliefs imprinted at different stages in their life e.g infancy-childhood-adolescence Vs adulthood... e.g late bloomer, someone who ‘escaped’ their childhood situation/conditions/environment...

These two are so different, hard to integrate... cannot simply ‘squash’ the states/beliefs together to integrate into one new whole... so get client to visualize each of the different elements / beliefs in his hands, in a dissociated way i.e no demonization/judgement... just clarity... observe as indifferent observer/bystander with no investment / vested interest... objective... to give chance to come up with a new whole... rather than try to integrate the opposites... a new identity, rather than try to integrate the old ones... need a new belief system capable of accommodating both... seek out common intentions on the part of each belief system i.e common objectives the apparently conflicting beliefs are seeking to attain ... e.g use question ‘What will having that get you?’ ... i.e what was aim/intention behind that belief / definition... so you don’t force conflicting thinking processes into one, and end up with a disintegration of the person’s identity... that’s dangerous... first you identify the common intentions underlying each part of that identity... then form a new identity based on these common intentions, that will be consistent with both existing, conflicting identities... i.e replace existing with new that is compatible... an updated 2.0 version that integrates all the functions / solutions / intentions... a dialectal synthesis... a higher self, rather than a fight between competing selves ... this way the resources available to each ‘part’ of the person can be accessed at the same time, in an integrated way, rather than them competing with, diluting, and getting in the way of, frustrating, each other...
Integrating dissociated elements of a personality / belief / identity / self can be done visually… like a Pegasus… that accommodates apparently competing desires / beliefs … to fly, with your feet on the ground… to be strong yet kind… to have security and fun… to be responsible and also have fun… to satisfy your different needs, with the one identity…

Case study… woman with symptoms of asthma, and allergic reaction to cats… get to imagine the desired state vividly i.e what want, NOT what don’t want… e.g. seeing herself playing with cats, happy, healthy, breathing easy and light and freely… (never frame from negative, use negative i.e. what don’t want, e.g. no symptoms… have to vividly describe desired state only using positives i.e. what IS, and never what is NOT)… when asked what stopped her from achieving this desired state, she described feeling ‘helpless and worthless’, with associated feelings of anger… Therapist ‘anchored’ that state after getting her to fully enter into those associated feelings, then directed her to let those feelings guide her back to their source… to regress back in time to when they first emerged… in this case she regressed back to pre-verbal infancy, experiencing her parents arguing with each other, and ignoring her cries/needs… the therapist then re-imprinted this experience, in the NLP way…

Test the success of a replace-imprint by observing the person re-enacting the same imprinting incident… to ensure the body language, access cues, etc are all consistent with a new, positive imprint i.e. that the limiting belief has been replaced… with a resourceful one…

If have doubts, lead person back to point where you felt the replacement imprint had not fully ‘imprinted’, to see if there is something else that needs our attention… stop when see the ‘cue’ or ‘tell’ and ask them to describe what they are feeling, seeing, hearing… e.g. ‘I feel curious and scared’… ask them ‘about what?’… ‘Something scary might be out there’… ‘What is it? What resource do you need?’… ‘a promise that I won’t get hurt’… ‘I have a sense of impending doom / destruction’… a generally unpleasant feeling… vague but scary… just below the level of consciousness… can’t quite place it… fragmented… broken…

Synesthesia refers to the experiencing of multiple representation systems simultaneously e.g. hearing a color, seeing a frequency… a confusing representation… unconscious trying to communicate… mixed up messages… distorted, pieces, confused sensory impressions… i.e. Freud says these are strategies of unconscious to sneak past ‘censors’ of the conscious… so not rational… or related to a pre-rational stage e.g. infancy, when no words, or reason present to represent the experience…
If the ‘impression’ is ‘dark’, then give the client a light to shine on it i.e a resource…so can view it from a safe distance…guarantee it won’t destroy you if look at from a safe distance…so give that bright light to shine on it...

Conscious mind uses ‘veils’ and ‘screens’ etc to prevent you directly knowing what it is… all feel is vague sense of danger … so it may not be an external thing at all, but some part of the self … that if you ‘go there’ you may ‘fall into’ that part of the self which the conscious mind defines as ‘dangerous’ e.g impetuosity, risk taking, running away from current situation, expressing authentic feelings about things, people, own sexuality, communicating honestly with self and others…being authentic and genuine i.e no masks…dangerous to take off…but unconscious wants you to…it is good for you…but conscious minds says ‘no way, that’s too dangerous’…this feeling is the limiting belief…that it is too dangerous to risk…but unconscious says ‘it will be good for you’… so gives you sense of curiosity…to sneak past ‘censor’ alarms … in case study client had allergic reaction to cats (in NLP you wouldn’t say ‘allergy’, because scientifically they don’t exist, they are neurotic symptoms / communication breakdowns, limiting beliefs)…she says ‘curiosity killed the cat’ … it is dangerous… Therapist asks client to ask the ‘curiosity’ what its intention is…is it malicious? ‘no, she answers, it wants fun, excitement, adventure… Therapist gets client to visualize the two parts of her, the curious one seeking fun, and the analytical one, scared of the possibility she’ll succumb to the crazy side of her… one dressed in business suit…other is all sexy… they can’t integrate… they can’t communicate… belittle/demonise each other… one is artistic, no concern for money, irresponsible in this way…other is no fun/boring…they have to learn to appreciate each other i.e resources needed…value each other…so can integrate into one entity that is both creative and practical…at moment neither succeeds, as the other is blocking them/ frustrating their attempts…neither wants the other to win at all… don’t want to compromise…want resources of both, working together… to same ends… get client to think of someone who manages that…if don’t know real person, then imagine a made-up person, vividly, who does manage this… i.e creative and practical without compromising either…instead of one having totally outrageous ideas that the practical side couldn’t possibly work with, have the creative side generate ideas the practical side can work with…instead of rejecting ideas, the practical side could try to work with them, make them a bit more realistic…brainstorm without judgement until can find way to work with… i.e thinking hats approach to bypass the judgements/critical/practical and allow the creative to free flow…then change hats etc…never reject any idea out of hand… until both hands moving freely…not just one then the other…feedback loops…one has ideas, other has solutions about how to finance / make money from…get money for…or do cheaply…visualize neural pathways intersecting, re-forming, vague channels deepening, the actual physical brain chemistry occurring when left and right hemispheres interact, the creative and rational, the cautious and the curious, the
security seeking and the excitement seeking... so they can begin working together harmoniously, offering each their resources... so both become stronger, rather than one judging the other, and weakening each other... get each side to validate the good intentions of the other side, so they can cooperate, rather than demonise/criticize/undermine each other... get them to share resources... have the creative one run films for the practical one showing how much fun it will have, until the practical / cautious one can believe it can do it / succeed... and the practical one can offer suggestions to make it more practical / realistic / less risky... the creative can write the scripts, and the practical one edit them... back and forth...

Need to integrate two parts into one new part... dialectic... synthesis... a new part that is creative and fun and analytical and practical... to overcome the objections each previously had to the other... and now the asymmetrical postures and gestures should have been replaced by symmetrical ones... i.e. use of both hands at once, what people say and their body language matches, etc... which was original cue / tell that there was conflict... now disappeared...

By getting person to form a complete, vivid representation of each part, one in each hand, seeing, hearing, and feeling them fully, and then letting each part look at and consider the other, to overcome their objections and mistrust... to validate the good intentions and positive outcomes each has to offer the other... search out intentions they share in common... e.g. a good, meaningful, interesting, full, fun, long life... see what resources each can contribute to this shared goal... to motivate their cooperation and integration into a new whole with all these resources, and the extra power of the synergy you get from combining them... achieve a unification of the parts into a new whole...

Meta-perspectives available when place the two parts in either hand, and add vivid sub-modalities to it... get an overview... a better view... a meta-view... from above... can consider from the outside... from a novel perspective... see things differently, from a different p.o.v... which is aim of process... a new view... a 'holistic' view... just gaining a new perspective can reveal things hidden by the habitual way of seeing, being, defining...

If a person has different accessing cues e.g. eye movements, and physiology, posture, tone, heart-breathing rate etc., for each aspect of their identity, this reflects different mental processes i.e. they are not harmonized / integrated... and they require this sort of work...

Ask client 'What stops you from achieving your desired outcome?'... observe immediate unconscious physiological response that arises before they have chance to consciously think about it... (the half second rule)... these non-verbal clues are more revealing than the verbal, considered, answer...
Seek a smooth transition between accessing cues e.g. eye movements, reflecting a smoother transition between the polarities of their beliefs...to add pathways / links between the two...so they can communicate better...integrate...become a new whole...do this by making one side as vivid as possible, then getting them to move their eyes to where they normally are for the other state, while holding the first vivid state...thus helping the brain to rewire new pathways...generate muscle memory...link the thesis and anti-thesis, in the prologue to producing the synthesis...forming neural connections...logical connections...muscle-memory connections...you make the integration more real...

Identify conflicting beliefs...calibrate the physiology of each part in the conflict...represent the beliefs in all 5 senses, putting the different beliefs in different hands...observe the you with X belief in one hand and the you with Y belief in the other hand...observe what images, sounds, feelings are associated with X and with Y...ask X and Y to look at the other and describe what they see...X and Y may dislike and mistrust each other at first...observe the persons different physiologies as they switch back and forth between hand with X and hand with Y...discover the positive intention / purpose of X and Y...ensure X and Y are aware of, and accept, each other's positive intentions...explain to both that their conflict is interfering with their realization of these positive ends. Seek out the shared higher level intentions of each, where lower level ones appear in conflict...Identify this common shared goal...have X and Y look at each other to identify the resources each has that would be helpful to it...secure agreement from the parts to combine their resources so they can achieve their intentions more efficaciously...if you have been working in metaphors, revert back to seeing X and Y as yourself...suggest that X and Y move together as the new identity is being formed...form a complete representation in all 5 senses that integrates the resources of both X and Y into Z. Calibrate to a symmetry/integration of the two physiologies that accompanied the separate parts...After hands have moved together and integration complete, test in future contexts to ensure there are no ecology issues i.e. avoidance/reward factors still at play...

To get another person excited about something, use their own criteria for what is exciting...you'll see it reflected in their physiology...use their own precise exact words to describe the thing...i.e. the words they use when describing something that excites them...

Criteria exist in hierarchies i.e. relative value...e.g. often enjoyment of food is more important to the person than maintaining a healthy weight, health etc...or sex is more important than financial security...fun more important than career...
Degree, in healthy, satisfied people, will trump hierarchy e.g. if they have the alternative of having a great fun experience, or earning a few extra dollars, the more balanced, happy, satisfied person will usually override their normal strict hierarchical criteria, and give up the few extra dollars for the fun. Whereas the neurotic will sacrifice the great fun day for a measly few dollars, and be miserable as a result.

Chunking is about breaking down larger goals into more easily attainable, manageable, measurable, immediately realizable, objectives...this makes the goal more concrete and attainable, provides a history of success, and motivates...some people leave the chunk size too large to be able to work with successfully... i.e overwhelmed by task set self...

Girth control often fails as people 'diet', rather than change their eating habits and diet. People tend to lose muscle tissue first, then fat, and then when they return to their usual eating patterns, put on fat first.

Successful people typically have vivid impressions of their successes, and only vague impressions of their failures Vs the opposite in people who aren’t succeeding. So need to reverse that. To start representing how you will feel when you succeed vividly, and stop focusing on your ‘failures’. To re-program the mind for success. To make the belief in success real. At least as real as any experienced ‘failure’. Using all 5 sensory dimensions.

If you have a goal, you need to vividly construct the impressions associated with achieving it, to make it real. As if it happened already. To ‘experience’ it intensely.

People often fear any change, as involves a change of the definition ‘self’... like fear of death... fear of change... unknown... if experience ‘taught’ ‘conditioned’ that change is usually for the worst... loss of old... a bad thing... to be feared... so change, loss of old (even if painful) ‘comfort zone’ of ‘self’ represents threat... one reason must first offer better alternative to current ‘self’... a new better self, to replace the old self... so never a void... and clear confidence in change for the better...

A=audio remembered (things people said / told / self-talk)

K= kinesthetic (affect / emotion / feeling)

V= visual remembered images

Compare how negative beliefs, ones we want to replace, are represented in clients/our mind... e.g. usually more vivid, more dimensions, more sub-modalities, more layers, more concrete... need to take all those physiological ‘tells’ and
associated postures, colors, brightness, loudness, clarity, definition, etc and superimpose it onto the desired belief, so that it assumes all the ‘concreteness’ for the person’s mind...seems just as real...and then replaces it...

Internal voice associated with bad feeling...e.g something significant other said / imprinted ‘voice in head’

Often unconsciously think we MUST become our parents...are doomed to...so don’t resist e.g becoming fat, cynical, angry, violent, smoker, drinker etc...and if introjected them into our psyche, feel compelled to become them...at the age they are NOW...the older we get...

Get to reproduce ‘tells’ i.e accessing cues that were vivid for the ‘sub-optimal’ belief in association with the more optimal belief...to match if for muscle memory...transfer the authority of ‘tradition’ if you like, the tradition of a set of muscle movements associated with the belief or mental reconstruction of a picture, sound, experience...e.g look down to the left in association with the new more optimal belief when the content / belief element, is the one you want to replace the limiting sub-optimal belief with...

‘Accessing’ refers to ‘accessing’ memories e.g of sights, sounds, feelings, smells, textures...and posture associated with positive and negative / happy and sad / limiting and resourceful memories...so ‘Accessing cues’ means the outward signs, tells, indicators that the person is ‘accessing’ i.e remembering / recalling a particular sense impression e.g how something smelled, tasted, felt to the touch, felt on the skin e.g heat/cold/wet/smooth, felt emotionally e.g sadness, happiness, confidence, shame, pride etc...how something looked including color, shape, brightness, etc...

Look to see which impressions e.g sense memories, the person is accessing when talking about a particular limiting belief...ask them what they are imagining / remembering, to ‘calibrate’ their accessing cues i.e don’t assume ‘one size fits all’ i.e that everyone accessing a sound will show the same behaviors...need to calibrate to person, so ask, observe, and work out the individuals ‘tells’ i.e how to ‘tell’ if they are lying, bluffing, really recalling an image or constructing an image i.e telling truth or lying...etc...

Seek out associations between limiting belief and accessing cues i.e what sensory impression is associated most strongly with the limiting belief...e.g something someone said, did, were told, overheard...something they saw, read...i.e the imprinting impression...incident...what about it had the greatest affect/effect...made the strongest impression and became the basis of the belief...

e.g if appears to be associated with a recalled sound...something told or overheard, get them to look down to left, is this is their accessing cue / tell for
recalling things heard…sounds, self-talk etc… or recalled pictures, get them to look up to right, if that is their accessing cue…and then make that sound or image more vivid, to identify exactly what it is…at first it may be vague…distorted…repressed…veiled…muffled…so may need to work by association so unconscious can express it / reproduce it despite censorship of conscious…

At first may be a vague sound/noise or color/image…on closer focus/inspection/attention, this usually resolves to e.g auditory dialog or a ‘film’…i.e increases in resolution from vague to more and more specific…so maintain physiology e.g looking down to left, till the ‘auditory impression’ resolves into something specific e.g a significant other telling the client ‘you are stupid / masturbation is a sin / sex is sinful / you are bad’ … or a similar limiting belief about the self…global…general… or about some type of behavior e.g striving to succeed, enjoying authentic sexual expression even if it goes against some dogma e.g masturbation, same-sexuality etc…

Usually impression on several levels / modalities / senses … e.g recall parent’s overweight, and then partner saying ‘you’ll never be thin, but that’s O.K, I love you anyway’ etc…

Work out what fear…then seek out model from client’s own history where they accepted the same risk / restrictions threatened, to attain some goal… and model current behavior on that… enter-into that same self at that time e.g losing weight requires sacrifice of over-eating, whenever feel like it, get the urge, bored, want pleasure… e.g when followed instructions, cos you wanted to learn how to do something…had to listen, do what told, discipline self, overcome distractions etc…recall your total 5 sensory impressions of how you felt in that situation…enter-into-it again…like putting on a set of clothes for a particular task…be that person again…in that situation…replace your current objections with this model…become that model you who overcame your own objections e.g learning boring, requires sacrifice, patience…but you did it then, because you wanted to learn something you thought would benefit you … so need to become that same person, in toto, simply in a different context, with the new content e.g disciplining your eating and exercising / following a directed course of action to achieve the ends of looking and feeling better…and as you imagined what it would be like once you had learned the new skill, imagine, vividly, all the good things associated with becoming slimmer and fitter and healthier…including financial, social, etc benefits…

Identify the auditory, kinesthetic, visual etc components and their sub-modalities, associated with the ‘model’ you…and transfer them all to the belief that is currently limited…whose objectives are too vague to be ‘believed’ by your unconscious…not real enough…not vivid enough…and take the ‘juice’ and
vibrancy and life of the model and move it into the desired belief, so it replaces the limiting belief with the resourceful model of behavior...and like doing good things for people leads your unconscious to assume you like them, care about them, (it doesn’t want to look inconsistent and foolish i.e has to justify the acts of kindness by imagining it cares), actual behaviors, postures, muscle memories, accessing cues, tells, physiology, breathing, pulse, smells, sounds, impression, real or imagined, lead the unconscious to ‘believe’ they reflect ‘reality’...and adjusts to accommodate that reality...to adapt to it...

Pay attention to details...e.g tone and tempo of auditory memories / constructs being accessed...details are what convince the unconscious something is ‘real’...whether imagined or ‘out there’...

Identify the components of the model behavior i.e what allowed the person in that situation to overcome her objections...the sensory impressions associated with overcoming the objections in the ‘successful example’ ... the modelled behavior....and apply them to the current objections i.e why it is hard to discipline myself vis a vis diet and exercise...i.e to change behavior...form new habits...attaining goals / objectives...

This is often called ‘leveraging’...using the levers known to work in another context for the person, or another model, and applying them to the current objective/ situation/context...

One ‘lever’ is ‘prioritizing’ satisfactions...what will bring the greater satisfaction...the short-term one or the long term one e.g avoiding study and watching t.v is satisfying, but compare that to the vivid belief in how much better life would be with that qualification... eating what you want, when you want, is satisfying, and here is the key point...do you have an imagined outcome that is more vividly satisfying than this impulsive eating? ... do you have a real motive to sacrifice that pleasure?... how to make the objective really motivating...to make the potential gains feel vividly attainable, and real, and desirable...so they appear to offer more pleasure than the eating does...something you can vividly recall every time you get the urge to over-eat, or avoid exercising...

Always frame outcomes / objectives in positive e.g NOT I want to lose weight, I will stop over-eating...but ‘I want to be ‘this’ size (vividly imagine a realistic, desirable size/shape for you), I will eat healthy portions, at healthy intervals, of healthy foods...and imagine tasty healthy foods, and you behaving as you will need to to attain your goals...vividly...on 5 sensory levels...to replace the ‘satisfaction’ or ‘pleasure’ of eating with the satisfaction / pleasure of being slim, fit, and healthy...devote as much mental energy to ‘enjoying ‘ that future states benefits as you normally do imagining how tasty and delicious and pleasurable that bag of chips, cake, etc would taste...form the habit of consciously switching images from food to ‘the slim attractive healthy you’ until it becomes habitual,
and unconscious, muscle memory…to switch from obsessive thoughts about eating, to the pleasure of being healthy, attractive, slender etc…from junk food to looking and feeling good…focus on the satisfaction / pleasure to be attained from your goal / objective, to replace the thoughts of the pleasure to be had from eating…and looking forward to that healthy, appropriately portioned, regular meal… i.e do not starve self…as you will end up obsessing about food, and have no “satisfaction” to look forward to…soon the healthy portioned regular meals will be enough to look forward to…and the vivid image of the ‘new healthier trimmer you’ will replace the constant thoughts of food…even planning how you will spend the money you save from over-eating, or eating particular unhealthy sorts of food, can replace the immediate satisfaction of eating (or even spending money / buying stuff) i.e replace the immediate satisfaction of ‘shopping therapy’ with the more satisfying dreams of what you will buy ‘one day’ i.e window shopping…knowing you can buy something and having a vivid image of how it will feel (it is easier to vividly imagine that when you have every reason to believe you could / can do it, if you chose i.e because you have savings, and enjoy that realization, than when you have no money…and so it is less satisfying…i.e scrooge has the satisfaction of knowing he could / can buy anything he desires, and so he can enjoy that…it is often more enjoyable than the purchase, as it is ideal…and totally real…as totally realizable…like women get a greater satisfaction from masturbation as they ‘know’ they can make their fantasies real any time they choose, because men actively flirt with them all day, making it clear they could have any of them, in any way they chose, and so their sexual fantasies are as real as real sex for them…and they cum hard…and don’t need to have real sex…can take advantage of men…it is unequal…and this is one reason porn that is too ‘unrealistic’ doesn’t work for men i.e they cannot believe it could happen to them, so the fantasy is not powerful…and one reason for ‘rape’ fantasy videos, or ‘men in power’ videos i.e it is more realistic for most men to imagine getting what they want by force, or because they are ‘the boss’ and women will do what they want / need for this reason i.e most men cannot attract the women, or afford to pay for the women, presented in a lot of porn…so it will not produce the sexual satisfaction…they simply cannot ‘enter into’ i.e imagine they are the man in the video…because that man, of that physical attractiveness or wealth, is too far from what they are…but the rapist is a normal guy, or the fat boss has just enough resemblance to themselves that ‘it could be real’…not that they want to rape / harm / commit any violence on women…but the fantasy is the more realistic one they could ‘enter into’ i.e introject themselves into the protagonist, the man getting the sex he wants / needs…anyway, just another way the whole system is biased towards women’s satisfaction, and why a lot of men consciously or unconsciously are bound to ‘hate’ women…to hate the inequality…and how women exploit it…the complaint they are the victims…are encouraged by malicious elements seeking a ‘war between the sexes’, race war, a disintegration of ‘family values’, etc…to destabilize society, bring more chaos, so they can offer their ‘solutions’… usually Bolshevik communist or corporate fascist
models... i.e create chaos, so they can impose their own dogmatic order, ... which the people would never otherwise accept / even consider...

So belief that ‘I won’t be able to do this / achieve this / experience this / have this’ will undermine any attempt to re-imprint the belief / make the fantasized experience real...

N.B if you habitually think about food i.e your pleasure images are of food, and taste, and the feeling of being full, you are focusing on the kinesthetic i.e feeling impressions...being motivated / driven by that sense... need to displace and replace with other less habitual senses e.g visual e.g ‘how I will look’ when I am slim...etc... all associated pleasures / satisfactions of being a healthy weight... so your ‘pleasure principle’ is not so narrowly fixated on food, and thus constantly driving your to obsess/think about food, and thus over-eat, and thus really suffer any time you limit your food intake...as this will be your habitual source of pleasure / satisfaction ... need to broaden ‘palette’ of pleasures / satisfactions and displace / replace over-eating with these e.g read a good book, go for a nice walk, have sex/masturbate, have a nice long relaxed bath, actively seek out alternative forms of satisfaction / pleasure so that food is not your only source of ‘reason for living’...i.e pleasure is whole point of life...any other posited ‘objective’ i.e ‘reason for living’ is absurd, usually deliberately imprinted to ensure you live for the pleasure of others, i.e so you work so that the imprinter, the beneficiary of that imprint, can enjoy as much as possible, at your expense, with you accepting this as ‘deserved’ and ‘normal’ i.e life not meant to be easy (for you and your group), life is a vale of tears that you must endure (but work hard so the priests can grow fat and easy from your labors), ‘that ours is not to question why, ours is but to fight and die’, so your leaders can enjoy the fruits of your sacrifice in luxury... guess who ‘defined’ the major western organized religions...all 5 of them... the Zionist ‘Jews’...and guess who imprinted ‘The Holocaust’ deep into your unconscious, from birth? And who benefits from that imprinted belief? And who uses that belief to ensure they have a blank cheque to do whatever they want, to whomever they want, as ‘victims’ and ‘gods chosen people’?...who always ‘wins’ every war (the banksters), who makes you believe paper is ‘money’ and ‘valuable’ and you should pay a huge proportion of the value you produce to them for the mere service ‘money’ provides...and who has you believe anyone who dares try to wake you up to the facts is a demon, vicious, malicious, extremist, crazy, evil person...ah, the ‘father of lies’ might be more precisely called ‘the father of (malicious) NLP’...

Need to feel ‘O.K’ about becoming ‘new’ person...NOT your parents...not the sheeple conformist the mass media and Zionist occupation, with their 5 religions, seek to trick you into being...
For many simply losing weight is a threatening idea...or becoming successful at anything...it would mean change...not everyone would be happy with that change...some friends who enjoy being ‘the attractive one’ would feel threatened...friends with low education etc might feel threatened, and want to ‘cut you down to (their) size’ so you don’t outshine them, and make them feel inferior, simply by striving to be a better you...they may fear losing you, you fear losing them...there is a vicious working class mentality that goes all the way into the lower middle class where you are expected never to try to rise out of that class...that that is a betrayal...how dare you spread your wings, and leave your chicken-winged and brained compatriots below you? No, they have given up on even trying (though the moment someone offers them a chance to sell out their class they do e.g become union organisers, party commissars, fake politicians) so they use all their excess energies in keeping others down at their own level, of motivation, of behavior...it is malicious...anyone who bases their world view on lies that humans are all motivated by good will and the best intentions is going to be a victim...we have to identify where good will comes from...from shared expectations of mutual benefit from social interaction ... not from some imaginary automatic human nature... watch babies fighting, tooth and claw, and the look on their faces...most people have to learn that it is in their interests to ‘cooperate’ and contribute with each other...the most able learn that together they can achieve more...but the least able resent the ‘high flyers’...and finding little satisfaction in their own lives, or feeling ‘robbed’ because ‘some have more’, they focus on ‘brining their betters down’...pretend to be ‘marxists’ when they are motivated by pure envy, malice etc...which becomes clear once they get their ‘workers utopia’, where they don’t seem to have any ‘ability’, but lots of need...feel entitled in the same way their ‘betters’ once felt...entitled to have stuff without working for it / producing it...just now at a much lower level of society and production, now that their ‘betters’ have been slaughtered, or sent to labor camps where they cannot employ their ‘superiority’ to producing the goods and services they once did...but hey, the malicious motives have been satisfied...now everyone is equally poor...who cares if the richest is about as poor as the poorest once was...as long as ‘no-one has more than me’ I am ‘happy’...or???

Anchor limiting belief-feelings then enter-into-it deeply, to trace it back to its origin ‘story’ i.e the incident/s in which the belief was imprinted...

Parents stronger/ older siblings stronger...if they always ‘won’ any battles, the younger can learn that they are inefficacious i.e can’t win...feel powerless...this feeling having been imprinted by interactions with parents and older siblings...so no matter how strong and big the person becomes, they have an innate belief in their lack of power to fight back...feel powerless...become victim of bullies
they could easily defeat, if but for this unconscious limiting belief … despite what they see in the mirror now, their unconscious acts according to the imprinted belief that they are small, powerless, will always lose, and thus avoid confrontations, allow self to be pushed around...often to surprise of others...but few kids want to encourage peers to feel stronger, they believe any strength in others is a threat, makes them appear weaker...bullies aren’t going to explain truth to their victims, and others who consciously or unconsciously envy their ‘betters’ are happy to see them bullied, and imagine that ‘social reality’ is real...that ‘pecking orders’ put in place by group dynamics define the ‘natural’ position of a person...

Imprinting events occurred at stage where person forming beliefs about themselves and the world...their identity...defining the ‘self’ and the world.

There is often something particular about the situation in which the imprint occurred...e.g parents will force them will upon child many times, but only in once case does that imposition result in an imprint...a self-definition...e.g potty training associated by Freud with many issues...

Child forced to comply may maintain some independence / control in subtle way that later becomes source of neurotic symptoms...e.g forced to sit on the potty, but parents can’t make you shit...can hold it in...they can’t even know you are deliberately defying them...so the child ‘wins’ and ‘controls’ the situation in this way...

The unconscious may do similar things, ‘sabotaging’ any attempt to ‘control’ it...to resist attempts to force it to do something...on principle...based on the original imprint of successful resistance...rebellion...can end up rebelling irrationally, for fear of allowing another ‘control’ e.g against the best, most well intended, good-willed, and obviously good advice...on principle...related to authority defiance disorder? (that one made up to define any defiance of irrational selfish authority as a mental illness e.g holocaust hoax, manmade global climate change – increasing weather severity, the media doesn’t lie, etc etc)

Find a resourceful experience to anchor all the modalities and sub-modalities for it...as the model...then displace/replace these elements onto context/ content where a limiting belief is currently producing symptoms/ outcomes we don’t want...

Use a similar type of situation, but where the outcome / beliefs were more optimal...find a specific example...so can re-create all aspects / associations / feelings of vividly...

Have to make sure unconscious does not conflate something you want to do (but have objections to e.g losing weight / but love eating) with a past imprint where
you were forced to do something you didn’t want to do, and resisted e.g. potty training example…otherwise you will sabotage your ‘diet’…as if it was being forced on you by someone else, and ‘success’ in the interaction is defined by resistance…stubborn refusal in subtle, unobtrusive ways that the ‘authority figure’ cannot clearly identify and thus ‘break your will’ and ‘force you’ i.e. you win, because you resist in ways they cannot observe and define, and thus counter / defeat you…

Symptoms often result of some internal conflict (ongoing or past unresolved conflict that imprinted the limiting beliefs / symptoms)…therefore don’t use imagery involving conflict e.g. ‘pacman’ metaphors or ‘violent/ war’ metaphors with ‘good and bad guys’…can end up tapping into/intensifying etc the internal conflict…cancer cells not ‘bad’ per se…just growing out of control…remission is where they return to ‘normal’…which is aim of visualization…must use compelling, modality and sub-modality rich, vivid, immersion in the desired state/condition/outcome i.e completely involved / absorbed into Vs merely superficial image of outcome desired e.g. image of thin you or Ferrari…have to ensure this desired state is consistent / compatible with your other desires, so you don’t have un/conscious conflicts of interest i.e objections…overcome any objections positively i.e with positive solutions…do not deny they exist…solve them…enter a relaxed, positive, receptive state of expectancy and belief that ‘it will happen’…ensure you feel entitled/deserving of it i.e overcome any objections from ‘imprinted’ beliefs e.g. ‘I deserve to be happy’, ‘I can be happy’ etc…

Cannot simply use dissociated images that conflict with other desires, and which you don’t believe you can, or deserve, to achieve…

Experience the desired state with 5 senses, all the smells, tastes, sights, sounds, and feelings associated with achieving the desired objective… in all sub-modalities, so experience seems real…so you ‘believe’ it to be real…to create the power of self-fulfilling prophecy and placebo effect…

Expect to smell, taste, hear, see, and feel all these modalities and sub-modalities associated with attaining the desired end…all the good feelings…

Ensure you have overcome any internal objections e.g. that ‘I don’t deserve this’, I can’t have this’, ‘If I get this bad things will happen’, ‘I have to stay down, and not threaten anyone by being pretty, smart, successful etc’…

Model this ‘faking it to make it’ on something compellingly real…an experience of success you had…how did it feel…what modalities and sub-modalities did you experience…immerse yourself in these fully…then transfer them to the desired outcome, so this has all the qualities your mind and body associate with ‘reality’…to make the desired outcome experience
‘real’…compelling…powerful…as Buddha suggested ‘remember it’ rather than try to imagine it… ‘remember it as having happened’… like ‘remembering’ the solution to a problem, rather than trying to solve it… assume it has already happened… that you have already solved it, and are actually remembering how it felt, remembering the solution… a fait accompli… perfect self-fulfilling prophecy…

If you are unsure of negative externalities that may be ‘blocking’ you, re-form the objective in a way that bypasses these possible feared consequences, so you overcome the un/conscious objectives…

Set up a scene with all the modalities and sub-modalities you associate with success, and expect to enjoy when you have achieved the desired outcome… write the script until you are satisfied with it… list all the ‘props’ that make the scene seem real… other people’s reactions to you, all the smells, sights, sounds, feelings, how it feels sitting in the Ferrari, or putting on that tight dress and getting admiring looks (maybe bitchy looks from some?)… until you have a ‘scene’ that is convincing to you as an onlooker… then ‘enter into it’ and become that character… not as an actor… but for real… experience the scene you have set up as real… congratulate yourself… feel that you deserve it…

Unconscious often responds to language that is figurative e.g. laughing at double entendres, ‘innocent’ language that results in a sexual response, because at some level it can be interpreted figuratively e.g. fingering, erection, in and out, ejaculation, spread legged, bent over… observe clients body language to see if unconsciously responding to language that is not overtly sexual, or related to some part of the body, but which could be taken that way… to see if you can find some unconscious reaction / issue… e.g. ‘are you carrying the weight of the world on your shoulders?’, is that a pain in the neck’, are you ‘looking for trouble’ or ‘don’t want to look at that’… metaphor may reveal source of problem, or of imprint…

Leukaemia, metaphorically, is due to white cells that refuse to grow up/mature… they keep multiplying out of control… could be reflexive of fear of responsibility or just growing up… remaining child-like… could reflect an unwillingness to do so, or fear of doing so, imprinted at young age…

We need to want to, know how to, and have the chance to. All three, to achieve something.

Note ‘remission’… whatever leads to cancer is always there, the body just regains control and homeostasis over it… e.g. viruses always present, but immune system keeps them in check…
Illness, like any other symptom, are a communication from the body / unconscious that something is wrong…if you listen, and hear the communication, and ‘express’ the ‘impression’ i.e complete the communication cycle, the symptoms disappear…the message has been received / heard / processed…respond to the communication / message the body is sending and the symptoms are no longer required…they disappear…the cancerous tissue is re-absorbed by the body, the immune system stops attacking itself, or defining harmless particles of pollen or gluten as ‘pathogens’…

If you have been ignoring your body, or unconscious, it may have to shout i.e use very extreme means of communication e.g irrational fears, pain, disease, illness etc…Like society’s flare up into civil wars, violence etc when the needs of some parts are ignored by the others e.g the elites over abuse the value producing workers etc…

Keep in mind must treat any system as a whole…cannot treat just one aspect of it…must treat the problems of the entire system, ecologically, holistically…respond to all communications … so illness question of lack of communication / listening/ responding appropriately…like holding hand in fire or on hotplate even though it hurts…

Many cases of people merely observing or recording an NLP session changing their own beliefs as a result, and thus becoming free of limiting beliefs, and the symptoms these had been producing i.e real physically documented medical conditions …and clients who underwent NLP whose tumors disappeared, or became benign, who tested positive for AIDs then negative…etc…whose cancers disappeared…allergic reactions stopped…breast cancer disappeared…

Weight loss related to definition / belief person has of themselves as ‘slender’ or ‘overweight’…

Note if you believe cancer kills, it can kill you. In fact it is not cancer that kills…it damages/interferes with/breaks down the immune system and other organ functions, allowing infections and organ failure, so system breaks down…Cancer cells are your own cells…so not question of getting rid of them, but transforming them…there are always a certain percentage of cancer patients who go into remission…often totally disappear…without any intervention…i.e spontaneous…

NLP aims to produce positive holistic ecological changes…positive mindset…positive relationships…positive diet and lifestyle changes…all contribute to better resistance to disease/ illness / pathogens i.e ‘clear’ of psychosomatic generators of dis-ease…need support from every direction, including doctors, family, friends, society…
A genuine change in beliefs is reflected in a change in attitudes, lifestyle, diet, exercise, relationships etc... just ‘pretending’ you believe won’t cut it... ‘glauben heisst machen’... generates positive reinforcing loops... positive self-fulfilling philosophies... greater ‘bounce-back’ from bad experiences / set-backs...

If you see three different doctors, you’ll likely get three different diagnoses, prognoses, and treatment plans... so go figure!

We are psycho-cybernetic organisms... we require a purpose / meaning for living e.g. expectation of pleasure, even ‘revenge’... often dis-ease / illness occurs after lose purpose / reason to live... mission...

People often much more accepting of death than Hollywood movies would suggest i.e. they have ‘given up on life’ and feel they’ve done all their going to do / were ‘sent here’ to do, really have no motivation to go on living, and not very concerned about dying...

Question is whether their beliefs are valid re: do they really have a positive reason to live? E.g. Hamlet’s ‘To be or not to be’ is extremely rational...

Often giving people a new mission, i.e. re-mission-ing them... leads to a remission of the illness/symptoms...

MHR Thanatos Vs Eros... and Hume, the more dominant affect absorbs the power of the less dominant affect... so either will get stronger and live, or weaker and die... rather than keep up see-sawing of ‘to be or not to be’...

Different mental and emotional states and physical states change the balance of chemicals in the body and brain chemistry, immune response etc e.g. stress, happiness, despair, confidence, hopelessness, are all part of the equation. Even changing pH levels can determine which sperm end up impregnating an egg, thus determining the sex of a baby...

NLP can cure phobias i.e phobia is mere belief imprinted... if allergy is immune system ‘phobia’ i.e. imprinted belief that ‘hay’ is pathogen e.g. because unconscious associated it with some fear / threat / danger e.g. I will spend all my time with my horses and neglect everything else, therefore defined hay-horses as danger / pathogen, and immune system responded to hay-horse set by defining hay as pathogen, and reacting to it, as if it was... i.e definition of allergy is such a response i.e. harmless particle identified as pathogen... form of propaganda... mis-information... set up huge ‘defence’ which produces symptoms of ‘hay fever’ i.e. allergic response... thus the belief that hay is harmful produces real harm... forces person to reduce time spent with horses... freeing up more time...
for family etc responsibilities…n.b ‘spring time’ allergies and ‘colds’…what is associated activity that formed original imprint of belief…what was being avoided / what self-defined ‘harm’ / risk …

3 anchor and 1 anchor allergy-belief imprint ‘clearing’…

Because some allergic reactions can be deadly i.e produce anaphylactic shock…never test the success of the ‘clearance’ of the symptoms without strict medical supervision e.g with appropriate medical expertise and equipment/pharmacological requirements e.g ‘injector-pens’ used for anaphylactic shock…

But for less threatening allergies like hay-fever, where this risk does not exist, you can follow the basic procedures that have been successful in the past in relieving people of allergic responses i.e replacing the belief imprinted on the mind and immune system that harmless particles are dangerous pathogens requiring their interaction…basically ‘curing’ someone of an ‘allergy’…

If symptoms disappear when a person is asleep, or distracted, then the chances are they are psycho-somatic i.e result of an imprinted belief…

The same principles can be expected to work with other ‘belief’ dependent ‘illnesses’ ‘dis-eases’ like cancer, arthritis, AIDS, lupus, migraine…anything where inflammation is present, where communication has broken down i.e propaganda / invalid definitions have corrupted the program…so immune system attacks own cells, or defines harmless particles / situations as dangerous / pathogens…

Get client to vividly imagine the situation in which the symptoms appear e.g that they are holding the ‘allergen’ up to their nose…or recall a vivid experience of the response / symptoms …re-create the circumstances…to calibrate the response…the physiology, posture, voice tone/level, any ‘indicator’ that the person is suffering the symptoms…in the situation associate with the symptoms…

Even fake roses have been used to induce allergic reactions to roses…even just thinking about being in the presence of the pathogen / phobia source can produce / stimulate / result in the symptoms emerging…all this indicates the power of the mind…that the symptoms are psycho-somatic in nature…and thus open to a ‘cure’ through NLP

Immune system has ‘fixed’ definitions…once it has defined a virus, bacteria, or particle, or situation (phobia) as harmful, the ‘fight or flight’ response is invoked…once the definition has been ‘written’ or ‘coded’, the response will be immediate, when that same element is perceived to be present, by the immune
system, or the mind (MHR just thinking it is present triggers the now hard-wired / coded response...If-then...

Need to teach the immune system a new response...displace / replace / over-write the existing definitions / code...so the response is over-written...to displace/replace the imprinted ‘belief’ with a new one...the ‘pathogen / danger / risk’ definition with ‘harmless / neutral / low threat’...re-programming...

First need to seek out ‘objections’ to a ‘cure’ i.e what benefits / avoidance elements involved...e.g if allergic to grass wife can’t nag you to cut it...phobia lets you avoid activities you don’t want to do / risks you don’t want to take...so seek out ‘objections’ and overcome them...requires honesty...self-awareness...what ‘value’ / service / benefit does ‘symptom’ provide...ecological / holistic context...what is real ‘meaning’ of the symptom...what is it communicating indirectly that you won’t ‘own’ i.e if you don’t want to cut the grass, just say so, and your unconscious won’t have to go through all this charade...a much more efficient / efficacious response can be found e.g pay the neighbor’s teenager to do it, rather than go through all this suffering / drama...of course it is unconscious...pre-conscious...below level of consciousness...so you don’t see it as such...will need to look in mirror, honestly, to ‘audit’ your ‘motives’ for having the symptoms...more particularly the motive that arose during the critical period in which the symptoms merged...the traumatic experience, the imprinting situation...when the new belief that ‘having this symptom’ was a good idea...that ‘hay is dangerous’, that ‘dogs are dangerous per se’ i.e a generalized definition...info / data / definitions fed into the program which computed ‘allergen’ or ‘danger’ and resulted in the phobia / allergy...when the belief was initially imprinted, the invalid belief / definition, it provided some immediate gain / value / service to the person...such as avoidance of the same painful result, or some other unrelated thing could be avoided e.g school sports...or it got the positive attention of parents etc...

Specialization of immune system elements...Macrophage cells have long tentacles that latch onto foreign substances like dust, pollen, grass particles, viruses, bacteria etc that have entered the body through breathing, swallowing etc...they ingest a little to identify it, then place a sort of ‘flag’ on the cell to identify it. Helper T cells are attracted to these flags. If the negative impression of the flag matches the positive impression of the T cell (like heterosexual animals), they will ‘mate’...if the information coded onto the foreign substance matches one of the codes imprinted in the T cells and defined as ‘dangerous’, the helper T cell will stick to the foreign substance and send out a ‘calling all cars’ chemical signal that will attract killer T cells...if the substance is identified / defined as a virus or bacteria or other pathogen, they will inject it with a chemical that disintegrates it...we end up with a war zone...and all war zones suffer ‘collateral damage’ and ‘casualties’...the battle produces inflammation,
lots of ‘byproducts’ of the carnage pollute the body, and produce the symptoms we associate with a cold or flu, or allergy, or phobia. When the viruses and bacteria ‘explode’ they release lots of toxins, chemicals etc that produce the side-effects we experience from colds, flus, allergies.

And so if these killer T cells, the ‘terminators’ of our immune system, explode the body’s own cells, or harmless foreign substances that we would otherwise just excrete through sweat, urine etc, they create war zone, ‘friendly fire’, and as the healthy cells are everywhere, they can end up ‘carpet bombing’ large areas of tissue, even enough to threaten the functioning of organs, and the biological processes required for health, vitality, and even life itself…

Other cells ‘mop up’ the body’s own defective, diseased, unhealthy cells, on a regular basis…any excess cell growth is contained and eliminated…cancer is unchecked / out of control cell growth in a position that prevents an organ carrying out its function effectively, weakening the body as a whole, and leaving it prey to pathogens, illness etc…vulnerable to pathogens / risks that it otherwise would have no trouble successfully overcoming / responding to…

An allergy occurs when the T cells attack harmless cells, or the body’s own healthy cells. It has somehow come to define them as dangerous. There is miscommunication. Propaganda.

Need to clear up the misunderstanding. Need to identify the ‘secondary gains’ that lead to the ‘noble lie’ i.e propaganda… the self-deceit … whether conscious at the time, or at a level below direct consciousness i.e a clever plan of the mind to avoid, or attain, the desired / undesired outcome … to gain pleasure or relief…to eliminate the ‘motive’ for the ‘noble lie’ e.g that I am allergic, have asthma, need/deserve attention, to ‘justify’ not doing X, or getting Y…seek out ways to get same relief / pleasure i.e same gain / avoidance, without the symptom…i.e more rational, efficient means to avoid cutting grass, neglecting family for horses, getting positive attention, avoiding X, getting Y…that don’t involve the current symptoms (or new ones)… find a truth that will supply the relief / pleasure, to replace the ‘noble lie’ with…delete the propaganda and replace it with truth…stop distorting reality and denying the underlying motives…face them…accept them…don’t judge them…find solutions instead…MHR often main resistance is due to this ‘judgement’ i.e ‘good and evil’…replace with practical heuristic problem solving approach that drains the issue of all ‘affect’ i.e guilt / fear / evil definitions…which are their ‘power’ i.e the ‘power of demons’ to distract / misdirect / deter direct confrontation of own desires / impulses i.e what want and want to avoid…their ‘affective power’ is due to the propaganda of religion, media, parents, society i.e women should want babies, men should want to fight wars and play sport and pay for sex one way or another, masturbation is a sin whose consequence is fates worse than death etc i.e
force us to be fake, lie to selves…and find alternative ways to ‘avoid’ what don’t really agree with i.e what is not real for us…not authentic…but we cannot do it directly i.e ‘come out’ or openly communicate our true desires etc…the truth for us…our reality…so our unconscious comes up with clever means of avoidance and gain…men can’t just cry out for love, they have to be sick, women can’t just escape a relationship, or avoid having children etc, they have to die of cancer…all the in-authenticness fucks up the systems communications…how can a software program run, and produce hardware, if its definitions are invalid…if it senses X but pretends Y…like a complex system of traffic lights, where some are falsely signaling green, you are going to see the whole system collapse due to the lies, the propaganda, the deceptions, whether ‘noble’ (intended to avoid harm in the self or others e.g self sabotaging tall poppy), or malicious (priests, mass media propaganda, powerful political and business interests set to enslave you directly and indirectly, to profit from your misery)…

Allergy…step one…find a substance e.g plant, or situation, that is as similar to the allergen / phobia as possible without generating the symptoms… e.g similar grass not allergic too…similar tree blossom…similar situation e.g train vs plane…i.e closed space…

Have person inter-into a remembered or imagined situation that is very similar, but doesn’t produce the symptoms…get them to vividly immerse self in as many levels of modalities and sub-modalities, sensory impressions, feelings, smells, sights, sounds, and observe their accessing cues and posture and breathing, and then ‘anchor’ this state with e.g a squeeze of their left hand or shoulder. We will now ‘transfer’ all these elements of the state ‘fine in the presence of X’ to the state associated with the presence of Y. i.e they are very similar states, so we can hope to ‘trick’ the mind into re-imprinting the state Y with the beliefs associated with state X…all the physiological elements that make up their response to X…to replace those limiting beliefs / states currently brought up by Y…

Make sure they are fully ‘entered into’ i.e completely ‘associated’ with the situation X / state X … rather than just dissociatedly observing it as a casual, uninterested, uninvolved, neutral, observer, third party watcher…has to be a real immersion…fully, vividly experience it … enter-into-it…become that person in that situation…as real as possible…with as much sensory details and ‘reality’ as possible…colors, sounds, smells, feelings, affects, emotions…not just real…but capable of imprinted strongly…strong impressions…complete impressions that will be easy to recall due the strong impressions they made…think about what things you can vividly remember…what made them so vivid…what made their impressions so strong…n.b we often speak of someone being ‘impressionable’ or ‘of at an impressionable age’…so travel back in time to experiences that made a
big impression on you, that you can remember to this day in detail, and use the same modalities and sub-modalities, to ensure that this new ‘experience’ feels as real…is experiences as real and compelling, and makes at least as equally strong an impression on your / the client’s mind…so this impression will be stronger than the one that formed the problematic imprint-belief…the limiting belief…the one that is so problematic…that resulted in the symptoms…so we can over-write it with at least as strong a magnetic charge as the charge that initially ‘wrote’ it…encoded it…

Imagine a bullet-proof plexi-glass shield has been placed between the allergen / thing have phobia of… and you…then imagine watching yourself on the other side of the shield, handling the allergen/thing, but having the response you have just anchored i.e of being fine…then bring that self on the other side of the shield back to the self watching that self, here…then imagine being in presence of allergen/threat but maintaining this anchored response…

Person may have trouble accepting the true nature of allergies / phobias…need a few moments to process the fact that the elimination of the phobia / allergy can occur so fast, because it is merely a matter of replacing a faulty definition / belief with a valid one…in future may feel the first stage of the old response, but there will be no follow through…i.e the initial muscle memory may be retained and expressed before the mind can process the response, remember the new definition / belief, and prevent any follow through with the older dysfunctional response…i.e the allergic reaction or panic … mind has been rewired…the immune system has been recalibrated to the new valid definitions…a change in neural pathways and brain chemistry… the old ‘anchored imprint’ has been collapsed…like propaganda revealed…like people suddenly realizing ‘the holocaust didn’t happen’ etc…

If allergen can not be specifically identified i.e the association imprint was more general e.g airborne pollen , then consider what ‘counter-example’ might be appropriate i.e an equivalent e.g lint or flour that the mind could associate with the original trigger…/ excuse / prop …

Often allergic reactions only occur when person experiencing stress…i.e related to their emotional state / stress … so need to train them to respond differently to stress … to the situation that produces stress…e.g some years they have hayfever, other years don’t suffer the symptoms…even though pollen count same…i.e internal state is the differentiator…/ trigger…for increased sensitivity / awareness of trigger for allergic reactions…

Find a counter example as close to the allergen, in the person’s imagination/view/definition as the allergen…e.g allergy to cows milk using goats
milk or soy milk, or something like milk e.g. coconut milk...help person suggest own counter example i.e. what seems most like to them...

To test if therapy worked, have specialist run tests, ... in case fails, and severe reaction occurs ...

MHR could person die just from imagining the allergen is present?

Some people will test ‘positive’ to almost every known allergen...under different stress levels...so deal with stress issues first...

May have to go back and work through ‘secondary gains’ i.e. ecology of allergy / symptoms...remove motive for them...

Test for any unresolved imprints at root of problem...Vs simply the first imprint associated with the symptoms...may be a deeper underlying imprint at root of this later one...but later one is first time recall symptoms...may be screen memory...real memory hidden/veiled/ blocked/repressed...though NLP only needs to deal with the belief, not the affect i.e. no need to express/process the experience, just re-imprint a new belief to overwrite the one written as a result of that affect/experience/trauma...

Fast processing: Calibrate: ‘what is it like for you when you are in the presence of the allergen/phobia’...observe details of client’s physiology, eye accessing cues, breathing etc... Explain the error of the immune system i.e. propaganda/noble lies/invalid definitions/mistaken identity so that it requires a quick ‘message’/‘reprogramming’/updated definition/re-training...but as problem so simple, this can be done very quickly and simply...Check for ecology/secondary gain...what would life be like without these symptoms? What positive and negative consequences of not having them? Find appropriate counter example resource i.e. close enough to allergen to make re-mapping/over-writing allergen response easy...Anchor response to the counter example throughout the process i.e. as overlay imagined allergen onto the response / beliefs / definitions so they merge, and the new response / beliefs / definitions of ‘harmless’ over-write the original limiting beliefs / erroneous definitions...Use dissociation e.g. plex-glass shield to establish dissociation, so no threat, while holding the anchor...have client see self on other side of shield/ screen in presence of allergen, but anchored, so having no response to it...experiencing it as harmless...re-programming immune system / definitions / beliefs about the allergen/ phobia locus...then gradually introduce the allergen / phobia locus into the presence of the ‘projected’ person on the other side of the plexi-glass...gradually so they have chance to get used to its presence, without any symptoms...wait until can observe a physiological shift, as if observing the immune system re-calibrating the allergen as ‘harmless’ i.e. re-writing its definitions, updating to these new facts / beliefs / definitions...then Re-associate
the person back into their own body, on this side of plexi-glass, then have them again imagine they are in presence of allergen / phobia locus…as hold the anchor…have them imagine a time in the future when they will be in the presence of the allergen / thing feared, that used to result in the symptoms / irrational fear response, feeling great…Test with real allergen / feared thing for any signs of previous phobia / allergy…

Three anchor process: this alternative uses 3 anchors…one each for the dissociated person, one for the counter-example, and a resource anchor…Vs just one for the counter-example… anchor how they want to feel in presence of allergen/feared thing… so in each part of process person can see themselves with the resources they need to face the allergen/phobia…gradually introduce allergen in dissociated state…future pace i.e see self in future in presence of allergen/feared thing with access to anchored resources…

Foreground/Background procedure…based on Pavlov’s experiences with dogs…Pavlov conditioned dogs to expect food i.e salivate, in response to hearing a bell, buzzer, and tone at same time…i.e presented with food after simultaneous sounding of bell, buzzer, and tone…so learned to expect food after these 3 triggers heard…Pavlov noted that, when later sounded individually, the dog responded most to the bell, less to the buzzer, and least to the tone… so he called the bell the ‘foreground’ and the buzzer the ‘background’…corresponding to what the dog responded most strongly to… Pavlov found that after he had conditioned the dog not to react at all to the tone, when he sounded all 3 sounds at the same time, the dog also ignored the buzzer and bell….  This sort of process has been adapted to NLP…in the following way:

e.g allergy to cottonwood trees…hold client’s arm then get them thinking about pine forests … and hold this ‘anchor’ as get client to vividly imagine pine trees ask client ‘what do those shoes feel like on your feet?…to couple focus on sensations in feet while thinking of pine trees… ‘how do your feet feel when you walk around cottonwood trees?...’ client’s physiology changes as shifts to thoughts of cottonwood trees … now client’s focus, in association with cottonwood trees, are not the allergy symptoms, but how his feet feel, and as his feet never showed any symptoms, he is now symptom free, when thinking about cottonwoods (Vs earlier he would display tension around eyes and skin color became uneven)...the cottonwoods were foreground in his impressions, while his feet, always present, were background. He paid them little attention, like Pavlov’s dogs to the tone. We created a strong association between his feet and the counter-example of pine trees (very similar to cottonwood trees to his way of thinking, but he had no allergy to them)…
You can ‘anchor’ a set of impressions visually e.g a man who wears a tie to work…tell him you’re glad you don’t have to wear a tie to work, and ask him if he minds, and as he considers his answer, anchor his response when it comes by holding an imaginary tie knot on your collar…now they will answer ‘no, I don’t mind’ and now you have anchored ‘I don’t mind’ in this context. Then ask client ‘do you really mind listening to your wife when he was really interested in what she was saying?, while fingering the invisible tie and thus activating the anchor of ‘I don’t mind’. Then ask him about her nagging. Do you mind her nagging? And whereas before he did mind, and got irritated, now he ‘doesn’t mind’. The tie was always in the background of his attention, his wife’s nagging in the foreground. The tie was thus ‘close enough’ on some level, in the client’s mind, to act as a counter-example.

The best ‘counter-example’ is a remembered incident where the person was in the presence of the irritant / feared item / allergen, and didn’t have a negative reaction.

Ask client to suggest a counter example…Example fear of dentist drill sound…client suggests electric mixer as it sounds similar…didn’t work, as she was in control of them, thus the situation was not close enough…therapist suggested hairdressers clippers, as she didn’t control them, but didn’t mind them, even though they sounded similar…with bonus that she associated that sound with ‘doing something good for myself’ and ‘looking better’…so now these good feelings associated with the hairdresser’s clippers could be carried over to the dentist’s drill sound…

Select something for ‘background’ that will always be there, but which person pays little attention to…like the dogs and the tone…e.g temperature, pressure in soles of feet. Try different ‘backgrounds’ until hit on the right one that ‘does the trick’ as a ‘counter-example’ i.e is accepted by the mind as close enough to the problematic trigger…Foreground is what the client is most aware of e.g the allergen/ feared object. Find a counter-example, where the symptoms don’t occur, but which the mind will accept as close to the same situation. Work out what ‘background’ can be common to each, what must be present in each, but which the mind pays little attention to e.g weight of clothes, pressure on soles of feet…While holding the anchor, have person focus on what they are most aware of in the counter-example situation / memory / experience. Aim is to produce a strong association between what is most in their awareness (foreground) and something they are not attending to (background).

An efficacious ‘counter-example resource’ is a situation in which the person would normally be expected to display the limiting symptoms, but didn’t…or a situation that is, in the client’s view, as similar to the one that provokes the symptoms as possible, without provoking the response/symptoms…in this
situation, what is the client most aware of i.e foreground of conscious awareness, what most attending to e.g sinus pain, itching eyes. Then search for a common ‘background’ that must be in each situation / context, but which the client is not attending to / is outside the persons’ conscious awareness e.g feel of shoes on feet, tie around neck, weight of jacket, some common denominator that is glossed over…Anchor this background feature… Hold this anchor and have client focus on the foreground/what most aware of, in the counter example experience / resource…create as strong an association as possible between the this foreground, and the background identified as common to counter example resource and situation where symptoms displayed/provoked/experienced … Release anchor and immediately have person associate / enter into / recall in vivid detail, the situation usually resulting in the symptoms…Calibrate the physiology of the client … if the symptoms still appear, go back to step 3 with a different counter-example and strengthen the association between foreground and background features…

An alternative to ‘anchors’ is to observe which sub-modalities are present when the symptoms are not present i.e the immune system working correctly / no propaganda / no misinformation / no invalid definitions… and map these onto the situation where it is over-reacting / identifying harmless things/bodies own healthy cells, as ‘threats’… typically there will be one critical sub-modality present in one and not in the other… seek it out… transplant it… add the sub-modality absent from the symptomatic response from the healthy response … replace/displace any additional sub-modalities present in the unhealthy response with ones from the healthy response… basically ‘mimic’ the healthy response, in the context of the stimulus that has been inducing / stimulating the unhealthy response… like making a historical re-creation as close as possible to the true story, with ONLY the propaganda bits / lies different, so it is convincing… i.e hiding lies in truth…

Sub-modalities include questions like ‘How do you think about it’… what words come to mind… what images… sounds, smells, feelings, emotions… of the symptoms and their response to them… (or vice versa!)

Calibrate, Explain immune system’s mistake, check for secondary gain/ecology issues, find efficacious counter-example (to use as a resource). Elicit the sub-modalities for that example i.e associated with the immune systems ‘healthy’ response to harmless things… e.g cat allergy, use interactions with dogs… grass allergy and response to wheat… so can identify the sub-modalities the immune system uses when it is responding appropriately … elicit the sub-modalities associated with allergic reaction, to identify the sub-modalities the immune system uses when it is responding inappropriately. Have person vividly think of the allergen, while reproducing in their mind, and physiology, every movement and thought, reaction etc, across all sub-modalities, so that they match the sub-
modalities of the counter-example i.e imagine allergen but without the response...future pace i.e have client apply to imaginary future interactions with allergen without the old reactions as therapist observes for any sign of the old symptoms...then test with actual ‘allergen’ (if safe to do so...if any risk of severe life threatening reaction e.g bee-stings or peanut allergy, have a specialist do this test, with all the ‘epi-pins’ etc on hand in case of anaphylactic shock etc...

Mozart’s letters described a creative process he applied to his musical creation. Here is a paraphrased translation, adapted by Rober Dilts in his book ‘Beliefs’.

Take a moment to be fully and consciously aware of your body. Your feelings. Pay attention to parts you normally don’t. Enter into your body fully, experiencing the symmetry and balance of the left and right sides. Search deeply inside for that part of your body that you’ve always been able to trust to be healthy. The one constantly trustworthy, reliably healthy part you have always been able to count on to be there for you. The part that is always healthy. It might be an ear, a hand, a leg. The part that is always reliably healthy and strong no matter what other ailments or illnesses you have suffered.

Focus your awareness intensely on that part. Enter-into-it.

Imagine that part is like a musical instrument that resonates with a melodious sound. This is the sound of vitality. Of energy. Of health. Of well-being. Of balance and harmony.

Amplify that sound. Allow it to resonate more fully. Until this resonance spreads out to include the parts of the body around it. Until the entire body begins to resonate with this melodious sound. Filling with a feeling of vitality, health, energy, and life. Allow the feeling to strengthen and grow.

Now smell that sound. Smell the aliveness and vitality and health and vigor and energy and harmony and balance. What does it smell like to you? Fruity? Spicy? Aromatic? What does it taste like?

Imagine that feeling as a light. Growing in intensity. Spreading throughout your entire body. What color is it? Imagine it growing in intensity. Becoming more vivid. What does vitality look like? Allow it to spread and intensify throughout your body. Allow it to dance and vibrate. A dance of color and rhythm. Spreading through your body, from the healthy vital parts out. Massaging every part of your body from the inside.

Know that music and that dance can continue. Even through tonight in your dreams, in your sleep, in the back of your mind...that music can spread...that
light can spread its warmth, its flavor all through you. And that you can taste that, in the things around you, in the food that you eat. In the sights that you see and the sounds that you hear. And that the sounds of life and health, and the colors of life and health, and the tastes of life and health can be there for you. And if you can pay attention to those, your unconscious mind can lead you to what are the most appropriate things to eat, to see, to hear.

And perhaps that light within you can become so strong and bright that it begins to shine out through your pores and eyes. And the sound spills out through your tone of voice, and spreads to others, without your having to try, but just by people being near you. They feel it, and they sense it.

Allow that process to continue at its own pace, its own rate of speed, in the way that's most ecological for you. And any of the ideas or the learnings that you've made here today, know that you can accept or incorporate them, or consider them, in a way that's most ecological and appropriate for you. And tomorrow morning, when you wake up, may you arise with a sense of energy and vitality, a relaxed feeling but with an alertness that perhaps you can feel as you allow your eyes to open and make contact with the world around you here. And even noises from outside the room won't interfere with that sense of inner vitality and peace.

THE FACT IS, YOU HATE ME, PEOPLE LIKE ME, WHO TELL YOU THE TRUTH ABOUT YOURSELF...AND WE ARE THE REAL WHISTLE BLOWERS...THE ONES WHO CAN TELL YOU ABOUT EVERYTHING ELSE THAT DESERVES CRITICAL INVESTIGATION... SO WHEN YOU DESTROY US, YOU DESTROY YOUR ONLY CHANCE OF HAVING HONEST WATCHDOGS LOOKING OUT FOR YOUR INTERESTS, AND THOSE OF YOUR FAMILY...SO FROM A PERSONAL LEVEL, FUCK YOU, AND FUCKING ENJOY YOUR HELL... THAT SAID, MY MOTIVE IS TO HELP YOU, SO OF COURSE I WANT TO SAVE YOU FROM YOURSELF, AND FROM HELL... BUT YOUR STUBBORN REFUSAL IS FRUSTRATING BEYOND WORDS... YOU DO GET WHAT YOU DESERVE, AS YOU DO UNTO OTHERS...YOU DESTROY ALL THE PROPHETS WHO WOULD BE HONEST WITH YOU, AND WOULD WARN YOU, AND SAVE YOU...SO WHAT CAN I DO BUT WASTE MY LIFE TRYING TO SAVE US ALL, INCLUDING YOU...DESPITE YOU... AND WHAT YOU DO TO ME, AND PEOPLE LIKE ME...OVER AND OVER AND OVER AGAIN...
Sleights of mind

SLEIGHTS OF MIND BY STEPHEN L MACKNICK

The neuroscientific study of magic

MHR 'MOSSAD MOTTO' 'BY DECEPTION MAKE WAR'...REFERENCE IS TO Sun Tzu in 'The Art of War' more than two thousand years ago: “All warfare is based on deception. Hence, when able to attack, we must seem unable; when using our forces, we must seem inactive; when we are near, we must make the enemy believe we are far away; when far away, we must make him believe we are near. Hold out baits to entice the enemy. Feign disorder, and crush him.” THIS IS KEY TO IDEA OF 'DEFENCELESS VICTIM' AND 'WE DON'T CONTROL THE MEDIA, FINANCE, NATO, U.N, BOTH POLITICAL PARTIES, CONTROLLED OPPOSITION, ALT. MEDIA ETC...

CHAPTER TWO:

the Ambitious Card routine. This famous trick can be done in an infinite number of ways, but the ones we are about to learn are especially germane to how magicians trip up your visual system. The magician asks you to choose a card, any card, from a deck. You do so and then place the card in the middle of the deck. The magician snaps his fingers over the deck and voilà—your card has mysteriously risen to the top. It is an ambitious card—it rises through all the
other cards every time. Houdini was the most famous magician in the world. Whereas he had earned supreme confidence in his abilities to pull off spectacular escapes, he was perhaps too confident in his abilities in close-up magic. With fulsome bravado, Houdini issued a challenge to all magicians: Show me any trick three times in a row and I’ll tell you how you did it. At the Great Northern Hotel in Chicago in 1922, a gifted magician, Dai Vernon, met the challenge by demonstrating his version of the ambitious card routine. Vernon, known as the “Professor,” was more than a match for Houdini. He was one of the best sleight of hand artists who ever lived.

Vernon asked Houdini to choose a card and sign it, in ink, with his initials. The card went into the middle of the deck. Vernon snapped his fingers. Houdini’s card was on top.

Houdini was stumped. “You must have a duplicate card.”

“With your initials, Harry?” asked Vernon.

Vernon repeated the trick three times, using a different method each time. Houdini was incensed. He couldn’t figure out how it was done. Vernon did the trick four more times. Still Houdini was fooled—though he never admitted it publicly.

Sleight of hand magic, when done well, is miraculous to behold. (The word “sleight” comes from Old Norse and means cleverness, cunning, slyness.) It is usually performed close-up, within a few feet of a spectator. There are hundreds of different sleights. Some involve misdirecting your attention (we’ll get to those in chapter 4). O

The basis of the trick is 'the double lift', probably the most basic and most central sleight in the magician’s repertoire—and a key feature of Ambitious Card routines. The trick is to turn over two cards on the top of the deck while making it look as if you are flipping only one. It’s that simple. But when it is used at the right time in concert with other types of misdirection, it is utterly astonishing. Dai Vernon was a master of the double lift. Say your card is the ace of clubs. The magician fans the cards and you put the ace in the deck. As he closes the fan, he puts one card on top of the ace and surreptitiously marks the spot, called a break, with his pinky finger. He makes a quick cut of the cards so that the ace is now the second card from the top. Then comes the double lift. He lifts two cards so that the ace is faceup, on top. It is the ambitious card.
The magician smiles and says, “Yes, it is an ambitious card.” He double flips the cards facedown once again and then takes the top card (which you think is the ace but of course it is not) and puts it in the middle of the deck. He snaps his fingers and turns over the top card, which is—the ace! It is surely ambitious, and you are dumbfounded.

Magicians train for thousands of hours to double-lift without revealing that they are “handling” the cards. They must train their fingers to deftly lift two cards while convincing you that they are lifting only one. This involves various maneuvers such as putting a small crimp in the two cards so that when they are facedown the magician can feel them as one. When the cards are flipped, the crimp is released and the cards lie flat. In mastering this sleight, magicians must be able to make the moves without paying attention to what they are doing.

So how does the double lift fool you each and every time? Why can’t your visual system track the cards correctly? It has to do with your center of vision. If you were going to detect two cards pressed firmly together moving as a unit, you would have to put your eyes inches in front of the magician’s hands and stare at the cards as if under a magnifying glass. Even then you might miss the sleight of hand.

The reason for this is that your visual system has very poor resolution except at the very center of your gaze. The cards are so thin that your vision is not up to the task of distinguishing them, especially in the hands of a skilled card sharp. Your center of gaze is called the macula—the region near the center of your retinas packed with photoreceptors. It, along with the fovea (the very center of the macula and the part with the very highest resolution), is responsible for high-acuity vision. It’s a piece of your anatomy that is so specialized it has its own set of diseases, including age-related macular degeneration. In fact, macular degeneration is the most common form of blindness in older people, as maculas slowly die over the course of a few years. Without maculas, you can see only with your peripheral vision, which has very low resolution. You navigate by seeing the world in terms of what appears off to the sides of your head.

In this sleight of mind—captured on rare film footage in the 1950s—Vernon asks you to choose a card and sign it. He takes the card and clearly sticks it into another way to do the Ambitious Card routine called the Vernon Depth Illusion (also known as the Marlo Tilt because the two magicians developed it independently). Long after Houdini died, Vernon continued to refine the trick with diabolical insight into visual processing.
the middle of the deck, slowly and purposefully, so there can be no mistake that it's your card. Then he flips the top card of the deck, and voilà!—it’s your signed card.

Here is how he did it.

After Vernon receives your card, he twists it slightly and sticks it partway into the center of the deck from the back. The twist ensures that the card does not enter the deck. Instead, it forces others cards to protrude where you are looking—at the front of the deck about halfway down. These pushed-out cards reinforce the idea that Vernon is really planning on pushing your card into the center of the deck. But it’s a ruse. While resquaring the deck (pushing the cards back in), as if to fix his mistake, Vernon tilts the back of the top card of the deck slightly upward. From the perspective of where you are standing, you cannot see the tilt, though there is now a gap of almost a centimeter between the top card and the next card down, as seen from the back of the deck.

Vernon then takes your signed card and slips it into the deck at the bottom of the unseen gap. From your vantage point it looks like it is going into the middle of the deck, but in fact it is now the second card down. You don’t notice this discrepancy for two reasons. First, from your perspective, you can’t see the tilt of the top card. It never occurs to you that he could be sliding your card into the second-card-down position, directly under the top card.

Second, your visual system convinces you that your card is much farther down than the second position. It looks to be in the middle of the deck, in approximately the same position as when Vernon first “accidentally” pushed out the cards with the twisted card. You saw other cards pushed out as it was “inserted.” But did you really see it go in?

The magician can push the card into the middle of the deck or just under a tilted top card. Either way, the card looks like it’s going into the middle of the deck from the vantage point of the spectator (left column). (Drawn by Jorge Otero-Millan)

Obviously not, but your visual system also tells you that your card is now occluded by the top of the deck. Your angle of perspective tells you that your card is being inserted. And your three-dimensional vision tells you that your card must be in the middle of the deck—about twenty-five cards down from the top.
card. Of course this logic is all wrong when the back of the top card is tilted up during the second insertion attempt. Afterward, a very innocent motion of Vernon’s hand allows the tilted card to drop, and the gap is now closed. Your signed card is now in perfect position to be revealed by a double lift. Vernon tells you that your ambitious card has risen to the top, and there it is. Then he compounds your sense of awe by saying, “Let me show that to you again.” He double-lifts the two faceup cards back down, and then he removes the top card (which is not your signed card, though you think it is) and actually puts it into the middle of deck. And you know the rest. Your signed card is now on top.

Two normal depth perception cues—occlusion and perspective—have conspired to fool you. These processes are automatic and occur without your being aware of them, which is why the trick works. Remember we said your brain constructs reality? In this case, your visual system is telling you what is “real,” but it is a hapless victim in the hands of a skilled magician.

Occlusion refers to the fact that if one person is partly hiding behind another person, you naturally assume that the person who is not occluded is closer to you. The same goes for playing cards. This is a logical deduction made by your brain, done automatically and virtually instantaneously, without conscious thought.

Again, Vernon fools your visual system. Because you “see” your card being inserted into the middle of the deck, well then, the other cards must be on top. They are occluding your card, which must be fairly far down the deck.

Nobody knows where occlusion is computed in the brain, but it presumably happens high enough in your visual system that the relevant neurons encode individual shapes. Neurons that become active early in your visual pathway detect only small features of the world—edges, corners, curves. To put together an entire shape and see an object of interest (a person, a card), you need shape-selective neurons that combine the outputs from early feature detectors. Following this logic, you need an even later level of computation that can determine that a neuron’s favorite shape is being occluded. In this way, your visual system builds your depth perception like an automobile assembly line, one piece at a time, until you end up with a percept rich in depth.

Also, Vernon is hacking into your brain’s drive to understand the world in perspective. Linear perspective rests on the fact that parallel lines, such as those in a railroad track, appear to converge in the distance (the Leaning Tower illusion in chapter 3 is based on this phenomenon). Your visual system interprets convergence as depth because it assumes parallel lines will remain parallel.
In Vernon’s card trick, size perspective comes into play. If two similar objects appear different in size, your visual system assumes the smaller one is more distant. Here, the signed card is slightly smaller on your retina, which means it must be farther away. It must be going into the middle of the deck, based on all the other clues you are seeing.

Mentalists have been duplicating hidden drawings for years. A person draws something on a piece of paper and hides it, and the magician reveals what is on the drawing. Sometimes the magician turns his back and covers his eyes while the drawing is made. Randi wonders, “Why cover your eyes with your back turned?” He demonstrates. A small mirror concealed in the palm of his hand as it covers his eyes shows exactly what the person is drawing.

Hillis once showed a magic trick to Richard Feynman, the Caltech physicist widely regarded as one of the most brilliant people who ever lived. “I’d do the trick and challenge him to figure it out. He’d go off for a day or two, think it through, and come back with the correct answer,” says Hillis. “Then I would repeat the trick using an entirely different method. And it drove him crazy. He never got the meta principle that I changed methods. This may be because of how scientists are trained to use the scientific method. You keep doing experiments until you find the answer. Nature is reliable. The idea that someone would switch methods just flummoxed him.”

Spoon bending can be done many ways. Here is how Tony taught us.

He starts with three spoons and has someone pick one and examine it. He asks that person to put the spoon to his forehead—Tony demonstrates by putting a spoon to his own forehead—and tells the spectator to report when it starts feeling warm.

As Tony brings his spoon down from his little demonstration—while everyone’s attention is focused on the poor sucker holding a spoon to his forehead—Tony simultaneously bends both of his spoons ninety degrees at the neck.

This is the essence of spoon bending. The spoons are bent before the illusion is created. Magicians call it ratcheting. He bends the first one in his right hand with his thumb while holding the stem of the spoon in his fist. He simultaneously bends the second spoon at the neck by pushing the bowl against the inside of his inner right wrist. The maneuver is very clean and natural. It’s meant to look as
though he is merely bringing the spoons together into his right hand. In any case, everybody’s attention is on the guy holding the spoon to his head. Meanwhile, Tony quickly transfers the now bent left-hand spoon into

his right hand. He holds the two spoons between his right thumb and forefinger so that the bends of the two spoons touch each other knee to knee. It appears that he is holding two unbent spoons that are crossed at their necks.

Tony then shakes the spoons and “lets them wilt.” It looks as if the spoons become soft and floppy and the necks slowly bend. Actually, he is allowing the bent spoons to turn slowly between his fingers so that the bends are in the same direction, and the bowls eventually hang down. While the spoons are bending, Tony takes a brief break and retrieves the third spoon from the spectator with his free hand. He redirects everyone’s attention back to the bending spoons by saying that he is concentrating on them. His mind is bending them. Meanwhile, he surreptitiously bends the third spoon against his leg and then holds it so that only the stem is visible.

When the two “wilting” spoons are completely bent, Tony hands them back to the assisting spectator and says, “Now let’s try that again.” He holds the third spoon in both hands so that the stem is pointed vertically from behind his two interleaved hands. Neither the bowl of the spoon nor the now extant ninety-degree bend in its neck is visible. The audience assumes the spoon is still straight, since the spectator just inspected it.

The principle of good continuation helps you see the spoons are crossing when they are held by the magician, despite the fact that they are actually bent.

MHR if you hold two spoons bent at 90 degrees to their own handles, so that your finger-tips cover the bend, people will 'see' two straight spoons that form an 'X' i.e cross each other just below the bowl of the spoon...as they expect that ... didn't notice you bending each spoon in your palm...so now you are ALREADY holding two spoons bent at 90 degrees to their handles...

Tony begins to concentrate on the third spoon, and slowly, excruciatingly, without his applying any perceptible pressure, the stem of the spoon folds until its
neck is bent toward him at a ninety-degree angle. Tony hands the bent spoon to the spectator, the audience applauds, and the routine is over.

A few critical psychological concepts help fool you into thinking the spoons must be straight when in fact they are already bent. The first is what visual scientists call amodal completion—the process by which an object that is occluded by a second object appears whole to you, even though it's occluded. such as a parked 'whole' car, even though you can only see the boot..you assume the rest of the car is there, so in your head you 'perceive' an entire car...but it could just be the boot of a car, like at some themed restaurants...

Tony took advantage of amodal completion when he pinched the two bent spoons between his thumb and forefingers. Because the stem from spoon number one lined up with the bowl of spoon number two, and vice versa, each spoon looked straight; amodal completion inappropriately completed both objects behind Tony’s fingers. Tony explains that this process obeys the law of “good continuation,” first codified by the German Gestalt psychologists of the turn of the century

Good continuation is the process by which your brain makes things seem whole based on sparse information. Amodal completion is one example of good continuation, but there are many others. We already mentioned filling in. The world is too large and too complex for you to see every item in it. When you look at a pebble-strewn beach or intricately woven Persian carpet, your brain is not resolving every pebble or every stitch of fabric. You don’t have enough cells in your retina for that. You see a small portion of beach or carpet and fill in the rest. Good continuation is so integral to a plethora of brain mechanisms that Tony thinks it is the most exploited principle in all of magic.

To see how clever your brain is at filling in, try the Ganzfeld procedure. (Ganzfeld is German for “the entire field.”) First, cut a Ping-Pong ball in half. Then tune your radio to static. Lie down, tape a half ball over each eye, and wait. Within minutes you will experience a flood of bizarre sensations. Polar bears cavort with elephants. Your long-deceased uncle comes into view. Whatever. Your brain cannot deal with zero sensory input, so it makes up its own reality. The point here is that your brain is constantly making up its own reality whether it receives actual reality-driven input from your senses or not. In the absence of sensory input, your brain’s own world making machinations keep on truckin’ nevertheless. That’s why solitary confinement is considered a punishment in our prison system. You might think that solitary confinement would be a relief from the dangers and unpleasantnesses of prison life. But it is just about the worst
thing that you can do to prisoners, because they lose touch with reality. Many consider the practice a form of torture, and volumes have been written on the negative psychological effects of solitary confinement. Prisoners eventually report having hallucinations and other types of psychotic reactions. That is, they begin to believe the illusions.

Prisoners eventually report having hallucinations and other types of psychotic reactions. That is, they begin to believe the illusions.

specializes in edges and another that specializes in the ends of lines. To detect the edge of a line, you rely on neurons in your primary visual cortex. To localize the ends of a line, however, you call on endstopped cells that are tuned to respond to the ends of long contours.

Some orientation and endstopped neurons respond especially well to moving stimuli, such as the stem of a shaking spoon. But the timing of their responses is
different. Your brain perceives the orientation of lines faster than the ends of lines. Thus the stem of a shaking spoon appears to move before the ends move—giving rise to the illusion that the spoon is bending.

The Secret of the Bending Spoon

Two normal depth perception cues: You may be surprised to learn that the depth perception your brain creates by comparing the images in your two eyes (called stereopsis) is an illusion, wholly a construct of your mind. Your left eye and right eye convey slightly different views of the world to your brain. If you close your left and right eyes in rapid succession and look at an object, you will see that the object shifts left to right. With both eyes open, your brain triangulates these two images into a single stereo image, which gives you a sense of depth. This is the principle behind stereo-depth illusions such as in the Magic Eye books. How stereopsis is actually accomplished in the brain remains one of the deepest mysteries of visual neuroscience. We know a bit, but relatively little compared to what we know about how other processes, such as motion perception, are accomplished. We know that the information from each eye remains segregated at the level of your optic nerves. We also know that visual information from your two eyes converges onto the same neurons in your primary visual cortex. This means that certain neurons in this brain region can respond to stimuli from either eye or both eyes. They are binocular. But where in the brain does vision, based on both eyes, come together? Where is the depth of each object in the scene computed? Where do the images fuse into one seamless experience? We know these things must happen. Otherwise we would have double vision instead of depth perception. In our own labs, we have found that the processes used to derive stereoscopic perception must arise several levels above the primary visual cortex in the visual hierarchy. Finding the exact location is an area of active research. Stereopsis contributes to Vernon’s trick, too, because your two eyes see your card pushed into the deck from different angles. Your brain triangulates these two different retinal images to compute the depth of the card within the deck. It’s an illusion, but stereopsis confirms that the card is mid-deck.

CHAPTER SEVEN: THE INDIAN ROPE TRICK: MEMORY ILLUSIONS

st and a photographer, were traveling in India when they saw a street fakir pull a ball of gray twine from under his knee, hold the loose end in his teeth, and toss
the ball toward the sky. The twine unrolled until the other end was out of sight. A small boy, “about six years old,” then climbed the twine. When the lad was thirty or forty feet in the air, he vanished. Kapoof. This happened outside in daylight; no hidden wires or supporting gizmos could be concealed from view. The artist sketched the event. The photographer took snapshots. But when the photos were developed, they revealed no twine, no boy. There was only the fakir seated on the ground. The anonymous author proffered an explanation: the fakir had mass hypnotized the entire crowd, but he could not hypnotize the camera. It was a hoax. The trick is impossible. It does not exist nor has it ever existed. Historians of magic say it is fitting that the author of the article was John Elbert Wilke, a gifted liar who later became the first director of the United States Secret Service, famous for his skulduggery and Machiavellian scheming. He wrote the story simply to increase the newspaper’s circulation. MHR or to test myth making and public opinion manipulation? How to cultivate a myth like 911, the holocaust etc?

misinformation effect—that is, the tendency for misleading information presented after the event to reduce one’s memory accuracy for the original event. In Johnny’s case, a confidently delivered, coherent-sounding story is much easier to remember than a quick series of subtle movements and visual impressions. In this way, Johnny effectively removed the possibility that the audience, or even Dan himself, could reconstruct the trick and work it out after the fact.

what you are NOT aware of, and the misrepresentation by the author of what actually happened, prevents us 'seeing' the trick e.g magician acts like has written down 'result' in just one card in one wallet...maybe has 10 wallets in his coat...has NOT shuffled deck, has 'stacked' the deck and memorised the card order...but claims after shuffled...etc...A stacked deck is one in which the magician has carefully placed every card in a predetermined order and then memorized the order. When the deck is cut, the position of only two cards has changed; the rest of the order is preserved.

In 2007, then presidential candidate Hillary Clinton made headlines when she recounted an episode of flying into a United States military base in Bosnia in 1996. “I remember landing under sniper fire,” she said. “There was supposed to be some kind of greeting ceremony at the airport, but instead we just ran with our heads down to get into the vehicles to get to our base.” Then CBS news aired a video clip from the trip. There was no sniper fire. There was no greeting ceremony. The first lady and daughter Chelsea were seen strolling along, shaking
hands, chatting and smiling. Many people had a good laugh at her expense...but author claims it was a case of false memory constructed out of mixed up real memories...??? yeh, and moonlanding real etc

one woman, under hypnosis, became convinced that she had memories of being in a satanic cult, of eating babies, of being raped, of having sex with animals, and of being forced to watch the murder of her eight-year-old friend. After later talking with other therapists and realizing that her doctor had manipulated her memory, she sued the psychiatrist for malpractice and won a large monetary settlement. MHR or were 'false memories' invented to cover an increasing number of such reports i.e break down of CIA etc conditioning programs...???

misinformation effect. In one example, participants viewed a simulated automobile accident at an intersection with a stop sign. After the viewing, half the people were given the suggestion that the traffic sign was a yield sign. When asked later what kind of traffic sign they remembered seeing at the intersection, those who had been given the suggestion tended to claim that they had seen a yield sign. Those who had not received the phony information were much more accurate in their recollection of the traffic sign

Misinformation can change your recollections in predictable and sometimes very powerful ways. You construct a false memory by combining an actual memory with the content of suggestions received from others. During this process, you forget the source of the information. This is a classic example of source confusion...yeh, but only about satanic cults with famous people right? NEVER about 'holocaust survivor' 'eyewitnesses' etc !!! or 911 'the first plane (suggested by 'the second plane/missile!)' !!!

MHR I knew the CIA sponsored this book...Karim Nader demonstrated that each time a memory is used, it has to be re-stored as a new memory in order to be accessed later. The old memory is either gone or inaccessible. Thus your memory about something is only as good as your last memory about it. This is why people who witness crimes testify about what they read in the paper rather than what they witnessed.

millions of other people recal seeing, on September 11, 2001, television footage of the first plane crashing into the north tower of the World Trade Center. But the footage of the first collision aired for the first time the day after the attacks. A
2003 study found that a staggering 73 percent of college students tested similarly misremembered the event.

MHR good info...so NO_ONE saw any 'first plane'....it took them one day to add it to the previous days footage...now certainly IF there HAD of been a 'first plane', they certainly would have had this footage on the day... N>B how even this book just misses the entire point...'first plane' doesn't exist...never was...only 'planted' suggestion implicit in 'second plane / missile' ... TELEVISION footage...it took a whole day to air it??????

now here they literally explain what I am saying about 'suggesting' a memory ... LITERALLY as a magic trick...if you don't believe ME...“One of the lovely things about being a magician,” he says, “is that you realize words have strong consequences. And this trick is the perfect example of how a magician can use language to create an effect that was not really there in the first place.” Tony asks the audience to think about semantics, ambiguity, and how a sentence can have two different meanings based on context. Consider these two sentences: I asked him to think of a card. I showed him a card and asked him to keep thinking of it. They describe the same outcome, except the first sentence implies more freedom, says Tony.

When Tony brought Hector to the front of the group, he used the first sentence to describe what happened. He implanted that lie in everyone’s memory. For Hector, who was there for the original event, the misinformation induced a source confusion. He would later remember that he himself chose the card freely. But, in fact, Tony had a different, earlier interaction with Hector. He had fanned a deck of cards and told Hector to stop when he felt the urge to choose one. Once Hector chose a card, Tony told him to keep thinking of it during the lecture. But, as you may suspect, Hector did not freely choose the card. Tony forced the jack of spades. We’ll get to forcing techniques in the next chapter. For now, keep in mind that Hector was set up.

Next up, Esther. Consider two sentences: I handed her a deck of cards and asked her to remove one and put it in her right pocket, and to put the rest of the deck in her left pocket. Or, I asked her to pick a card and put it in her pocket. Again, the first sentence implies a lot more freedom—she has control of the cards—but, says Tony, that is not what happened. He fanned the cards and asked her to select one but, again, her choice was not free. Once again, he forced the jack of spades on her. She was set up, too.

“This is a lame trick,” confesses Tony, “but by just using language, it is amplified into a miracle. Hector and Esther each have a false memory simply because of the words I used. By assimilating their memories to match my words,
they helped lead the audience straight into a memory illusion and the experience of magic.” MHR but of course people are highly selective in applying their 'knowledge'...quick to laugh at others, and totally miss point self, in daily life...and no-one asks WHY it took an entire day to get that 'footage' on air? and to be honest, I am YET To see THAT footage referred to...I bet it doesn't exist...that THIS IS CIA doing exactly what they are talking about right at this point in the book !!!In 1975 an Australian eyewitness expert, Donald Thompson, appeared on a live TV discussion about the unreliability of eyewitness memory. He was later arrested, placed in a lineup, and identified by a victim as the man who had raped her. The police charged Thompson even though the rape had occurred during the time he was on TV. They dismissed his alibi that he was in plain view of a large audience and in the company of other guests on the show, including an assistant commissioner of police. The policeman taking his statement sneered, “Yes, I suppose you’ve got Jesus Christ, and the Queen of England, too.” Eventually, the investigators discovered that the rapist had attacked the woman as she was watching TV—the very program on which Thompson had appeared. The woman had confused the rapist’s face with the face she had seen on TV. Thompson was cleared MHR AND IF YOU STILL NEED EVEN MORE IRONIC PROOF OF WHAT I HAVE BEEN ARGUING FOR YEARS...the earliest childhood memory of Jean Piaget, the famous child psychologist, was of nearly being kidnapped when he was two years old. He remembered details—being strapped into his pram, watching his nurse defend herself against the kidnapper, scratches on the nurse’s face, and a police officer with a short cloak and white baton chasing the kidnapper away. But it never happened. Thirteen years after the alleged kidnapping attempt, Piaget’s former nurse confessed that she had made the whole thing up. Piaget eventually realized that his strong visual memories of the episode were fabricated, based on having heard the story told many times by his family...MHR SO PEOPLE ACTUALLY ‘REMEMBER’ A ‘FIRST PLANE’ WHEN THEIR WASN’T ONE...CONFUSING THAT MISSILE WITH A PLANE IS MORE FORGivable, BUT STILL, THE EYEwITNESSES CLEARLY DESCRIBE IT AS NO A PASSENGER PLANE ETC, AND WE HAVE THE FOOTAGE, AND ENGINE...SO REALLY ZERO EXCUSES FOLKS...

Magicians plant false memories in many tricks. One notable example is the twisting arm illusion. The magician places his palm on a flat surface and begins twisting it in an impossible 360-degree arc. Then he gives it a second spin. The trick is based on the fact that the magician has twisted his entire arm under his long coat sleeve, which no one can see. After the first revolution, the magician asks the spectator to do the same. During this effort, he resets his arm for one more revolution. The audience never remembers the magician removing his arm from the table because they are so wrapped up in the illusion. They remember
that his palm spun around twice without lifting from the table, a case of misdirection plus false memory.

Memory illusions stem from your need to make sense of the world. If you see a bunch of oranges on the floor and then a picture of a probable cause such as someone reaching for an orange on the bottom of a big pyramid of oranges, you are likely to remember seeing the person grabbing the bottom orange even when you did not. You imagine the event and fill in the details as needed. You can remember events differently from the way they occurred or even remember events that never took place at all.

an easy trick that served to boost human memory capacity immensely. “All I did was to associate each number-object pair with an imagined caricature of each object. But the real trick is that I have a list of standard objects that I use to represent each number. It’s based on similar-sounding objects, or number homonyms. For example, the number one sounds like ‘wand,’ so when I make the association between the object and the number, I’m really associating a wand with the chosen object. In this case I burned the image of a tennis ball holding a wand into my memory. Then when the time comes to recite the list, I take each number in turn (backward or forward), recall the associated number-homonym that I always use for that number, and then use that to jog my memory as to the associated object from Susana’s list. To delete an item from the list, I imagine each object-number pair being destroyed graphically as Susana crosses it from her list. In the case of the wand-wielding tennis ball, I imagined the pair on fire and then the tennis ball exploding from the internal pressure. I did this for each of the deletions, and then when I went through the entire list in my normal fashion, it was easy to see which numbers had been deleted because I had destroyed them in various ways in my imagination.”

Apollo used what is called a peg system, a form of linking any number of items to a particular digit. Numbers or digits are represented by a word—wand for one, hive for five, hen for ten, and so forth. Then you associate your number word to a vivid visual image. The linking elements are more easily remembered if they interact, are unusual, and tap into your emotions, making you laugh, feel disgust, or perhaps sense danger. Your imagination is what drives the power of the associations. You can also link items without using numbers by associating each word to the next one on your list. For Susana’s list, you could think of a giant polka dot tennis ball ricocheting off a roulette wheel and the roulette wheel serving as the steering wheel on the bus, and so on.
These memory systems work because your brain’s short-term memory, without some form of assistance, is capable of remembering only seven units (plus or minus two) of anything at a time. After seven items, you begin to forget so as to make room for new items. Or you “chunk” items, as when you remember the seven digits of a phone number (prefix plus four) and an area code. A line of poetry that contains more than around seven beats needs to be broken into two lines.

Another mnemonic strategy called the method of loci (the plural of locus, which means location, or place), also known as the memory palace, has been around for centuries. It’s based on the assumption that you can best remember places that you are familiar with, so if you can link something you need to remember with a place that you know very well, the location will serve as a clue that will help you to remember.

According to Cicero, the Roman philosopher, the method was developed around 500 BC by Simonides of Ceos, a Greek poet who was the only survivor of a banquet hall collapse in Thessaly (he had stepped outside). He was able to identify the dead, who were crushed beyond recognition, by remembering their faces based on that day’s seating arrangement. Simonides soon realized that he could remember any number of items by setting up walking routes in his mind’s eye and visualizing items at various spots along the way. When it came time to remember, he simply retraced the familiar route and easily recalled each item. Unlike linking, loci involves placing a strong visual representation of each item in a geographical space. The nice thing about the method is that, if you forget an item, you can keep “walking in your mind’s eye” through the space and pick up the next thing to be remembered.

The method was taken to China in 1583 by an Italian Jesuit priest, Matteo Ricci, who hoped to spread Catholicism but first had to demonstrate the “superiority” of Western culture. Ricci did so by teaching the method of loci to young Confucian scholars who had to learn countless laws and rituals by heart.

You can try this yourself. Make a list of items you want to memorize, perhaps a shopping list—ice cream, bread, cat food, mayo, chicken breasts, and so on. Now imagine walking through your house or apartment. Start at the front door and make your way through several rooms. (If you live in a one-room apartment, divide the space into distinct areas.) In your imagination, place each item on your shopping list at a single location along your route. Your front door is smeared with Cherry Garcia ice cream. Your living room couch is now a loaf of French bread. The door to your kitchen is shaped like a cat. Your dining room table has dissolved into a mass of mayo. Your bathroom floor is tiled with chicken breasts.

When you want to remember your shopping list, all you have to do is visualize your front door. You will instantly see the ice cream. As you enter the living
room, the French bread will come to mind, and so on. Memory experts say you should make the images as weird and outrageous as possible.

You can also place more than one item in any location. If you have a list of forty grocery items to remember, you could place four items at each of ten locations. Each of these four items should interact at its location. As you open your front door, a gob of Cherry Garcia melts in a loaf of French bread with mayo icing and Meow Mix topping.

The three-time winner of the World Memory Championship, Andi Bell, can memorize ten randomly shuffled decks of cards in the time it takes him to scroll through them. That’s five hundred and twenty cards. Then he can answer any question: What is the thirteenth card in the fourth deck? What is the twenty-second card in the eighth deck? and so on. He never misses a card. Bell’s memory palace is a walk around London with specific landmarks. The route and the landmarks—streets, buildings, doorways, traffic lights, mailboxes, and the like—never change. They are fixed in his imagination. Each card has an icon. The jack of clubs is a bear. The nine of diamonds is a saw. The three of clubs is a pineapple, and so on for all fifty-two cards. To memorize a random deck of cards, Bell places an icon at each landmark along the route in his mind’s eye. Then he can easily reconstruct the order of the cards by visualizing each icon as he walks through his memory palace.

In an article for Slate magazine, the journalist Joshua Foer describes how he entered the USA Memory Championship just to see how he could do. He says competitors insist they are not naturally gifted. They just use mnemonic techniques to help them recall three-hundred-digit binary numbers and to match hundreds of faces with names in twenty minutes.

A stacked deck, as the name implies, is simply a deck with the cards set up in a predetermined order. It is never shuffled honestly, so that the magician, knowing the position of one card, can always calculate the position of every other card. To memorize a stacked deck, a magician starts with randomly shuffled cards. If you examined them, you would not see anything suspicious. Then the magician creates a personal memory palace to remember the exact order in this particular deck. From then on, he does not shuffle them. He only pretends to mix the cards using a variety of so-called false shuffles. By peeking at the bottom card of the deck as he carries out tricks, the magician can always know the exact order of all the cards by invoking his memory palace.

Stacked decks can also be cyclical and, once you see how they are put together, diabolical. One of the most famous is the Si Stebbins stacking system, originally published around 1898 by William Coffrin, alias Si Stebbins, in a booklet titled
Si Stebbins’ Card Tricks and the Way He Performs Them. To create a Si Stebbins stack, you first organize each playing suit in order. Take all the spades and place them ace, two, three, and so on up to king. Do the same with the diamonds, hearts, and clubs. Then lay these four mini-stacks side by side in the following order: clubs, hearts, spades, diamonds. The mnemonic for this is CHaSeD. Now for the stacking. In the stack of clubs, put the ace on top. In the stack of hearts, put the ace, two, three, and four on top. For spades, put the ace through the seven on top. For diamonds, put the ace through the ten on top. Then make a full stack by piling the little stacks of clubs, hearts, spades, and diamonds. You now have a stacked deck. You can cut the cards any number of times, and by looking at the bottom card you can always know the card on top. How? By counting. The stacking results in the fact that every card is three values higher than the preceding card.

Some corporate magicians use amazing memory feats to appear to read minds. For example, when they receive a list of people attending a seminar at a given company, they can Google the names to find a subset with photos posted online. Then they memorize the face and name of each one along with any personal information they can gather. (Before Google, such magicians could look up people in newspaper archives at the library, or even send accomplices to discover information at the company office.) The amount of data collected can be quite large. During the corporate seminar, the illusionist can then claim mentalist powers and “read the minds” of various people by providing their names, work and home addresses, office and home phone numbers, children’s names, pets’ names, genealogical information, etc. The goal is to provide so much detailed information that it seems impossible that the magician could know it all in advance, and that the only solution must be that he’s reading the mind of the client in real time. In the world of magic, such subterfuge is called a hot reading. But the real feat is that the magician did indeed remember all that information, and was able to conjure it as if by magic during the seminar.

at the Magic Olympics in Beijing. Juan Tamariz, the famous Spanish magician, called a volunteer from the audience and, after much joking, prompted him to “pick a card, any card.” The deck looked normal, but it really contained only six cards—the three of hearts, the nine of clubs, the seven of clubs, the jack of diamonds, the two of spades, and the ace of hearts—repeated in order over and over. Tamariz fanned the cards in front of the volunteer and noted the exact position of the card that was selected. By counting down the line of cards, Tamariz was able to identify and then surreptitiously lift an identical card from the stacked deck. While the magician did not know the identity of the chosen
card, he now had an exact copy of it in his possession and was able to produce it, as if by magic, at the end of the trick.

Tamariz began his trick with an incredibly corny routine. He announced he would teach us some comedy. Pacing the stage and wringing his hands, he asked everyone in the audience to touch their two index fingers together, making a horizontal line in front of their eyes, and then stare into the distance. “You see?” he said. “You’ve created a magic sausage floating in front of your eyes. And if you’re really hungry, you can use six fingers to make three sausages.”

The magicians in the enormous lecture hall were stumped. What was Tamariz talking about? Sausages? Fingers? Just then, Tamariz jumped into the audience and corrected the finger position of a guy in the front row. “You’re doing it all wrong!” he screamed. Then he praised the man in the next seat over. “That’s perfect! It’s so good you can slice them up and share.” With that, Tamariz did a karate chop in the air, through the perfect finger sausages, and produced a string of three large kielbasa.

Um, what was that all about? The magicians squirmed with concern. Poor old Tamariz, he must be losing his touch. Of course, the sexagenarian began prancing again and pulled off several gorgeous tricks flawlessly. Everyone forgot the sausage nonsense.

About forty-five minutes later, Tamariz invited a woman onto the stage and had her count out ten cards. He had her place a rubber band around them, carry them to a table across the stage, and return to his side. Next he invited a man to step up onto the stage next to the banded cards. The two volunteers were a good fifteen feet apart, and Tamariz never left the woman’s side. Tamariz asked her to count out another ten cards onto a table and then hold them in her two hands. With much fanfare he proclaimed he would make some of the cards teleport across the stage. Once he was done, there should be thirteen cards in a stack on the other side of the stage. Tamariz magically waved his hands toward the woman and asked her to give him the cards so he could count them for all to see. Only nine cards remained. One was missing. He handed her the cards again and repeated the magical wave. Now he recounted, and two cards were missing. A third time…three cards were missing. “Let’s see how I’m doing,” he said, and asked the man to count out the cards next to him. The man did and said, softly, “Um, there are ten cards here.”

Tamariz pretended to be crushed. “Ten? You only have ten? Are you sure? Could you count them again?” Yes, only ten and not thirteen. Tamariz was deep in thought. “Ummm, could you check your left pocket?” Nothing was there. “Your, umm, right pocket?” Nada. People started shifting in their seats.
Everybody wanted to disappear. “Could you check your inside left breast jacket pocket?” Tamariz said. Still nothing.

Dejectedly, Tamariz said, “And your inner right jacket pocket?” The man’s left hand entered his right inner jacket pocket and he looked up suddenly in surprise. He stopped cold. Hackles rose on one thousand necks. Slowly, the man removed his hand from the pocket. In it were three cards.

“Three cards!” screamed Tamariz. “Three cards! It’s a miracle!” Only you know it isn’t. He planted the cards on this guy during the sausage trick, now a long-forgotten ruse. (The onstage volunteer was the same guy that Tamariz corrected right before pulling sausages out of the face of the man on the next seat.) And no one—neither the volunteer nor the world’s best and brightest magicians—remembered that he had had that opportunity an hour earlier. Memory can play tricks on us all.

Successful magicians hijack your brain’s attentional mechanisms without your knowing it—you believe you’ve been paying attention the whole time. No matter what trick they are doing, the real trick is in your head, so secrecy is not as important as many believe.

As we have noted before, magicians are masters of live performance who have spent thousands of hours practicing their art.

The discovery of inattentional blindness and change blindness in recent decades (detailed earlier in chapter 5) has greatly advanced the cognitive sciences. Magicians evidently knew implicitly about these phenomena for centuries, judging from the design of their tricks

mirror neurons. Recall that these are the brain cells that become active when you carry out an action and when you observe another person carry out that same action. When you wave good-bye, mirror neurons in your premotor cortex fire away. When you watch someone else wave good-bye, those same neurons fire, but you don’t move your body. In other words, mirror neurons link action and perception.

Your mirror neuron system gets more active the more expert you are at an observed skill. When pianists listen to someone else’s piano performance, the finger areas in their primary and premotor cortex increase above their baseline
activity. Their mirror neuron systems automatically run the performer’s keystrokes in emulation. The same thing does not happen in the brains of nonmusicians. While they can certainly appreciate the music deeply, their experience is inevitably shallower than the pianist’s in at least one way, because they are not experiencing what it is like to actually produce it.

The same goes for athletics: the better your own skills, the more deeply you understand the skilled performances you witness. For example, when classical ballet dancers and experts at an Afro-Brazilian art form that combines martial arts and dance called capoeira watched video clips of each kind of dance, the dancers’ brains showed distinct patterns. Both disciplines require exact limb positions, choreographed movements, extreme muscle strength, and years of practice. You would think that their mirror neuron activity would be equivalent, yet when ballet dancers observed capoeira movements, their mirror neuron activity was weaker compared to when they watched other ballet dancers—and vice versa. The actions you mirror most vividly are the ones you know best, and you, and your brain’s motor control pathway, empathize with the activity more deeply.

Illusions are not exceptions and they are not necessarily mistakes. They are integral to perception and represent fundamental aspects of your visual and cognitive processing. They are adaptive shortcuts that your brain makes to speed up such processing, or reduce the amount of processing necessary to provide you with the information you need to survive and to thrive, even if the information isn’t technically accurate.

Try this for yourself: look at this page indoors, and then take it outside and look at it under direct sunlight. It’s remarkable in that it’s unremarkable. The page looks exactly the same—black letters on a white background. But how can that be? Depending on the nature of your indoor lighting, there is about one million to twenty million times more light under direct sunlight than indoor light. Outside, there are millions of times more photons reflecting off the black letters than there were off the white paper inside, so why don’t the black letters, when outside, look brighter than white?

Furthermore, the colors of the photons (the distributions of wavelengths) are probably different inside and outside, too. Your visual system can see color and brightness only as a function of the numbers of photons and their wavelengths that fall upon your retinas. Thus the page cannot possibly be “white” both inside and outside.

If the photons inside and outside are so different (and we assure you that they are), why does the page look the same in both environments? The answer is that your visual system massages the visual data with two processes called brightness
constancy and color constancy, so that the page looks the same to you under very different lighting conditions. But this is an illusion, which means the physical reality doesn’t match your perception. In reality, the book has a different physical appearance in each environment, even though you see it as the same.

Visual illusions help you survive in a visually complex world when you exit from the cave. They help you recognize ripe versus unripe fruit in the tree or by firelight. Similarly, cognitive illusions help keep you alive. You make assumptions, confabulate memories, and attend to only one thing at a time, because it’s an efficient way to navigate the world and to find the resources you need. It’s more efficient than the alternative, which is to try to process everything you encounter. Accuracy is usually not needed and it’s difficult to achieve. You’d need a much bigger head to hold a brain large enough to be always accurate, and humans already have enough of a problem with childbirth because of the size of our noggins.

Magicians have tapped into the power of cognitive illusions more effectively than scientists have, though less systematically. The magician’s goal is to misdirect you and create a sense of wonder (though some con artists use these same tricks to steal).

Mac King, who does such a fantastic fake coin toss. He’s so quick you can’t catch him doing it. Mac has shown us how he does it, and it looks almost identical to a real coin toss. He can toss the coin (or fake it) for many repetitions before we’re able to tell a real toss from a fake toss.

The goal of our project will be to determine if known principles of visual processing might enhance the perception of a magic trick.

your visual system has a spotlight of attention. It’s the region of your visual perception in which you enhance everything that occurs. But the principle holds true for hearing, touch, other sensory systems, and even cognitive functions—for everything your brain does. Your spotlight is directed to a region of your cortex and enhances the activity carried out in that region.

But attention exercises another effect in your brain, too. It not only increases the neural signals at the center of your spotlight, it also suppresses the activity in the
surrounding region. In the visual system this can create a so-called center-surround attention focus in your visual field. You see better at the center, while the surrounding items are suppressed.

In your touch system, attention creates a center-surround spotlight on your skin. Apollo Robbins’s tap on your shoulder forces you to pay attention to that particular location, while suppressing the more subtle sensations produced by the removal of your wristwatch a few feet away. And in the cognitive areas of your brain, attention creates a center-surround region in whatever type of space is being computed by that region. You may fixate on a given idea and suppress all others that might compete.

Our research shows that the spotlight affects visual processing from the very first stages of the visual pathway, signifying that it is a very important factor in what you see and don’t see. We believe it also determines what you hear, feel, and are aware of in a magic show, and indeed in the rest of your waking life.

Our studies further show that the harder you try to attend to something, the more you enhance it and the more you suppress surrounding information.

!!!!! CIA SHIT OR WHAT? Christopher Chabris and Daniel Simons in their 2010 book, The Invisible Gorilla, argue that you should rely on deep rational thinking, not your intuitions, to guide your decisions. For example, some parents choose not to vaccinate their children because of their deeply held intuition that vaccinations lead to autism. Chabris and Simons argue that the apparent link is no more than an illusory correlation. Rational examination reveals that there is no causal relationship between vaccinations and autism. ??? FACTS PEOPLE...STATISTICAL FACTS...NOT INTUITION, WHO SPONSORS ALL THESE BOOKS? CIA ALL THE WAY...JEW WORLD ORDER...PRETENDING TO BE OFFERING BOOK ON 'CRITICAL REASONING' ETC WHILE PEDDLING PROPAGANDA / 'RIGHT THOUGHT' ETC...

In terms of its underlying brain mechanism, an intuition may result from weak neural activity in a given brain circuit. The activity is not strong enough to be accessible to your logical mind and drive your rational decision-making processes.

Brain signals can be weak for a number of reasons. The information coming from your sensory or memory systems is sketchy, as in black art, where the
contrast between an object and the background is so low that the object is for all intents and purposes invisible.

Or brain signals may be weak because your attentional mechanisms suppress otherwise strong signals. For example, when Apollo Robbins pulls a quarter out of your breast pocket and moves it elegantly along an arc across your face, you follow it the way a tennis spectator follows the ball. You miss that Apollo simultaneously removes your reading glasses from the same pocket, directly under your nose, even though the image of his stealing hand is falling directly on your retinas.

In this sense, rationality and intuition are two ends of a continuum, with weak (intuitive) signals at one end and strong signals, which can be used to reason with, at the other end. Attention can serve to change the strength of any signal up or down anywhere along this continuum. Thus no decision is purely rational, because even though you see clearly in the center of the spotlight, there is darkness just outside the spotlight. Not only are you influenced by your biases, expectations, and assumptions, but you also actively suppress and ignore critical information. Conversely, the vaguest intuitions and gut feelings usually become accessible to your “rational” mind when you cast your attentional spotlight on them, making them more salient and easier to examine.

A crucial take-home lesson from this journey through neuromagic is that when you are confronted with the uncertainty of a complex decision with lots of variables, you cannot always anticipate what will turn out to be most important factor, because of the suppressive and enhancing effects of your own attention. To overcome this, you must cast your attentional spotlight over each detail of the decision in turn, even if some initially appear insignificant or ephemeral. Reasoning things through is critical, but so is addressing your intuitions, so that your attentional spotlight can focus on each morsel and bring it forward for analysis. Only then will you be able to see the whole picture.

all of magic, every little sleight, is really happening in our minds.
EPILOGUE:

Magicians know that multitasking is myth and so they use a “divide and conquer” approach with attention. They split your attention so you cannot concentrate fully on any part of the stage at a given time.

Magicians know that memory is fallible and that the more time that has elapsed between the acquisition and the recovery of that memory, the less accurate it is
magicians make mistakes all the time, they set them aside and keep moving forward, and the audience hardly ever notices. You should do the same

Magicians use humor and empathy to lower your guard. If you sympathize with a magician, you will enjoy yourself more and be less vigilant about catching the secrets behind his magic. When negotiating interpersonal, professional, or business relationships, do as a magician and disarm with charm

Each spectator is a “telepath.” If you have something to hide from your business partner or spouse or a law enforcement agent, you will do best not to think about it while in their presence, lest your voice, gaze, or posture give you away

Magicians know that attention enhances one small part of the world, while suppressing everything else. MHR you have limited attention / processing power, so if someone gets you to focus on something IN PARTICULAR it will prevent you from 'attending to' what they are trying to misdirect your attention AWAY from...what they are trying to 'hide', or have you NOT notice / perceive...e.g when selling, get client focussed on something you've 'observed' is important to them, so they can't process all the other 'negative' details e.g sports car sex appeal / fun becomes focus, can't process all the negatives e.g impractical, expensive, insurance etc...this is why forcing yourself to write a list of pros and cons lets you sequentially focus your full attention on each item as you go down the list, and consider them each individually and fully. your attentional processes will enhance each particular issue, while suppressing all other information.

MHR our 'drives' and 'emotions' and 'fears' and 'hopes' do this TO us...so we become 'tunnel visioned' e.g do crazy things to get that sex, job, victory, etc...at time totally oblivious to all the 'rational' facts...e.g when really mad / angry / frightened...heroic acts easy as you are unaware of any competing 'facts' or 'impressions' e.g 'save your friend' overrides 'fuck, there are people shooting at me etc...for some reverse...focus on fear cripples all other motives / data...'shit, there are people shooting at me, stay down'... focus on the consequences or risks vs the benefits / desired action...
MHR note my 'spiders' when waking, saw over and over, often ran to turn light on, and looked for...then realised if I moved my eyes, the 'spiders' moved their position, then realised after time that I was seeing some sort of retina residue, or half asleep images, and was constructing what I expected /feared out of them...i.e 'gestalt'...though often HAVE woken up with spiders hanging from ceiling ??? or have I ??? e.g german hostel? ???

Fluorescent pigments seem brighter than standard pigments because they reflect more visible light than they would if they were not fluorescent...Two brothers, Joe and Bob Switzer, invented fluorescent paint and Day-Glo paint in the 1930s. They sneaked into their father’s pharmacy and shone light on different chemicals; some glowed brightly. So they mixed chemicals to develop various kinds of paint that fluoresce under ordinary ultraviolet light.

All celestial bodies, including galaxies, project dots of light smaller than any photoreceptor in your eye. but some celestial bodies are so bright that the extra light they produce reflects off the back of your retina. This reflection in turn excites many more photoreceptors in a larger circular area. The result is that bright stars seem larger

Tamariz uses inattentional blindness: Details can be found in his instructional masterpiece, The Five Points of Magic.

Inattentional blindness while walking and talking on a cell phone,” MHR WHY MULTI-TASKING WHILE DRIVING ETC SO DANGEROUS...YOU JUST DO NOT SEE DANGERS / RISKS / PEDESTRIANS / CYCLISTS / MOTORBIKES / ENTERING TRAFFIC ETC ... The same problem does not happen when you talk to a passenger in your car because both of you will quiet down or stop talking when traffic gets heavy, it starts raining, or you need to make a quick lane change. Your passenger sees what you see whereas the person on the cell phone does not

The British mentalist and magician Derren Brown loves change blindness
perception of certain sounds relies, in part, on being able to feel these sounds. Actually you do mishear people all the time. You figure out the meaning from the context. You may hear “bog” instead of “dog” but the sentence “the boy petted the bog” makes no sense—so you think dog. Moreover, even though you can hear sounds in the absence of airflow, puffs of air might make it easier to distinguish between two words such as “tall” and “doll” when there is a lot of ambient noise.

Your ears can also fool your eyes: L. Shams, Y. Kamitani, and S. Shimojo (2002), “Visual illusion induced by sound,” ... and Sound-biased touch,”

synesthesia...The Man Who Tasted Shapes...Wednesday Is Indigo Blue: Discovering the Brain of Synesthesia...Neuroscientists have identified at least fifty-four varieties of synesthesia...

researchers speculated that oxytocin might intensify social emotions in general, leading to generosity and trust in positive situations and to envy and gloating in competitive scenarios.

To people who don't know about electromagnetism, can do trick..'I can make you as powerless as a baby' to strong man...who can first lift the 'box', then can't, when you turn on the current :D
Magicians are beginning to use in their stage acts perceptual effects originally designed for scientific experiments. Derren Brown and Penn & Teller execute change blindness routines that are firmly rooted in the cognitive sciences. Teller says of the change blindness routine in the Penn & Teller act, “The idea came straight from science. We thought it would be fun to show how bad they are at noticing stuff” (J. Lehrer, “Magic and the brain: Teller reveals the neuroscience of illusion,” Wired.com, April 20, 2009)

Reading books like this one can help you understand why magic is cool intellectually. But learning to do tricks well enough to actually fool someone will take you to another level altogether.

Contrary to the gambler’s fallacy, a roulette number that has occurred more often in the past may be more (rather than less) likely to recur in the future. The reason is that no roulette wheel is perfectly manufactured. Real-life wheels are sometimes slightly biased, and they will have very small tendencies to land more on certain numbers. In the early 1990s, the Pelayos, a family of Spanish gamblers, secretly recorded roulette results for extended periods of time in Spanish, Dutch, and even Las Vegas casinos, and they successfully predicted that some numbers were slightly more likely than others to come up. They quickly amassed a small fortune, and just as quickly were banned from further casino play.

Why authors use ‘consciousness’ and ‘awareness’ as if mean the same thing, when their whole book shows the exact OPPOSITE? you can be 'aware' of something sub-consciously, or non-consciously i.e NOT attending to it consciously, though it is registered, and at any time you COULD turn the narrow beam of your consciousness onto it...like a search light ?

While it is tempting to conclude that we humans have special cognitive skills that other species lack entirely, every time scientists decide that some attribute or capacity distinguishes us from the rest of the animal kingdom, other researchers quickly disprove them. Knacks such as language, tool use, fashion and culture, even dancing are not exclusive to humans but were all considered at one point as defining of and restricted to the human realm. MHR this I love them for noting :D
An early and perhaps apocryphal example of trompe l’oeil, reported by Pliny the Elder, is the legendary competition between two renowned painters in ancient Greece, Zeuxis and Parrhasios. Each artist brought a covered painting to the contest. When Zeuxis unveiled his work, his painted grapes were so realistic that birds flew from the sky to peck at them. Convinced of his victory, Zeuxis tried to uncover Parrhasios’s painting to confirm the superiority of his work. He was defeated, however, because the curtain he tried to pull back was Parrhasios’s painting itself.

Joint attention permeates every social interaction, in sophisticated and often subtle ways. Neuroscientist Sonya Babar and her colleagues found that when we look at somebody’s face, we shift our gaze between the two eyes of our partner, seeking the best eye contact. The eye we settle on at any given time tends to be the mirror image of the eye chosen by our interlocutor. For instance, if we sense that our partner’s eyes are focused on our right eye, we reflexively respond by shifting our gaze to her left eye. This joint shifting of gaze is perceived as proper eye contact. However, if a partner looks at our right eye as we look at her right eye, both of us will usually sense a break in eye contact or lack of attention. Reference: S. Babar et al.

A Google search using the terms “shot” and “mistaken for” produced a host of gunshot victims (over 3 million results), including those mistaken for coyotes, turkeys, monkeys, deer, foxes, and, in the case of one unfortunate snorkeler, a giant rodent.

34

Theory of mind is critical to magic because magicians know you have it and that it is a lever by which to control your mind. It’s the basis of joint attention. Magicians overtly attend to objects and locations of potential interest in order to control your attention, drawing it away from a secret move.

Mentalists use mathematical probabilities, human nature, sleight of hand, gimmicks, and trust to make it appear that they can read your mind. Their acts are highly theatrical, often invoking “mystical” powers of clairvoyance, telekinesis,
telepathy, precognition, divination, and mind control...their illusions are spun from an ability to exploit human gullibility and, as you will see, to carry out brilliantly sneaky, under-handed maneuvers...

Randi looks out into the audience, hand shielding his eyes from the spotlights like a sailor blocking the sun as he peers out to the horizon. “I met a young woman outside before the show who agreed to assist me with this next trick. Could you please stand up?” A young woman stands near the center of audience. Randi introduces her as Zoe.

“Now, before we get started, could you please confirm that we have never met before tonight?”

“Correct,” she says.

“That you are in no way being coerced by me, that you haven’t been paid by me, and that any decision you may make has not been given to you by me?”

“No,” says Zoe.

“When we met in front of the hall tonight you chose a word from a magazine completely at random and of your own free will?”

“Yes.”

“Was that magazine a different copy of this specific magazine, which we chose from the rack of free literature outside this very building?” Randi says, as he pulls a folded free apartment rental guide from the breast pocket of his navy blazer and slowly opens each page to show the audience that there is lots of text.

“Yes.”

“And I asked you, did I not, to open that magazine to any page you wanted having lots of text on it, and to choose any word you liked from that page freely, while I stood with my back to you?”

“Yes. “Okay. You have a piece of paper with that word written on it. Could you please circle that word now, as I try to read your mind?”

“Okay,” she says, and she circles the word on the page.

Then Randi begins to pace. He prowls to stage right and to stage left. The shadow he casts from the spotlight jumps in animation against the pleats of the
red velvet curtain standing a full two stories high behind him. His brow knots severely as he rubs his forehead and temples. He mumbles to himself in a slightly disconcerting but amusing fashion.

Finally, Randi stops in front of an easel holding a large writing pad next to the podium. He uncaps a huge black Sharpie and, with his eyes closed, looking up into the lights, right hand pressing on his eyelids, left arm extended with unsheathed pen ready to strike, he speaks. “I’m starting to get something,” he says as he writes an N on the paper. “It’s all coming now.” He proceeds to receive mental vibrations for eight more characters as well, spelling out the phrase: NI+d3)3P.

Finished, and visibly exhausted from the effort, Randi pulls his hand from his face. He looks at the pad for a long time, totally silent, then turns back to the crowd. The throng starts to fidget as they become embarrassed for the poor old coot.

“Is the magazine written in the English language?” Randi eventually asks, failing to hide the disappointment in his voice.

“Yes,” giggles Zoe, as other nervous laughs arise from the audience. Zoe is still standing, and she is so embarrassed for Randi that when she responds she has to lower the paper she has been using as a mask to hide her face.

“Are you a mathematician?” Randi hopes sadly.

“No,” says Zoe.

“Okay, well, I guess I didn’t get it,” Randi concludes, shoulders and chin slumping. “What was the word?”

“Deception,” says Zoe.

“What? Hmm? I’m sorry, I didn’t hear you,” says the suddenly frail octogenarian, bent over to bring his now cupped ear closer, eyes squinting into the glare.

“Deception!” yells Zoe.

“Hmm. Yes, well…sometimes these things fail,” he says dejectedly. Looking up at the pad one last time, he does a double take and says, excitedly, “Oh, but wait a minute! I think I see what happened!” Now thirty years younger, he positively leaps as he lifts the page from the pad and rips it off. He turns to the crowd with the ripped page and slowly rotates it 180 degrees as he says, “I must have gotten the signal from you upside down and backwards!”
Once the rotation is complete, the page reveals the now legible message: d(P+I.

The crowd roars as Randi receives his standing ovation.

Randi announced during the show that the magazine had been “destroyed,” not discarded. An important modification, to be sure, but not enough of a misstatement that Zoe would complain. For most people, when an object enters a trash can, it ceases to exist and is for all intents and purposes destroyed. But no act is beneath the Amazing Randi. Once Zoe entered the philharmonic hall, Randi did indeed go dumpster diving to recover that ripped magazine. Zoe had torn the relevant page from it, true, but now he knew which page was missing. And because Zoe used Randi’s own specially selected pen to circle the word, a nice hard ballpoint pen, the circling of the word left an impression that was barely discernible on the adjacent page of the magazine. So Randi knew the page and its exact location. To find the word itself, Randi took a second copy of the magazine, ripped out Zoe’s chosen page, put it under the embossed page from Zoe’s magazine, and lined up their corners so that they overlapped perfectly. Randi then poked a hole through the embossed circle, marking the word Zoe chose on the page below. It was, of course, “deception.”

In yet another incredibly devious move, Randi took a third pristine copy of the magazine and ripped out the same page Zoe had ripped out, with the same tear pattern, before putting it in the trash can to replace Zoe’s original. This new copy had never been touched by the pen and so it had no embossed circle in it. If Zoe, or some other person in the audience, reconstructed Randi’s methods and came back to do a little dumpster diving of their own, they would find what looked like Zoe’s original ripped magazine. They would remain mystified.

To further throw off the audience, Randi had Zoe circle the word during the act itself so that if any of the other audience members saw the ripped page during or after the act, they would assume that the circle had been created during the show and not before. (Randi was careful not to mention that the word had been circled before the show.) Randi similarly implied that Zoe had written down the word on a piece of paper rather than saying that she had the page ripped from the magazine, so that people wouldn’t even think of trying to get the evidence and reconstruct the trick.

Randi allowed Zoe to make her word choice in truly free manner, but it was not a secret choice, though it felt like one to everybody, including Zoe. Randi had controlled her every move from the minute he said hello. Then, all he needed to do was figure out how to spell “deception” upside down and backwards. For a master magician like Randi, that little bit was the hardest part of the whole trick.
by two or more. Let’s say you pick 478. You write it down. Step two, the magician asks you to reverse the order of the number and write it down: 874. Third, you are asked to subtract the smaller number from the larger number, in this case 874 - 478 = 396. Fourth, reverse that number to become 693 and add it to 396. Your answer is 1,089.

So far, so good. Now the magician hands you three or four books (or more if he wants to lug them around). You choose one, any one, your free choice. The books look normal, not marked in any way. He says, “Excellent choice! Now turn to page 108 and look at the first line. Count over to the ninth word and hold it in your mind. Got it?” You follow his instructions. The word is “yellow.”

“Concentrate now,” says the magician. “I am going to read your mind. The word is coming into focus, slowly, slowly. I see a, hmm, a color? It starts with, let me see, it starts with a y? Yellow! The word is ‘yellow.’ Am I right?”

Indeed he is. The ninth word at the top of page 108 in the book you picked is “yellow.” He memorized it before the show. He also memorized the ninth word at the top of page 108 in all the other books. If you had chosen any one of them, he would have known the word you’d find.

The 1089 Force is a mathematical trick based on the fact that any three-digit number manipulated in this manner always—always!—adds up to 1,089. The magician simply picks the books and looks up the word he wants you to find. He could, for example, tell you to turn to page 10, count down to the eighth line, and look up the ninth word in that line (1089.) The effect is astounding and always entertaining.

Another mathematical force convinces you that everyone in the room can be made to share the same mental picture. You all are asked to think of a small number and then silently perform the following operations. Double the number. Add 8 to the result. Divide the result by 2. Subtract the original number. Now convert this number into a letter of the alphabet (1=A, 2=B, 3=C, 4=D, and so on). Next, think of the name of a country that starts with this letter. Got it? Now think of an animal whose name starts with the next letter. Finally, think of the color of that animal.

The magician makes a dramatic pause. “Oh, my, your collective image must be wrong. There must be a problem. There are no gray elephants in Denmark.” The trick works because everyone must choose a country that starts with D, and Denmark is the most common. The next letter is e, and most people think of an elephant. And who isn’t going to think of a gray elephant?
People usually make the same choices because when they are asked to stand up and speak in front of hundreds of other people, they tend to say the first thing that comes to mind. Mentalists know that the number of countries starting with D is vanishingly small, and that the likelihood that they’ll pick the Dominican Republic is low unless they are either unusually cool under fire or have some time to consider. Most people then choose “elephant” and not “emu” for the same reasons. They are nervous. They’re scared of looking stupid in front of so many people, and they can’t think clearly enough to come up with something clever.

Mentalists may also use something they call the “one-ahead principle”: to give the impression of reading your mind, they stay one step ahead of you at all times. The coincidences are multiplied in your mind, resulting in the illusory feeling that the only explanation is supernatural ability.

Magic Tony showed us a trick based on this principle. He gave us a deck of cards to shuffle thoroughly and then he spread the deck facedown on a table and announced that he would predict our choices. “First, you will choose the nine of hearts,” he said. We slid a card out of the spread, Tony looked at it, and set it aside.

Without showing it to us, he exclaimed, “Good job! Now I predict you’ll choose the two of clubs.”

We chose another card at random and slid it to him, still facedown. He looked at it and said, “Excellent!”

Tony gathered the remaining cards and shuffled them. “Now you will choose the queen of spades. “Pick any card as I run my thumb down the corner of the deck by saying ‘stop.’” He held the deck in one hand and riffled his thumb down the deck.

About halfway through the deck we said, “Stop.”

Tony removed the card, picked up the other two cards we had chosen, and turned over all three in front of us: the nine of hearts, the two of clubs, and the queen of spades. Wow!

To accomplish this trick, Tony first surreptitiously memorized the card at the bottom of the deck: the nine of hearts. He then spread the cards facedown and asked us to make our choices, announcing that we would choose the nine of hearts.
When we picked the first card, we thought it must be the nine of hearts (after all, this was a trick by a terrific magician) but we could not verify that with our own eyes. In fact, the card was the two of clubs, which Tony saw with his own eyes.

Then Tony announced that for our next card we would choose the two of clubs. (Hmmm, he already had that card on the table but we followed his direction and pulled another card. He saw that it was the queen of spades.)

Tony then collected the remaining cards, did a false shuffle so as to keep the nine of hearts exactly where he wanted it, and asked us to choose a card as he riffled the deck with his thumb. We chose a “random” card in the middle of the deck, but he lifted the cards from where he was keeping the nine of hearts while distracting us from the sleight with eye contact. He removed the nine and laid it out with the other two chosen cards to show that his three predictions were correct. In fact, he had simply “predicted” whatever card had previously been chosen

knows in advance exactly what you will do—what card you’ll choose from a deck, what word you’ll choose from a book, what object you’ll choose from an array of items on a table. He is in complete control. When a mentalist has you in his clutches, your sense of free will is an illusion.

A classic method of forcing is called magician’s choice. You are asked to make a free choice among items but, no matter what you choose, the magician calls the shots by how he verbally responds to your choices...For example, if the magician puts two cards facedown on the table and wants you to choose the one on the right, he will say “Choose either one.” If you choose the one on the right, he goes on with the trick. If you choose the one on the left, he will say, “Good, you keep that card and I’ll use the remaining one.” Thus he forces the card he wants

Forcing works because your brain is on a constant, active lookout for order, pattern, and explanation and has a built-in abhorrence of the random, the patternless, the nonnarrable. In the absence of explicable, you impose it. When you think you are choosing something, but the choice is changed on you or distorted in some way, you nevertheless stick to your guns and justify your “choice.” You confabulate.

Confabulating is a fancy term for shamelessly making things up. It is another of those potent and ubiquitous brain processes that occur all the time but to which you are seldom wise. Normally this process is beneficial. For instance, confabulation is what allows you to “see” people and objects in drawings instead
of the tangle of dark lines that you are actually looking at. It is also what allows you to “see” faces in clouds; it allows your perception to be flexible and creative. But when this sort of pattern imposition goes on at higher levels of cognition, the implications can get a little uncomfortable. Your mind will go to surprising lengths to preserve its sense of agency and choice and continuity of the self. When you are influenced by others, you rationalize their influence as being good decision making on your part.

The breadth and depth of confabulation is revealed following some kinds of brain injury, when the mind’s normal system of checks and balances is perturbed. For example, when the right brain hemisphere is damaged, spectacular delusions can arise about the state of the body. Here is Dr. Anna Berti, a neuroscientist at the University of Turin in Italy, interviewing one her patients, “Carla,” whose paralyzed left arm rests in her lap next to her good right arm.

“Can you raise your right arm?” Yes.” Carla’s arm goes up.

“Can you raise you left arm?”

“Yes.”

The arm remains motionless. Berti tries again.

“Are you raising your left arm?”

“Yes,” says Carla. But still her arm does not move. “Can you clap your hands?”

Carla moves her right hand to the midline of her body and waves it in a clapping motion. The left hand is motionless.

“Are you sure you’re clapping?”

“Yes.”

“But I can’t hear a sound.”

Carla replies, “I never make noise when I do something.”

Insistent denial of paralysis was long thought to be a psychological problem, Berti says. It was a reaction to a stroke: I am paralyzed, it is so horrible, I will deny it.

But it is not a Freudian dilemma. Rather, it is a form of so-called neglect syndrome in which a brain area involved in the mental simulation of movements,
the supplementary motor area, is damaged. When you close your eyes and simply imagine a golf swing or skiing motion, you activate this part of your brain.

When Berti asks Carla to raise her left arm or clap her hands, the region that imagines such movements produces a familiar pattern of activity in her brain. But the regions that carry out those movements and also maintain awareness of making them are not working.

The conflict is overwhelming. Carla’s sense of having moved via simulation is powerful. Awareness is absent. Paralysis is complete. Her brain’s solution: confabulate.

If prodded, patients make up stories to explain their lack of action, Berti says. One woman said her arm “went for a walk.” A man claimed that his motionless arm did not belong to him. When it was placed in his right visual field, he insisted it was not his.

“Whose arm is it?” Berti asked.

“Yours.”

“Are you sure? Look here, I only have two hands.”

The patient replied, “What can I say? You have three wrists. You should have three hands.”

Neuroscientists can also unmask your confabulatory nature in the laboratory. Two young Swedish scientists have developed a new scientific method that uses magic techniques to examine the fascinating way in which confabulation operates in the intact, healthy, ostensibly rational brain.

We are in Benasque, Spain, nestled in the heart of the Pyrenees, at the Pedro Pascual Center for Science, a retreat designed to bring together scientists from every discipline to hash out ideas in hopes of inspiring new interdisciplinary approaches. Miguel Angel, the Spanish magician whom you met in chapter 5, has just completed his demonstration of change blindness. Now up on stage are two neuropsychologists from Sweden, Petter Johansson and Lars Hall, from Lund University. These two twentysomethings are today’s fair-haired boys of cognitive science, and not just because they’re Swedish. They have brought a veritable smorgasbord of methods to the discipline. One especially sweet meatball was featured in an October 7, 2005, article in Science magazine describing the invention of a new and powerful method for studying human cognition, rationalization, and decision making called choice blindness. And they did it using magic...
Forcing is a method used by magicians to make you think you’ve made a free choice when in fact the magician knows in advance exactly what you will do—what card you’ll choose from a deck, what word you’ll choose from a book, what object you’ll choose from an array of items on a table. He is in complete control. When a mentalist has you in his clutches, your sense of free will is an illusion. A classic method of forcing is called **magician’s choice**. You are asked to make a free choice among items but, no matter what you choose, the magician calls the shots by how he verbally responds to your choices.

For example, if the magician puts two cards facedown on the table and wants you to choose the one on the right, he will say “Choose either one.” If you choose the one on the right, he goes on with the trick. If you choose the one on the left, he will say, “Good, you keep that card and I’ll use the remaining one.” Thus he forces the card he wants.

Forcing works because your brain is on a constant, active lookout for order, pattern, and explanation and has a built-in abhorrence of the random, the patternless, the nonnarrable. In the absence of explicability, you impose it. When you think you are choosing something, but the choice is changed on you or distorted in some way, you nevertheless stick to your guns and justify your “choice.” You confabulate.

MHR I detailed the experiments done that confirm this illusion of free choice, and our mind’s tendency to impose order and intention and explain away and confabulate to construct a narrative that can accommodate what would ‘make sense’ given our social reality, and what we’ve just apparent experienced, but which refutes / exposes the social reality for a fraud… and our beliefs for erroneous social condition and faulty assumptions etc…

Confabulating is a fancy term for shamelessly making things up. It is another of those potent and ubiquitous brain processes that occur all the time but to which you are seldom wise. Normally this process is beneficial. For instance, confabulation is what allows you to “see” people and objects in drawings instead of the tangle of dark lines that you are actually looking at.

Your mind will go to surprising lengths to preserve its sense of agency and choice and continuity of the self. When you are influenced by others, you rationalize their influence as being good decision making on your part.

The breadth and depth of confabulation is revealed following some kinds of brain injury, when the mind’s normal system of checks and balances is perturbed. For example, when the right brain hemisphere is damaged, spectacular delusions can arise about the state of the body. Here is Dr. Anna Berti, a neuroscientist at
the University of Turin in Italy, interviewing one her patients, “Carla,” whose paralyzed left arm rests in her lap next to her good right arm.

“Can you raise your right arm?”

“Yes.” Carla’s arm goes up.

“Can you raise you left arm?”

“Yes.”

The arm remains motionless. Berti tries again.

“Are you raising your left arm?”

“Yes,” says Carla. But still her arm does not move. “Can you clap your hands?”

Carla moves her right hand to the midline of her body and waves it in a clapping motion. The left hand is motionless.

“Are you sure you’re clapping?”

“Yes.”

“But I can’t hear a sound.”

Carla replies, “I never make noise when I do something.”

Insistent denial of paralysis was long thought to be a psychological problem, Berti says. It was a reaction to a stroke: I am paralyzed, it is so horrible, I will deny it.

But it is not a Freudian dilemma. Rather, it is a form of so-called neglect syndrome in which a brain area involved in the mental simulation of movements, the supplementary motor area, is damaged. When you close your eyes and simply imagine a golf swing or skiing motion, you activate this part of your brain.

When Berti asks Carla to raise her left arm or clap her hands, the region that imagines such movements produces a familiar pattern of activity in her brain. But the regions that carry out those movements and also maintain awareness of making them are not working.

The conflict is overwhelming. Carla’s sense of having moved via simulation is powerful. Awareness is absent. Paralysis is complete. Her brain’s solution: confabulate
If prodded, patients make up stories to explain their lack of action, Berti says. One woman said her arm “went for a walk.” A man claimed that his motionless arm did not belong to him. When it was placed in his right visual field, he insisted it was not his.

“Whose arm is it?” Berti asked.

“Yours.”

“Are you sure? Look here, I only have two hands.”

The patient replied, “What can I say? You have three wrists. You should have three hands.”

Neuroscientists can also unmask your confabulatory nature in the laboratory. Two young Swedish scientists have developed a new scientific method that uses magic techniques to examine the fascinating way in which confabulation operates in the intact, healthy, ostensibly rational brain.

An October 7, 2005, article in Science magazine describing the invention of a new and powerful method for studying human cognition, rationalization, and decision making called choice blindness.

Introspection illusion. construct a personal narrative that may or may not correspond…

When you are asked to say why you have a particular preference or how you arrived at that preference, your personal self-report of your internal mental processes is confabulated. To put it bluntly, you are unaware of your unawareness

? show two photos of equally attractive women…put down on table, pretend now to push the photo they’d chosen as more attractive across to them, really pushing other photo…ask them why they preferred this woman…most will give an explanation (assuming it was the woman they had preferred, when it is not)…

by using what magicians call Black Art (similar to that of Omar Pasha in chapter 1), but in this case instead of a black curtain they used a black tablecloth and black-backed photos. In order to fool subjects, they asked them to point to the preferred photo and laid it facedown on the table. That photo had a black back. On top of it they had hidden a second photo, this one of the rejected face. That photo had a red back. When it came time to move the photo toward the subject, the scientists slid the red-backed card (rejected face), leaving behind the black-backed card (preferred face), which was now invisible against the tablecloth. The subjects never saw the swap
The swaps were discovered less than a third of the time. On the successfully swapped trials, the subjects actually confabulated their reasons for having chosen the substitute photo.

One man said, “I preferred this one because I prefer blondes,” when in fact he had first chosen a dark-haired woman. One woman chose a woman without earrings, and when the photo was secretly swapped for a woman with earrings, she said she had chosen that one because she liked earrings. Pants on fire! The subjects hadn’t chosen the people whose photos they now held in their hands, but they thought they had. So what do you do when you are made to justify a choice you believe you made? Confabulate. Deny!

In a follow-up experiment, shoppers in a supermarket tasted two kinds of jam and then explained their choice while taking further spoonfuls from the “chosen” pot. The pots were rigged so that the subjects effusively praised jam they had previously rejected. A similar experiment was done with tea.

Currently, the researchers have begun to examine choice blindness for moral and political opinion. Using a new tool, a “magical questionnaire,” they are able to manipulate people’s answers to questions presented in a survey format. Participants are asked to rate to what extent they agreed with a specific moral statement, e.g., “It is morally reprehensible to purchase sexual services even in democratic societies where prostitution is legal and regulated by the government,” and then, at the end of the experiment, they are asked to explain why they agreed or disagreed with the statement. Again, the results show that a majority of the participants are blind to the changes made, and that they often construct elaborate arguments supporting the opposite of their initial position.

These studies help us understand how we rationalize many of our decisions. It’s not so much the nature of decision making but the repercussions of those decisions that affect our lives.

MHR people don’t want to ‘loses face’ or ‘backtrack’ i.e change expressed opinion…even if they had expressed the opposite…if they now believe they’d said X, they’ll back up this ‘decision’…rationalize it to themselves…. Consider impact of ‘public opinion surveys’…if public told most people believe X, maybe they’ll rationalize why X is good choice, even thy had voted Y / expressed different opinion in survey…???

If you truly had free will, advertising and salesmen’s pitches would have no effect.
Cognitive dissonance. This arises when two competing ideas, behaviors, facts, or beliefs are in conflict in your brain. A common way that your brain reconciles the conflict is to change its attitude, beliefs, or behaviors to bring one of the competing ideas into prominence. Magicians love cognitive dissonance, since it leads spectators to feel as though they’ve made decisions freely for themselves.

MHR and so do Jew World Order ‘democracy’ fans…why let a strong leader emerge and become a statesman, when you can manipulate people into thinking they want your candidate, and even your own self-serving policies, and install a ‘Jew World Order – man’, and ensure no ‘statesman/woman ever has a chance…

When you make a decision between two things that seem equivalent, cognitive dissonance frequently comes into play. You elevate the value of your choice for the simple reason that it was your choice.

MHR the ‘two party’ system provides the perfect means to the ends of the Jew World Order…you have to chose one of them, so you do, and then justify to yourself why you are going to vote for/voted for, them…then you’ll try to make it appear a good decision, to save face, by justifying ever ‘Jew’ World Order policy they put in place…including going from NO war to, this war was GOOD and necessary…even though your candidate promised ‘no war not matter what’…

Illusion. Those who believe that the mind is wholly separate from the brain—a supposition called dualism—tend to believe that free will is a fundamental property of the mind. According to this view, free will is a separate, numinous quality of being that is not subject to physical laws or reducible to chemistry and circuitry.

But in the realm of neuroscience, there is not a shred of evidence for dualism. The mind is what the brain does. Consciousness and mind are products of your brain.

How could that be? You feel as if you are in full control of your mind. Sure, your brain carries out many tasks without your being conscious of them. You drive home on automatic pilot. You put cups into a dishwasher while carrying on an interesting conversation. But making important decisions? Isn’t mental life dependent on the fact that you are free to choose among different possible courses of action? Your decision-making process seems to be driven by your own volition. This feeling fits your sense of justice and moral responsibility.

Let’s look at several lines of evidence for the idea (dare we say fact) that free will is an illusion. In the 1970s, Benjamin Libet, a neurophysiologist at the University of California, San Francisco, carried out a series of studies that
first challenged the notion that we make decisions consciously and freely. Libet asked people to stare at a clocklike timer with a ball moving around the periphery once every three seconds. They had to press a button with their right index finger whenever they felt an urge to do so and afterward tell Libet where the ball was (what time it was) when they decided to make the move. Two testing devices—an EEG (electroencephalograph) and an EMG (electromyograph)—recorded their brain activity and the electrical activity of their muscles. Libet found that participants had the conscious sense of willing the movement about 300 milliseconds after the onset of the muscle activity. Moreover, the EEG showed that neurons in the part of their motor cortex where movements are planned became active a full second before any movement could be measured. You might think that the delay was due to the conduction time between the brain and the muscles. But a full second? No way. There was definitely something interesting happening here.

The findings mean that your brain unconsciously makes the decision to move well before you become aware of it. In other words, your brain, not your conscious mind, makes the decision. This does not match your experience, but it is how your mind actually works. Before you get discombobulated, know that there is a silver lining to these results: while decisions are unconsciously prepared ahead of time, you can still veto your actions. According to Libet and others, you may not have free will, but you do have “free won’t.”

MHR this is an example of ‘I reckon’ and brain as computer, working in the background…the idea of ‘checking yourself” i.e stopping an action you are about to carry out doesn’t mean you have a FREE won’t…it is just a later calculation superimposed over the earlier one…it is usually impossible to stop an action half-way…you can ‘decide’ after having carried out the action, not to do it, but it is in motion…you can only ‘regret’ having made it…but it isn’t an indication of any ‘free’ will / won’t…just a later reckoning / calculation…

Carefully designed laboratory conditions, such as in Libet’s experiment, can reveal free will for what it is: a sophisticated cognitive illusion. And if we pay close attention, we can also find rare instances in our everyday life in which the illusion breaks down.

You always have the option of not laughing when you don’t want to, right? You have control over your body and behavior, correct? Wrong. How often have you laughed at an ‘inappropriate’ moment, and not been able to control yourself? So that while we feel we are in control, we are actually just along for the ride a reflex, which by definition is a process that takes place in the shortest possible route through a given neural pathway. When the doctor hits your knee with a
hammer and your leg jerks, that is a reflex. No brain required. Laughter, on the other hand, involves a highly complex series of emotional, cognitive, and motor actions.

John-Dylan Haynes of the Max Planck Institute in Berlin, Germany, recently reprised Libet’s work using functional brain imaging. He wanted to see what happens in people’s brains when they make conscious choices. If you had taken part in the study, you would be lying in a scanner when Haynes tells you that you can decide if you want to press a button with your right hand or left hand. You are free to make this decision whenever you want, but you have to remember the time when you feel you have made up your mind. The researchers used a sophisticated computer program trained to recognize typical brain activity patterns preceding each of the two choices.

Haynes was astonished to find that brain signals—tiny patterns of activity in your frontal lobes—predict your decision (that is, whether you will press the button with your left or right hand) up to seven seconds before you are conscious of this ‘choice’...and ‘own’ it...believe it was a ‘conscious’ choice, rather than a choice made for you, which you have merely become conscious of ...

MHR my idea of ‘efficiency’ may actually offer scope for some ‘free will’ in terms of decisions...though still underlying any decision are all the genetic ‘definitions’, even before social conditioning programs tonnes of assumptions that are often erroneous, into our minds...what we ‘want’ can be programmed e.g. equality, to be slaves, to imprison historians, at some level, but the most powerful are inherited genetically e.g desires, impulses, urges, biological drives...and even overriding these with criminal mind control producing perversity doesn’t mean anyone has free will...the programmers nor the programmed, any less or more...someone is being ‘compelled’ to do the programming, and to submit, but deeper inherited biological drives at some level e.g fear, desire, lust, greed...TROONATNOOR...

MHR so while I appear to contradict myself, I am true to myself i.e I don’t need any ‘experiment’ to prove the obvious...the left and right button and time stuff may just be an efficient way to solve a problem / complete a task...given to the brain...doesn’t really indicate presence or absence of free will...but may help some people come to terms with TROONATNOOR i.e no free will...at best highly conditioned / programmed / restricted will...but probably zero...which begs the question...why sentience / consciousness then?...and the answer is ‘experience engine’ i.e it’s a game...begs the question, then why does it suck? And maybe answer is it was designed ot be a sucky game...who knows what our motives were...a challenge? ... or maybe the game was designed to generate a particular type of ‘energy’ e.g Matrix e.g ‘flyers of Don Juan Matus / Matthi?
MHR magic tricks work the same way everyday attributions of cause and effect work...we ascribe them...assume them...see correlations and assume cause and effect...we see what appears to be a woman's legs, and head...attached to each other...of the one person...when they are two different people...so when the one is 'sawed in half' before our eyes, even though we know this must be impossible, we 'see' it happening with our own eyes...if 'seeing is believing' then we 'saw' a woman cut in half, even though we 'know' it is impossible...our 'perceptions' override our logic...but they are based on assumptions i.e even our 'impressions' are literally merely 'impressions' e.g 'the impression I got'...an idea impressed on our minds...we should NOT be able to 'see' a woman cut in half and then rejoined...but we do...because of our assumptions that there was only one woman and one box...when there were two women in two separate boxes...but we 'saw' only one of each...we were 'persuaded' and 'convinced' to 'believe'...we assumed this...so our own mind played trick on us...in natural world, where no trick was being deliberately played, our senses would 'speak true' to us usually...when some freak coincidence didn't produce the same effect the magicians deliberately instigates/produces/constructs/tricks us with...like Gestalt images i.e 'girl' in widow turns out to be flower arrangement...distance blurs, our mind 'constructs' from what it 'sees'...and much more than what is there...etc...

MHR remember ultimately 'free' will meaningless....it is what you would will in the absence of any motive/desire/impulse/determinant/objective/reason i.e purely arbitrary action...why would anyone act without motive?...it would be meaningless and reflexive of nothing...just unconnected actions...without purpose or meaning....the 'purpose' or 'intent' is what motivates all action...without it what does 'volition' mean? Why act? And if action is just total reflex, why consciousness? What is 'original' impulse? Lila/play? Some god requiring servants to boss around,torture, love, hate, destroy? Like playthings? But where did that God's motives come from? If not an eternal/always was/will/will be motive intrinsic to all sentience/matter/consciousness/energy CEME? consciousness OF...there must exist, at the same time, something to be conscious of, for consciousness to exist...the 'self' consciousness produces the dualism i.e 'conscious of my self'...as first consciousness? Then 'other' not-self? Or just one self...universal self...see TROONATNOOR...But can motive come before consciousness? Is there any consciousness with no motive? A motive for consciousness? And therefore OF something? Is the motive the primerty? And energy/matter/space/time MEST its product? Lila? Play?

We just always were/are/will be...changing forms...primary motive 'experience' i.e 'entertainment'? No other essential 'objective'...all others reflexive of it...i.e dead person doesn't need food, sex, love, acceptance, approval? So can just 'satisfy' all needs by death...unless life satisfies some need of non-existence itself...death...boredom? Silly to assume some 'original'
consciousness that produced all the rest of MEST...why not MEST be sentience / consciousness...then why all this suffering / misery / slavery? Or just a slave – master game? Or a material necessity...of the MEST...this is the nature of the MEST...consciousness its prisoner? ...evolves...expands and contracts...

our neural resources are limited and that we cannot attend to everything in our visual field. Well, that attentional limit would be even more woefully deficient if we also had to attend to every single little process in our brains. Do you really want to know every minute detail of the information that the neurons in your prefrontal cortex are sending to your primary motor cortex in order to reach for a glass of water? Suffice it that when we are thirsty, our arm successfully picks up a glass of water and brings it to our mouth.

MHR can convince people they have ‘caused’ something...or someone else has caused it e.g voodoo...especially if ‘primed’...well people believe the wine and wafers have become the blood and flesh of their god man Jesus...the zombie jesus cannibal vampire cult ‘believe’ this...and by eating his flesh and drinking his blood, hope to become ‘one with’ their godman... ‘placebo’ and ‘nocebo’ effects are very common...’healing hands’...’faith healing’...

‘the devil made me do it’ is the reverse of this coin...voodoo dolls...possession by spirits...madness...angels speaking in your ears...hey, Moses claimed some burning bush / angel / god told him to massacre his adopted family, and their entire nation...then later to massacre his own followers after the ‘golden bull’ affair...what is even more appalling than ‘the devil made me do it’ is ‘god made me do it’...Most people censor themselves even when no-one likely to punish them is listening... a sort of voodoo...beliefs in the efficacy of the spying network...typical Cult of Judah stuff i.e spy on your loved ones, and renounce them, and cast the first stone at their public stoning, for any ‘anti-semitism’ a.k.a word or deed that challenges the power of the cult of Judah, and its ambitions for a ‘jew’ world order.

Consider ‘be cause’...we ‘will’ something and it happens e.g we want to say something, and we do ... wow...power...we were the cause of the utterance...all games are so addictive as they appeal to this ‘be cause’...will X to happen, on the screen, and X happens, and you get a rush of some chemicals in the brain called ‘power’ or ‘satisfaction’ or ‘confidence’...feedback...your will was done...what a rush...you are god...just a step from ‘willing’ your vocal chords to produce words to believing you can ‘will’ anything at all to manifest simply by ‘willing’ it...e.g that Porsche or super-model in your bed...just an extension...all those Cult leaders believe they are literally gods...but you wouldn’t believe them, so they claim to simply ‘represent’ some god...that is more easily believed...especially when you’re told millions of people believe it, and over thousands of years, billions have believed it...so who are you to not
believe it? Wouldn’t that be quite risky and foolish? Especially if the result is being stoned to death by your own loved ones? Or having to stone them to death?

MHR remember any time we do something ‘BECAUSE’ it cannot be defined as ‘free’ i.e arbitrary…”free will” would be totally arbitrary…not ‘purposeful’ at all…or at least we’d get to chose our purposes?…if there is a ‘reason’ or ‘motive’ or ‘purpose”, then unless we arbitrarily chose those reasons, motives, or purposes?…see TROONATNOOR…if I can ask ‘why’, and you have a ‘reason’…then the action was determined by that reason…etc…

Functional magnetic resonance imaging, or fMRI, measures brain activity by tracking increased blood flow, the idea being that more active brain regions will use more energy and will “light up” in the scanner. Scientists located regions that specialize in things like our basic sensory processes, speaking, reading, or feeling strong emotions. More recently, they found areas specialized to recognize faces or places

**the Miser’s Dream, is a classic.** the magician continually plucks coins out of the air, seemingly from anywhere he wants, and tosses them into a receptacle…Teller explains that he began by palming five coins in his right hand. His left hand holds six more coins that are pinned with his fingers against the inside wall of the bucket. Some coins will drop from his right hand, and some from his left (which you cannot see) while he pretends to drop a coin from his right. In the latter case he is only faking the action of tossing from the right hand, using the flick-down motion to reconceal the coin. But the faked action engages your mirror neurons, so you are predisposed to see it as the same natural tossing action you yourself perform daily with coins, car keys, cooking ingredients, and so on. The clink of the coin dropping into the bucket from the left hand helps create the illusion that the fake-tossed coin from the right hand landed in the bucket. What we’re actually seeing is the same coin flash in the right hand over and over and over again. Your assumptions have misled you. Teller says that the first coin raises the question in your mind: Where is it coming from? After four coins, you think you know. He has to be palming them in his right hand. Just then Teller reveals that his right hand is completely empty except for a single coin held between his thumb and index finger. You conclude there are no hidden coins. But wait. He is still dropping them, clink clink, into the bucket, only now they are coming from his left hand. “Every time you think you know what is happening, I am changing the method,” he says. Every coin is a new little burst of sight and sound—you see it, you hear it, and it is all happening so fast you are deceived. You think any repetition is a real repetition. “Your natural inclination as an observer is to assume that what I’m doing is the same thing over and over again. We take for granted that a repetition is a repetition [even] when it’s not.”
“We all infer cause and effect in everyday life,” adds Teller. When A precedes B, we conclude that A causes B. The skilled magician takes advantage of this inference by making sure that A (a fake coin toss) always precedes B (a loud clink). However, A does not really cause B

Teller’s performance of the Miser’s Dream reveals the human compulsion to find patterns in the world and to impose them even when they are not actually there.

MHR the ‘trick’ is to do one thing, with one hand, and allow people to suspect it, then once you’ve actually stopped doing what they suspected, you show them they were ‘wrong’…when in fact their assumptions were correct…only now you’ve moved onto a different method for producing the same effect…this is what really baffles them…they were right in their assumptions, but you appeared to have debunked their assumptions…there was a pattern…but you changed the pattern…and now they won’t look for that first pattern/make the same assumption next time you show them your trick…because they have already ‘seen with their own eyes’ that their assumptions were false…there was nothing in your right hand when you showed it to them…as if merely to satisfy their curiosity and soothe their suspicious minds, and assuage their ‘doubts’ that there was no magic, just a handful of coins…in a way like the ‘trance within the trance’ Erickson employed therapeutically, but which Alex Jones and his controlled opposition kosher alternative media mates employ maliciously/exploit…

Illusory correlation can lead to extraordinary beliefs, such as the ancient Aztec theory that a human sacrifice had to be performed each morning in order to make the sun rise. That stupid ‘gamblers dilemma’ which is the basis of all superstition, and not, as falsely claimed, a rational justification for joining the hegemonic cult, would ask of you ‘are you willing to risk the sun NOT rising this morning, by FAILING to murder a war prisoner? And are you thus willing to risk not having a war prisoner to sacrifice, by not continually fighting wars for your cult leaders?

In our minds, our own contributions and sacrifices are magnified by the fact that we remember our own actions better than we remember those of others.

Magic is the theatrical linking of a cause with an effect that has no basis in physical reality MHR such as explosions that are real, as we saw them, and their consequences with reports of aeroplanes being hijacked and crashed into buildings, which are total lies…or mass shootings carried out by professionals, and blamed on some lone mad gunman who either kills himself, is killed at the scene (the Sandy Hook shooter was officially declared dead the day before the massacre, his body merely dumped at the scene, while the Las Vegas shooter, and Nice Truck driver were pumped full of bullets, and you can bet there was never an autopsy done, or never allowed to stand trial like Martin Bryant,
tricked / tortured into making false confessions or waiving their rights to a trial if they have them, or just shipped off to some torture center like Guantanamo bay or local ‘black site’), or shot before they can even be officially charged, like the JFK ‘lone gunman’.

MHR all of reality, as Hume reminds us, could be such a ‘trick’ … where we ascribe ‘cause and effect’ relationships that are not strictly ‘real’…just precedence and antecedence, proximity etc…And of course ‘sympathetic magic’ is pure construction of cause-effect relationships…

two brain regions—with the mouthful names dorsolateral prefrontal cortex (dIPFC) and left anterior cingulate cortex (ACC)—lit up when people watched the magic tricks. Research has shown that one of these areas, the ACC, detects conflict, whereas the other, the dIPFC, tries to resolve conflict—exactly what you would expect when a cause-and-effect relationship is violated. In the surprise condition, the conflict detecting area, the ACC, lit up along with another region of the prefrontal cortex called the ventrolateral strip, which has been found to register surprise. In the plain vanilla control condition, none of these areas showed increased activity. The researchers concluded that your ability to detect information that contradicts or challenges your established beliefs is crucial for learning about the world. The highlighted circuit seems to play a role in the neurobiology of disbelief MHR to be able to ‘learn’ something ‘new’ that contradicts / debunks earlier conditioning…and to ‘entertain’ new ideas / impressions rather than discount / deny / filter out etc…

the gambler’s fallacy It plays in the house’s favor that customers are drawn along by the illusion that knowing the past will help them predict the future.. modern roulette wheels come outfitted with electronic counters that conveniently provide various statistics for the gamblers’ “benefit,” such as the numbers corresponding to the last fifteen balls, the percentage of black versus red numbers, the “hot” or most frequent numbers, or the more frequent dozens (numbers 1 through 12, numbers 13 through 24, or numbers 25 through 36). Of course none of these statistics changes the fact that the ball has exactly 1 in 36 chances of landing on any given number on the next spin.

Monte Carlo casino in 1913. Elegantly dressed gamblers stood around a roulette wheel and watched as the ball landed on black twenty-six times in a row. With increasing excitement, many patrons began betting on red. It just had to come up next. Sure, the wheel is random, but it had to “self-correct,” right?

Wrong. We all succumb to the superstition that when we observe a random process with a deviation, then logically the imbalance will have to even itself out. For example, ask yourself, if you toss a coin seven times, which is more likely to be the result? Heads, heads, heads, heads, heads, heads, heads. Or tails, tails, tails, tails, tails, tails, tails. Or heads, tails, tails, heads, tails, heads, heads.
Answer: they are all the same. Each is an independent fair toss. The coin has no memory. If you toss twenty tails, the probability of flipping another tails is one in two.

**The Monty Hall Problem** Let’s Make a Deal, tests your ability to assess probabilities. You don’t know which of the two remaining doors hides the prize, and so you may think, hey, the odds are fifty-fifty. It feels right to stick with door number one. But you’d be wrong. According to experts on probability, you should always switch. Choosing door two doubles the probability of winning the car from one-third to two-thirds. The Monty Hall problem arises because the contestant correctly believes that there is a 1 in 3 chance of selecting the car door in the initial door choice. But the host then removes a goat door from the remaining two doors. Now, if the contestant did indeed choose a car door in the original round (a 1 in 3 chance), then the remaining door will contain a goat. But if the contestant chose a goat door in the original round (a 2 in 3 chance), then the remaining door will contain the car. So it’s twice as likely that the contestant’s original choice was a goat rather than a car, and since it is certain that one of the remaining doors must hide the car, it is always in the contestant’s best interest to switch...he trouble is, the solution doesn’t feel right. It doesn’t match your intuition. And you are not alone. When the puzzle was first published, many scientists, including one or two Nobel Prize winners, were outraged by the correct solution because it did not feel right to them, either. Equal probability is deeply rooted in intuition.

In a coldreading, a magician, mentalist, or psychic draws information out of you to give you the impression that he is reading your mind. The method relies on an ability to sense unconscious behavior and to spin out vague statements that fit anyone’s situation. The deception is all linguistic. There is nothing supernatural about it.

Sedona is one of fourteen supposed power points on earth that can “ground the vibrational frequencies” coming in from extraterrestrial sources. (The other hot spots are Haleakala in Hawaii, Mount Shasta and the Golden Gate Bridge in California, the Black Hills of South Dakota, Central Park in New York City, Machu Picchu in Peru, Mount Olympus and Delphi in Greece, Japan’s Mount Fuji, the Great Pyramids, Popocatepetl and Palenque in Mexico, and the Ganges River.)

A cold reading involves teasing out information from a client with questions phrased as statements. “I sense you’ve got an issue or problem that’s concerning you.” Of course they do. Otherwise why would they be there? Everybody worries about health, money, love, and death. So if you say, “I sense some problem with your health” and they don’t respond, you continue without skipping a beat: “I don’t mean your physical health. It’s your emotional...or financial health.” And...
so…forth. Every statement is made with rising inflection, grammatically a statement, but inviting completion as a question. You miss a lot of the time, but people forget the misses and remember the hits.

Flatter your subject shamelessly. Remember, the psychic succeeds by telling you what you want to believe. Ham it up. Don’t blurt out “You like ice cream.” Look deeply into the crystal ball, the guy’s palm, tea leaves, tarot cards, food stains on his shirt—whatever—and slowly show an expression of insight and discovery: “Your rising moon in the Milky Way tells me you like ice cream.” The bigger the ham, the more he’ll swear by your powers. “That’s amazing! I love ice cream.”

Base questions on the client’s stage of life. According to the mentalist Derren Brown, people in their twenties tend to be quite self-involved, wondering what their real self consists of. Older people may be more worried about illness and death. Make empty truisms—“You are sometimes introverted”—sound substantial. Leave everything wide open. For example, you might say, “You are very creative, but it may not be that you specifically, say, paint, it may be that your creativity shows itself in more subtle ways.” If the person paints, bingo, you’re a mind reader. If not, you are flattering the person’s inner creativity.

Always ask: Who’s Michael? Or Linda, or a similarly common name that the victim will likely match or suggest a variation, like Mike or Mitch, Lynn or Lynette, etc. Never go with “Who’s Bathsheba?” Unless, of course, you’ve nailed everything 100 percent and want to aim for a grand slam finish. Remember, as a psychic, you’re not constrained by either time or the truth. If there’s no one in the present with that name, you ask if they ever knew someone in the past, and if that fails, shift to the future with a worried expression, saying, “Be careful when you meet someone named Bathsheba, I sense difficulties, possibly a betrayal…” Their method was to ply and probe clients to determine their desires and then, for a price, sell them the promise of those desires. The industry is thriving because people are desperate to confirm that everything is going to be all right, that their decisions have been good ones and will continue to be good ones, and that they will be reunited with their loved ones on the “other side.

Mentalists and psychics often tell you exactly what you want to hear. The psychics who read Susana’s “future” changed their story based on her body language and facial expressions. When she smiled and nodded the “clairvoyants” were encouraged to expound on a particular topic, but when she raised or knitted her eyebrows, they would revise the preceding statement. “I see success in your future” one of the psychics said. Susana frowned and tried her best puzzled expression. “Not professionally” the “psychic” immediately corrected, “I mean you will have successful, meaningful personal relationships.” Susana smiled and relaxed her shoulders. The self-proclaimed visionary also relaxed visibly
Research suggests that about 10 to 15 percent of adults are hypnotizable. Up to age twelve, before top-down circuits mature, 80 to 85 percent of children are highly hypnotizable. One in five adults is flat-out resistant to hypnosis. The rest are in between, prone to occasional hypnotic states such as losing all sense of time and surroundings while driving on a monotonous highway or watching a spectacular sunset. No one knows what makes one person more or less hypnotizable, although certain subtypes of a gene called COMT may confer susceptibility.

But those who are susceptible can be identified with the help of standard questionnaires and interview techniques. Many are complicit in that they believe hypnotism is effective. They expect it to work, so it does.

Brain scans show that the control mechanisms for deciding what to do in the face of conflict become uncoupled when people are hypnotized. They are then open to suggestion. Thinking that a medicine will relieve pain is enough to prompt the brain to release its own natural painkillers. People who expect pain not to be as bad as it actually is experience a reduction in pain equivalent to that achieved by a shot of morphine. Hyperactive children who are given a “dose extender” in full knowledge that it is an inactive pill can reduce their regular medication by half with no ill effects. Hypnosis and placebos are effective anesthetics. They are used for treating anxiety, tension, depression, phobias, addictions, asthma, allergy, high blood pressure, and many other medical conditions.

In all these instances, top-down processes override bottom-up information. People think that sights, sounds, and touch from the outside world constitute reality. But the brain constructs what it perceives.

Oxytocin, the hormone released during childbirth, breast feeding, social recognition, and cooperation. Zak and his colleagues have carried out numerous studies showing that oxytocin makes acts of cooperation feel really, really good. When you feel trusted, your brain releases oxytocin, and that causes you to reciprocate the trust. If you inhale oxytocin in a laboratory experiment, your generosity to strangers skyrockets. Con men and magicians are equally adept at causing your brain to squirt oxytocin to make you trust them.

The key to a con, says Zak, is not that you trust the con man, but that he shows he trusts you. Con men ply their trade by appearing fragile or needing help, by seeming vulnerable. Because of oxytocin and its effect on other parts of the brain, you feel good when you help others. “I need your help” is a potent stimulus for action. As for the pigeon con, the first hook was Zak’s desire to help the poor guy get this nice gift to his undoubtedly sweet wife. The second hook was the man who wanted to give the necklace back but who was late for his interview. If only Zak could help him get that job. Zak’s oxytocin system was in high gear, urging him to reciprocate the trust he had been shown and to help these people. Only
then did greed kick in. “Hey,” thought Zak, “I can help both men, make a wife happy, and walk away with a hundred bucks—what a deal!” Yes, suspend all suspicion and give up the cash. Cons often work better when an accomplice poses as an innocent bystander who “just wants to help,” says Zak. We are social creatures, after all, and we often do what others think we should do.

Simpsons ‘pig’ boxing scam…send out emails to 100 people…half predict A will win, half B…so 50 people will think you’ve predicted accurately…you then send half of that 50 prediction for A, and half for B, in next fight / horse race…again repeat…so half that got the ‘correct’ prediction emailed again…this time you ask them to place a bet, using your system, through you…they have experience of your ‘system’ ‘working’ 3 times in a row…some send money, you keep it…they wait for payment…the half that ‘won’ again…but you’ve scammed them, taken their money…you make up a story about a ‘pooled’ bet with even better odds than they can get elsewhere, so they bet through you…though you don’t bet…just take their money…

Oxytocin causes us to empathize with others, and that is the key to building social relationships.

Magicians also elicit oxytocin in the brains of their audiences, but to different ends. They want you to trust them, so they, too, pretend to be vulnerable.

Our timing must indicate that we understand when the magic happens for the audience MHR the ‘magic’ happens in the audiences perception, not on the stage…the magicians do tricks…the audience’s mind converts it into ‘magic’ i.e belief / acceptance / suspension of disbelief – judgement…all ‘magic’ is deception / misdirection / misleading etc…no ‘magic’…all a set up…

Magic Trick Categories

All magic tricks follow certain central themes:

Appearance: You produce something from nothing—a rabbit from a hat, a coin from thin air, a dove from a pan.

Vanishing: You make something disappear—the rabbit, the coin, the dove, the Statue of Liberty, whatever.
Transposition: You cause something to move from one place to another—as when Tamariz transports cards from a table into the jacket pocket of somebody he’s never approached.

Restoration: You destroy an object, then bring it back to its original state—as when a magician rips up your hundred-dollar bill and then hands it back to you intact.

Transformation: An object changes form, such as when a coin turns into a different coin or three different lengths of rope are transformed into three equal lengths.

Telekinesis (levitation or animation of an object): You defy gravity by making something rise into the air—such as the classic woman with the hoop run around her. Another example is Teller making a red ball hover and follow him around onstage. Or you make a spoon bend with your thoughts alone.

Extraordinary mental or physical feats or extrasensory abilities: You catch a bullet with your teeth or you can tell what a person will choose e.g. precognition tricks

Setting up a complex trick in which we will magically transport a card into the middle of a brain made out of Jell-O. But first we need Scotto to pick a card identical to the one we embedded last night into the fake Jell-O brain. It is the jack of diamonds.

To force the card onto Scotto, Steve loads the jack of diamonds as the top card of the deck, then shuffles the cards without actually moving the jack. When this false shuffle is complete, Steve cuts the cards into his left hand, which puts the jack of diamonds in the middle of the deck, but he sticks his left pinky just above it so that he knows exactly where the card is. From the front of the deck, the cards look flat, but from the back there is a clear gap caused by the “pinky break.” A master wouldn’t have had to actually stick his finger into the deck. The pinky would simply hold open a small gap. But despite months of practice, it’s clear to Steve (and probably everyone in the room) that he’s no master.

With the pinky break in place, Steve runs his left thumb down the front corner of deck (“the riffle”) and waits for Scotto to say “Stop.” But no matter where Scotto chooses to stop, Steve will lift the cards from the back of the deck at the pinky break, ensuring that Scotto’s “choice” is the jack of diamonds. Steve’s misdirection involves looking into Scotto’s eyes as he lifts the cards, so as to keep Scotto’s attention away from the sleight of hand.

Learning tricks like these, we’ve been surprised to discover, is just as much about what you do with your eyes and body as it is about what you do with your
hands. The trickiest part for us has been to learn to do things without attending to them—or, more precisely, while attending to something else. Pulling off these simple sleights requires about as much dexterity as you need when learning how to shuffle a deck of cards for the first time. But to learn to pay attention to irrelevant things while specifically not attending to the secret methods—all the while not looking guilty? Very difficult.

The route to success is practice, practice, practice, and more practice. This is true of every motor skill you acquire throughout your life—learning to walk, kick a soccer ball, play the piano, hit a tennis ball, block a punch in tae kwon do, ski down a black diamond slope, or put a pinky break in a deck of cards. But now we aren’t just directing a ball to a specific point at a specific time, we are also using our own spotlight of attention to misdirect

You have in your brain swaths of tissue, called the motor cortex, that map all the movements you are able to make. Your primary motor map sends commands from your brain down to your spine and out to all your various muscles. When this map is activated, your body can move. You have other motor maps involved in planning and imagining movements, but for now let’s look at how a familiar skill develops.

Let’s say you are learning to play the piano. When you are a novice, the region of your brain that maps your fingers—yes, you have finger maps—grows in an exuberance of new connections, seeking and strengthening any connection patterns that maximize your performance. If you give up practicing, your finger maps will stop adapting and shrink back to their original size. But if you keep practicing, you will reach a new phase of long-term structural change in your maps. Many of the novel neural connections you made early on aren’t needed anymore. A consolidation occurs: the skill becomes better integrated into your maps’ basic circuitry, and the whole process becomes more efficient and automatic.

There is another level to all this, and that’s true expertise, or virtuosity. If you practice a complex motor skill day in and day out for years on end, always striving for perfection, your motor maps again increase in size. Professional pianists (and magicians!) unquestionably possess enlarged hand and finger maps. Their maps are larger than average because they are crammed full of finely honed neural wiring that gives them exquisite (and hardearned) control of timing, force, and targeting of all ten fingers. Violinists also have enlarged hand maps—but only one. The map that controls their string-fingering hand is like the pianists’. But their bow hands, while deft and coordinated, do not become beefed up beyond normal.

Here is one more interesting fact about expertise. As you gradually master a complex skill, the “motor programs” it requires gradually migrate down from
higher to lower areas in your motor circuitry. Imagine a guy who signs up for samba dance classes. Like all novices, he is terrible at first. During his first several lessons, he is processing his dance-related movement combinations up in his higher motor regions, such as the supplementary motor area. This area is important for engaging in any complex and unfamiliar motor task. The dance moves are at first very complex for him. He needs to pay attention to them constantly, and even so he often loses track.

He sticks with it, though, and after a couple of months he is getting a lot smoother. He is using his supplementary motor area much less for his dancing these days. Many of the motor command sequences he is using now have been transferred downward in the cortical hierarchy, to reside mainly in his premotor cortex. He’s become a competent dancer. He’s not Fred Astaire, but he needs to pay less attention to the basics now. He makes far fewer mistakes. He can improvise longer and longer sequences.

Finally, if he practices often for many months stretching into years, eventually his premotor cortex delegates a lot of its dance-related sequences to the primary motor cortex. Now he can be called a great samba dancer. Dance has mingled intimately with the motor primitives in his fundamental motor map. The dance has become part of his being.45

Susana experienced the gradual acquisition of expertise when she practiced the martial art tae kwon do through high school and college. She has a brown belt and was once the junior tae kwon do champion of Galicia, the region of Spain where she was raised. She found that in the sparring ring, novice martial artists boldly telegraph their intentions through eye movements and body language. The same is typically true of new magicians, who need to think about their tricks as they perform them, and therefore perform them badly.

Accomplished magicians don’t need to pay attention to their moves during a trick because the movements come as second nature, as naturally as walking or talking, leaving them free to attend somewhere else. Juan Tamariz jokingly asserts that each spectator is a “telepath.” He says that if the magician thinks, even for a brief instant, “Here’s where I do the trick,” the audience will be able to tell. Thus magicians must be able to perform their routines by rote, without needing to engage any conscious processes. If this is accomplished, the audience won’t be able to isolate the critical instant or location of the secret method behind the trick. We all do this in real life to some extent. If you have something to hide from your business partner, spouse, or a law enforcement agent, you will do best not to think about it while in their presence, lest your voice, gaze, or posture give you away.

The French Drop or Deceptive Biological Motion
Arturo de Ascanio, the father of Spanish card magic, once said that sleight of hand must be so good that attentional misdirection is not needed, and that the misdirection must be so perfect that sleight of hand is superfluous.

We’ve talked a lot so far about how magicians misdirect your attention. But what about sleight of hand? How does a magician learn to perform flawless sleights, and are any parts of the maneuver more important than others?

Sleight of hand involves making your hand movements ambiguous so that it looks like you are doing one thing when in fact you are doing another. For example, the “French Drop” is a classic sleight in which a coin is apparently removed from one hand by the other and then moved to another position in space before revealing that the coin has disappeared. The moves take a lot of practice to perfect, but nobody has examined scientifically the critical aspects of the maneuvers, until now.

In this famous vanish, the magician holds a coin in one hand and moves his other hand as if to grab it. But instead of taking the coin, he drops it into the palm of the hand holding it and uses his grabbing hand to provide cover. When he moves his grabbing hand away (which you are sure holds the coin), you soon see that it is empty. In fact, the coin is hidden in the palm of his holding hand in a way that makes the hand seem empty.

split the movements into three phases: the Approach phase, in which the grabbing hand is approaching the holding hand; the Mid-Capture phase, in which the grabbing hand appears to capture the coin; and the Retreat phase, in which the grabbing hand appears to move away with the coin.

Which phase is most important to the successful sleight of hand? The Mid-Capture phase, is critical. subjects usually guessed the final position of the coin when novice magicians performed the trick but not when experts performed it. The same was true for the Retreat phase, though the effect was not as big as in the Mid-Capture phase.

These results suggest that skilled magicians are more proficient than amateurs in making ambiguous hand movements during the Mid-Capture portion of the trick. They are so good that the parts in your brain that perceive biological motion cannot tell the difference between a real grab and a fake grab.

a classic sleight in magic—the switchout. She is secretly holding the fragment from the duplicate card—the one inside the Jell-O brain—between her index and middle fingers. Once Scotto’s card is completely ripped, Susana then hands Scotto the fragment from the brain card, as if it came from the newly torn jack. Later, when we remove the jack from the brain, Scotto will find that the fragment
he is holding impossibly and exactly matches the missing corner. Pure teleportation!

It took Susana several multihour lessons with Magic Tony, and two or three destroyed decks of cards, to perfect the sleight. She does it brilliantly in the audition, raising her gaze to look Scotto in the eye and misdirecting his attention at the critical time of the switch. Scotto will tell her later that he knew she must be performing a switchout when she ripped his card, but nevertheless he couldn’t detect it when it happened.

A dovepan is a gimmick made of two nested pans with a large covering on top—roomy enough to hold live birds, birthday cakes, you name it. You can buy them in every magic shop. The magician displays the bottom pan, which is empty. He covers it and then waves his magic wand. The top pan drops down into the bottom pan automatically by virtue of a spring-loaded mechanism that is activated when the top and the bottom pan meet. He then removes the cover. Voilà, a dove flies out. Or a rabbit hops out.

Salt is critical because its ions—sodium and chloride—allow neurons to communicate over long distances.

A fake thumb tip—a rubber gimmick that looks just like a real thumb—that was used to sequester the salt inside his left fist. His right hand delivers the fake thumb tip to Susana’s waiting gloved left hand. When the undulating duet is done, Steve removes Susana’s left glove, which serves to get rid of his thumb tip. Susana is also wearing a fake thumb tip filled with more salt in her right hand, under her glove. At the end of her dance number, she removes her right glove, palms the thumb tip into her right fist, and pours her salt supply into the dovepan. It appears as if the salt has traveled through two bodies.

in magic, there are no new tricks. Nearly all the illusions you see in modern magic shows were invented in the nineteenth century or earlier by showmen in Europe, Asia, and the Americas. Modern magicians have been updating and elaborating the same basic tricks ever since.

Moreover, magicians have long excelled at engineering. In the second century BC, Heron of Alexandria, a Greek-Egyptian inventor, made temple doors open and close magically during religious ceremonies. The secret mechanism was a predecessor to the steam engine. Magicians also used to be famous for inventing self-operating machines, called automata, with purely mechanical moving parts.

“Heron’s Temple.” Heron of Alexandria invented the automatic opening of doors. The secret mechanism, called aeolipile, consisted of a vessel with two curved pipes connected to it. When the water in the vessel boiled, the steam came
out of the tubes, activating a rope mechanism that opened the doors slowly and majestically.

In the mid-nineteenth century, Jean-Eugène Robert-Houdin, who is considered the father of modern magic (and the main inspiration for Ehrich Weiss, better known as Harry Houdini), used his engineering skills as a clockmaker to construct amazing mechanical contraptions that seemed to operate by magic. A device similar to two different famous Robert-Houdin automata called “Orange Trees” is featured in the 2006 movie The Illusionist. Robert-Houdin also invented the first electric house security alarm and other Rube Goldberg contraptions such as a three-tiered alarm clock system that set off alarms at different places around the house and at different times while also triggering the release of morning oats to his mare in the barn. Other renowned magicians, such as André-Jacques Garnerin and John Nevil Maskelyne, made important technological advances by inventing the parachute (Garnerin) and the first ribbonless typewriter and the coin-operated lock for vending machines and, unfortunately, pay toilets (Maskelyne)

Robert-Houdin had used sleight of hand to put a wax bullet into the gun of his ‘dupe’, and it broke into pieces when fired. He held a real bullet in his mouth and—voilà, when his dupe ‘shot’ him, he appeared to catch the bullet in his teeth. Easier when he could bring his own gun, trickier to replace bullets in someone else’s gun

Mulholland obliged by writing two illustrated spy manuals. The first describes and illustrates (with delightful drawings) numerous sleights of hand and close-up deceptions for secretly hiding, transporting, and delivering small quantities of liquids, powders, or pills. The second manual describes methods used by magicians and their assistants to secretly pass information. Spies thus became adept at misdirection, change blindness, escapology, and creating cognitive illusions.

By the 1970s, however, attempts to assassinate Fidel Castro with exploding cigars and similar escapades began to embarrass the CIA. In 1973, the agency’s director, Richard Helms, ordered all copies of the classified magic manuals to be destroyed. The results of such chicanery were just too unpredictable.

For decades, rumors of the manuals’ existence circulated in intelligence circles, until parts of them were unearthed and published in the late 1990s and early 2000s. In 2007, a retired CIA officer, Robert Wallace, discovered a complete set of the lost manuals and published them, with the historian H. Keith Melton, under the title The Official CIA Manual of Trickery and Deception.

The book reveals that our spies knew about change blindness. An intelligence officer would always park his car at the curb directly in front of his house. On the
day In magic, a larger action covers a smaller action as long as the larger action itself does not attract suspicions. One CIA officer took his dog out for long walks at night (the large action), which gave him numerous opportunities to secretly mark signal sites and service dead drops (the smaller actions). The surveillance teams became used to the pattern and never got suspicious.

Magicians manage “sight lines” to create illusions. Your vantage point in the audience can be used to trick your visual system, as we saw with Vernon’s Depth Illusion in chapter 2. A CIA officer discovered that when he was walking in urban areas, on routes he used frequently, the surveillance team trailing him was always a few steps behind. When he made a right-hand turn on foot, he would be in the clear—“in the gap”—for a few seconds. He used that gap to conduct his clandestine moves, out of sight.

Mulholland also gave lessons on misdirection. In the days when many people smoked cigarettes, he instructed officers to lift a flaming match to light a target’s cigarette while using the other hand to drop a pill into the target’s drink.

To make a miniature camera “disappear” after taking a secret photo, the spies borrowed a magician’s tool called a holdout—a simple piece of elastic that retracts an object up a sleeve. They hid toolkits and micro-film in buttons, coins, boot heels, and suppositories.

Houdini inspired many of the spies’ techniques, including the Identical Twin Illusion (which they called “identity transfer”), which involves disguising two people to look like the same person. One spy went a step further and dressed up in a giant Saint Bernard dog suit so that when he was “taken to the vet” (actually a safe house) he could pass on documents before returning home in the dog suit. A real 180-pound Saint Bernard also lived there.

a mentalism puzzle called kirigami, invented by Max Maven. It involves folding and cutting paper with letters of the alphabet to find four-letter words. The volunteers think they are free to find a variety of words, but we have set up the puzzle to force them to choose only two: “cage” and “head.”

We bring out homemade “mind-reading helmets” constructed out of spaghetti strainers adorned with flashing lights and buzzers—they look like Acme bombs purchased by Wile E. Coyote—and each push a secret remote button in our jacket pockets to make the helmets buzz as the volunteers concentrate on their words, which are being “transmitted” through the air to the dovepan.

After three seconds, Susana lifts the cover of the dovepan and what do you see? Why, it’s the confluence of the words “head” and “cage”: our technology has generated the head of the actor Nicolas Cage! (It’s amazing what you can buy on the Internet.)
By explaining how magicians hack the human brain, do we worry that we’ll ruin the mystery for everyone else? Will the magic go away?

We have been fortunate to work with some of the world’s greatest magicians who have been generous in sharing their ideas about the essence of magic and, yes, often willing to reveal their secrets. The reason is that great magic is not about secrets. Nor is it all about the tricks or the methods behind the tricks. You can find complete descriptions and explanations on the Internet of just about every magic trick ever invented.52

A great magician makes you experience the impossible by disrupting normal cause-and-effect relationships. Sure, he can use secret methods, but his act will be even more magical if you know the secret and yet the impossibility still occurs. Successful magicians hijack your brain’s attentional mechanisms without your knowing it—you believe you’ve been paying attention the whole time. No matter what trick they are doing, the real trick is in your head

Magic manipulates OUR PERCEPTIONS in the here and now—our reality

iPhone app called iForce.55 The application presents itself as a drawing program called Doodle v1.2, but it’s really a sophisticated trick that uses the iPhone’s internal accelerometers to create a mentalism effect based on precognition.

After you buy this app for $3, you write a prediction on the iPhone screen, using your finger in a painting app. You lay the phone facedown on the table. You ask your friend to choose a number between one and eight. Or to pull a bill out of his wallet. Or flip a coin three times and remember the sequence of heads and tails.

You then ask your friend to tell you the number, show the bill, or reveal the coin toss sequence. You turn the iPhone back over, and—will wonders never cease—that is exactly what you wrote on the screen. It might be seven, $20, or tails, tails, heads. Your prediction was correct.

The app works because when you appear to be making the prediction, you are really running two fingers side by side down the face of the iPhone, and that opens a secret screen in the program. You select what type of trick it is (numbers 1–8, type of bill, coin toss, and so on) and then set the phone facedown as if to hide your prediction. When you flip the phone over to reveal the prediction—note that there are only eight possible answers to the questions—you can flip it to the left or right, over the top or the bottom, fast or slow. In other words, you have eight possible ways of flipping the phone faceup, depending on your friend’s answer.

The phone interprets the way it is being flipped, and the iForce app draws the correct response on the screen.
Like holding a stick a certain way to ‘inform’ your accomplice about something e.g location of dupes ‘selection’, a number etc…so long have finite options, and a ‘tell’ for each e.g how hold stick, words used, body language etc for each potential choice, can always ‘con’ dupe.

the famous Cups and Balls, a sleight of hand that was performed by Roman conjurers as far back as two thousand years ago. The trick has many variations, but the most common one uses three balls and three cups. The magician makes the balls pass through the bottom of cups, jump from cup to cup, disappear from a cup and turn up elsewhere, turn into other objects, and so on. The cups are usually opaque and the balls brightly colored.

Teller recalls that one day he was sitting in a diner in the Midwest with Penn, fiddling with an empty water glass and wadded-up paper napkins for balls. He turned the glass upside down and put a ball on top, then tilted the glass so that the ball fell into his other hand. The falling ball was so compelling that it even drew his own attention away from his other hand, which was deftly and automatically loading a second ball under the glass. He was so well practiced that he no longer needed to consciously control his hands. In fact, Teller found that the sleight happened so quickly he himself did not notice…Teller further realized that all of this took place despite the fact that he should have been able to see the secret ball as it was loaded under the cup. Its image was on his retina, but he nevertheless missed it because his attention was so enthralled with the falling ball. He surmised that if it worked for him with a transparent cup, it would work with an audience. The transparency of the cups would make the trick all the more magical to the audience. And that is how Penn & Teller came up with the idea for a cups and balls routine using transparency. They claim that their version of the trick violates four rules of magic: don’t tell the audience how the trick is done, don’t perform the same trick twice, don’t show the audience the secret preparation, and never perform cups and balls with clear plastic cups. The exposure is what makes this trick a superstar.

The discovery of inattentional blindness and change blindness in recent decades (detailed earlier in chapter 5) has greatly advanced the cognitive sciences. Magicians evidently knew implicitly about these phenomena for centuries, judging from the design of their tricks, and so scientists have been inadvertently reinventing the wheel. By studying magic, scientists could have made these advances earlier. We propose that the study of magic is now poised to help to derive new principles to optimize attentional resources in people with cognitive decline, as well as to create heuristics to improve education in our schools.

We love being fooled, even though we have read explanations of many of the tricks. Experiencing a master magician fling our attention around like a fly...
fisherman’s lure, forcing us to strike at the morsel and then reeling us in, is unlike any other cognitive experience

**mirror neurons.** Recall that these are the brain cells that become active when you carry out an action and when you observe another person carry out that same action. When you wave good-bye, mirror neurons in your premotor cortex fire away. When you watch someone else wave good-bye, those same neurons fire, but you don’t move your body. In other words, mirror neurons link action and perception.

Your mirror neuron system gets more active the more expert you are at an observed skill. When pianists listen to someone else’s piano performance, the finger areas in their primary and premotor cortex increase above their baseline activity. Their mirror neuron systems automatically run the performer’s keystrokes in emulation. The same thing does not happen in the brains of nonmusicians. While they can certainly appreciate the music deeply, their experience is inevitably shallower than the pianist’s in at least one way, because they are not experiencing what it is like to actually produce it.

The same goes for athletics: the better your own skills, the more deeply you understand the skilled performances you witness. For example, when classical ballet dancers and experts at an Afro-Brazilian art form that combines martial arts and dance called capoeira watched video clips of each kind of dance, the dancers’ brains showed distinct patterns. Both disciplines require exact limb positions, choreographed movements, extreme muscle strength, and years of practice. You would think that their mirror neuron activity would be equivalent, yet when ballet dancers observed capoeira movements, their mirror neuron activity was weaker compared to when they watched other ballet dancers—and vice versa. The actions you mirror most vividly are the ones you know best.

We are willing to bet that the same holds true for magicians. If Teller watches Mac King perform a fake coin toss, his mirror neurons are going to have robust responses. If an ordinary muggle watches Mac do the same trick, she will be entertained, but we suspect her mirror neurons will not respond as strongly.

Now imagine that everybody in the world could perform one trick and perform it well. Would magic suffer from this vast increase in exposure? Would ticket sales to shows fall? On the contrary, the more you learned, the more interesting magic would become, because you, and your brain’s motor control pathway, would empathize with the activity more deeply.

Illusions are not exceptions and they are not necessarily mistakes. They are integral to perception and represent fundamental aspects of your visual and cognitive processing. They are adaptive shortcuts that your brain makes to speed
up such processing, or reduce the amount of processing necessary to provide you with the information you need to survive and to thrive, even if the information isn’t technically accurate.

Try this for yourself: look at this page indoors, and then take it outside and look at it under direct sunlight. It’s remarkable in that it’s unremarkable. The page looks exactly the same—black letters on a white background. But how can that be? Depending on the nature of your indoor lighting, there is about one million to twenty million times more light under direct sunlight than indoor light. Outside, there are millions of times more photons reflecting off the black letters than there were off the white paper inside, so why don’t the black letters, when outside, look brighter than white?

Furthermore, the colors of the photons (the distributions of wavelengths) are probably different inside and outside, too. Your visual system can see color and brightness only as a function of the numbers of photons and their wavelengths that fall upon your retinas. Thus the page cannot possibly be “white” both inside and outside.

If the photons inside and outside are so different (and we assure you that they are), why does the page look the same in both environments? The answer is that your visual system massages the visual data with two processes called brightness constancy and color constancy, so that the page looks the same to you under very different lighting conditions. But this is an illusion, which means the physical reality doesn’t match your perception. In reality, the book has a different physical appearance in each environment, even though you see it as the same.

**Visual illusions help you survive** in a visually complex world when you exit from the cave. They help you recognize ripe versus unripe fruit in the tree or by firelight. Similarly, cognitive illusions help keep you alive. You make assumptions, confabulate memories, and attend to only one thing at a time, because it’s an efficient way to navigate the world and to find the resources you need. It’s more efficient than the alternative, which is to try to process everything you encounter. Accuracy is usually not needed and it’s difficult to achieve. You’d need a much bigger head to hold a brain large enough to be always accurate, and humans already have enough of a problem with childbirth.

Mac King, who does such a fantastic fake coin toss. He’s so quick you can’t catch him doing it. Mac has shown us how he does it, and it looks almost identical to a real coin toss. He can toss the coin (or fake it) for many repetitions before we’re able to tell a real toss from a fake toss.

Apollo Robbins intuits that, in some circumstances, a curved motion is more effective than a straight motion for misdirection, whereas straight motion is more
effective than curved motion in other situations. One underlying neuroscientific hypothesis is that curved versus straight motion results in different types of eye movements and that those eye movements have different effects on attention. If this is correct, Apollo’s insight may reveal an important new perspective on the relationship between cognition and the oculomotor system.

Magic profoundly manipulates the nature of our conscious experience. As such, it holds the promise of revealing some of the most compelling scientific discoveries.

The neurobiological study of consciousness

The Large Hadron Collider to examine the Higgs boson, the ephemeral particle that is the very basis of mass.

**Spotlight of attention means we ‘miss’ stuff outside of it**

Your visual system has a spotlight of attention. It’s the region of your visual perception in which you enhance everything that occurs. But the principle holds true for hearing, touch, other sensory systems, and even cognitive functions—for everything your brain does. Your spotlight is directed to a region of your cortex and enhances the activity carried out in that region.

But attention exercises another effect in your brain, too. It not only increases the neural signals at the center of your spotlight, it also suppresses the activity in the surrounding region. In the visual system this can create a so-called center-surround attention focus in your visual field. You see better at the center, while the surrounding items are suppressed.

In your touch system, attention creates a center-surround spotlight on your skin. Apollo Robbins’s tap on your shoulder forces you to pay attention to that particular location, while suppressing the more subtle sensations produced by the removal of your wristwatch a few feet away. And in the cognitive areas of your brain, attention creates a center-surround region in whatever type of space is being computed by that region. You may fixate on a given idea and suppress all others that might compete.

The spotlight affects visual processing from the very first stages of the visual pathway, signifying that it is a very important factor in what you see and don’t see. We believe it also determines what you hear, feel, and are aware of in a magic show, and indeed in the rest of your waking life.

Our studies further show that the harder you try to attend to something, the more you enhance it and the more you suppress surrounding information. This
suppression versus enhancement dynamic gets really interesting when you think about decision making and the role of intuition versus rational thinking.

MHR very Zen…focus on here and now…and broaden the spotlight of attention…so much that it becomes universal…overwhelms mind…maybe source of feelings of ‘one-ness’…prevents ‘individuation’…for real, or just an artefact i.e feeling due to the mind losing focus / becoming overwhelmed with data…as Don Juan Matthis suggests in his Indian initiations…unfocussed watching / observing…overwhelms…lose sense of ‘self’…and actually ‘see’ what there…which is possibly just E M soup…MHR…

Apollo Robbins is onstage with Susana, discussing magic and the brain at the Chicago Cultural Center. He’s stuffing a large silk handkerchief into his fist. With one eyebrow raised à la Dr. Spock, he’s showing the audience how their angles, meaning their sight lines, are critical to successful magic. The audience feels as though it is learning secret magic techniques. It’s exposure as entertainment.

When the silk is fully crammed, Apollo opens his fist and, voilà!, the handkerchief has been transformed into an egg. He then pulls the silk from his hip pocket, as if the silk had magically transported itself there from his hand.

“It’s an easy trick,” he explains. “All you need is a fake egg and two identical silk handkerchiefs.” He turns the egg around and reveals that it has a hole into which he stuffed the silk. The crowd laughs as he slowly pulls the stuffing back out through the hole.

“Here’s why the angles are important. First, the setup,” Apollo says. He refolds one of the silks and puts it in his hip pocket, along with the fake egg. He puts the other silk in his jacket breast pocket. He is now set to repeat the trick.

“Step one, I palm the egg,” he says as he secretly extracts the egg from his pocket. “But you can’t see that from where you’re sitting.” His hand is in an ice-cream cone eating position, egg tucked neatly within. “Then I take the silk from my breast pocket and stuff it into the egg like this.” Again he stuffs the silk into his fist. “Make sure nobody is behind you or has an angle that allows them to see the egg in your hand.”

“Here’s the egg just like before,” he says, opening his fist. The silk is gone, as expected. “But if you look closely, you can see there’s another way to keep people from seeing the hole.” He now turns the egg, revealing the small opening. Then, to everyone’s amazement, he peels the hole off the egg, showing that it was not an actual hole but a sticker. Yet the handkerchief is gone! Apollo now
removes the silk from his hip jacket pocket and flicks the sticker away. To prove that the egg is real, he grabs a glass from the table, and cracks the egg into it.

Magicians call the silk-to-egg trick a sucker trick—the magician does a trick and then apparently exposes its secret method, only to immediately show that the explanation was bogus. It’s similar to apparent repetition except now the audience thinks it knows how the trick is done. Sucker tricks are based on apparent exposure, rather than the actual exposure done by the Masked Magician.

MHR WTF !!!!! Cult of Judah propaganda at its height! Christopher Chabris and Daniel Simons in their 2010 book, The Invisible Gorilla, argue that you should rely on deep rational thinking, not your intuitions, to guide your decisions. For example, some parents choose not to vaccinate their children because of their deeply held intuition since when was it intuition? All of it was due to research and statistics...what a stupid obvious lie...how could it be intuition? Why would anyone link vaccination for typhus with autism? ...what rampant b.s...that vaccinations lead to autism. Chabris and Simons argue that the apparent link is no more than an illusory correlation. Rational examination reveals that there is no causal relationship between vaccinations and autism Really? How could ‘scientists’ who wrote this book on magic include such rampant propaganda? Paid to include it? An editor ‘suggested’ it???

In terms of its underlying brain mechanism, an intuition may result from weak neural activity in a given brain circuit. The activity is not strong enough to be accessible to your logical mind and drive your rational decision-making processes.

Brain signals can be weak for a number of reasons. The information coming from your sensory or memory systems is sketchy, as in black art, where the contrast between an object and the background is so low that the object is for all intents and purposes invisible.

Or brain signals may be weak because your attentional mechanisms suppress otherwise strong signals. For example, when Apollo Robbins pulls a quarter out of your breast pocket and moves it elegantly along an arc across your face, you follow it the way a tennis spectator follows the ball. You miss that Apollo simultaneously removes your reading glasses from the same pocket, directly under your nose, even though the image of his stealing hand is falling directly on your retinas.

You’re not only influenced by your biases, expectations, and assumptions, but you also actively suppress and ignore critical information. Conversely, the vaguest intuitions and gut feelings usually become accessible to your “rational” mind when you cast your attentional spotlight on them, making them more salient.
and easier to examine…MHR subtle cues / tells trigger your suspicion, though ‘can’t put finger on it at the time’…

when you are confronted with the uncertainty of a complex decision with lots of variables, you cannot always anticipate what will turn out to be most important factor, because of the suppressive and enhancing effects of your own attention. To overcome this, you must cast your attentional spotlight over each detail of the decision in turn, even if some initially appear insignificant or ephemeral. Reasoning things through is critical, but so is addressing your intuitions, so that your attentional spotlight can focus on each morsel and bring it forward for analysis. Only then will you be able to see the whole picture.

MHR people are lay, want what they want, decide to ‘overlook’ things that would prevent them having what they want e.g animal products, so U.K govt. ‘Brexit’ bill deprived animals, legally, of having any ‘feelings’ or ‘emotions’ or ‘being able to suffer pain’, as the German etc occupational governments just make ‘the holocaust’ etc ‘legal reality’…to avoid debates they could never win…

Magicians know that multitasking is myth and so they use a “divide and conquer” approach with attention. They split your attention so you cannot concentrate fully on any part of the stage at a given time. When you have a long list of things to do, you may feel tempted to do two or more tasks simultaneously, such as answering e-mails while attending a staff meeting. Chances are you will do neither task well. For your best performance, do one thing at a time.

MHR Bewilderment / confusion … set up controlled oppositions to divide your attention, ensure you can never stay focused on a topic, like the news…or Alex Jones suddenly ‘leading’ the conversation away from the crucial and valid point the guest just made…and sometimes both guest and Jones both working for same side … so your ‘trusted’ guest is just as likely to lead you astray, even though appears to be ‘battling’ with Jones i.e WWF…

Magicians know that memory is fallible and that the more time that has elapsed between the acquisition and the recovery of that memory, the less accurate it is. Know this about yourself and keep records of important information and conversations immediately after they happen. MHR which I used to do…take notes during and after interactions…and recall public service meetings where people were given the chance to ‘edit’ what they’d said, to ensure it was ‘accurate’ !!!!

Even though magicians make mistakes all the time, they set them aside and keep moving forward, and the audience hardly ever notices. You should do the same. MHR most of ‘embarassing yourself’ is due to calling attention to your ‘faux paux’ yourself…most people exaggerate in their own minds how ‘embarassing’ it really was for ‘others’…unless YOU draw attention to it, most people overlook
it...YOU are focused on you, they are NOT...remember that...musicians, comedians, public speakers, performers...you know what ‘perfect’ was to be, they don’t...they hear what you played, not what you didn’t ‘manage’ this time around...they don’t have the ‘ideal’ version in their heads...so they don’t compare what you do manage anywhere near as unfavorably as YOU do...

Some salespeople and psychics will “read your mind” by telling you exactly what you want to hear. That is why we have ‘pre-selected’ candidates and ‘Cambridge Institute’ research and ‘data mining’...so future Cult of Judah pre-selected candidates can tell you what the research has discovered (from your facebook, twitter, youtube, etc etc accounts) exactly what you, and people like you, want to hear...they actually will narrow it down to the ‘swing voters’ in a district, research what they ‘want to hear’, then feed their candidate /clients exactly that...to get the vote of the few thousand people in each electoral district that actually ‘decide’ the outcome (where rigging and ballot box manipulations haven’t already ensured victory for the preselected Cult of Judah nominee)...in some cases a few votes can decide...and those few voters will be approached directly...it is as if ‘the candidate was speaking directly to MY desires!!!’...of course what they say, and what they do, e.g no war, and immediately, we are at war...are totally different things...but once voted in, they have 4 or so years to continue the swindle...and who wants to admit their ‘own’ candidate is a fucker? How would that reflect on THEM, the voter???

Magicians use humor and empathy to lower your guard. If you sympathize with a magician, you will enjoy yourself more and be less vigilant about catching the secrets behind his magic. When negotiating interpersonal, professional, or business relationships, do as a magician and disarm with charm

Each spectator is a “telepath.” If you have something to hide from your business partner or spouse or a law enforcement agent, you will do best not to think about it while in their presence, lest your voice, gaze, or posture give you away.

Magicians know that attention enhances one small part of the world, while suppressing everything else. When making a difficult decision such as hiring somebody or taking a job offer, make a list of all the tidbits of information you have, no matter how unimportant they may seem. Then sequentially focus your full attention on each item and consider them each individually and fully. Carefully consider the ramifications of each fact and each feeling or intuition you may have. In turn, your attentional processes will enhance each particular issue, while suppressing all other information. Once you reach the end of the list, you will have a full picture based on both the hardcore facts and your gut feelings. You will be ready to decide

“the sky is filled with stars”: All celestial bodies, including galaxies, project dots of light smaller than any photoreceptor in your eye. But then how is it that some
stars appear bigger than others? The answer is that some celestial bodies are so bright that the extra light they produce reflects off the back of your retina. This reflection in turn excites many more photoreceptors in a larger circular area. The result is that bright stars seem larger.

Your left eye and right eye convey slightly different views of the world to your brain. If you close your left and right eyes in rapid succession and look at an object, you will see that the object shifts left to right. With both eyes open, your brain triangulates these two images into a single stereo image, which gives you a sense of depth. This is the principle behind stereo-depth illusions. The information from each eye remains segregated at the level of your optic nerves. We also know that visual information from your two eyes converges onto the same neurons in your primary visual cortex. This means that certain neurons in this brain region can respond to stimuli from either eye or both eyes. They are binocular.

But where in the brain does vision, based on both eyes, come together? Where is the depth of each object in the scene computed? Where do the images fuse into one seamless experience? We know these things must happen. Otherwise we would have double vision instead of depth perception. In our own labs, we have found that the processes used to derive stereoscopic perception must arise several levels above the primary visual cortex in the visual hierarchy. Finding the exact location is an area of active research. Stereopsis contributes to Vernon’s trick, too, because your two eyes see your card pushed into the deck from different angles. Your brain triangulates these two different retinal images to compute the depth of the card within the deck. It’s an illusion, but stereopsis confirms that the card is mid-deck.

"Dancing Bar" … read it again…did you ‘read’, like me, ‘dancing BEAR’ the first time?

Having a spotlight of attention dissociated from your center of gaze is that it enhances your ability to deceive others. Having a roving spotlight of attention that can point away from your direction of gaze allows you to hide what you are paying attention to (a potential food source, a desirable mate) from competitors. Marc Hauser at Harvard University has shown that monkeys will intentionally look away from hidden food sources in order to mislead other monkeys away from their stash.

Species use deception to maximize survival and reproductive success. Some birds will feign having a broken wing to lure a predator away from the nest: a form of misdirection. Such pretense of weakness is an old strategy in human warfare. Sun Tzu wrote in The Art of War more than two thousand years ago: “All warfare is based on deception. Hence, when able to attack, we must seem
unable; when using our forces, we must seem inactive; when we are near, we must make the enemy believe we are far away; when far away, we must make him believe we are near. Hold out baits to entice the enemy. Feign disorder, and crush him.” Other animals rely on camouflage and mimicry for deceptive purpose.

“Did you see the unicycling clown? Inattentional blindness while walking and talking on a cell phone,” Applied Cognitive Psychology

MHR people IMAGINE they are ‘paying attention’ e.g to the road conditions / driving, when literally impossible to attend to two different actions at same time…enter ‘trance’ for one…i.e fail to see what there…imagine you are ‘looking’ but you are NOT seeing…

The British mentalist and magician Derren Brown loves change blindness and has made several video clips of the trick in London settings, based on the original Simons videos

Researchers at the University of British Columbia in Vancouver—linguistics professor Bryan Gick and his student Donald Derrick—found that perception of certain sounds relies, in part, on being able to feel these sounds. Their paper was published in Nature, November 26, 2009.

Neuroscientists have identified at least fifty-four varieties of synesthesia:
'Lost' t.v show premise that if they didn’t push the button, the world would end, could ONLY be tested by waiting to see if the world ended...NO other way to know...!!!

Oxytocin causes us to empathize with others: A recent study indicates that oxytocin is not all touchy-feely. Experimental subjects who inhaled oxytocin while playing a competitive game in the laboratory experienced stronger feelings of envy and gloating than subjects exposed to a placebo. The researchers speculated that oxytocin might intensify social emotions in general, leading to generosity and trust in positive situations and to envy and gloating in competitive scenarios. MHR all back to David Hume i.e the ‘power’ of any emotion absorbs the power of the competing emotion, when one ‘tips the balance’ and is acted on / processed e.g self-interest Vs envy can lead to malice or goodwill, depending on which ‘wins the day’...so the power of ‘bad’ can enhance the ‘good’...if it wins...or vice versa...the bad becomes stronger...depending on the ‘dominant’ motive / emotion / feeling / desire / instinct / computation etc...

The sheikh nearly fainted: In 1856, Louis-Napoleon asked Robert-Houdin to convince certain Arab chieftains that the French war machine had magical powers. Religious tribal leaders called marabouts, who used magic to control their followers, had advised their chieftains to break with the French. Napoleon wanted Robert-Houdin to convince the Arabs that French magic was stronger than Arab magic—thus avoiding a war in Algeria. One evening in a stifling hot theater in Algiers, Robert-Houdin demonstrated his powers to the assembled chieftains. He produced a cannonball from a hat. He passed around an inexhaustible bottle that dispensed hot coffee. But his pièce de résistance was issued as a challenge: “I can deprive the most powerful man of his strength and restore it at my will,” said the French magician. “Anyone who thinks himself strong enough to try to experiment may draw near me.” A muscular man approached. “Are you very strong?” “Oh, yes.” “Are you sure you will always remain so?” “Quite sure,” the man replied. “You are mistaken,” said Robert-Houdin, “for in an instant I will rob you of your strength and you shall become as a little child.” Pointing to a small wooden box, he said, “Lift up this box.” The man lifted the box and laughed. “Is that all?” Robert-Houdin said “Wait!” and then, making an imposing gesture, “Behold.” He waved is magic wand. “Now you are weaker than a woman. Try to lift the box.” The man tried. He pulled with all his might. Sweat poured down his face. He tried to rip the box apart, to no avail. You see, the box contained a powerful electromagnet, which exerted a force unknown to the marabouts. Robert-Houdin then delivered an electric shock to the man, who ran screaming off the stage. With this display of French supernatural power, the rebellion was put down.

Contrary to the gambler’s fallacy, a roulette number that has occurred more often in the past may be more (rather than less) likely to recur in the future.
The reason is that no roulette wheel is perfectly manufactured. Real-life wheels are sometimes slightly biased, and they will have very small tendencies to land more on certain numbers. In the early 1990s, the Pelayos, a family of Spanish gamblers, secretly recorded roulette results for extended periods of time in Spanish, Dutch, and even Las Vegas casinos, and they successfully predicted that some numbers were slightly more likely than others to come up. They quickly amassed a small fortune, and just as quickly were banned from further casino play.

Magic secrecy fundamentally ended in the sixteenth century, with the publication of The Discoverie of Witchcraft. This book, which reveals that performance magic is achieved by natural means, was intended as an argument against the existence of witches, and as a protest against witch hunts. Today, the magic publishing industry is huge. Amazon.com currently sells 79,119 books on magic (almost seven times more than “romance novels,” currently 11,653 on the Amazon site). That’s not even counting the instructional DVDs. Many more YouTube videos disclose magic tricks and provide step-by-step instructions on how to perform them.

Crick, the codiscoverer of the double helix, wrote the first popular book on the subject of consciousness, The Astonishing Hypothesis. WTF why is David Hume totally neglected by psychology / cognitive science, when HE was the true founder of the ‘science’ cult of Judah in Rome much?
NOTES FROM 'BELIEFS: PATHWAYS TO HEALTH AND WELL-BEING BY ROBERT DILTS, TIM HALLBOM AND SUZI SMITH

MHR WHY NO-ONE EVER GIVES DAVID HUME THE CREDIT AS A FOUNDING FATHER OF PSYCHOLOGY I.E OUR ENTIRE NOTION OF 'REALITY' AS CONSTRUCTED ... THUS PRONE TO ABUSE BY DELIBERATE 'ENGINEERING'?

DEPRESSING TO READ THE USUAL LIST OF 'THANKS' FROM AUTHORS TO ALL THOSE WHO HELPED / CONTRIBUTED TO THEIR PROJECTS...WHEN I HAVE ZERO SUPPORT FROM ANYONE, EVER...IN ANY FORM...WHICH SHOULD HELP YOU COMPREHEND MY GENUINE INDEPENDENCE FROM ANY ESTABLISHED CULT, OR EMERGING CULT...ORGANISATION, SCHOOL OF THOUGHT, IDEOLOGY...LIKE DAVID HUME, PROBABLY THE MOST INDEPENDENT AND PRODUCTIVE THINKER OF ALL TIME, I DID THIS ALONE...WITHOUT ANY 'DEADLINES', APART FROM THE FEAR OF NOT BEING ABLE TO
FINISH 'IN TIME' FOR ANYONE TO BENEFIT...IT IS ALREADY TOO LATE TO PUBLISH...JUST LIKE DAVID HUME'S BEST WORK...DANGEROUS TO WRITE...AND WILL BE CENSORED, AND NEVER REWARDED EXTRINSICALLY...AND I DO NOT WANT TO BE A ROLE MODEL TO ANYONE ELSE, I WOULD NEVER WANT ANYONE TO LIVE MY LIFE...ENDURE IT...THIS WAS 'UNFAIR' AND 'INJUST' TO EXPECT ANYONE TO WORK FOR NOTHING BUT CRITICISM, REJECTION, ABANDONMENT, DISAPPROVAL, THREAT OF TORTURE AND IMPRISONMENT, FATES WORSE THAN DEATH...NO-ONE SHOULD BE EXPECTED TO SACRIFICE FOR OTHERS, WITH NO REWARD...SO AS A ROLE MODEL I FAILED...THERE MUST BE BALANCE IN EVERY LIFE BETWEEN THE SOCIAL AND THE PERSONAL, THE PRIVATE AND THE PUBLIC, THE SATISFACTION AND THE SACRIFICE / ENDURANCE...THE PLEASURE AND THE PAIN...WITH EACH BEARING A FAIR SHARE OF COSTS AND OF BENEFITS, OR REWARDS AND BURDENS...SO IN EVERY WAY I WILL FAIL...EXCEPT IN THE PRODUCT...THE ACTUAL MATERIALS I WRITE...THEY HAVE SUCCEEDED BEYOND MY WILDEST DREAMS...I NEVER EXPECTED TO BE SO CLEVER, TO BE SO LUCID, SO AWAKE...SO SHOCKINGLY AWAKENED IT IS JUST OVERWHELMING...TO BE IN REALITY...WHATEVER IT IS...AWAKE...AWAKE...SO PLEASE, IF YOU DON'T 'GROK' MY WORK NOW, PLEASE KEEP COPIES SAFE SOMEWHERE, SO MAYBE ONE DAY WHEN SOMEONE ELSE OTHER THAN ME AND DAVID HUME ARE READY, THESE MATERIALS WILL BE AVAILABLE, TO ALLOW A MASSIVELY STEEP LEARNING CURVE, AND SUDDEN EXPLOSION OF AWARENESS, OR AWAKENING...SOME TIME, AFTER THIS JEW WORLD ORDER HAVE EATEN ITSELF ALIVE...AND THE FEW REMAINING EMBERS OF HUMANITY MIGHT BE BLOWN BACK INTO LIFE, INTO FLAMES...SERIOUSLY, IF THE WORLD ONLY SAVED ONE SET OF ONE AUTHOR'S BOOKS, THEN I WOULD WANT IT TO BE MINE IF I WAS THE PERSON IN FUTURE INHERITING THAT ONE SET OF BOOKS...THAT IS WHY I WROTE THEM...AND WHY I NEVER ALLOWED MYSELF TO TAKE TOO MUCH PRIDE IN THEIR PRESENTATION...I COULD WRITE EVERYTHING SO MUCH BETTER...BUT THEN THE VOLUME WOULD BE SO REDUCED...I'D NEVER GET TO EXPRESS AND LEARN ALL THAT I COULD HAVE, BY BEING TOO PROUD TO PUBLISH MY 'DRAFTS'...SO I MISS OUT ON SHOWING YOU JUST HOW GOOD I CAN WRITE / COULD WRITE...MUST SACRIFICE MY PRIDE IN MY CRAFT...IN ORDER TO GET THE INFORMATION OUT...THE IDEAS...THOUGH IT IS A HOLISTIC WORK...AND MOST OF MY BOOKS ARE BEYOND MY EXPECTATIONS...SURPRISE ME...I DIDN'T EXPECT I HAD SO MUCH IN ME...BUT OF COURSE I DID EXPECT I WAS 'SPECIAL'...ENOUGH TO
SACRIFICE SO MUCH TO EXPRESS WHAT IT WAS THAT MADE ME SPECIAL...AN HONESTY....INTELLECTUAL HONESTY AND PURITY OF PURPOSE... BUT IT WILL ALL BE ABUSED BY THE CULTS...INTERPOLATED WITH GARBAGE...OR IGNORED AS 'TOO DANGEROUS AS TOO HARD TO CORRUPT'...LIKE HUME...I GUESS MY ONLY FRIEND ON THIS PLANET...MY ONLY EQUAL...BUT EVEN HE WAS FOR USURY, SO GO FIGURE...ANYWAY, HE WAS A SUCCESS, I WILL DIE A TOTAL FAILURE, IN THE WAY THE WORLD DEFINES IT...AND AS A TERRIBLE ROLE MODEL OF IMBALANCE I.E OF HAVING GIVEN TOO MUCH, SACRIFICED TOO MUCH, PAID TOO MUCH, WORKED TOO HARD, ACCEPTED TOO MUCH... BUT PERSONALLY, I FEEL PRIVILEGED TO HAVE HAD THE GREATEST LUXURY OF ALL...ACCESS TO INFORMATION...TIME TO DIGEST IT...TIME TO WRITE / COMPOSE... TO SAVE MYSELF IF NO-ONE ELSE...AND TO WORK FOR THINGS I BELIEVE IN...IN THAT WAY A REAL ROLE MODEL...WORKING TOWARDS A GENUINELY PRODUCTIVE MODEL PER SE..THE MODEL OF TRUTH, JUSTICE, BEAUTY...HONESTY...INTELLECTUAL COURAGE... F**K I HOPE I GET TO FINISH, AND 'PUBLISH', AND SOME OF THE 'GOOD PEOPLE' READ AND SHARE THIS...AND THEN I GET TO DIE BEFORE THEY CAN TORTURE ME FOR BEING SO GOOD, FOR OPPOSING THEIR EVIL.....ANYWAY, LETS HOPE DEATH IS THE END OF THIS TORTURE...'EVEN THIS MUST END'...BUT SAD, BECAUSE BILLIONS OF SENTIENT BEINGS WILL GO ON SUFFERING...WHY? BECAUSE OF THEIR DNA? MAYBE...IS THERE ANY FREE WILL? IS SCHOPENHAUER RIGHT? BUDDHA RIGHT? TO LIVE IS EVIL....L.I.V.E   E.V.I.L, I MEAN, LOOK AT IT, THE WORDS...REFLECTIONS...ANYWAY, I THINK WE CAN DO MUCH BETTER, WHATEVER OUR INHERITANCE...AND MY LIFE'S WORK HAS BEEN TO FIND THE PATH, BEAT IT, PUT UP SIGNPOSTS, AND HOPE SOMEONE WITH THE SAME CHARACTER / NATURE / ABILITY AND MOTIVES FINDS THE POWER TO REALISE THE EDEN PROTOCOLS...ETC...

WHAT WE BELIEVE / OUR BELIEF 'SYSTEMS' DEFINE OUR 'REALITY' AND EXPERIENCE OF WHATEVER IS 'OUT THERE' I.E ELECTROMAGNETIC SOUP... CULTS CONTROL OUR BELIEFS...IMPOSE BELIEFS...DEFINE OUR REALITY...PUNISH US FOR 'DIVERGING' FROM THEIR IMPOSED 'ORTHODOXY' / 'MODELS' / DOGMAS / ARTICLES OF FAITH... JUST LISTEN TO THAT RABBI.....A FUCKING DELUDED RETARDED IMPRISONED SOUL...GRASPING AT DOGMA AS THE ONLY WAY TO STOP HIM FALLLING INTO THE 'ABYSS' OF HONEST REALITY...UNKNOWINGNESS...WILLING TO ENSLAVE HIMSELF, AND
EVERYONE, TO AVOID HAVING TO 'COME DOWN' TO THE LEVEL OF THE SKEPTIC, FROM HIS 'PERFECT' DELUSION OF SIMPLISTIC ILLUSION...BUT WITH THE VERY WORST OF INTENTIONS...EVIL...HE IS PURE EVIL...THE SMUG, SELF-SATISFIED FACE OF PURE EVIL...NOT PERSONAL MALICE EVEN, WHICH IS EVIL ENOUGH, BUT A BUREAUCRATIC CULT EVIL...A FORMULA FOR EVIL...FOR SLAVERY...OF EVERYONE...COS SOMEONE SAID SO...THEY EVEN WROTE IT DOWN IN A BOOK...FUCKING RETARD...SLAVE...

BELIEFS IMPACT MOTIVATIONS AND BEHAVIORS / ACTIONS...SO THEY ARE AS REAL AS ANYTHING...BUT PURELY SUBJECTIVE, AND TOTALLY 'IN OUR HEADS'...IMAGINE THAT...THE MOST INSUBSTANTIAL THING IN 'REALITY' LEADS TO MASS MURDER, MISERY, ENSlavEMENT, DESTRUCTION, TORTURE...MERE 'IDEAS' WITH ZERO 'SUBSTANCE' RESULT IN THE GREATEST CATASTROPHES WE'VE EVER SUFFERED...BELIEFS...SO SURELY WE MUST LEARN HOW TO AVOID BEING PROGRAMMED / TRICKED / CONDITIONED....JUST AS THE SLAVE MASTERS SEEK TO LEARN HOW TO DO THESE THINGS....???

BUT OF COURSE YOU IMAGINE YOUR 'BELIEFS' ARE SIMPLY 'REALITY'...FUCK, YOU'RE TOO CLEVER TO EVER HAVE BEEN TRICKED, EVEN AS A BABY...RIGHT...WE'RE ALLFUCKING GENIUSES WHO CANNOT BE DECEIVED BY ANYONE...WE 'KNOW' WHAT WE 'KNOW' TO BE TRUE...FUCK NO WONDER WE ARE ALL SLAVES...

GETTING 'BELIEFS' TO CORRESPOND MORE CLOSELY WITH 'OBJECTIVE REALITY' WHATEVER THAT IS, WILL MEAN OUR ACTIONS ARE MORE APPROPRIATE AND PRODUCE MORE DESIRABLE OUTCOMES...OUR BELIEFS PRODUCE OUR ACTIONS WHICH PRODUCE OUR MAN-MADE ENVIRONMENT AND THUS OUR OBJECTIVE REALITY...WAR IS A DIRECT OUTCOME OF BELIEFS...AND NOTHING HAS HARMED US MORE, COST US MORE, AND CONTINUES TO, AND WILL IN FUTURE COST US MORE, THAN WAR...AND WHY DO WE HAVE WAR? BECAUSE A FEW POWERFUL PEOPLE WANT TO PROFIT FROM IT, TO GAIN CENTRALISED POWER FOR THEIR CULTS...AND OTHERS JUST 'GO ALONG TO GET POWER / MONEY FOR THEMSELVES...AND SOME HUMANS LOVE WAR...AND FORCE THE REST OF US TO FIGHT AND DIE IN THE WARS THEY WANT...WHILE MANY IDEALISTIC PEOPLE THINK THEY ARE FIGHTING FOR SOMETHING POSITIVE...THAT BELIEF IS IN MODERN WAR THE MOST DANGEROUS...THE ILLUSION...THE PROPAGANDA...THE IDEA OF 'JUST WARS' AND 'THREATS'...911 WAS...
OBJECTIVE, BUT THE MOTIVE WAS TO PRODUCE A BELIEF THAT
WAR WAS NECESSARY, TO 'PROTECT' OUR FREEDOM, THAT WE
NEED TO GIVE UP OUR FREEDOMS TO PROTECT THEM...TO GIVE UP
EVERYTHING TO PROTECT OURSELVES FROM 'TERROR'...WHEN IT IS
OUR OWN GOVERNMENTS THAT CARRY OUT THE TERROR, AS
MACCHIAVELLI SUGGESTED, SO WE RUN TO THEM FOR
'PROTECTION'...AND SUBMIT TO THEIR AUTHORITY / RULE /
TYRANNY AS THE LESSER EVIL...WHEN IT IS THE GREATEST
EVIL....THERE BEING NO OTHER COMPARABLE EVIL....AS IF TOTAL
TRYANNICAL CENTRALISED GOVT WAS THE ONLY ALTERNATIVE
TO TOTAL ANARCHY...AS IF THERE WAS NO 'MIDDLE POSITION', NO
'MODERATE' POSITION...A GOVT. WITH VERY LIMITED POWERS TO
LIMIT OUR FREEDOMS IN THE MOST LIMITED WAYS E.G TO STOP
ONE PERSON KILLING ANOTHER, OR STEALING....GOVERNMENT IS
THE MASS MURDERER, AND CONTINUAL THIEF...SUPPOSED TO
PROTECT US FROM EACH OTHER...BUT REALLY JUST GIVING HTE
WORST AMONG US UNLIMITED POWER TO DO THE VERY WORST ...
WORSE THAN WE WOULD EVER HAVE DONE TO EACH OTHER...DUE
TO THE LIMITS ONE PERSON HAS TO THEIR POWER TO DO HARM...
INSTEAD WE EMPOWER A FEW WITH UNLIMITED POWER TO DO
UNLIMITED HARM...AND TO PROTECT US FROM THEMSELVES...THE
ULTIMATE 'PROTECTION RACKET' ...WHICH ALL CULTS ARE BASED ON...INVENT 'HELL' AND 'HEAVEN', THEN THREATEN WITH HELL,
AND OFFER HEAVEN, ... ALL YOU GOTTA DO IS SUBMIT FOR YOUR
ENTIRE LIFE ON EARTH...TO AVOID ONE, AND ENJOY THE
OTHER...BUT THEY ARE ONLY 'BELIEFS'...NOT OBJECTIVE REALITY
IN ANY FORM...AND YOUR 'ENTIRE LIFE' IS HTE ONLY 'OBJECTIVE
REALITY' YOU SHOULD BE CONSIDERING...BUT THEY KILL YOU,
SAY IT WAS THE 'TERRORIST', AND THE ONLY WAY TO PROTECT
YOU FROM THIS 'TERRORIST' IS TO GIVE THE GOVT, THE REAL
TERRORIST, UNLIMITED POWER...THAT IS THE JEW WORLD
ORDER...THE CULT OF JUDAISM...HAVING WORKED THROUGH THE
RELIGIONS OF JUDAISM, CHRISTIANITY, ISLAM, MARXISM,
HOLOCAUSTINAITY, AND NOW MAN MADE GLOBAL CLIMATE
CRISIS... ALL TOOLS OF THE CULT OF JUDAISM...AND THEY WILL
SOON HAVE TOTAL CONTROL...WHOEVER THEY REALLY ARE...WHY
SHOULD I CARE WHO THEY ARE...I CARE ONLY WHAT THEY INTEND
DOING, AND WILL DO, BASED ON WHAT I KNOW THEY HAVE
ALREADY DONE... ANTI-SEMITISM IS THE NOTION THAT SOMEONE
HATES THEIR SLAVE MASTER / MURDERER / RAPIST JUST BECAUSE
THEY (THE PERPETRATOR OF THE HARM) JUST HAPPEN TO
IDENTIFY WAS BEING 'JEWISH'... TO CALL THEMSELVES 'JEWISH',
AND NOT BECAUSE OF THE HARM THEY ARE DOING, AND PLAN TO
DO... IT WAS INVENTED TO STOP YOU BEING ABLE TO IDENTIFY
OUR COMMON ENEMY...THE CULT OF JUDAISM...THE JEW WORLD ORDER...OUR OWN OCCUPATIONAL GOVT...IT CENTRALISED ALL POWER IN A FEW HANDS, THEN CORRUPTED AND 'DIRECTED' AND 'ADvised' AND 'MANIPULATED' THOSE FEW, TO GAIN TOTAL POWER OVER ELECTED LEADERS THEY PRE-SELECTED, THEN LET US CHOOSE FROM AMONG, JUST LIKE IN THE JEW.S.S.R AND CHINA...THEY PUT ON A GOOD WORLD WRESTLING FEDERATION STYLE SHOW...WHEN THEY ARE ALL ACTORS, WORKING FOR THE SAME CIRCUS MASTERS...MOST REALISE THIS, AND PLAY ALONG...SOME HAVE NO IDEA, AND WE CAN BE SO STUPID AS TO ELECT SUCH IDIOTS??? ANYWAY, MOST PEOPLE ARE IN THEIR OWN CULT, AND WOULD LOVE THAT THEIR OWN CULT, THEIR OWN 'KIND' GAIN ABSOLUTE POWER...SO THEY ARE GETTING WHAT THEY WANT, AND DESERVE, ONLY NOT IN THE WAY THEY EXPECTED...ALL SEEKING TO BECOME SLAVE MASTERS, ALL SUPPORTED SLAVERY, ONLY TO WAKE UP ONE DAY AND REALISE THAT THE PRISON SYSTEM THEY WERE BUILDING, THE SLAVERY SYSTEM, WAS NOW THEIR OWN HOME, THEIR OWN SLAVE MASTER, WITH THEM AS PRISONERS, AND SLAVES...FOR AS YOU DO UNTO OTHERS, AS YOU SEEK TO DO UNTO THEM, SO SHALL BE DONE UNTO YOU... IT IS REALLY YOU DOING IT TO YOURSELF...SO DON'T COMPLAIN...GIVE UP SLAVERY...ETC...

if people really believe they can't do something, they're going to find an unconscious way to keep the change from occurring. They'll find a way to interpret the results to conform with their existing belief.

WE CAN PROVE THE HOLOCAUST IS PROPAGANDA, NEVER HAPPENED, THAT 911 HAD NOTHING TO DO WITH PASSENGER AIRLINERS BEING HIJACKED BY TERRORISTS, THAT THE U.S S LIBERTY WAS A DELIBERATE FALSE FLAG WITH THE U.S PRESIDENTS FULL COMPPLICITY, THAT A SMALL GROUP OF 'JEWS' EFFECTIVELY RULE THE WORLD, OR SIMPLY THAT JEWS OWN MOST OF THE MASS MEDIA, WORLD FINANCIAL ORGANISATIONS ETC...BUT PEOPLE WILL JUST 'REJECT THE FACTS / OBJECTIVE REALITY...AND GO ON BELIEVING WHAT THEY ALWAYS HAVE BEEN TOLD TO BELIEVE / CONDITIONED TO BELIEVE...AS IF THEY WERE THEMSELVES CULT MEMBERS ... SO OF COURSE THE CULT MEMBERS WILL FIND WAYS TO 'DISCOUNT' AND 'REJECT' AND 'DENY' ANY FACTS I PRESENT...I MEAN, TO BE FAIR, WHEN YOU ARE IN THE CULT, YOU FEAR THIS GOD CHARACTER, AND ITS HARD TO JUST START BLASPHEMING AND BEING 'HERETICAL' AND SIMPLY ACCEPTING THAT THERE NEVER WAS ANY COMPELLING OR EVEN SPURIOUS EVIDENCE EVER GIVEN FOR THIS CHARACTER'
GOD'S EXISTENCE...AND MOST OF YOU WON'T BE ABLE TO 'KICK THE HABIT' OF 'BELIEVING' THAT THIS GOD CHARACTER IS 'REAL'...WHEN IT IS SUCH AN ABSURD BELIEF TO ANYONE 'FREE' OF THE CULT MENTALITY...I MEAN REALLY 'FREE'...NOT JUST IMAGINING THEY ARE 'FREE' ... BUT REALLY FREE ENOUGH SO THAT THEY HAVE ZERO KNEE JERK REACTIONS / FEARS ...

YOUR SUBCONSCIOUS AUTOMATICALLY RE-ORGANISES YOUR SENSE PERCEPTIONS, FILTERS, BRAIN ACTIVITY, ETC TO ACHIEVE THE 'PERCEPTIONS' AND 'ACTUAL BELIEFS' (AS OPPOSED TO YOU CLAIMING TO BELIEVE IN SOMETHING, BUT YOUR BEHAVIOR CLEARLY INDICATING THIS IS SELF-DECEPTION) ... SO IF YOU SECRETLY COULDN'T BARE A UNIVERSE WITHOUT SOME 'GOD' DIRECTING IT, AND SOME 'HEAVEN' AWAITING YOU AFTER DEATH, OR SOME 'HELL' AWAITING YOUR ENENIES, THOSE YOU ENVY ETC, THEN YOUR MIND WILL ARRANGE YOUR PERCEPTIONS AND 'REASONING' TO ACCOMODATE YOUR HEART FELT DESIRE I.E YOU WILL 'FIND' ALL SORTS OF 'COMPELLING' EMOTIONAL / EXPERIENTIAL JUSTIFICATIONS...YOU MIGHT EVEN BECOME A 'MIRACLE' YOURSELF...JUST TO MANAGE TO HANG ONTO A BELIEF YOU REALLY COULDN'T DO WITHOUT...WHICH IS WHY I DIDN'T PUBLISH 'RELIGION' UNTIL I HAD FOUND THAT I COULD HONESTLY OFFER GENUINE LOGICAL / RATIONAL HOPE I.E THAT LIFE WAS CLEARLY ETERNAL...ETC...

BASICALLY CULT LEADERS OFFER BENEFITS, AND THREATEN PUNISHMENTS...AND ACTUALLY TORTURE PEOPLE / KILL PEOPLE, ENTIRE FAMILIES, ENTIRE CITIES, THAT DON'T 'GO ALONG WITH THEM'...THE MOST BASIC THING THE CULT OF JUDAISM OFFERS IS THE PROMISE OF SOME PERSONAL GOD WHO IS JUST AS MUCH A FUCKER AS YOU ARE I.E TOTALLY HUMAN GOD, LIKE A TERRIBLE TWO YEAR OLD THROWING A TANTRUM, ONLY ONE WHO PROMISES TO TORTURE ALL YOUR ENEMIES FOR YOU, FOR ETERNITY, OFFERS YOU HEAVEN, AND ALSO THE RIGHT TO RAPE, ENSLAVE, STEAL FROM, AND IF YOU LIKE MURDER, THE MAJORITY OF PEOPLE ON THIS PLANET, NAMELY THOSE NOT IN THE CULT...PRETTY HARD FOR THE MAJORITY OF PEOPLE TO RESIST SUCH AN OFFER...AND THOSE WHO DO, YOU JUST THREATEN TO SHUT UP OR WE'LL KILL / RAPE / ENSLAVE / TORTURE YOU ETC... AS MOSES DID FROM THE VERY BEGINNING WITH HIS MASSACRE OF HIS OWN PEOPLE WHO WOULDN'T 100% SUBMIT TO HIS ARBITRARY WHIMS REGARDING HOW 'GOD' WAS TO BE WORSHIPPED / APPEASED / APPEALED TO ...
THEN THE CANANNITES WHO HAD NEVER DONE ANYTHING TO HARM MOSES OR HIS PEOPLE, WERE GENOCIDALLY SLAUGHTERED, WHY? BECAUSE MOSES WANTED THEIR STUFF FOR HIS CULT...SO HE TOLD HIS CULT MEMBERS 'GOD COMMANDS' IT...ETC...ETC...THAT IS YOUR 'ETHICS' AND 'MORALITY' OF THE CULT OF JUDAISM...THAT PEOPLE SEEM SO IN LOVE WITH...ONLY A CULT INDOCTRINATED MEMBER COULD EVER HAVE ANYTHING BUT REPUGNANCE FOR THE CULT OF JUDAISM...AT LEAST ITS LATER OFFSHOOTS HAD A LITTLE ETHICS / MORALITY IN THEM, BUT STILL THEY WERE POISONED AT THE SOURCE...BY THEIR ROOTS IN JUDAISM...IN THE CULT...

simple NLP formula for change: Present (problem) state plus resources equals desired state.

Present State + Resource = Desired State

THE PROBLEMS IS THAT THE RESOURCES HAVE BEEN CRIMINALISED / CENSORED / DEMONISED ... LIKE THE CURE THAT IS BANNED, SO THAT THE DISEASE CAN SPREAD, AND REMAIN VIRULENT...

interferences are beliefs that need to be integrated or dismissed ... often lack of 'data' e.g belief X gives a sense of security / comfort / knowing...and a void is scary...which is why we latch onto any old belief in the first place, that is offered by the cult we grow up in...whether of nationalism, some religion, some 'ethnicity', some 'tradition'...

MHR WE KNOW NOTHING, ALL WE HAVE IS BELIEFS, WHICH WE ARE MORE OR LESS CERTAIN OF...WHERE THERE IS NO COMPETITION, THEN THE WEAKEST RANDOM BELIEF BECOMES THE STRONGEST ONE, AND THUS WHAT WE 'BELIEVE', EVEN IF WE BARELY BELIEVE IT AT ALL E.G 'GOD' ... IN THE ABSENCE OF ANY ALTERNATIVE BELIEF TO HOLD, AND FEARING THE 'ABYSS' OF 'NO BELIEFS' E.G ZEN / HUMEAN SKEPTICISM / BEING LEFT ADRIFT IN A VOID, FALLING DOWN A DARK ABYSSS, THE BELIEF OFFERED, NO MATTER HOW ABSURD, REPUGNANT, SILLY, RIDICULOUS, AT ODDS WITH PERSONAL EXPERIENCE, WILL BECOME OUR BELIEF AND WHAT WE 'KNOW' TO BE TRUE...

HUMAN NATURE IS SUCH THAT THE SUBCONSCIOUS WILL TRY TO 'JUSTIFY' ANY EXISTING BELIEF...AND TEND TO FEND OFF ANY ALTERNATIVES, TO AVOID THE HARD WORK OF TOTALLY
RECALIBRATING OUR 'BELIEF SYSTEMS'...WE SEEK THAT WHICH JUSTIFIES / SUPPORTS EARLIER BELIEFS...FROM ALL THE LATER OPTIONS AND POTENTIAL SENSE IMPRESSIONS...

N.B THAT FILTERS TEND TO FILTER OUR, SIMPLIFY, BUT THIS CAN HELP US SEE, BY REMOVING A LOT OF DISTRACTING DATA...SO NOT ALWAYS BAD...THE POINT IS TO BE FREE TO PUT ON, THEN TAKE OFF, A RANGE OF FILTERS, RATHER THAN BE STUCK WITH THE CULT FILTERS WE INHERITED...YES ALL RELIGIONS ARE CULTS...THE MORE 'EXTREME' AND 'FUNDAMENTALIST' BEING MORE OBVIOUSLY SO, WITH PEOPLE KILLING THEIR OWN CHILDREN FOR 'VIOLATING' CULT RULES, OUT TO THE EDGE WHERE PEOPLE JUST SUPERFICIALLY IDENTIFY / AFFILIATE AS A 'LAPSED CATHOLIC' OR 'LAZY CHRISTIAN' OR 'MODERATE MUSLIM' OR EVEN 'SECULAR JEW', BECAUSE AFTER ALL 'JEWISHNESS' IS PURELY BASED ON RELIGIOUS TEXTS AND RELIGIOUS FOODS AND HOLIDAYS AND CELEBRATIONS AND RITUALS, I.E TRACE BACK TO / REDUCE TO THE CULT PRACTISES AND BELIEFS....NO-ONE 'BELIEVES' SOMETHING WITH ZERO SENSE IMPRESSION INPUT E.G OBJECTIVE SENSORY IMPRESSIONS I.E 'EVIDENCE OF THE SENSES' UNLESS IT DERIVES FROM SOME CULT DOGMA E.G MY ANCESTORS ESCAPED SLAVERY IN EGYPT...THERE IS ZERO RECORD OF THIS, AND NOTHING OTHER THAN 'BELIEF' AND 'ACCEPTANCE OF A CULT DOGMA' TO JUSTIFY IT...

COMPUTER ALGORITHMS ARE 'FILTERS' E.G 'FILTER OUT ALL EXTRANEOUS DATA'...WHAT IS 'EXTRANEOUS' BEING THE KEY TO UNDERSTANDING THE FILTER...I.E TAKE OUT 'ANYTHING THAT CONTRADICTS MY THEORY' OR 'REMOVE FROM HISTORY TEXTS ANYTHING THAT CONTRADICTS MY DOGMATIC / GIVEN / RECEIVED VERSION OF HISTORY'...

THEN THERE IS THE 'FILTER' THAT AUGMENTS I.E ADDS DATA, SUCH AS A 'INFRA RED' NIGHT VISION FILTER, THAT LETS YOU 'SEE' THE 'HEAT GIVEN OFF' FROM AN OBJECT, AND THUS FORM AN IMAGE OF IT BASED ON THIS...

OR A FILTER THAT TAKES DATA WE HAVE NO EXISTING SENSORY IMPRESSION ORGANS / DECODING SYSTEMS FOR E.G WE CAN ONLY 'HEAR' AND 'SEE' AND 'SMELL' A LIMITED BANDWIDTH OF FREQUENCIES...BUT WE CAN EXTEND THESE BANDWIDTHS...E.G SONAR...BATS AND DOLPHINS CAN 'PING' OBJECTS AND LOCATE THEM, WE NEED 'AUGMENTED' TECH TO DO THIS...WE CAN THEN REPRESENT THINGS WE HAVE NO SENSORY PERCEPTION ORGANS
FOR, IN WAYS WE CAN PERCEIVE...LIKE DECODING THE BINARY O'S AND 1'S OF ALL DIGITAL SIGNALS INTO SOUNDS, SIGHTS, HAPTIC / TOUCH IMPRESSIONS... SO WE CAN 'SEE' THINGS IN OUTER SPACE WITH OUR EYES, THOUGH WHAT WE DID WAS DECODE MUCH HIGHER / LOWER FREQUENCIES WE COULD NEVER 'PERCEIVE' WITH OUR EYES, INTO VISUAL REPRESENTATIONS... SO MODERN 'TELESCOPES' DON'T SIMPLY COLLECT LIGHTWAVES AND PRESENT THEM AS IMAGES, THEY COLLECT ALL MANNER OF FREQUENCY RANGES, THEN ENCODE THEM AS IMAGES... REMEMBER THAT WHEN YOU SEE 'IMAGES' TAKEN BY SPACE TELESCOPES, OR EVEN GOOGLE EARTH IMAGING, WHAT YOU ARE SEEING IS NOT AN ISOMORPHIC REPRESENTATION... YOU ARE NOT SEEING WHAT YOU WOULD SEE IF YOU WERE IN A SATELLITE, ORBITING THE EARTH, OR MARS ETC... IT IS A CONSTRUCT... AN EXTENSION OF THE WAY OUR OWN BRAINS WORK... AUGMENTED TECHNOLOGICALLY... EXTENDED... TO 'PERCEIVE' FREQUENCY BANDWIDTHS NORMALLY OUTSIDE OUR NATURAL RANGE OF PERCEPTION...

AND WHILE ON THE SUBJECT OF 'FILTERING OUT' STUFF... GOOGLE AND NASA DO THIS ALL THE TIME... THEY ADD LAYERS OF 'OPAQUENESS' OR 'CUT AND PASTE' REGIONS ON TOP OF EACH OTHER, TO HIDE THINGS FROM YOU... COMPARE OLDER LOW RESOLUTION IMAGES WITH MORE RECENT ONES, THAT SHOULD HAVE HIGHER RESOLUTION, AND YOU WILL SEE THINGS HAVE BEEN 'DISSAPPEARED' DELIBERATELY... SO DON'T TRUST NASA OR GOOGLE, OR ANYTHING YOU ARE PRESENTED WITH AS 'REALITY'... REMAIN SKEPTICAL... AND LISTEN TO THE CRITICS... IT IS OFTEN HIT AND MISS, SO KEEP A HEALTHY SKEPTICISM... BUT PAY ATTENTION... AND FORM YOUR OWN JUDGEMENTS... LOOK FOR PATTERNS... DON'T ACCEPT ANYTHING WITHOUT SKEPTICISM... OFTEN THE PROCLAIMED 'REVOLUTIONARIES' AND 'CRITICS' ARE REALLY WORKING FOR THE SAME PEOPLE... JUST MISDIRECTING YOU, TAKING UP YOUR PRECIOUS TIME AND ATTENTION, WASTING IT, SENDING YOU ON WILD GOOSE CHASES,... ANYONE WITH A BIG BUDGET AND GREAT PRESENTATION SHOULD BE ESPECIALLY WORTHY OF SKEPTICISM, BUT TODAY THE ENEMY EVEN PUT IN LOW BUDGET, LOW RES. CONTROLLED OPPOSITION... AND HELP 'USEFUL IDIOTS' TAKE UP YOUR PRECIOUS TIME AND ATTENTION...
IDEOLOGIES CAN BE CULTS... BUT THEY CAN ALSO BE PRODUCTIVE FILTERS... TO BE TAKEN OFF AND REPLACED AND COMPARED WITH OTHER SUCH FILTERS... RATHER THAN 'GLUED ON' I.E BECOMING 'CULT' DOGMAS, THROUGH WHICH ALL EXPERIENCE IS FILTERED / DISTORTED / SELECTIVELY ATTENDED TO ETC...

USED PRODUCTIVELY, THEY ARE LIKE THE INFRA-RED GOGGLES YOU PUT ON AT NIGHT, OR IN THE DARK, BUT TAKE OFF LATER... OR ALGORITHMS PLACED ON DATA SETS TO 'DISCOVER' PATTERNS IN THE HUGE CHAOTIC RANDOMNESS OF 'TOO MUCH' DATA... TO 'FILTER OUT' THINGS WE SUSPECT ARE DISTRACTIVE ... NOT OF INTEREST ... NOT RELEVANT E.G THE FUNDAMENTAL PROBLEM OF 'THEORY' AND 'MODELLING'... TO REDUCE THE DATA SET TO MANAGEABLE SIZE... TO FOCUS ON PARTICULAR VARIABLES / ASPECTS / DIMENSIONS / BANDWIDTHS / ELEMENTS / PROPERTIES... NECESSARY AND SUFFICIENT ETC... SUCH FILTERING 'MODELS' REDUCE 'USER BURDEN' AND HELP US 'SEE' THINGS WE'D OTHERWISE NOT NOTICE, GIVEN AN EXCESSIVE BURDEN OF DATA PROCESSING I.E TOO MUCH DATA ... TOO MANY THINGS TO ATTEND TO AT ONCE... SO 'MARXISM' IS A USEFUL FILTER / IDEOLOGY TO 'PUT ON' FOR A TIME, TO FILTER OUT A LOT OF WHAT MIGHT BE 'NOISE' IN TERMS OF SOCIAL JUSTICE, HISTORICAL EVENTS, ETC... AS LONG AS YOU REMEMBER YOU ARE WEARING A FILTER, AND AS LONG AS YOU ARE FREE TO TAKE IT OFF, AND PUT ON OTHER FILTERS, USING THEM ALL AS MERE TOOLS, AS MEANS TO YOUR ENDS, RATHER THAN ENDS IN THEMSELVES AS 'THE FINAL WORD' OR 'THE DEFINITIVE REALITY' OR 'DOGMA' OR 'ARTICLES OF FAITH', OR 'CULT BELIEFS' ... THEN ANY FILTER / IDEOLOGY, EVEN THE MOST HUMBLE OF 'MODERATION IN ALL THINGS' (INCLUDING MODERATION, WHICH MOST FAIL TO SEE I.E BECOME EXTREMISTS, REJECT ALL 'EXTREMES' I.E LIVE LUKE WARM, WE MUST 'WELCOME DIONYSUS INTO OUR CITY REGULARLY ETC') ... CAN BECOME A DOGMA / CURSE / FIXED WAY OF SEEING AND BEING / A PRISON/ A CULT MENTALITY... A CONTROL GRID... A MENTAL PRISON... A CONTROL SYSTEM...

PEOPLE USE WORDS LIKE MODELS, PARADIGMS, IDEOLOGIES, RELIGIOUS BELIEFS, OR JUST 'BELIEF SYSTEMS' TO REFER TO THESE FILTERS. THE THING THAT MAKES YOU A CULT MEMBER, THAT DISTINGUISHES YOU FROM A 'FREE' PERSON, IS WHETHER YOU FEEL FREE TO CHANGE GOGGLES / FILTERS / MODELS ... WHETHER YOU ARE ABLE TO OVERCOME THE DISCOMFORT ASSOCIATED WITH DOING THIS... TAKING OFF YOUR GENERAL 'COMFORTABLE' GOGGLES, THE ONES YOU GREW UP IN, CAN'T REMEMBER EVER
NOT WEARING (THE FIRST STEP WAS TO REALISE YOU ARE WEARING GOGGLES AT ALL, THAT THERE ARE OTHER GOGGLES THAT MIGHT GIVE A MORE ACCURATE / PRODUCTIVE / GENERATIVE / SATISFYING OUTLOOK / DEFINITIONS / EXPERIENCES / INTERPRETATIONS ETC OF LIFE...AND PUTTING ON OTHER PEOPLE'S GOGGLES / FILTERS ... BEING FREE TO DO THIS IS THE SIGN OF WHETHER YOU ARE A CULT MEMBER OR A FREE PERSON...HOW MUCH POWER A CULT HAS OVER YOU...Anyone who was once in a CULT RULED BY FEAR, WHICH THEY ALL ARE, OF SOME 'GOD' OR 'HELL' OR 'PUNISHMENT' WILL ALWAYS FEEL A TWinge WHEN CONTRADICTING ANYTHING THEIR CULT TRADITIONS / BELIEFS / RITUALS / PRACTISES / DEFINITIONS ETC WOULD DEFINE AS 'BAD', AS 'EVIL', AS 'WORTHY OF AN ETERNITY OF SUFFERING IN HELL FOR TRANSGRESSING / DOING / CONSIDERING EVEN DOING ETC...

MY BOOKS ARE THE OPTIMAL EDUCATION... THEY OFFER INSIGHTS INTO ALL THE FILTERS / IDEOLOGIES / RELIGIONS / CULTS / MODELS / BELIEF SYSTEMS POSSIBLE...SO THAT YOU BECOME FREE TO PICK AND CHOOSE FROM EACH...AND CONSTRUCT YOUR OWN, WHILE NEVER IDOLISING ANY MODEL AS 'THE END OF HISTORY' AND 'THE TRUTH' OR 'THE DEFINITIVE ARGUMENT' OR 'GOD' OR 'ANY FIXED REPRESENTATION / IDEA E.G IN THE FORM OF A STATURE, OR MENTAL IDOL I.E AN IDEOLOGY / SCHOOL OF THOUGHT / DOGMA / ARTICLE OF FAITH...

IN FACT ANY TIME ANYONE EVER SPEAKS OF 'FAITH' YOU ARE DEALING WITH A CULT...LEAVE YOUR BRAIN AT THE DOOR...NEVER REFLECT OR EVEN THINK ABOUT WHAT YOU ARE TOLD...JUST ACCEPT...SUBMIT...ACQUIESCE...TURN OFF YOUR CRITICAL FACULTIES....THIS OF COURSE OFFERS A POWERFUL SENSE OF 'LIBERATION' AT FIRST...FREEDOM FROM THE RESPONSIBILITY TO HAVE TO SOLVE THE PUZZLES OF LIFE...CERTAINTY...LIKE ANY DRUG...VERY POWERFUL...COMFORTING...A PLEASURABLE RELEASE FROM THE TURMOIL AND STRESS OF 'SEEKING'....YOU HAVE FOUND THE ANSWER...WHew...WHAT A RELIEF...BUT SOON YOU WILL FIND IT COMES AT A PRICE...THE PRICE OF FREEDOM...YOU ARE GIVEN 'THE ANSWER' ALONG WITH A WHOLE LOT OF RULES YOU MUST SUBMIT TO...ESPECIALLY YOU MUST GRANT THE CULT LEADER THE AUTHORITY OF A GOD, FOR HE CLAIMS TO SPEAK FOR A GOD, AND THAT IS SOMETHING YOU MUST GO ALONG WITH...CONVINCE YOURSELF IS TRUE...ESPECIALLY WHEN THAT PRIEST, IN THE NAME OF 'GOD', ORDERS YOU TO KILL YOUR OWN CHILDREN, TO HAND OVER ALL YOUR WEALTH, TO GO AND KILL PEOPLE FROM ANOTHER 'CULT', OR PEOPLE NOT YET ENTHRALLED BY YOUR OWN
CULT, TO FORCE THEM TO SUBMIT TO YOUR CULT LEADERS, AND TO JOIN YOUR CULT...IN FACT CULTS ARE NOTHING MORE THAN A WAY TO ENSLAVE THE MAXIMUM NUMBER OF PEOPLE USING THE SMALLEST FORCE I.E THEREBY ALLOWING THE SMALLEST NUMBER OF PEOPLE, VIA A STRICT HIERARCHY OF BENEFITS THAT 'TRICKLE DOWN' THE POWER PYRAMID, TO RULE OVER THE GREATEST NUMBER OF PEOPLE...AND ALL CULTS SEEK TOTAL WORLD DOMINATION...AND THE CURRENT CULT, THE ONE THAT HAS BEEN AT WORK FOR THE LONGEST, CONSISTENTLY BUILDING POWER, TREATING ITS MEMBERS AS DISPOSABLE MEANS TO THEIR ENDS, AND ADOPTING ENTIRE NATIONS / CONVERTING ENTIRE PEOPLE'S E.G KHAZARS, TO ITS CULT, IS THE CULT OF JUDAISM....WITH ITS 'SUBSIDIARY' CULTS CHRISTIANITY, ISLAM, MARXISM, MAN-MADE GLOBAL CLIMATE CRISIS, AND PROBABLY EVEN NAZISM ITSELF...GIVEN THAT THE CURRENT POWER BASE OF THE CULT OF JUDAISM IS ASHKEDNAZI, BASED EARLIER IN RUSSIA, IN THE JEW.S.S.R, AND NOW IN THE JEW.S.A, THE E.JEW, AND THE 'RUSSIAN' FEDERATION...IT IS SAFE TO ASSUME THAT NAZISM WAS SUPPORTED AND CO-OPTED BY THE JEW WORLD ORDER, THE CULT OF JUDAISM, TO SERVE ITS ENDS...EVEN IF HITLER HIMSELF WAS GENUINELY FIGHTING TO FREE THE WORLD OF THE CURSE OF THIS CULT...

MOST PERSONAL 'PROBLEMS' ORIGINALLY SERVED SOME PURPOSE / PROVIDED SOME BENEFITS, AND STILL DO E.G AVOIDANCE OF SOMETHING E.G 'I'M TOO SICK TO GO TO WORK'... THE SYMPTOM, THE SICKNESS, GIVES YOU AN EXCUSE TO AVOID GOING TO WORK... AND CULTS OF COURSE OFFER A 'SOLUTION', OR DID AT SOME POINT, TO A 'PROBLEM'...E.G OF DESPAIR, HOPELESSNESS, LONELINESS, ISOLATION, REJECTION, ABANDONMENT, DISAPPOINTMENT, GOALLESSNESS, LACK OF MEANING...EVEN ACTUAL PHYSICAL THREATS E.G OFFERED SAFE HARBOR / PROTECTION ... OFTEN YOU DIDN'T REALISE THAT YOUR 'PERSECUTOR' HAD BEEN EMPLOYED BY/ WAS THE SAME AS, THE CULT LEADERSHIP, TO 'MOTIVATE' YOU TO SEEK PROTECTION FROM THE CULT...PROTECTION RACKETEERING ETC... SO BEFORE YOU ARE LIKELY TO BE ABLE TO FREE YOURSELF OF THE CULT, YOU WILL NEED TO FIND OUT WHAT 'NEEDS' AND 'WANTS' IT SERVES / SATISFIES, OR AT LEAST DID AT SOME POINT SATISFY, OR PROMISE TO SATISFY...E.G I WOULDN'T PUBLISH 'RELIGION' UNTIL I HAD ANSWERED THESE QUESTIONS FOR MYSELF AND EVERYONE ELSE...E.G IF RELIGION / CULTS OFFERED 'ANSWERS' TO 'QUESTIONS', THEN I'D NEED TO COME UP WITH BETTER ALTERNATIVE ANSWERS, AND TO DISCOVER THE MOST
COMPELLING QUESTIONS (CONTROLLING THE 'QUESTIONS' IS HOW YOU CONTROL THE NARRATIVE / DISCUSSION / DEBATE I.E LIMIT THE QUESTIONS AVAILABLE...WHEN YOU FIND MORE QUESTIONS, YOU ARE ON THE RIGHT PATH TO FREEDOM FROM THE CULT...BECAUSE WHAT ANSWERS YOU GET WILL BE DETERMINED BY WHAT QUESTIONS YOU ASK .... E.G 'HOW TO DEFEND MYSELF FROM NON-CULT MEMBERS' VS 'ARE NON-CULT MEMBERS ACTUALLY A THREAT AT ALL?'...MAYBE THEY ARE ACTUALLY TRYING TO HELP ME FREE MYSELF OF THIS CULT...ETC...

WE CAN 'CURE' THE PSYCHOSOMATIC SYMPTOM BY ADDRESSING THE 'AVOIDANCE' STRATEGY ITSELF...E.G SIMPLY 'ALLOWING' OURSELVES 'NOT TO GO TO WORK' WITHOUT HAVING TO 'JUSTIFY' IT BY 'BEING SICK' CAN RELIEVE US OF THE SYMPTOM / ILLNESS / DISEASE / HEALTH PROBLEM ... WE SIMPLY SAY 'I'M NOT GOING BACK TO THAT JOB'...THEN FINDING ALTERNATIVES TO 'THAT JOB' I.E NEW JOB...ETC...OR SOLVING THE PROBLEM AT WORK THAT MAKES YOU WANT / NEED SO DESPERATELY TO AVOID GOING THERE....LEARNING ASSERTIVENESS WITH BULLIES, OR OTHER STRATEGIES TO COPE...TO IMPROVE YOUR WORKPLACE EXPERIENCE...IN THE CASE OF CULTS, INCLUDING 'NATIONALISM' WHICH IS A CULT MENTALITY / PRISON, YOU HAVE TO PROVIDE ALL THE 'BENEFITS' OF CULT MEMBERSHIP IN OTHER WAYS...FIND OUT IF THE THINGS YOU'VE BEEN PROMISED ARE REAL I.E ARE CULT PEOPLE HAPPIER? MORE SECURE? LET ALONE DOES 'HEAVEN' EXIST? DOES 'HELL' EXIST? ARE THE 'THREATS' YOU'VE BEEN CONDITIONED TO ACCEPT AS REAL, ACTUALLY REAL? E.G DO ALL NON CULT-MEMBERS REALLY HATE YOU, AND WANT TO KILL YOU, AND WILL KILL YOU, THE MOMENT THEY GET A CHANCE, IF YOU LEAVE THE 'SECURITY' OF THE CULT...

DOES THE CULT / NATION REALLY PROVIDE THE BENEFITS IT CLAIMS? FREEDOM? LIFESTYLE? CHOICES? ARE THE 'ENEMIES' OF THE CULT REALLY 'EVIL' AND 'MALICIOUS'? OR JUST SEEKING TO FREE YOU FROM THE CULT? OR MERELY JUST LIVING AN ALTERNATIVE THAT MIGHT BE SUPERIOR TO YOUR CULT LIFESTYLE?

IF BEING 'SICK' GETS YOU ATTENTION / AFFECTION YOU DIDN'T GET BEFORE YOU WERE 'SICK', THEN YOU'D BETTER FIND ANOTHER WAY OF GETTING THESE POSITIVE BENEFITS, OF ASKING FOR THEM EVEN, E.G ATTENTION AND AFFECTION, OR YOU WILL PROBABLY REMAIN SICK, BECAUSE YOUR SUBCONSCIOUS THINKS IT IS DOING YOU A FAVOR BY MAKING YOU SICK...PROVIDING THE SYMPTOMS
REQUIRED TO GET THE 'BENEFITS' YOU CRAVE / DEMAND / NEED SO DESPERATELY... IF THE CULT OFFERS APPROVAL AND ACCEPTANCE FOR 'SACRIFICING YOUR FIRST BORN' OR 'GENOCIDALLY MASSACRING EVERY MAN WOMAN CHILD AND ANIMAL OF NON-CULT MEMBERS' ... AND YOU CAN'T DO WITHOUT THESE EMOTIONAL BENEFITS, YOU'D BETTER FIND A GROUP OF PEOPLE WILLING TO OFFER ACCEPTANCE AND APPROVAL, LOVE, EMOTIONAL BENEFITS ETC, WITHOUT THE 'PRICE' OF HAVING TO BECOME A MASS MURDERER, OR YOU ARE GOING TO BE MISERABLE... AND PRODUCE A LOT OF MISERY IN THE WORLD...

IT IS VERY HARD TO 'FORGET' THE IDEA OF 'HELL' AND ETERNAL DAMNATION AND 'GOD'...ONCE CONDITIONED TO 'BELIEVE', AND HAVING ALL THE PEOPLE AROUND YOU APPEARING TO BELIEVE IT ... WHO ARE YOU TO QUESTION THE MAJORITY? AND RISK ETERNAL DAMNATION...PEOPLE WHO GREW UP FREE OF ANY CULT, SUCH AS MOST ETHNIC ESTONIANS, COULD NEVER REALLY COMPREHEND THE POWER OF SUCH STUPID, SILLY, OBVIOUSLY MADE UP, FABRICATED, CONSTRUCTED, MANUFACTURED 'SOCIAL REALITIES' I.E LIES... OR SEE WHAT POWER THEY POSSESS TO ENTHRAL OTHERS...OTHERS WHO GREW UP IN THE 'MENTAL PRISON' OF THE 'CULT MENTALITY'...THE 'SOCIAL REALITY' OF THE CULT...

THEN THERE IS THE FACT THAT CULTS APPEAL TO THE LOWEST IN HUMAN NATURE...THE DESIRE TO STEAL, RAPE, MURDER, ENSLAVE...TO BENEFIT AT THE EXPENSE OF OTHERS...TO USE OTHERS AS MERE MEANS TO OUR ENDS...ALMOST ALL NON-VEGAN HUMANS EXERCISE THEIR POWER OVER OTHER SENTIENT BEINGS, TO A GREATER OR LESSER DEGREE, IN THIS WAY E.G WE ENSLAVE ANIMALS AND ABUSE THEM AS MERE MEANS TO SATISFY OUR OWN DESIRES E.G TO EAT FLESH, DRINK MILK, WEAR THEIR SKINS AND FUR, FORCE THEM TO DO THE HARD MANUAL LABOR AS BEASTS OF BURDEN, SUBJECT THEM TO 'EXPERIMENTS' TO SATISFY OUR MERE CURIOSITY, OR 'CURE' SOME DISEASE WE SUFFER FROM, OR COULD BENEFIT FROM CURING IN OTHER WAYS E.G MONEY, POWER, STATUS, PUBLIC ESTEEM, SELF-ESTEEM...

BASICALLY WE CAN ONLY BECOME ENSLAVED IF WE LEGITIMATE, IN PRINCIPLE, THE PRACTISE OF SLAVERY...WE USUALLY INTEND OTHERS TO BE THE VICTIMS, AND OURSELVES TO BE THE 'BENEFICIARIES', BUT WHAT WE FIND IS THAT WE ARE 'HOISTED BY OUR OWN PETARD'...WE ARE IMPRISONED WITHIN THE WALLS WE BUILT TO HOUSE OTHERS...ENCHAINED BY THE CHAINS WE FORGED TO ENCHAIN OTHERS....KARMA BABY...YOU THINK IT ISN'T
REAL...I DON'T MEAN THE MYSTICAL NOTION, BUT THE SIMPLE FACT THAT 'AS YOU DO / PLAN TO DO, UNTO OTHERS, SO SHALL BE DONE UNTO YOU'...EITHER THIS LIFE, OR IN NEXT LIVES...AND STATISTICALLY IT WILL BE IN THIS LIFE...THE PYRAMID STRUCTURE REQUIRES EVERYONE BELIEVE THEY ARE ON THEIR WAY TO THE TOP OF THE PYRAMID, BUT THE FACT IS THAT ONLY A FEW CAN ENJOY THE 'BENEFITS' ... SO MOST EVERYONE WHO 'PLAYS THE GAME' WILL LOSE...AND BECOME ENSLAVED BY A SYSTEM THEY PLAYED ALONG WITH, EXPECTING TO BENEFIT FROM...

MHR NUMBER ONE 'OFFER' OF CULTS IS 'SENSE OF PURPOSE'... THAT OF WORKING TOWARDS A GOAL I.E GOAL -ORIENTED ACTION...WITH FIRM BELIEF CAN ATTAIN...AND THE VAGUEST / MOST DESIRABLE GOAL POSSIBLE I.E ETERNAL HAPPINESS....AND RAPE, MURDER, THEFT, WEALTH, POWER, SLAVES, STATUS, GLORY ETC FOR THE MEAN-TIME, FOR THE MOST 'CAPABLE' CULT MEMBERS I.E A HIERARCH OF REWARDS FOR THE HERE AND NOW, AND ETERNAL BLISS...SO VAGUE IT CAN MEAN ANYTHING TO ANYONE...VERY POWERFUL 'OFFER'...EASY TO MARKET...SELL... BUT SENSE OF PURPOSE FOR THE GOOD NATURED WHO WANT TO HELP I.E THE 'NICE' CULT MEMBERS WHO ARE NOT IN IT FOR THE RAPE AND PILLAGE, BUT WANT TO SERVE SOMETHING BIGGER THAN THEMSELVES....A HIGHER PURPOSE...WHAT IS EASIER, AND MORE REWARDING THEN, THEN TO BE ABLE TO OFFER 'NON CULT MEMBERS' HEAVEN, AND SALVATION? SO THE CULT MYTHICAL 'SALVATION' AND 'HEAVEN' ARE MASSIVE MOTIVATORS FOR THE BEST PEOPLE, AS RAPE, PILLAGE, WORLD DOMNINATION, ARE FOR THE 'WORST' IN HUMAN NATURE / CULT MEMBERS...

WE 'KNOW' THINGS BY 'FAMILIARITY' ... ANOTHER WORD FOR 'REPETITIVE EXPERIENCE OF SOMETHING'... IT BECOMES 'FAMILIAR' AND WE 'KNOW' IT...WE CAN 'KNOW' THAT THE PERSON APPROACHING IS A PARTICULAR PERSON BY THE SOUND OF THEIR VOICE, OR EVEN HOW THEY WALK, IN THE DARK, AT A DISTANCE... 'KNOWING' IS 'CERTAINTY' IS 'COMFORT' VS SUSPENSION / SUSPENSE I.E 'RELIEF' OF THIS SUPSENSE IS 'KNOWING'...SO WE SAY WE'D RATHER KNOW EVEN BAD NEWS, THAN REMAIN IN THE VERY UNCOMFORTABLE STATE OF 'SUSPENSE'... WE SAY 'IT'S KILLING ME, NO KNOWING'...WE'D RATHER KNOW THE BAD NEWS, THAN REMAIN IN THE STATE OF NOT-KNOWING...SO WHEN THE CULT OFFERS US 'KNOWLEDGE', WHETHER IT IS AN IDEOLOGY OF SEMITISM I.E CULT OF JUDAISM, OR MARXISM, OR ANARCHISM, OR SOME THEORY OR MODEL OF REALITY, THAT OFFERS 'CERTAINTY' AND 'AN END TO THE SUSPENSE THAT WE EXPERIENCE AS 'KILLING US'... SOME
'ANSWERS' TO THE 'QUESTIONS' THEY THEMSELVES HAVE DEFINED AS 'SIGNIFICANT'... OR WHICH ARE NATURALLY COMPELLING E.G HOW TO SURVIVE, GAIN THE SUPPORT / AFFECTION / LOVE / ACCEPTANCE / APPROVAL / ESTEEM OF OTHERS, AND FOR MANY, THE POWER OVER OTHERS, TO RULE THEM, DIRECT THEM AS MEANS TO OUR OWN ENDS / COMFORT / BENEFITS / PLEASURE / RELIEF...WHEN ANY CULT OF ANY TYPE, FROM A RELIGION, TO A 'NATIONALISM' TO A 'TRADITION' TO A POLITICAL / ECONOMIC THEORY, CAN OFFER THE 'SOLUTION' TO THIS DILEMMA, IT HAS INTRINSIC POWER OVER PEOPLE...OVER THEIR MINDS...THEIR HEARTS... AND THEN MOST PEOPLE ARE BORN INTO A CULT...AND ITS 'TRUTHS', NO MATTER HOW FATUOUS AND CLEARLY DIVERGENT FROM ANY SORT OF CORRESPONDENCE TO EXPERIENCED 'REALITY', ARE AT LEAST 'FAMILIAR' AND LITERALLY 'KNOWN', AND THUS COMFORTING...ESPECIALLY WHEN THEY ARE DEEPLY ASSOCIATED WITH PARENTS, FRIENDS, SIGNIFICANT OTHERS, AND ALL THE 'LOVE', ACCEPTANCE, APPROVAL, SUPPORT, RELIEF, PLEASURE THESE HAVE PROVIDED... AND EVEN IF ALL THEY HAVE PROVIDED IS ABUSE / EXPLOITATION ETC, THIS IS ITSELF ALL THAT IS 'FAMILIAR' AND 'KNOWN' TO THE PERSON...THE CULT VICTIM...AND UNLESS THEY 'LEARN' ALTERNATIVES, THEY WON'T BECOME AWARE OF ANY ALTERNATIVES...THEY WILL FIND WAYS TO 'JUSTIFY' AND 'LEGITIMATE' THEIR SUFFERING / EXPLOITATION / ABUSE / REJECTION / ABANDONMENT / REJECTION BY THE CULT / THEIR FAMILY ETC...AND USUALLY GO ON TO REPRODUCE ALL THIS MISERY BY REPRODUCING THEMSELVES, AND THEIR EXPERIENCE, THIS TIME IMPOSING IT ON THEIR OWN CHILDREN ETC...

FAMILIAR IS ANOTHER WORD FOR 'KNOWN'...AND THE LINK WITH 'KNOWING' SOMETHING MUST ALWAYS BE KEPT IN MIND...WE CAN ONLY EVER 'KNOW' WHAT 'WE'VE KNOWN'... UNTIL SOMEONE LIKE ME STEPS UP AND OFFERS AN ALTERNATIVE, TO 'KNOW', THE 'REALITY' OF EVERY CULT VICTIM WILL BE LIMITED TO WHATEVER THE CULT OFFERS, GOOD OR BAD...AS THE 'CONSENSUAL / SOCIAL / SHARED REALITY' OF THE CULT...TOTALLY REFLEXIVE... AND IF THE CULT DEFINES NON-CULT MEMBERS AS EVIL, AND MALICIOUS, AND THAT WE MUST GENOCIDALLY EXTERMINATE THEM AND THEIR ANIMALS, THEN THAT IS WHAT WE WILL 'BELIEVE'...AND 'KNOW'...LITERALLY IT IS ALL WE HAVE EVER 'KNOWN'...AND WE WILL 'BELIEVE' IT TO BE THE ONLY WAY OF BEING AND SEEING...AND WE WILL TREAT ANYONE WHO DEFIES THE CULT LEADERSHIPS AIMS / DEFINITIONS / PLANS ETC AS EVIL...AS SOMETHING WE MUST DESTROY BY ANY MEANS
AVAILABLE...INCLUDING DECEPTION...AND IF NECESSARY WE WILL DIE, AND MURDER OUR OWN CHILDREN, OR SEND THEM TO WARS TO KILL AND DIE, SIMPLY BECAUSE THE CULT LEADERS ORDERED IT...THEY USUALLY WILL CLAIM IT IS 'GOD'S WILL', AND THAT THEY SPEAK WITH 'GODS' AUTHORITY...OR SOME OTHER 'IDOL' SUCH AS 'THE FOUNDER' OR 'THE ANCESTORS' OR 'THE KING' OR 'THE PROPHET' OR 'THE GURU' OR JUST THAT GUY WHO WROTE THAT BOOK WE BASE ALL THIS SHIT ON...HE WAS LIKE 'ENLIGHTENED' AND A 'GENIUS' OR 'SPOKE WITH ANGELS' OR 'SPOKE WITH GOD' OR WAS JUST 'INSPIRED'...ALL GOD-MEN AND GOD-WOMEN OF SOME VARIETY...IDOLISED INTO SOMETHING WORTHY OF EVERYONE'S RESPECT / FEAR / LOVE...STRANGELY THE GODS ONLY EVER SPEAK WITH THE HIGHEST PRIESTS, OR ONLY 'WAY BACK THEN' AND NOT ANY MORE...BUT WHAT WE KNOW IS WHAT WE ARE TOLD TO KNOW...WHAT IS 'FAMILIAR' AND 'KNOWN' TO US AND BY US...AND NOTHING MORE...

IT IS SO RARE FOR ANYONE TO HAVE HAD THE OPPORTUNITY I HAVE HAD, OF BEING SO DESPAIRING OF THIS WORLD THAT I COULD WALK AWAY FROM ANYTHING IT HAD TO OFFER, WHICH SEEMED NOTHING, WHICH IS WHAT IT EVER OFFERED ME, SO I WAS FREE TO LOOK AT THE WORLD AS AN OUTSIDER, WITH NO INVESTMENT...NO EMOTIONAL INVESTMENT IN ANY PARTICULAR CREED, PHILOSOPHY, RELIGION, CULT, IDEOLOGY, IDEA OF IT, DEFINITION OF IT...IT HAD REJECTED ME SINCE BIRTH, MOSTLY...BUT I STILL FELT GUILTY REJECTING IT...AND SOUGHT TO 'CORRECT' IT...TO HELP IT...WITHOUT NEEDING IT TO REPAY MY EFFORT, SACRIFICE, RISK...I GREW UP IN FEAR OF GOD / HELL / GUILT / SIN...IT TOOK A WHILE TO ESCAPE...BUT THE CULT THAT PRODUCED THAT 'KNOWLEDGE / BELIEF' NEVER OFFERED ME ANY BENEFITS...MY OWN FAMILY OFFERED NONE...I HAD NO 'LOYALTY' TO IT...NOTHING TO GAIN BY SUPPORTING IT / DEFENDING IT...SO I WAS MORE FREE THAN MOST PEOPLE WHO EVER GREW UP IN A CULT...LIKE 'CHRISTIANITY', AND IT WAS THE PERIPHERAL EDGE OF THAT CULT I.E 'CHURCH OF CHRIST'...AND IT DIDN'T SEEM TO EVEN WANT ME (I ASKED TO BE BAPTISED BUT WAS REFUSED, I THOUGHT IT WOULD BE TOO HARD, LIKE EVERYTHING IN LIFE, SO I WANTED A FRIEND TO HELP ME, BE THERE, AND THEY SEEMED TO THINK THAT THAT PERSON WAS MANIPULATING ME TO BE BAPTISED?? SOMETHING LIKE THAT, SO THEY REFUSED...MAKES YOU WONDER AT FATE...ACCORDING TO RABBI'S, ONCE YOU 'SELL YOU SOUL TO THE CULT OF JUDAISM' YOU ARE IN FOR LIFE, AND SO ARE YOUR KIDS...SO MAKES YOU WONDER !!!
ONE TYPE OF interference is when the person doesn't know how to create a representation of change or how he'd behave if he did change. You have to know how to move from present state to desired state ... THIS IS THE BIG PROBLEM NON-CULTISTS FACE...MOST PEOPLE WANDER FROM ONE CULT TO ANOTHER... IDIOTS SAY 'IF YOU DON'T BELIEVE IN SOMETHING, YOU WILL FALL FOR ANYTHING' ... WHEN IN FACT IT IS THE OPPOSITE ... HUMEAN SKEPTICS CAN ENTERTAIN ALL IDEAS, WITHOUT NEEDING TO 'FALL' FOR ANY OF THEM... IN FACT IF YOU BELIEVE IN ANYTHING, YOU ARE ON YOUR WAY TO 'FALLING' FOR ANYTHING, ANY CULT THAT COMES ALONG... BELIEVE IN NOTHING...ENTERTAIN ALL POSSIBILITIES...ACT HEURISTICALLY ACCORDING TO APPARENT PATTERNS...BUT WALK LIKE ON ICE...TOTALLY RELAXED AND FLEXIBLE, OR YOU WILL FALL / SLIP INTO A BELIEF / CULT ... HEURISTICS MEANS 'YOU ACT AS IF YOU BELIEVE SOMETHING IS REAL' FOR THE SAKE OF PRACTICALITY...BUT NEVER ASSUME YOU KNOW ANYTHING, OR THAT ANYTHING IS 'FIXED' AND 'SOLID' AND 'RELIABLE'...ASSUME YOU WILL GAIN BETTER UNDERSTANDING ALL THE TIME, AND BE READY TO REJECT EVERYTHING YOU THOUGHT YOU 'KNEW', WHEN A BETTER MODEL / UNDERSTANDING / DEFINITION COMES ALONG / YOU DISCOVER IT / YOU FORMULATE IT / YOU IDENTIFY MORE RELIABLE PATTERNS / UNDERSTANDINGS OF WHAT 'SEEMS' TO BE 'REAL'... TREAT IT ALL AS VIRTUAL REALITY WITH REAL PLEASURE, PAIN, AND RELIEF...ACT CONVERGENT WITH THE FEEDBACK, BUT NEVER ASSUME ANY OF IT IS EVEN 'REAL'...OR YOU WILL END UP IN A MIND PRISON OF SOME PERSON'S CREATION...OR YOUR OWN EVEN...

MOST PEOPLE CANNOT IMAGINE WHAT IT WOULD BE LIKE, THAT IT IS EVEN POSSIBLE, NOT TO BELIEVE WHAT THEY BELIEVE...NOT TO DEFINE THINGS AS THEY DO...NOT TO BE IN THE CULT, WEARING THE CULT'S GOGGLES, USING THE CULT'S FILTERS...THEY'D BE 'LOST AT SEA', VERY UNCOMFORTABLE...THEY CAN'T IMAGINE LIVING WITHOUT 'GODS' AND 'DEFINITIVE KNOWLEDGE / BELIEFS'... IT IS AN UNKNOWN LAND...THEY CANNOT EVEN BEGIN TO IMAGINE BEING FREE OF THEIR CULT'S IDEA / MENTALITY... THEY'D FEEL 'ADRIFT'... IT IS TERRIFYING FOR MOST PEOPLE...TO BE ADRIFT...WITH NO CERTAINTY TO HOLD ONTO...UNTIL THEY GET RID OF ALL THE FEARS...AND THEN IT BECOMES A GAME WITH UNLIMITED POTENTIAL POSSIBILITIES...WHICH IS WHAT LIFE IS...'LILA'...'PLAY'.... WHEN YOU BECOME PLAYFUL...ASSUME YOUR HIGHEST NATURE... YOUR HIGHER RESONANCES... N.B THAT IN HAEMMOGLOBIN AND PLANT GREEN STUFF, AS IN 'ALCHEMY' AND 'MONOATOMIC ELEMENTS', ONE SUBSTANCE, RESONATING AT A PARTICULAR
FREQUENCY, CAN ACTUALLY 'TRANSMUTE' ANOTHER SUBSTANCE, CHANGING ITS RESONANT FREQUENCY, AND THUS ITS NATURE, ITS CHEMICAL PROPERTIES, ITS PHYSICAL PROPERTIES...AND THIS IS WHAT THE TRUE PROPHET DOES...THE TRUE PHILOSOPHER...THE 'PHILOSOPHER'S STONE' IS THE ABILITY TO RESONATE OTHER BEINGS / CONSCIOUSNESSES TO HIGHER LEVELS...TAKE THE LEAD AND TURN IT TO GOLD, THROUGH HARMONIC RESONANCE...RAISING THE LEAD TO THE LEVEL OF GOLD... RAISING OTHER BEINGS CONSCIOUSNESS ... TO THE LEVEL OF THE PROPHETS / PHILOSOPHERS... CALL IT 'CHARM' OR 'CHARISMA'...BUT JESUS AND BUDDHA HAD IT...OF COURSE THE MAJORITY CULT WILL DESTROY SUCH A PROPHET / PHILOSOPHER...ANY SLAVE MASTER HATES THE PERSON WHO WOULD FREE THEIR SLAVES.... AND MENTAL PRISONS ARE SO MUCH MORE EFFICIENT THAN STONE WALLS AND CHAINS...SO ANYONE WHO COMES ALONG AND EVEN 'THREATENS' TO FREE THE SLAVE'S MINDS, IS ENEMY NUMBER ONE TO THE SLAVE MASTER...THE CULT LEADER... THEY DEFINE THEM AS THE 'ADVERSARY' AND 'EVIL'...BECAUSE THEY SEEK TO FREE THEIR SLAVES... AND SO THEY GET THE SLAVES TO DEFINE THEIR TRUE SAVIOURS, THEIR TRUE FRIENDS, THEIR TRUE ALLIES, AS 'THE ENEMY', AS 'AMALEK', AS 'SATAN'...

IN THE PAST THE CATHOLIC CHURCH HAD THE POWER OVER MOST OF US...AND WE WERE SLAVES...LONG AFTER THE 'JEWS' WERE 'FREE' (EVEN HAVING ESCAPED THEIR PHARISAIC CULT OF JUDAISM AT THAT TIME) ... CALLING SOMEONE A 'HERETIC' WAS A DEATH SENTENCE FOR OVER A THOUSAND YEARS, IN MOST OF EUROPE...AND IN THE MIDDLE EAST CALLING SOMEONE AN 'INFIDEL' WAS A DEATH SENTENCE FOR ANY 'MUSLIM'... TODAY IN MOST NATIONS YOU CAN'T BE PUT IN PRISON OR KILLED FOR REJECTING THE RELIGION OF CHRISTIANITY OR ISLAM, FOR BEING A NON-BELIEVER, A HERETIC, AN INFIDEL....BUT TODAY IN EUROPE AND MOST WESTERN NATIONS YOU CAN BE PUT IN PRISON FOR BEING ANTI-SEMITIC...FOR NOT BOWING TO THE CULT OF JUDAISM...FOR OPENLY CHALLENGING ITS DOGMAS, ITS LIES, ITS MYTHS, ITS HOLOCAUST AND CURRENT GENOCIDE IN PALESTINE, TO SEEKING TO UNCOVER ITS SECRET POWER...TO REVEAL ITS SECRET POWER...TODAY ANTI-SEMITISM IS THE TRUE HERESY...AND DURING THE DAYS OF THE JEW.S.S.R IT EVEN CARRIED A DEATH PENALTY... SO THAT SHOULD GIVE YOU SOME PAUSE FOR THOUGHT, IF YOU DOUBT THE POWER OF THE CULT OF JUDAISM, AND THE 'JEW' WORLD ORDER, TODAY....IT HAS COME FULL CIRCLE...MOSES ENFORCED THE CULT VIA MASS SLAUGHTER OF HIS OWN PEOPLE, THE STONING OF CHILDREN BY THEIR OWN
PARENTS FOR THE MILDEST BREACH OF THE 613 LAWS OF MOSES / CULT OF JUDAISM...THEN THE 'JEWS' FREED THEMSELVES OF THIS CULT...THEN THE CULT FOUND NEW CULT MEMBERS, THE KHAZARS, WHO THEN TOOK CONTROL OF RUSSIA AND EASTERN EUROPE, AND TODAY ARE ONCE MORE SEEKING TO ENSLAVE THE OLD 'JEWS' WHO HAD BEEN 'FREED' OF THE CULT OF JUDAISM, AND THE REST OF US...AND SUCCEEDING...SOON THEY WILL SIMPLY SLAUGHTER ALL WHO WILL NOT 'SERVE THE CULT OF JUDAISM'... BILLIONS OF US...LIKE IN THE OLD TESTAMENT...THIS INCLUDES THE 'JEWS' WHO WILL NOT SUBMIT TO THE CULT OF JUDAISM...THEY WILL BE BUTCHERED, MAN, WOMAN, CHILD, AND ANIMAL, ALONG WITH THE REST OF US...FACTS PEOPLE...I KNOW THESE AS MUCH AS I KNOW 'GRAVITY' OR 'THE SPEED OF SOUND'... WE HAVE AS MUCH COMPELLING EVIDENCE TO BELIEVE THAT A 'JEW' WORLD ORDER IS CLOSING IN ON US AS WE DO TO BELIEVE ANYTHING ELSE WE BELIEVE, OR ANYONE HAS EVER BELIEVED...

ANTI-SEMITISM IS SUPPOSED TO BE ABOUT HATING JEWS...WELL CLEARLY SOMEONE TRYING TO FREE JEWS FROM THE CULT OF SEMITISM, THE CULT OF JUDAISM, DOES NOT HATE 'JEWS'. WHAT WE HATE IS THE JEW WORLD ORDER. THE CULT OF JUDAISM. WE LOVE JEWS. WE LOVE EVERYONE. WE WANT TO SAVE EVERYONE FROM EVERY CULT THAT EXISTS. AND PREVENT NEW CULTS EMERGING...CLEARLY MOSES BUTCHERED TENS OF THOUSANDS OF 'JEWS' AT THE VERY START. IT IS 'JEWS' WHO BOMBED AND MACHINE GUNNED CONCENTRATION CAMPS, MURDERING JEWS DELIBERATELY, THEN LEFT THEM TO STARVE AFTER THE CAMPS WERE 'LIBERATED'...EVEN THE U.S LEFT 'JEWS' AND OTHER INMATES TO STARVE TO DEATH AFTER THE CAMPS WERE LIBERATED, EVEN AS THEY FED MANY GERMAN AND SS NAZI PRISONERS OF WAR VERY WELL...THINK ABOUT THESE FACTS...'THE HOLOCAUST' NEVER HAPPENED, BUT IT WAS MADE TO APPEAR AS IF IT HAD HAPPENED, BY THE JEW WORLD ORDER, THE JEW.S.S.R, THE CULT OF JUDAISM ... TO JUSTIFY 'ISRAEL' AND TO DESTROY GERMANY...TO DESTROY GERMAN MORALE...TO MAKE GERMANS DESTROY THEMSELVES...

CONGRUENCE...YOU NEED TO WANT TO END SLAVERY, INEQUALITY, INJUSTICE, UNFAIRNESS...WHO REALLY DOES? SO WHEN THE PROPHET COMES ALONG TO 'REFORM' THE EXISTING CULT, OR SET UP A NEW ONE, TOO FEW PEOPLE REALLY WANT IT'S PRINCIPLES...EVERY SLAVE OF COURSE WANTS TO BE FREE,
ASSUMING THEY DON'T LIKE THEIR POSITION, THOUGH SOME ARE DOING VERY NICELY AS SLAVES...WOULDN'T GIVE IT UP FOR THE RISKY FREEDOM / INDEPENDENCE...HAVE NOTHING TO GAIN BY BEING 'FREE' REALLY...BUT GENERALLY, THE APPEAL TO 'EQUALITY' AND 'JUSTICE' RESONATES ONLY WITH THE LOWEST OF THE CULT PYRAMID...IT'S BASE...THEY HAVE NOTHING TO LOSE...EVEN DEATH BETTER, FREEDOM TO DIE, BETTER THAN THEIR LOT...SO IT IS TO THIS MASS THAT 'MARXISM' AND ALL OTHER CULTS 'SPEAK'...TO THEIR SELF INTEREST...NOT REALLY TO THE PRINCIPLES...THE PRINCIPLES JUST HAPPEN TO COINCIDE / CORRESPOND TO THEIR PERSONAL SELFISH NARROW SELFISH INTERESTS...PRETTY SOON THE FREED SLAVE IS DOING THEIR BEST TO 'CLIMB THE LADDER' UP THE PYRAMID...ANY TIME THEIR PERSONAL VESTED NARROW INTERESTS CONFLICT WITH THE SUPPOSED PRINCIPLE OF 'JUSTICE' AND 'EQUALITY' AND 'FREEDOM', THEY FIND A WAY TO BYPASS / OVERRIDE THE PRINCIPLE...IF THEY BOTHER AT ALL...THEY MAY PUBLICALLY PRETEND THE PRINCIPLES MEAN SOMETHING TO THEM, WHILE PRIVATELY FEELING ZERO NEED TO justifiy ANYTHING TO THEMSELVES...THOUGH MOST FEEL A FEW PANGS OF CONSCIENCE, AND SO SET UP SPURIOUS / SPECIOUS / NOMINAL ONLY / SUPERFICIAL DEFINITIONS THAT 'ACCOMODATE' THEIR OWN DESIRES / SELFISH EGO DRIVES NARROW VESTED INTERESTS WHILE AT LEAST NOMINALLY APPEARING TO BE PURSUING 'UNIVERSAL' GOOD I.E FOR ALL, NOT JUST FOR THEMSELVES...OF COURSE WITHIN EVERY PYRAMID THERE MUST BE A HIERARCHY OF INEQUALITY...AND INVISIBLE CEILINGS TO KEEP MOST PEOPLE OUT...AND TO STOP MOST PEOPLE SEEING THE HYPOCRISY...AT LEAST THOSE BEING RECRUITED I.E THE IDEALISTS, WHO CAN BE CO-OPTED / TRICKED INTO DOING THE BIDDING OF THE TOP OF THE PYRAMID, BUT UNWITTINGLY, SO THEY ARE VERY 'CONVINCING' TO THE MASSES I.E THAT THEY ARE PURSUING THE MASSES INTERESTS...EVEN PRIESTS DO THIS...GIVE THE MASSES THE FALSE IMPRESSION THEY GIVE A SHIT ABOUT THEM...ARE WORKING TO FREE THEM ETC...ANYWAY, SO FEW GENUINE IDEALISTS...AND THEY TEND TO GIVE UP WHEN THE IDEALS BECOME INCONVENIENT / BECOME A BURDEN / EXPENSIVE / IMPOSE COSTS / LIMIT OPTIONS...AND WHEN THE IDEALIST REALISES THAT THE MASSES ARE NOT AT ALL INTERESTED IN THEIR PRINCIPLES, JUST IN ADVANCING AS INDIVIDUALS, UP THE PYRAMID, THEY TEND TO BECOME DISSILLUSIONED...AND THEN THERE IS THE SHEER STUBBORN STUPIDITY OF THE MASSES...THEIR SELISH REPRODUCTION OF THEIR SITUATION, AND THUS AMPLIFICATION / MULTIPLICATION OF THEIR WOE AND MISERY...
YES, SO CONGRUENCE... YOU WANT ONE THING, BUT IT CONFLICTS WITH OTHER THINGS YOU WANT MORE... SO YOU UNCONSCIOUSLY SABOTAGE THE ATTAINMENT OF IT / THE PROCESS OF ATTAINING IT... YOU DON'T REALLY WANT IT AS MUCH AS YOU IMAGINE / CLAIM / PRETEND / CONSCIOUSLY THINK... EVEN HEALTH / LIFE... MOST ILLNESSES / DISEASES ARE SELF-INFlicted / TOTALLY PREVENTABLE / LIFESTYLE OUTCOMES...

THE CULTS THUS 'INTERPOLATE' A LITTLE 'IDEALISM' AND 'GOOD NATURED STUFF' AND 'GOOD WILL AND BENEFFICIENCE' INTO THEIR CULT PROPAGANDA... THEY FOCUS ON THE LOWEST COMMON DENOMINATOR, THE EASIEST THINGS TO APPEAL TO I.E FEAR AND DESIRE, LUST, HATE, LOVE, PAIN, PLEASURE, RELIEF, APPROVAL, ACCEPTANCE, BENEFITS, POWER, STATUS, PRESTIGE, PUBLIC-ESTEEM... FOR THE MASSES... BUT 'PRETEND' TO GIVE A FUCK ABOUT PRINCIPLES LIKE JUSTICE, FAIRNESS, NOBILITY, ETC... I.E SO YOU HAVE A FEW 'PROPHETS' SPEAKING WISDOM AND ETHICS IN THE TORAH, WHICH OTHERWISE IS ABOUT GENOCIDE, RAPE, SLAVERY, A CULT OF JUDAISM WORLD GOVERNMENT WHERE THE CULT MEMBERS ENJOY THE HIGHEST PRIVILEGES AND POWER AND BENEFITS, AND THE REST OF THE WORLD SERVES THEM AS WILLING SLAVES... IT WILL AT LEAST APPEAR THAT WAY, ONCE YOU KILL ANYONE WHO WON'T AT LEAST PRETEND TO JUST LOVE NOTHING MORE THAN SERVING THEIR 'JEWISH' MASTERS... AND THEN YOU'LL RE-WRITE HISTORY, TO SHOW HOW BAD IT WAS BEFORE THE JEW WORLD ORDER... YOU WILL HIGHLIGHT ALL THE 'STRAW MEN' THE CULT ITSELF SET UP AS 'MODELS' OF EACH ALTERNATIVE E.G FAKE CRONY CAPITALISM, FAKE CHRISTIANITY, FAKE BUDDHISM, FAKE REPUBLICS, FAKE NATIONALISM... AND THEY WILL SIMPLY MURDER ANYONE, FIRST TORTURING THEIR FAMILY TO DEATH BEFORE THEIR EYES, OFTEN GETTING THEIR FAMILY MEMBERS TO DO THE TORTURING, SO PRETTY SOON YOU WILL GET THE VERY SOLID ILLUSION THAT EVERYONE 'JUST LOVES SERVING THE JEWS' AND DO SO WILLINGLY, OF THEIR OWN FREE WILL....BECAUSE THEY WANTED TO... THEY CHOSE TO... JUST AS THE CULT LEADERS PREDICTIVE PROGRAMMING I.E TORAH, SAID THEY WOULD... SERVE THE JEWS OR DIE... ACTUALLY SUFFER FATES MUCH WORSE THAN DEATH... THE MASTER NEVER LETS THEIR HUMAN CAPITAL DESTROY ITSELF OF ITS OWN FREE WILL... SO WATCH OUT FOR SUICIDE BECOMING A CRIME AGAIN... WHILE 'EUTHENASIA' FOR ANY 'NON-PRODUCTIVE' SLAVES WILL BECOME AS COMMON PLACE, AND LEGITIMATED BY A NEW 'THEORY' THAT EVERY CHILD WILL LEARN FROM CRADLE TO GRAVE... A NEW SET OF RULES FOR THE SLAVES OF THE CULT... BUT WHAT OF THE JEWS WHO DON'T

PEOPLE FEAR THE 'CONSEQUENCES' THEY'VE BEEN CONDITIONED TO EXPECT E.G HELL, BAD LUCK, LOSS OF FRIENDS, REJECTION BY OWN FAMILY / CULT MEMBERS / EX-COMMUNICATION / ABANDONMENT / MATERIAL BENEFITS ASSOCIATED WITH CULT MEMBERSHIP / ACCEPTANCE / APPROVAL ETC.... BUT ALSO OF 'VOID' AND 'I CANNOT SEE MYSELF INDEPENDENT OF ALL THE CULT THINGS...ALL THE THINGS I WOULD LOSE / WOULD NO LONGER BE / BELEIVE...ESPECIALLY IF MEANT FAMILY REJECTS, LOSS OF JOB, LOSS OF HOME, LOSS OF FRIENDS...WE NEED TO OFFER AN ALTERNATIVE THEY CAN 'BELIEVE' IN ... SEE THEMSELVES AS BEING AFTER LEAVING THE CULT...NOT JUST LEAVE THEM WITH A SCARY VOID OR VAGUE 'FREEDOM'...

GENERAL LIMITING BELIEFS THAT CHANGE IS POSSIBLE, CAN BE QUICK AND PAINLESS, AND CAN BE MUCH BETTER THAN THE CURRENT WAY OF BEING AND SEEING ... PEOPLE FIND IT HARD TO BELIEVE IT IS EVEN POSSIBLE TO LIVE 'WITHOUT A GOD' / OTHER DOGMA / BELIEFS...EVEN THE COPTIC ORTHODOX POPE FOUND MY RESPONSE TO HIS QUESTION IMPOSSIBLE TO BELEIVE...AND MY UNCLE WAS ALMOST IN AWE OF ME, THAT I COULD WALK AROUND A CATHEDRAL DURING A MASS, AS HE LIVED IN 'AWE / FEAR' OF GOD/RELIGION...WE NEED TO OFFER ROLE MODELS THAT ARE NOT MERELY 'ANARCHY' AND 'REJECTION OF LIFE' AND 'NIHILISM' I.E MY EDEN PROTOCOLS ARE A SUPERIOR AND FULL AND COMPLETE AND SATISFYING ALTERNATIVE, ONE THAT CORRESPONDS WITH ALL
THAT 'CORRESPONDS' WITH WHAT WE CAN OBSERVE / EXPERIENCE OF THIS WORLD I.E 'PROVE' OR 'SUPPORT' WITH SENSE IMPRESSIONS / PERCEPTIONS AND RIGOROUS, CRITICAL, COMPELLING REASON, LOGIC, AND COMPASSION...

FINALLY PEOPLE NEED THE FREEDOM TO ESCAPE / CHANGE I.E LEAVE THEIR CULT...IN MOST NATIONS YOU ARE NOT FREE TO 'KNOW THE HOLOCAUST DIDN'T HAPPEN' OR 'KNOW 911 WAS A JOINT CIA-MOSSAD FALSE FLAG' OR 'KNOW THAT THE JEW WORLD ORDER IS ALREADY IN PLACE, AND ABOUT TO INSTIGATE WORLD WAR THREE AND ITS ABSOLUTE, OPEN, RULE... WE NEED TIME AND SPACE AND RESOURCES ... WE NEED SOMEWHERE TO GO TO...SOMEWHERE NOT JUST ANOTHER VERSION OF THE CURRENT CULT... A SOVEREIGN STATE...AN INTELLECTUALLY FREE / SOVEREIGN STATE / CONDITION / SITUATION...

HOW DO I DO WHAT I DO? I.E BE A ZEN HUMEAN SKEPTIC WITH COMMITMENT TO REAL PRINCIPLES, BASED ON COMPASSION I.E TRUE EMPATHY, AND MY 'OPTIMAL ETHICS GENERATOR' ? HOW CAN OTHERS 'DO' THE SAME? 'BE' THE SAME? AND THEN BE EVEN MORE ... TO CONTINUE DOWN THE PATH IT TOOK ME SO LONG TO GET ONTO, AND WHICH MOST PEOPLE ARE NEVER OFFERED AS AN ALTERNATIVE...SO THAT WE CAN CONTINUE UP THIS PATH TO OPTIMAL EXPERIENCE ENGINE DESIGN, AND SYSTEMS ENGINEERING I.E OPTIMAL LEVELS OF FREEDOM, EQUALITY, FAIRNESS, JUSTICE...FULL OF COMPASSION / EMPATHY / THE OPTIMAL ETHICS GENERATOR / VEIL OF IGNORANCE PRINCIPLES...

PERSONAL EVOLUTION? AND IF DEATH IS THE END, THOUGH HARD TO SEE HOW NOW, THERE WAS NO BALANCE IN MY LIFE...NO ROLE MODEL...WHY SEEK THE TRUTH IF ALL YOU GET IS WHAT I GOT, THEN DIE...IF THERE IS NO BENEFIT I.E EVOLUTION ONTO BETTER NEXT LIVES? WE CAN'T BE SURE OF EITHER...BUT I DO KNOW THAT NO-ONE KNOWS, AND I DO KNOW WHAT RELIGION IS, WHY IT OCCURS, WHO IT BENEFITS, WHO PAYS....I KNOW THAT NO-ONE HAS EVER BEEN CONTACTED BY ANY GODS...ALIENS QUITE POSSIBLY / LIKELY EVEN, AS THE SUMERIAN TABLETS STATE...

You may also need to get them into the appropriate physiology. For instance, if a woman comments that she doesn't know why she can't make a picture, notice her posture. If she is slumped back, breathing deeply in a kinesthetic posture or has her head tilted down and to the left, it's no surprise that she can't make a visual image because her body is in a posture that is associated with feelings and hearing, not seeing. My metaphor for physiology (which extends on down into subtle physiological changes, like your eyes moving up to make pictures and moving down for feelings and sounds), is that of a television or radio tuner. There are stations transmitting television waves through the room you're in right now. A television set has a specific physiological set-up that allows it to pick up those waves. When you turn to channel 7, it picks up one frequency of these incoming waves over the others, with minimal interference from the others. People operate in much the same way. If I want to make internal images, I look up and right, I make my breathing shallow, and my body shifts so that it's more upright and I'm able to make a picture. Occasionally if you turn to channel 3, you'll get interference from channel 4. That happens in your mind sometimes, too. You have the picture of what you want, but you've got the wrong voice attached to it ... you've got a voice that's saying, "No, you can't do that." So you get noise from another channel—your auditory channel. Using your physiology correctly allows you to be able to do some particular behavior and get the outcome you want.

Beliefs: Identification and Change 9

In NLP "strategies" is the word used to describe how people sequence their internal and external pictures, sounds, feelings, smell and taste to produce a belief, a behavior or a thought pattern. (We refer to the five senses as representations or modalities. We never experience the world directly—we "represent" it to ourselves through internal images, sounds and voices and kinesthetic feelings.) An effective strategy uses the most appropriate representations in the most appropriate sequence to achieve a goal. For example,
when the goal is spelling a word correctly, good spellers will almost always make a remembered picture of the word, and then check their feelings to make sure

10 BELIEFS

the picture is "right." Poor spellers use ineffective strategies, such as trying to sound out the word phonetically, or trying to construct a picture of the word from its sound. Neither of these strategies work well for consistently spelling correctly. In the case of speed-reading, as long as people sub-vocalize, their reading speed will be limited to how fast they can talk. Regardless of what physiological state they're in, they're going to reach a limit in their speed. If they say the words to themselves, instead of seeing them, it slows them down because words are sequential. To change to a faster reading speed, they would need to see the words and form images of their meaning directly. One thing that makes a person a good athlete or a good dancer is the ability to watch people do something, and then step right into it themselves. You might think they're good because they're better coordinated than most people. What allows them to be better coordinated? It is the map that they're using in their mind—the sequence of representations and the submodalities that they use? (Submodalities are the qualities or smaller elements within each modality. For example, a few of the submodalities in the visual representational system include brightness, clarity, size, location and focus; in the auditory system, volume, tempo, location of sound; kinesthetic, pressure or duration of touch. Changing submodalities or the sequence of representations will change your subjective experience of any event, often dramatically.) All of us have "talents," not because we're smarter or have better genes, but because we can build robust representations for a particular skill or behavior quickly and efficiently. To illustrate this, think of some subject in school you learned quickly and easily and were talented in. Then think of one you struggled with. Notice the difference in the way you represent each of these. The difference in your "talent" has to do with the strategy that you used.

In the case of pain, research has shown that placebos can work as well as morphine in 51-70% of the patients. Another study looked at placebos from the opposite point of view. In this study, the researchers wanted to find out how well the placebo responders reacted to real drugs, so they gave them morphine. They found out that 95% of the placebo responders did respond in a positive way to the morphine. In comparison, only 54% of people who did not respond to placebos got relief with real morphine—a difference of 41%. People with a high response expectancy for relief got relief. With this kind of data you have to wonder about the efficiency of certain medicines.

There is a pharmacological effect from drugs, including alcohol, and an expectancy effect.

They concluded that the responses were functions of beliefs
Placebo effect (the person's response expectancy) is a very important component of behavior and of change

Beliefs are not necessarily based upon a logical framework of ideas. They are, instead, notoriously unresponsive to logic. They are not intended to coincide with reality. Since you don't really know what is real, you have to form a belief—a matter of faith. This is really important to understand when you are working with a person to assist him in order to change his limiting beliefs. There is an old story described by Abraham Maslow that illustrates this. A psychiatrist was treating a man who believed he was a corpse. Despite all the psychiatrist's logical arguments, the man persisted in his belief. In a flash of inspiration, the psychiatrist asked the man "Do corpses bleed?" The patient replied, "That's ridiculous! Of course corpses don't bleed." After first asking for permission, the psychiatrist pricked the man's finger and produced a drop of bright red blood. The patient looked at his bleeding finger with abject astonishment and exclaimed: "I'll be damned, corpses do bleed!"

A woman had interviewed 100 "cancer survivors" in hopes of finding out what these survivors had in common. She described a cancer survivor as someone who had been given a terminal diagnosis of cancer with a poor prognosis for recovery, but who was still alive and healthy, enjoying life ten or twelve years later. Interestingly enough, she could find no common patterns in the treatment received by these people. Different people received different treatments, including chemotherapy, radiation therapy, nutrition programs, surgery, spiritual healing, etc. However, there was one thing that these survivors all shared: they all believed that the method of treatment they were getting was going to work for them. The belief, not the treatment, made the difference.

You as the helper, tend to find substantiation for your beliefs in someone else. I know a therapist who had been sexually abused as a child—she was always trying to uncover abuse in people that she worked with. She managed to find sexual abuse in most of her clients—whether it was actually there in their personal history or not.

When people tell you about their beliefs often you'll get logical constructs that they've invented to make sense out of certain behaviors that they engage in. Freud talked about the notion of free-floating anxiety (anxiety caused by an unconscious conflict). According to Freud, all that the person is aware of when having this problem is the feeling of anxiety. So he makes up logical reasons why he feels the way he does. His logical reasons have nothing to do with his anxious feelings.

Explanations generally don't have anything to do with where those feelings are coming from. Freud claimed they always developed from repressed sexual feelings. I find, instead, that the feelings she is experiencing often comes as a
result of internal conflicts which are, indeed, unconscious, but often have nothing to do with sex.

Often when you are working with a belief, especially a belief that has to do with someone's identity (or an issue that is very painful to deal with), it will be hidden by smokescreens. You can identify smokescreens when the person suddenly starts blanking out, or begins to discuss something irrelevant to the process you're doing. You block out or disassociate off some belief structure so you will be protected from confronting it.

When a person feels both hopeless and helpless, he becomes apathetic

Outcome expectancy and/or his self-efficacy expectancy, you'll often find an incongruity. For example, when you ask "Do you believe that you'll recover from your illness?" you'll frequently get the verbal reply "Of course," while the person is shaking their head in nonverbal disagreement. If you work with a person based only on what he says, you'll miss half the message. When someone offers you an incongruent message like that, you want to work with the conflicting parts

Response expectancy is what you expect to happen to you either positively or negatively as a result of the actions you take in a particular situation. The placebo effect illustrates an example of response expectancy

Placebos often have a very high success rate. On the average they work as well as the genuine drugs in about one third of the cases.

What the person can and can't do; should or shouldn't do; or ought or ought not to do. You might also hear, "I am this way," "I am a poor speller," "I am a fat person." These statements indicate identity beliefs that limit the person's thinking about themselves, and what they can do to change.

Using a variety of methods—including NLP. When you ask, "What does it mean about you that you haven't been able to change this?" you sometimes get an identity belief statement in response. You can ask the person, "What do you want instead, and what stops you from having that?"

(1) You've got to know how to do it. (2) You have to be congruent about wanting your outcome. (3) You also have to have the belief that it's possible for you to make the change. Mhr expectancy theory...why not credit it?

If any one of these things are missing, the change won't be complete. You can want to do something, believe you can do it; but if you don't know how, you don't have the physiology, or you don't have the right strategy, you will experience difficulty. Furthermore, you can have all the abilities, all the training and everything you need to be effective at something, but if you're incongruent about
it or if you don't have the belief you can do it, you won't be able to get the change you want.

Work on submodalities of beliefs ... how individual comes to 'believe'...so can mimic this process with new belief i.e replace old limiting with new generative / more optimal / motivating belief...need to work out exactly what makes one 'though' believable / compelling...what is it about HOW it is visualized, etc...i.e subtle differences between what is compelling and what isn't...need to observe client for 'tells' about what significant in an image / idea / feeling...then replicate it...appeal to it...MHR

If you know how to watch and listen for these internal connections, you'll find out how a person has structured his limiting beliefs

Often people get feelings from internal images they make. It's useful to know that sometimes the most important thing is the kind of picture that it is. Occasionally there is a very subtle "difference that makes a difference" in submodalities that determines whether you're going to have a strong feeling about something or not.

It's worth spending the extra time finding the most critical elements of a limiting belief. The process of adding resources, regardless of the technique used is less important than knowing what to change.

How to uncover the way a person has constructed their reality and their beliefs. Having the ability to identify the structure of a person's thinking gives you the ability to know exactly how to intervene effectively.

Lots of adults still aren't sure whether or not a powerful experience they had as a child was real or imagined. Another common experience is when you have been absolutely certain you told someone something and they claim you didn't and later you realized you rehearsed it in your mind but never actually talked with them.

As human beings, we will never know exactly what reality is, because our brain doesn't really know the difference between imagined experience or remembered experience. The same brain cells are used to represent both. Because of that, we have to have a strategy that tells us that information received through the senses passes certain tests that imagined information doesn't.

Try a little experiment. Think of something that you could have done yesterday but know you didn't do. For example, you could have gone shopping yesterday, but you didn't. Then think of something you know you did do—like go to work or talk with a friend. Contrast the two in your mind—how can you determine that you didn't do one and did do the other? The difference can be subtle, but the qualities of your internal pictures, sounds and kinesthetic feelings will be
different. As you contrast your imagined experience with your real one, check your internal experience—are they located in the same place in your field of vision? Is one clearer than the other? Is one a movie and one a still picture? Are there differences in the qualities of your internal voices?. You have a "reality strategy" that lets you know the difference.

Many people have tried to change or re-program themselves by visualizing themselves being successful. For all the people who naturally use this as a strategy, it will work fine. For all the people that use a voice that says "You can do it," this visual programming won't work. If I want to make something real for you, or convince you about something, I've got to make it fit your criteria for your reality strategy. I have to make it consistent with the qualities of your internal pictures, sounds and feelings. (These qualities are called submodalities.) So, if I assist you in changing your behavior in some way, I want to make sure that it is going to fit in with you as a person. By identifying your reality strategy, you can determine precisely how you need to think to be convinced that something is legitimate enough for you to do.

Reality Strategy Demonstration

Robert: Joe, would you come up here so that I can demonstrate how I elicit and work with a reality strategy? What we're looking for in Joe is a sequence of internal representations or checks he goes through to determine

Reality Strategies 31

what is real. As you watch and listen to this demonstration, I'd like you to keep a couple of general strategy elicitation rules in mind. The first rule is to engage the person as fully as possible in the here and now as you are eliciting his strategy. I'll want to engage Joe in an ongoing example of his reality strategy rather than ask him to remember something. I'll want to use present tense language to keep him associated in the experience. The second rule involves contrast. I'll want to contrast an experience Joe knows is real with one he knows is imagined. By using contrast, I can identify what is different in his thinking process—I don't care about what is the same. It will be the differences that we can test to make sure we have his reality strategy, versus some other strategy. (To Joe.) We're going to start by having you think about a simple action you took that doesn't have any emotional content. What is something you did yesterday that you know you did? Joe. Traveling on the train and bus to get here. Robert. Now pick something that you could have done, but didn't do. Joe. Have an ice cream sundae. Robert. You could have had an ice cream sundae, but you didn't. That fits completely in the realm of possibility. Joe. Oh, actually, hold on a second . . . Robert. You did have one, huh? (Laughter) What did you have on top of your ice cream sundae? Joe. Just granola. Robert. So you had granola. What's something that you could have had on it, but you didn't? Joe. I could have had hot fudge on
it. Robert. You could have had hot fudge. One of the nice things about strategies is that it doesn't matter what the content is. Believe me, when we start determining what is real for Joe and what is not, the distinction of hot fudge or granola is going to be just as important as any identification of

32 BELIEFS

reality. Whether it's a hot fudge sundae or getting in a fight with someone you're close to, the content doesn't really matter. The process will be the same. (To Joe.) How do you know that you took the train and the bus and that you had granola instead of hot fudge? How do you know that you really did one and not the other? (To Group:) Watch. He's showing us the answer. Joe: Well, I know I had granola because I went through a process of remembering it, and having remembered it, I know that I must have done it. Robert. What he's doing is interesting, because I've elicited a lot of reality strategies from people, and usually I get this one later in the elicitation. He said, "Well, I thought about the granola first, so logically, I must have had that." (To Joe.) How do you know that you went through this process I mean sitting right here, right now? Joe. (Eyes up and left) Well, when you asked me to come up with something that I did yesterday . . . Robert You visualized . . . Joe. Yeah. (Eyes up and left again) (To Group:) As I mentioned, there's a sequence of processes. I saw Joe do more than make a picture, although that was the starting point. Often you don't question your first reality check because when you think about what you did, there's one thing that comes to mind, and it seems like that's all there is. You don't question one picture in your mind, but you may question the reality if you get two different pictures. (To Joe.) I'll ask you what you really did yesterday, and this time I want you to visualize hot fudge. Joe. I didn't have hot fudge. Robert. Right. But I'm going to ask you to picture it. That's how you "know" the difference. Initially, when I said, "What did you do yesterday?" you saw granola rather than hot fudge. I'm going to ask you to go back through the same process because I think you have more mental checks than Reality Strategies 33

just a picture of granola on ice cream. What I want you to do now is to make two pictures; make the one of ice cream with granola, and another one with hot fudge, and make them look like each other. I'm going to say, "What did you have yesterday?" and I want you to visualize hot fudge with the same internal visual qualities as the granola. Joe: I just did while you were talking. Robert. OK. What did you have yesterday? Joe: (Incongruently) Ah ... I had the ice cream with . . . ah, hot fudge on it. Robert: Did you really? Joe. No. Robert. OK. How do you know? Joe. That's a good question, because I can make a pretty good picture of ice cream with hot fudge. I've had it plenty of times. It's not an image that just comes out of nowhere. It's a part of me, in a way. Robert: But you still know
which you had. This is important. Now you have two images that are equally clear. You can see one as well as the other. If I say, "What did you have? "you can see either one. How do you know which one you really had? Joe. That's a good question. It's not just from the picture, I guess. Robert. Think about it. Are you sure about which one you had. Joe. Ah . . . yeah. Robert. Good. (Laughter) What makes you sure? Joe. I can contextualize it. Robert. That's good, too. (To Group:) So there's another piece. Typically, the first response for reality is whatever comes up on the first association to the question. Even though we're talking about a trivial instance here, we can put this in the context of beliefs. You say to someone, "Are you a good speller?" "No, I'm not a good speller.""How do you know that?" "Just never have been." The first association is whatever comes up. What Joe said next is, "It's not just the picture that I come up with, now there's a context around it." Let's find out what context means. My guess is what we're going to discover—judging from Joe's accessing cues—is an internal movie. (To joe:) Maybe you saw yourself pulling out the granola. The granola is not going to suddenly turn into hot fudge just because you can clearly see a still picture or an image of a hot fudge sundae. Is that it? Joe. Absolutely. Good guess. Robert. OK. What do you see up there? (Points up to Joe's left, where Joe is moving his eyes.) Joe. Just supper time, along with the whole context of the other food I ate. My wife was there, but there wasn't any hot fudge in that experience. Robert. Can you put hot fudge in? Joe. Yeah, OK. Robert. You're picturing it? Joe. It's all in my mind's eye. Robert. Now, what did you have after dinner on your sundae last night? Joe: Granola. Robert. How do you know that? When I asked you, did you see them both? How did you make that determination? Joe. Because I heard myself say it. Robert: Oh, because you heard yourself say it. That's interesting. There's a voice in your head that tells you what's real. (To Group:) I'm going to push this a little bit, and we'll eventually get to a point where you'll see a change happen. You will see momentary confusion. (To Joe.) You have a voice . . . Joe. While we were sitting here, I just told you . . . (Joe emphasizes the word told indicating an internal voice.) It was more like a habit. I already told you that I had granola and so ...

Robert. It's a habit? Joe: I must have said it at least a half a dozen times. Robert. What would make it just as familiar to have talked about hot fudge? Joe. I would have done it. I'd have memories of doing it. Robert. Repetition is one way to make something real and familiar. How many times would you need to see it and tell yourself you had it? Half a dozen? Joe. I don't know. (To Joe.) I'm going to ask you half a dozen times what you had on your sundae yesterday, and I'd like you to visualize the picture you have of hot fudge and say "hot fudge." Are you willing to do this? Joe. Sure. Robert What did you have yesterday on your sundae? Joe. Hot fudge. Robert. Was it good? Joe. Very good. Robert. What did you have yesterday, again? Joe. Hot fudge. I had to rush making it, because I was in a hurry getting out. Robert It was what that you had? Joe. Hot fudge. Robert. Let's wait a little bit . . . Joe. It's more of a peanut butter fudge, actually.
(Laughter) Robert. Was it very hot or ... Joe. It's best if you let it cool a little bit, so that it doesn't melt the ice cream as much. It was very good. Robert. OK. How are they matching up, now? What did you have? Joe. I had hot fudge. Robert. OK (Laughter)

36 BELIEFS

(To Group:) We only did a few trials. This is the same strategy that people use with affirmation tapes. If you repeat something often enough, it will become more real for you. (To Joe:) What did you have last night? Joe. I had granola. Robert How do you know that, now? Joe. The pictures are different. . . Robert. Think of granola. Really think of it. I want you to visualize it. OK. That's good. Now, visualize the hot fudge. Really visualize it. I noticed something different about the physiology that Joe is displaying. When you visualize those two things, Joe, I want you to look at them side by side. Do they go side by side or does one overlap the other? Joe. I only thought of them separately, so far. Robert When you visualize the granola, where does it appear in your visual field in your mind's eye? Joe. About here. (Gestures to left center) Robert. About there (Repeats Joe's gesture). Where is the picture when you visualize the hot fudge? Joe. I think it was almost the same place. Robert Here? (Gestures to right of center slightly). Is there anything qualitatively different about the two pictures? Compare them now. Joe. I've just gone through a process to make them the same—so, no. Robert. OK. I want you to actually put your eyes over there and visualize the hot fudge there. (Gestures left of center). OK? Now, take the granola and put it over here. (Gestures to right of center). Got it? Which one did you have? (Long silence, look of confusion on Joe's face and then group laughter) Joe. ... I had the . . . granola. Robert Good. (To Group:) The point is that now we're starting to see a little lag in this processing. Of course, you can take this to an extreme and I'm not really into doing that. The reason that I'm doing this with Joe is not to confuse him about reality, but to find out what those checks are. Let's say I want Joe to change something, and I want to convince him that this is a real change that he can have. If I really want Joe to have as much of a choice about some new behavior as he had about some old behavior, I need to identify his reality checks. The only thing Joe has to rely on to determine reality are the representations (pictures, sounds, and feelings) that are stored in his mind. Since your brain doesn't know the difference between a constructed image (one that you've made up) and a remembered one, you can imagine how confusing it gets when you're dealing with things that happened 10 years ago. Or what if you're dealing with a dream and you're not sure if you really had it or made it up? How do you know what is real? Joe. The submodality distinctions seem really important for me in determining the difference. My contextual movie of the hot fudge isn't as bright, it isn't as focused, and . . . Robert. (To Group:) He's telling us about the next steps to take. Rather than continuing this as a demonstration, Joe can explore this further in the upcoming exercise. I am asking you to do the following exercise
because it is often useful to explore a person's reality strategy when you are working with his beliefs. Joe relies on some pictures, sounds, and feelings that flash into his mind in a fraction of a second. Whenever any of you make decisions about what you believe, you don't sit down and analyze what's happening in your brain. Are the submodalities a certain way? Is there a movie or voice there? etc. One movie might have feelings with it, and the other movie might not. You won't get a chance to consciously analyze these fleeting thinking processes. Typically, you'll notice the first picture or voice that comes to mind and that's what seems real... the one that's been imprinted in you most strongly. That's the reason why I think it's important to find out about your own reality strategy... Not everyone's going to have the same strategy that Joe has, and it's useful to find out how you determine what's real.

Reality Strategy Exercise

I'd like to ask everyone to do an exercise using the following format.

Part I:

(a) Pick some trivial thing that you did, and something you could have done but didn't do. Make sure that the thing that you could have done but didn't do is something that is completely within your range of behavior. If you could have put peanut butter on your ice cream, but you don't like peanut butter on your ice cream, you wouldn't really have done that. Pick an example like Joe did, where you've done one thing a number of times and yet you've also done some other thing a number of times. The only difference should be that you "actually" did do one of them yesterday. (b) Determine how you know the difference between what you did and what you could have done. What you come up with first will typically be the most obvious reality check. You might have a picture of one and not the other. After you make the picture, you may notice other things about it. Joe went through submodality differences. He made a movie about it and filled in some other pieces. He said the one he did was brighter.

Part II:

(c) Pick two things that happened during your childhood and determine how you know that they were real. You're going to find that it is a bit harder to determine what happened back then. In Joe's case, we took something that happened less than 24 hours ago, and we were able to shift realities. When you consider something that happened 24 years ago, it's an even more interesting decision process because your pictures will not be as clear and may possibly be distorted. Sometimes people know the real things that happened because they were fuzzier than the things they made up. (d) Start making an event that you didn't do like the one other that you actually did. After you get the pictures of the one the person might have done, looking like the pictures of the experience the person actually
did do, shift representational systems to auditory or kinesthetic. For example, Joe
switched to the ongoing context. He said, "I can check, because just a few
minutes ago when you first asked me which one was real, I told you it was the
granola and I can remember that." We haven't changed that memory yet. Be
careful as you begin to change the thing that you didn't do to be represented like
the thing you did do. I'd like you to at least get to a point where you have to really
think about which experience was real, like our example with Joe. The object
here is not to confuse your reality strategies, but to find out what reality checks
exist for you. Remember, we're eliciting a strategy, not trying to destroy it. Note:
The person who acts as the responder can put a hold on the process whenever you
want to. If the process starts getting scary (which it sometimes can), you may get
a swishing sound, or maybe you'll feel a spin. (There are various kinds of signals
that a person can get.) When someone else is eliciting and playing with your
reality strategies, it is appropriate to ask them to stop when you get
uncomfortable.

Let me share a process with you that John Grinder and Richard Bandler taught us
when we were first learning about NLP. They had us take a number of
experiences that we did on a particular day (either successfully or
unsuccessfully), and locate the point where a decision was made. We'd pick three
alternative resourceful behaviors that we could have done in each of those
experiences and run them through our reality strategies, making each behavioral
choice as full, radiant, and moving (using the same submodalities) as our reality
strategies. Whether each behavior was successful or not, we'd develop more
behavioral choices. If it was a negative experience, we'd often find that there was
a simple thing we could have done to have been more resourceful. I'd recommend
this process for negative experiences. Go through the entire negative experience,
making sure everything works out in a positive way. The next time you encounter
a similar situation to the negative experience, instead of going back and
unconsciously associating to what you did the last time (and the time before that
and the time before that), you now have a decision point with new choices. You'll
be responding in a new way.

"Success is as much a limitation to creativity as is failure. "This is because when
you remember a success, your memory often becomes really strong and you get a
good feeling about it. You are likely to keep doing the same thing over and over
again without exploring other options. You get to a point where you stop being
creative and get stuck, because you've run into a new situation where your old
behaviors don't work and you don't have new choices.

I remember working with a nurse who had gotten so depressed that she planned
to poison herself and her two children. She told me she'd do anything to feel
better. I said, "First, you want to change your state; let's find out if you have any
good memories." Of course, like most depressed people, she said no. Notice that I
didn't really ask for a memory, I asked for a decision. In essence, I said, "Sort back through your memories, find one that you would decide is positive, and tell me about it." That's a complex question to answer and it doesn't really have anything to do with faulty memory. It has to do with making judgments and decisions about what's positive. Since I wanted to change this woman's state, I said, "What would it be like if you could now breathe differently and sit up, look up and right and imagine something positive?" Her eyes looked up and she started visualizing something positive. I saw a shift in physiology that looked very positive. Then, suddenly, she stopped, looked back down and returned to the depressed state. I asked her, "What happened? Did you hit a bad memory or did something come up that got in your way?" She replied, "No." I asked her what made her stop doing it. Her reply was, "It feels funny to put my eyes up there. It's very unfamiliar." Think about that response. Here's a person whose bad feeling made her so desperate that she was going to poison her children. Yet she stopped doing something that was making her feel good because it was unfamiliar. So, I asked her how she would know if it was familiar. She said, "I would have done it before." I had her look up once, twice, three times and finally after about 10 times, it felt pretty familiar for her to do that. It was an important breakthrough in her therapy. Having done something before is a powerful convincer confirming the reality of either positive or negative experiences. Repetition is one way that people make something seem real and familiar.

Repetition is very convincing. What does it mean if someone tells you they haven't been able to do something like sing on key for 30 years? Is that proof that they can't? No. It just means that they've been trying to do it the wrong way for a long time. It doesn't mean they can't do it. I'm marking this out as significant, because repetition of experience is so important. One of the reasons that it's important is that there's a process that all of us go through called threshold. Threshold can apply to beliefs, reality strategies or learning strategies. If you have a little metal strip and you bend it back and forth, it will go back pretty much the same way it started. It goes back to the same form that it had before, even though it's been bent a little bit. If I take that metal strip and repeatedly bend and twist it, the strip will eventually break. Once it snaps, no matter what I do, it won't go back to the way it was before. The metal strip has been pushed over a threshold. Nothing I do now will get it back unless I recast it or weld it. I suddenly put the strip through a radical change by bending it and twisting it. The same thing happens when you put a person through such a dramatic shift that makes his past seem a lot less real than what it has been up until now. That's a function of the way your brain works.

Robert. When doing New Behavior Generator, you visualize yourself doing something with new resources, then step into the visualization. If you don't filter
that new experience through your own reality strategy, then you're just
pretending. On the other hand, what's the difference between pretending and
really changing? If you pretend long enough, it will seem as real as anything else.

Many of the beliefs we have acquired were installed by the time we were 5 years
old by your parents, significant other people and possibly by the media. These are
people that often don't know how to install good reality strategies. A lot of
your beliefs were installed in your brain before you had well developed reality
strategies. Those of you who acquired good reality strategies were either lucky,
or else you had bad experiences with the alternatives. You eventually figured out
how to install good ones. Even though most of us are sure about our reality, you'd
be surprised at how much of your reality you've actually built. You most likely
believed in Santa Claus at one time, but you've changed that. You still might find
yourself dealing with beliefs and realities that were programmed in at a time
when you didn't have resources for determining high quality information. For
example, a child often confuses their dreams for reality. Sometimes people have
such strong reality strategies that it limits them from using their imaginations as a
resource also. It's a very delicate balance, even when you know what you're
doing. Occasionally people will "fuzz out" bad experiences, pretending that they
really did not happen. They downplay them. Other times, people will take
experiences and exaggerate them beyond what really happened. What if you take
an event that someone thinks was real, that set them in a direction in life 25 years
ago, and change it? When you do that you may need to first work with the belief,
"I've wasted 25 years of my life because of the beliefs I've acquired."

a lady I worked with had been through a lot of physical and emotional problems.
These problems were severe enough to create a survival issue for her. Her
problem stemmed from an internal "voice" that was giving her all kinds of
trouble. We gave her resources concerning a past experience to change her body
image and gave the part of her that created "the voice" new resources. When we
integrated all these resources together, she became really, really sad, like she had
lost something. When I asked her what was going on, she said, "All my life, my
goal has been to survive. Surviving has always been a challenge. Now that
I have all these resources, it's like part of me is gone. What am I going to live for now?"
This is not a bad place to get to with a client, because then you can say, "What do
you want to live for? What would be a worthwhile mission? What would be nice,
instead of just having to survive all the time?" When you do really good work
and help a person create change that's pervasive, the mission question is probably
going to come up. And it's not always something you're going to know about
ahead of time. If you work with this possibility before you work with other
issues, and futurepace new possibilities for the person, it makes your work easier.
How many of you fight your own reality strategy and get stuck when you try to
change your own behavior? I've heard people say, 'I'd give anything to be
different, but I don't want to fool myself.' They're saying, 'If I filter this new
belief for behavior through my reality strategy in such a way that it becomes as real for me as the other things that I do, I'll be fooling myself." You are damned if you do and damned if you don't. That is a double bind. Even if you're checking reality on something that's trivial... like whether you had hot fudge or granola, you'll often run smack up against some real important beliefs or conflicts. The value in understanding reality strategies is not that of determining what really happened in your life. Instead, it allows you to set up a series of decision checks or behavior checks to pass through before you're willing to believe that something new is true, or before you're willing to actually take action. You're not going to take action on something unless it's clear, or unless it fits into the overall scope of who you are, etc.

Belief strategies are the ways in which we maintain and hold beliefs. Like reality strategies, they have a consistent pattern of pictures, sounds and feelings that operate largely unconsciously. Belief strategies are a set of evidence procedures you use to decide whether something is believable or not. This kind of evidence is usually in the form of submodalities—the qualities of your pictures, sounds, and feelings. Try an experiment for yourself. Contrast something you believe with something you don't believe. Notice the differences in the qualities of pictures, sounds, and kinesthetic feelings. How does your brain code the differences? A common difference is the location of the pictures, but there will be other differences as well. Belief strategies are different from our "reality strategies," because we cannot test them with sensory based reality checks. Because they are so highly patterned, they can last a lifetime. This is fortunate, because without these strategies, our understandings of ourselves and the world would not be stable. The problem is that belief strategies work as automatically and as durably for limiting beliefs as they do for beliefs that propel us toward our potentials. Luckily, they have a definite structure that can be elicited, so they can also be changed at the most basic levels of thinking through conscious intervention.

Robert First, let's do a basic comparison. We might be able to find all the information by doing a comparison. I want you to think about losing weight for a moment. (Judy slumps down, sighs, and she looks down and to her left with muscle tension around her mouth.) Now, think about doing NLP with a specific client, maybe a time that you particularly validated a success. (Judy's shoulders lift, the tension leaves her face and she looks up.) OK. (To Group:) You can see that there's a pretty dramatic difference in physiology; accessing cues as well as the rest of the physiology.

We now have a way of testing whether or not she's changed her belief. The physiology differences will provide us with an accurate unconscious test of our work. The second reason is to provide a contrast of present state with desired state and to sort out what is different in her physiology.
One of the nice things about working with people is that they tend to be very systematic in their patterns. Now we've seen this physiology a few times. It looks like a pattern

the physiology associated with her difficulty in losing weight, looking down to her left, the eye movement that indicates internal dialogue

I believe other people can, because I've helped other people do that. But I can't do it. (Gestures with her right hand, while her left hand is still.)

Notice that as she's talking about the conflict, there's an asymmetry in her gesturing. She says, "I wish I could just drop the whole thing and let my body do it" and uses both hands—a symmetrical gesture . . . then she used an asymmetrical gesture when she says she can't do it. Those asymmetries are usually very, very telling in indicating internal conflicts. For example, when someone says to me, "I want to really be aggressive," and he's got his right hand just sitting flaccid, it probably means that a part of him wants him to be aggressive and another part of him doesn't. Calibrating to body symmetry is very helpful. It's not that I think that every time somebody isn't gesturing symmetrically they're in a conflict; instead, it's a cross-check that I use. If I don't see symmetry, I'm going to keep checking for when they gesture with one hand versus the other as they talk about their problem.

(Looks up and to her left, indicating a visual memory.)

Now, if you just see the book and the counting of calories, does that make you have the feeling? (Judy pictures the book, slumps down and moves eyes down and right.) OK. So, just looking at that can trigger the feelings. Now let's contrast this with doing NLP with clients, the behavior Judy believes she can do comfortably. (To Judy:) You've done NLP with other people . . . yes? (Judy immediately adopts the more resourceful physiology.) How do you know that you can do that, and it's not a lot of work? Judy. Well, I can see it clearly in my mind. Robert. What do you see? Judy. I can see the person that I'm working with. I see the response and I also hear confirming feedback from my client. Robert. This is the interesting thing. There's a phenomenon that I jokingly refer to as therapist's or consultant's syndrome. You have all these skills that are developed around seeing and hearing other people. Yet, when it comes to you, you can't see and hear yourself—so you get lost. You don't know what to do. It's not because of anything that you're doing wrong. It's just that you can't see or hear yourself and give yourself feedback

See the symmetry?—Judy gestures with both hands in describing her client situation. Judy: When I think about counting calories, I just see the book and that's all. Robert. So, you just see the book. Anything on the book? Judy: I can see the words and the cover and the colors . . . it's like a color photo. Robert But
when you see the client? (She shifts physiology and the group laughs.) (To Group:) Could be a pattern. We get two hand symmetry with the client, and then asymmetry with calorie counting; here she just gestures with her left hand. (To Group:) Let me summarize what we've accomplished thus far. We've gathered information about Judy's belief that she "can't lose weight." When asked about losing weight she makes a little still picture of a calorie counting book and gets a negative feeling. Then a voice comes in and says, "Other people can lose weight." We've also noticed an asymmetry in her gesturing—when she talks about losing weight, counting calories and hard work, she gestures with her left hand. When she says, "But I can help other people," she gestures with her right hand. There is also a consistent posture that looks non-resourceful that she adopts whenever she thinks about trying to lose weight. We've contrasted this with something she thinks she can do—helping clients using NLP. Here we find that she makes a big panoramic picture and hears the client just like she's there all over again. She also adopts a resourceful posture and gestures symmetrically with congruent hand gestures.

What we have been doing is finding the patterns in her behavior that are present with each belief. At this point, as I'm gathering information, I like to have my client identify another belief about her abilities—another belief about what she can do. I'll gather the same kind of information about her physiology, her eye movements, her posture and her internal images, voices, and feelings so I can crossvalidate my information. I want to find out what patterns are the same in terms of these qualities between the belief that she can help someone using NLP and some other useful belief about "what she can do." Judy. I thought of one as you were talking. I made a major change about how I felt about my mother . . . which generalized to everything in my life. Robert. How did you do that? Judy. (Laughing) I went to an NLP practitioner. Robert. What did this practitioner do? What changed in your thinking about your mother? I mean, you made the changes; this person just facilitated that for you. Judy: It was how I felt about my relationship with my Mom that changed. Robert. The NLP practitioner didn't just say, "Change a feeling," and it changed. Something that you did inside made the feeling change. Judy. Actually, what she had me do was write a letter. So I guess that I was talking to myself. Robert: What did it change about your perception? Judy: It helped me get in touch with a feeling that was there when I was . . . (Judy looks up and to her left.) Robert. Are you seeing anything? Judy: Yes, I see the whole scene when this happened. Robert. So, you're seeing this person . . . Judy: No, I'm seeing myself writing this letter. Robert. So, you're watching yourself write the letter, disassociated, as if from a third party position? Judy: Yes. Robert: And you really believe that you've changed your attitude toward your mother? Does this mean you can change your attitude about people in general? Judy. Yes, because I see that I can in a lot of areas of my life. Robert. Because you see that ability in a lot of life areas. (To Group:) One of the things I've heard her say a couple of times that shows as a similarity about both of these is that there's
something about a "big picture." She says, "I can see the whole thing," instead of just parts of a picture, like in the image she made of the calorie counting book. Notice the difference between a myopic focusing on one little thing versus seeing the whole scene. She gets a lot less information from a small, still picture than she does from a whole scene.

MHR despair / depression associated with ‘focus’ i.e non-shifting...straying focused on one thing, whereas ‘adjusted’ people ‘switch’ between negative and positive views, probably bigger and smaller views i.e of what is troubling / despressing, rather than entire world of possibilities i.e narrow focus on what is ‘bad’ in their life, forgetting what is / was / could be good...have given up seeing / working towards good...really evolution may be saying ‘poor thing, this experience engine sucks, lets abandon it as futile / negative, and move onto our next lives / new experience engines...only the slave master / beneficiaries of your existence don’t want to lose your ‘human capital’ value of them...whether as source of value / positive emotions / motivation e.g parents / friends don’t want ot lose a friend / child...slave master a slave, government a soldier and worker / tax payer...Cult a member...

Keep gathering enough information from a person until she suddenly sees the whole picture and that's how she knows what to do. Right now I don't necessarily want her to come up with her solution; what I want to do is to get her to believe that she can do it. Obviously, she's not going to lose weight sitting up here in front of us. If she believes that she can do it, I think that she has the resources she needs to be able to accomplish her goals.

make your limiting belief strategy like the strategies where you do believe you can do something. Look at yourself in your mind's eye as if you were a client that came in to see you. See yourself and the things that you've tried in the past to lose weight. In fact, hear yourself describing what you've tried. Imagine that you, "the client" told you all the things you've told me. First of all, put the picture out in front of you. (Gestures) Do you see yourself? Judy. I see bits and pieces of that calorie book, but I still have the feeling . . . Robert. You still have the feeling. What do you do if a client that has a big feeling?

Judy. Well, I do little tricks. I might have them concentrate on the feeling. Then I put it out

Robert Sounds good. (Laughter.) (To Group:) I think she has all the resources. By the way, she's going to tell me how to do this. (To Judy:) Can you tell me how you can lose weight? Judy. Let's see if I can do that. (Her eyes move up to her left, then down and to her right to access her feelings.) It's such a big feeling. Robert So, it's a big feeling. What do you do with a client that has a big feeling?
What would you have your client do? Judy: Again, it depends. I can have them get into the "bigness" of the feeling, and then play with it. Or if it's appropriate, I might have them shrink the feeling down and make it smaller. Robert. Which one of those would be the most appropriate for you? Use your intuition now. Judy. Sometimes I think if I could really get into that big feeling, I'd really get a handle on my problem. (To Group:) There's another thing that I'm going to do now. We can see that this isn't only a feeling; there's a picture up there too. (Gestures up and to her left.) It will be useful to find out what that picture is all about. (To Judy:) Go back into the feeling now and look up. Is there anything that you see? It's OK to stay with that feeling; it may be something that you see. Judy: I see this huge woman ... I mean she's huge (Judy tenses up noticeably.) Robert Who is it? Judy. Well, it influences me. Robert This is something that you see, and somehow this picture is connected to you? That picture is bigger than you are; it creates that big feeling which influences you. How is it connected to you? Judy: It's what I could call an influence on me. Robert How does it exert that influence?

Judy: I feel like that huge woman is out there surrounding me all the time. Robert: So, she's out there... she's like surrounding you. Judy: Yes. Robert. Having that piece of information, let's have you step back, move the picture away from you. See a picture of yourself surrounded by her out in front of you. Judy. (Relaxes) OK. Yes. I like it better out there. Robert. Now that you can see what's going on out there, what resource does the you that's surrounded by her need in order to have choices that you want? Judy. Ah, that's interesting. I've been trying to take care of her. I never thought about taking care of me. Robert. Well, it's you that needs the resources. Judy. I need to be reassured that she is not me. Robert. What do you need to do in order to do that? Judy: I need to visually separate the two out. Robert. Do that. If you need any resources, we'll add them in. Judy. Yes. OK. I can do that. Robert. Good. Anything else the you up there needs? (Gestures) Judy: I'm just running through this whole business of beliefs. I can change the belief I've had when I separate myself from that huge woman surrounding me. I can see that my belief about losing weight has certainly not been logical since it's been based on that feeling, and whatever that personification of a huge woman is. Robert. (To Group:) As we're watching Judy calibrating we're beginning to see a little bit of this other physiology coming in, the physiology associated with what Judy believes she can do. (To Judy:) I think you have the resources you need. Probably what stopped the belief was that you didn't know what you were looking at out there. Because this limiting belief has been manifesting visually, it's hard for you to see what you need to do (Gestures) when you're surrounded by it in here (Gestures internally). It's not just chunking it down out there in the bits and pieces; you have to see the whole picture. I think that's been a big part of what was going on. As you look at it out here in front of you, can you widen the picture? How could you separate the influence or deal with it? Judy: I have a little mental exercise that I can go through. It's one of the techniques I would use for somebody else. I can just move them apart, then see
what I need to do to lose weight. (As she is doing this process in her mind, her physiology shifts dramatically to the resourceful physiology of "what she believes she can do.") Robert. I believe that you have the resources you need. Do you believe that you can lose weight? We can deal with specific techniques on how to lose weight later on. Remember, when you first thought about losing weight, there was a conflict. (To Group) I don't go on to take the next step with someone until I see a fairly clear shift in physiology like the one we're seeing here. I know I've made progress when I asked her to think about it again and she didn't fall back into the first non-resourceful physiology. I could clearly see that there is a very different strategy and physiology associated with losing weight now as compared to when I first asked her about her belief.

Identifying Belief Strategies Exercise

Let's do an exercise now. Think of something that you believe you can do and contrast it with something that limits you. Determine the difference. Then take the limiting belief and make it like the thing you believe you can do. If something stops you from doing it, find out what stops you.

Belief Strategies 59

The object is to make the limitation become more like the resourceful belief. Use whatever change process you can. What you end up doing may not look anything like what I did in terms of identifying the interference and adding the appropriate resource. The basic goal is to get the belief you don't believe to be as much like the one that you do believe as possible.

Discussion

Most of you found that you could identify the differences and create the desired change quickly. Some of you found good examples of significant past experiences (Imprints) that stop you. For a complete discussion of Imprints and Re-imprinting techniques see Chapter 4. Some other people found some pretty good examples of beliefs about having to be perfect. That kind of belief can really discount the person. People who have this belief say, "I did it, but I didn't do it perfectly." You could do something perfectly a thousand times, and then if you do it wrong once, it means you didn't do it perfectly and all the successes that you have had are discounted. And of course, even though you have a success, you know it may not be "real" because if you do it wrong the next time, the rest won't count. If you compare yourself with God (MHR really? That fucked up raving psychopathic tantrum child? Incompetent so badly programmed total fucked up world? Then wouldn’t let his ‘creations’ correct his mistakes? Insisted he was perfect? Just accept his mistakes, and worship that fucker? God as your example? Come on … he fucked up, and won’t admit it, and let people like me
correct his mistakes !!!), you're going to end up looking shabby. A problem with this kind of belief is that your criteria for defining success is inappropriate.

Many of you probably found that the beliefs you identified involved a comparison. To illustrate, I worked with a lady who had a clear idea of what she wanted to achieve. The closer she got to achieving her goal perfectly, the worse she felt about not achieving it yet. You can imagine what a bind that was. The better she got, the worse she felt, because the closer she was to perfection, the worse she felt about that last little bit that she hadn't achieved. This person had a life pattern of starting something, doing really well at it, getting to a point where she was almost successful, and then encountering so much stress she would drop out. She never achieved full success at anything. This process we've just completed is useful for information gathering. By using this contrastive analysis procedure, you can pinpoint the precise place where the change work needs to be applied. This can save you time and frustration when you're working with others.

Tim and Suzi were once working with a man who had a fear of flying on airplanes. He had tried many things to change his fear, but none of them worked. They had him access the feelings associated with flying and established a kinesthetic anchor by touching his shoulder. (Anchors are stimulus-response processes where some external stimuli gets paired to an internal state or set of representations. An example of a naturally occurring anchor is a special song that triggers you back to some prior experience whenever you hear it. Bandler and Grinder discovered that anchors can also be deliberately set. Internal states can be paired to an external touch, a sound or something the person can see. Once this association has been set, you can then trigger the internal experience at will. If you establish a kinesthetic anchor, you can hold a state stable by maintaining the touch.)

They suggested that the anchored feeling "take him back in time" to other events where he had experienced that same feeling. Then almost immediately he complained of "drawing a blank." They very patiently held the anchor and paced him, stating that the "blank" was actually quite significant and recommended that he relax and concentrate on the blank. As he relaxed they told him a story, a therapeutic metaphor, about a time when they were out walking in the fog one night in their neighborhood searching for a dog. It was so thick they couldn't see ten feet in front of them and even though they couldn't see through it, they intuitively knew where things were located and were able to find what they were looking for. After approximately ten minutes he began seeing still, slide images, which he stated could not possibly have anything to do with his phobia. The first slide was of an old gentleman holding some flowers. The man had lived next to him when he was a small child. He then saw additional slides which they were able to piece together into a movie about an early childhood experience. In this case, it was an experience that he had no recollection of at the conscious level,
yet it was significant to the phobia as they explored the connections. He had been playing with other little children in a vacant lot behind the older gentleman's house when they discovered an abandoned refrigerator lying on its back. Somehow one of the other little boys had gotten locked inside and could not get out. The man Tim and Suzi were working with had actually switched positions in his mind with the trapped little boy and was feeling the other child's panic. The children were able to get help and the trapped little boy was rescued before anything serious happened to him. When the man's father came upon the scene he said, "Let that be a lesson to you. Never get into any place that you can't get out of." As an adult, this man got the feeling of panic whenever he was "trapped" on an airplane. Once they had gotten beyond the "blank" or impasse, they were able to use the re-imprinting process outlined in this chapter to give him new choices about his feeling concerning flying on airplanes. He now reports that he flies on airplanes three or four times a month as a part of his work and is so comfortable that he often sleeps during the flight.

An imprint is a significant event from the past in which you formed a belief, or a cluster of beliefs. Every form of healing, whether physical or psychological, that I know of gives credence to the fact that present behaviors are often created or shaped by past behaviors and past events. What's important to us as NLP practitioners about past experiences is not the content of what happened, but the impression or belief that the person built from the experience. The notion of imprinting comes from Konrad Lorenz, who studied the behavior of ducklings when they hatched. He discovered that baby ducks would imprint a mother figure in the first day or so of life. They did that by sorting for movement, so that if something moved just after they hatched from their eggs, they followed it and it "became" their mother. Lorenz would move, and the ducks would follow. He found that if he reintroduced them to their real mother later, they would ignore her and continue to follow him. In the morning, when he got up, he would go outside and find the ducklings curled up around his boots, instead of in their own nest. He once reported that a ping pong ball rolled by one of the eggs when it hatched and the emerging duckling imprinted to the ping pong ball, making it the "mother." Later in life, the duck would shun others of its own species at mating time and try to mount various kinds of round things. Konrad Lorenz and his colleagues believed that imprints were established at certain neurologically critical periods, and that once the critical period had passed whatever had been "imprinted" was permanent and not subject to change. Timothy Leary investigated the imprint phenomena in human beings. He contended that the human nervous system was more sophisticated than that of ducklings and other animals. He established that under the proper conditions, content that had been imprinted at earlier critical periods could be accessed and reprogrammed or re-imprinted. Leary also identified several significant developmental critical periods in human beings. Imprints established during these periods established core beliefs that shaped the personality and intelligence of the individual. The primary
critical periods involved the establishment of imprints determining beliefs about biological survival, emotional attachments and well-being, intellectual dexterity, social role, aesthetic appreciation, and "meta cognition," or the awareness of one's own thought processes. Thus, health problems might stem back to core beliefs and supporting behaviors established during the biological survival critical period, while phobias could have their roots in the emotional well-being period. Learning handicaps might derive from imprints formed during the critical period involving intellectual dexterity, and so on. My development of the NLP Re-imprinting technique grew out of a series of seminars I co-conducted with Leary. It was as a result of my work with him that I realized that some traumatic episodes experienced by clients were more than just bad memories that could be dealt with by using simple integration techniques. They were often belief and identity forming imprints that formed the cornerstones of a person's personality, and thus they required a different approach in order to influence the person in an adequate and lasting way. Imprints can be significant "positive" experiences that lead to useful beliefs, or they can be traumatic, or problematic experiences that lead to limiting beliefs. Typically, but not always, they involve the unconscious role modeling of significant others. Compare the duck's behavior with human behavior using child abuse as a point of comparison. Research validates that often people who have been abused as children unconsciously get into relationships, as adults, that repeat their childhood experience. For example, often women who have been abused as children marry men who abuse them as adults. Males who were beaten as a child may abuse their own children. If they were beaten by their mothers, they may get into relationships where they are somehow the lesser person. Research shows that women who were beaten by their mothers are apt to be more violent with their own children than those who weren't. Imprints are one explanation of this phenomena. People abused as children can imprint that this is the typical behavior associated with fathers, mothers, husbands or wives. At the time the ducklings were hatching out of the eggs they didn't say, "Gee, that's a strange looking mother; I'd better check things out." Their brains were probably saying, "This is how mothers are,"—human beings do the same sorts of things.

Modeling And Taking On The Other's Point Of View INTROJECTION / IMPRINTING

I was once working with a lady who had cancer of the throat. She felt like her throat, and in fact, the rest of her body, wasn't hers. She had the feeling that someone had taken it away from her. I anchored that feeling and had her use the feeling to help her remember an experience in her past. It was a very early childhood memory. She said, "My mother is grabbing me and she's shaking me by the throat." While she was saying this, however, she was making the shaking movement with her own hands. The voice she used was one of anger, like her
mother's must have been, not one of a fearful small child. She had switched positions with her mother. She was not exhibiting the behavior of the little child, but the behavior of her mother, the aggressor. When you're a child, you're in an intense ongoing relationship with your parents. You will imprint (introject) some of their beliefs and behavior and make it part of your own. As one lady put it to me, "When I was little and was beaten by my mom, I just felt hurt and confused. Now that I'm older, I find it easier to identify with the feelings of my mother. Instead of the hurt, scared feelings I got as a child, I get the angry feelings of my mother." Another woman told me that "at times I feel possessed by my mother." As you grow up and your body changes, you typically find it easier to match the behavior of the adult person. An imprint is not necessarily logical. It's something that's intuitive, and it typically happens at critical developmental periods.

In childhood most of us don't have a real sense of self identity, so we pretend we're somebody else, and we often take on the role model—lock, stock and barrel. We can end up like the ducklings that weren't very discriminating about what they would accept as a mother. Who you are as an adult is, in many ways, an incorporation of the adult models you've grown up with. Your model of being an adult has the features of past significant others; features that have been stuck in early ways of believing and behaving that you made a part of yourself at an early age. These beliefs and behaviors emerge when you reach a certain age and are not a child anymore. That's why it's as important to deal with the other persons involved as well as the younger you in the Re-imprinting process. I worked with a woman who wanted to exercise more and really get her body in shape. When we got close to the change she wanted, she had a really strong reaction. I asked, "What stops you?" and she said, "If I made this change, then I'd really like myself." That didn't sound so terrible to me, so I asked her how that would be a problem. She replied, "Because if I like myself, then I lose people I care about." I asked her where that came from, because that's a belief. "If I like myself and take care of myself, then I lose other people." It turned out that there was precedence in her family history. When significant others in her family had really done something good for themselves, their partner felt threatened and couldn't handle it. Then the relationship would break up. When my client looked into her future, she got a bad feeling about doing something good for herself. That feeling related to something in other people's pasts. It was role modeled from somebody else. So you can have strong limiting feelings resulting from imagining what it would be like to be in another person's shoes.

Identifying And Working With Imprints

The hardest part of changing any belief system is the fact that the imprint is likely to be out of conscious awareness. Your most significant behaviors are usually the
ones that are most habitual. Those are the behaviors that you're least consciously aware of. When using an anchored feeling as a guide to past memories the experiences you remember first may not be as important as going back to the point where you feel confused and say "I don't know." "I don't know why I do that." At that point, you know you're really onto something significant—I often call that an impasse. That's a rather interesting orientation, and is perhaps a different approach than what you might have taken some time in the past. That's when you know you're "at the right address" in terms of identifying the circumstances in which you created the limiting belief.

If you're not having any luck finding an imprint associated with an impasse, have the person make up something that might be associated with it. You can say, "Guess what that feeling is all about." That will get you started. If the episode they make up carries the same intensity in their physiology as the problem state, you know there's a connection. Occasionally when you anchor a feeling, even an intense one, and hold it to assist the person in remembering past experiences, the person will come upon a blank, as did the man with the airplane phobia. Suddenly, there's nothing there to work with. It would appear that some people have learned to dissociate from the pain to avoid what might be coming next. You can anchor that "blank" or dissociated state and take it back in time, on a search for a significant past imprint. You need to be patient with this and often your patience will pay off. The person will often begin to get slide pictures that they can piece together to find the details of the imprint situation. Another useful technique for identifying imprints, when a person reaches an impasse, is to immediately interrupt them and then anchor a powerful resource state. You might want that resource to be something like courage or power—a generic resource that would be useful in many different situations. Then, take that resource anchor back into the impasse to help the person get through it. I often find therapeutic stories (metaphors) useful when working towards integration. If you hit an impasse where the conscious mind is doing one thing and the unconscious another, it's useful to tell a metaphor, especially if the person is saying, "It just doesn't make any sense." I have a quote on my wall from Albert Einstein that reads, "Everything should be made as simple as possible, but not simpler." I often tell that to people when they are stuck and suggest that if they try to make something happen faster or less simple than is possible, they sometimes run into resistance. One of the nice things about metaphors is that they're processed by both brain hemispheres, so they bridge thinking gaps nicely. Even if the metaphor is doing no more than repeating what you just said by restating it in an analogy or story, it can be understood at a different level.

You may occasionally find imprint experiences where there is no obvious introjection of a significant other. Let me give you some examples of imprints where there is not a clear switching of positions with a role model. I worked with a 35 year old man who was a successful executive, but he couldn't spell. We tried
to teach him the spelling strategy and he just kept blowing it. It turned out that as soon as he'd look up and left to visualize the spelling word, he'd start associating into an experience where he'd see his teacher's face, looking at him and telling him how bad he was. Then he'd feel bad. The picture was "clogging up" the channels so he couldn't see words, just the teacher's face. He said when he tried to visualize words they wouldn't stay up there in visual memory; they just kept disappearing. His problem stemmed from his relationship to a significant other even though he did not switch position with her.

We explored the positive intention behind his third grade teacher's behavior by having him switch positions with her. He discovered that she was trying to motivate him to learn to spell. Determining the positive intention changed the relationship in his mind and the teacher's face didn't need to hang up there. After that he didn't even have to look back at the word; the letters literally jumped up in his mind. He already had the letters and he knew how to spell words; he just couldn't get access to the words in his mind's eye because of this interference. When we took away the interference (the image of the teacher's face), the words were suddenly there. This is an example of an imprint experience that prevented a person from doing a simple process and resulted in the man's belief that he couldn't spell.

As he was talking to me about his present state, I noticed that he looked up and left. It was clearly a picture that he was making that was outside of his conscious awareness. Even though he was accessing visually, he said that the water felt "squishy." When I asked him what he was aware of visually, he said, "I don't know. I don't see anything." (Often in pinpointing beliefs the person has only a partial awareness of his own thinking process.) I asked him to look up, and exaggerate the feeling, making it stronger, to see if any pictures came to mind. Suddenly, as he began to exaggerate the feeling, a remembered image popped up of when he was playing in a muddy river at the age of 12. They were dredging the river for a body and he stepped on it. That was what bothered him about murky water. Just knowing about that past imprint didn't change the fear. We had to consider what abilities, information or other resources needed to be added to that early experience to make it different. Since no obvious switching with others was involved, rather than doing a full Re-imprinting, I only needed to do basic anchoring. I had him go back to the experience, and, using basic anchoring techniques, add more choices to give him the desired state. It was a simple step but it made all the difference—he was able to dive in murky water, using appropriate caution.

An imprint experience generally involves the unconscious role modeling of significant others. The purpose of Re-imprinting is to give you new choices in the way you think about the old imprint experience. These choices assist you in changing the beliefs you made about yourself, the world and the role models. To
accomplish the Re-imprinting, you need to add the resources you would have needed at the time of the experience in order to have had more choices about your behavior. You will probably need to add resources to the other people who were involved in those early experiences also. (See Re-imprinting Process Summary, Steps III and IV, page 96.) Editor's Note: What follows is a complete transcript of a re-imprinting session with a client, showing how resources are added into the role model, as well as to the client. Note Robert's consistent use of backtrack pacing for rapport and understanding. His comments to the group are also metaphors and explanations for Bill.

I use content in several ways. Sometimes it is useful to get some content about the significant experiences (imprints) a person has had so you can see how things fit together. I also need enough content to calibrate to the voice tone, accessing cues, physiology, etc. that are associated with Bill's experience. When I ask someone to tell me about "x" experience, I am not concerned with the verbal, conscious answer they're giving. Rather, I'm checking for the body posture, accessing cues, tone and tempo of voice, gestures, and language patterns they adopt. I'll let you know as we go along what information I get from these cues.

I sometimes think of my role at this stage in the work as being a behavioral travel agent. Someone comes into you as a travel agent and you ask, "Where would you like to go?" If they say, "I want to go home," you need a lot more information before you can assist them. (To Bill:) When you think about that, I noticed that your eyes went up. Do you have a picture? Bill: Sure. I can see myself in the future feeling good and having no symptoms. Robert. You have a dissociated image. The "no symptoms" statement is a negative statement about what you won't have. If you have no symptoms, what will you be like? Bill: I'm looking healthy. Robert. What things will you be doing in the healthy future that you aren't doing now? Bill: I would physically feel better. Robert. Do you get that "better feeling" when you look at the image? Bill: If I look at it long enough. Robert. Long enough? Bill: I look at myself working out at the gym and feel better. Robert. How would you expand that to other contexts as well? Would you be doing anything differently in your relationships or at work? Bill: I would be spending a lot more time with people. Recently I haven't felt good enough to have a lot of relationships. Robert: So you'd be spending a lot more time with people. Bill: Enjoying myself with them. Robert Are there any specific people? I don't need specific names. Bill: Yes. Friends and people at work. (To Group:) Notice that we have an expanded image now. He just started off with an image of looking healthy in a gym. We want him to look at the broader life around that. So we might begin to ask, if you are healthy in that setting, what does it mean about the rest of your life? We need to check for
any ecological issues in other life areas that might need to be dealt with. Sometimes health means to the person that they'd really be living life the way they'd really like. When you work with people that want to give up something, they may say, "If I quit smoking, then I'm going to finally be able to do everything that I've always wanted in life." Of course, this means that there are more issues than just quitting smoking, because there is a big implication behind quitting. Health for Bill means a lot more than working out in a gym. (To Bill) What needs to change inside your body to give you the healthy future you want? Picture the inside of your body right now, and also picture how you would be different as a person if you were the healthy you. Compare the pictures. Bill: My immune system would be stronger. Robert: How specifically? What would that look like? Bill: I don't know. I go to the Simonton model—little Pac Men.1 Robert: The Pac Man model of the immune system.

(To Group) The first thing Bill says is that he's never pictured that before. He is saying, "I don't know what that would look like." He jumps to a model that his Pac Men (immune system) would be stronger than the virus, or something like that. What is AIDS, and what does it do? It is a virus that presents a paradox. It actually attacks certain cells of your immune system. If you try to attack those cells using visualization, you're actually going after your own internal defense system. The AIDS virus infects your immune system's marker cells—the ones that identify what is good in your body versus what the other immune cells need to eliminate. That's why you are more susceptible to infections when you have the AIDS virus. It isn't because you have less Pac Men. The Pac Men aren't infected. The cells that turn the joystick are. What is problematic is that you have to get rid of some of your own immune cells in order to build up your immune system.

So, it's not a matter of having more Pac Men. It's a matter of having them doing the right things. It's not a matter of having the Pac Men eat something, it's a matter of maintaining the integrity of your physical identity. There are lots of examples of people that have the AIDS virus but don't have any of the symptoms. They may never have symptoms, or it can take years for symptoms to develop. (To Bill) In order to get to the healthy future you want, some things have to be accomplished inside your immune system as well. That's the reason I'm asking what your image is and going into this explanation. Bill: I understand. Robert. Your immune system determines what is self and what isn't self. It's about identity. Sometimes immune system problems and illnesses will correspond to other identity issues as well. That's another reason why I've been asking, "Who are you going to be in your healthy future?" Let me give you a quick example.

People who have multiple personalities often have different immune reactions in each personality. For instance, they may have an allergy in one personality and not in the other. One woman I read about even
had diabetes in one personality and not in the other. One type of diabetes is related to a malfunction where the immune system attacks the cells in your pancreas that produce insulin. By changing your identity you frequently change a whole bunch of other things (such as the immune system), all the way down.

Bill: I have several guesses. I've used illness in the past to get love. I did that when I had asthma as a kid. I could get attention by being sick. I'm getting attention right now in my life. Robert. You say, "I notice I'm getting positive gain from this now. Attention." (To Group) He's also saying, "asthma and constriction." There is some correlation there. We could deal with strategies for getting attention, but I want to deal with underlying beliefs. That will really make the difference. (To Bill) Do you believe you can do what you need to do to achieve the healthy future you want?

Bill. I'm trying to. My whole experience of NLP for the past two years is that NLP doesn't work for me. I've seen it work over and over on others. I've even used it with other people successfully—but nothing seems to work on me. (To Group) This is a good indicator that a belief limitation is present. When NLP practitioners ask, "How do you identify a belief?" I often suggest they find something a person has tried to change for a long time but keeps failing to achieve. When Bill talks about what he wants, he looks up and to his right. When he talks about what stops him, he makes a gesture like this (pushes his hand down and to his left behind him). We want to watch for what he does when he says "yes" versus when he says "no." We don't want to interpret it yet, just notice it.

Robert. When you think about yourself now in comparison with where you want to be, what is in the way? Bill: Right now I don't get results in the change work I try to do on myself. Robert So, it's just the fact that you haven't gotten results? Bill: It's a hideous "Catch 22." Robert. Let's explore this a little bit. Think of some things you've done. Has there been a time when you thought you would get results? Bill: I keep thinking I will, but I don't. Robert So, you think you'll get results. Bill: Hope. I hope I'll get results, but I don't think I will. That's different. Robert You say, "I hope I am going to get results." That's different than thinking you will and it's different than believing you will. You hope you are, but. . . Bill: I don't know. (To Group:) He said, "I don't know." He didn't say "I don't know," which is something to consider. When you're going for an outcome, don't just take any piece of information you first get and run with it. What you are after is a pattern. That's what NLP is all about—finding patterns in behavior. One of the ways I know I have a pattern is if I have three examples of the same nonverbal cue. When I see or hear the same response, I start to know there is a pattern. If I contrast the physiology three times when someone has failed versus three times when they've succeeded and I see or hear the same things going on, I know I have a pattern. Another way I know I have discovered a pattern is to see behavioral
consistencies around the same category of internal events. This is another way you find an answer when somebody says, "I don't know what stops me" when you are gathering information using the well-formedness conditions for outcomes.

Robert Let's go all the way back to the first time. What's the first thing you tried it with? Bill: Lower back pain. I worked with an NLP trainer. The work he did alleviated the pain for about an hour. Robert So, something happened and it started hurting again. What made it start hurting? Bill: (Drops voice to auditory tonality.) I don't know what made it start hurting again. Robert Right now you were just looking down and to your left, which usually means you are thinking in words. Were you just repeating the question or ... Bill: No, I was only aware of feeling my back.

78 BELIEFS

Robert. When you were feeling your lower back your eyes went down and left. Move your eyes down and left. What did the NLP trainer do? Bill: (Again looks down to the left) A Behavior Generator, where you watch yourself do a new behavior in a situation then step into it and experience it; but it didn't work. I have my own internal terrorist. Robert. You said you had an internal terrorist. When did you first notice it? Bill I'm not sure when I first noticed it. It's always been very difficult for me to get what I want. Robert: He says, "It's always been difficult to get what I want." That's an example of a belief statement. Bill: Yes, and it's had an awful effect on my life. Robert. Where does that belief come from? Do you want to have that belief? Bill No. Robert. How come you still have it then? Bill: (Frustrated) Because the work I did to change the belief didn't work. Robert. So, right now, you looked up to your left. (Gestures) What was going on? This time your eyes went way up there. (Gestures up and to Bill's left.) Bill: I was starting to get angry. Robert. At what? Put your eyes back up there. Bill: I'm angry at how difficult my life has been. Robert. So, what do you see in your mind's eye? Bill: All sorts of examples of how my life has been difficult. Robert. How far back do they go? Bill: Puberty. Robert. Stay up there for a moment. You said you started feeling angry. Bill: Yes—angry and frustrated. Robert. Angry about your life. When you see those examples, that makes you angry.

Bill: No. Frustrated about my life and that makes me angry. Robert. You say frustration first, and then anger. Usually frustration occurs when you know what the goal is, but you don't know how to get there. So, there have been things you've wanted to do but couldn't. (Bill is nodding.) Have you been frustrated with yourself or the world? Bill: Myself first. Robert Yourself first. I want you to make that image again and take that sense of frustration . . .
(To Group:) Notice. Here is a person who needs to have a belief to drive him forward to get healthy. To do all the things it takes to get better may be difficult, sometimes arduous, and sometimes complex. What Bill is saying is that he has many, many examples of failures of getting what he wants. As soon as he gets started trying to make a change, he gets frustrated. All these old memories and behaviors come to mind and interfere with his attempt to get what he wants.

(To Bill:) Let's start with the frustration and anger since those emotions seem to be the ones that come out first. You mentioned that it started at puberty. Take a moment and think about how frustrating everything has been. (Anchors the feeling.) Take that feeling back in time—maybe there are words also. (Long pause while Bill remembers) Robert What do you see? Bill: I'd rather not reveal the content. Robert That's OK. Does it involve someone else? Bill: Yes.

Robert. One person, primarily? Bill: Yes, um hm. Robert. Do you see that person looking right at you? Bill: No, I see me and the other person. Robert. Put yourself inside "the you back then" for just a moment. What generalizations are you making about what is going on? Bill: How bad I am. (Long pause) That I can't get what I want. That I don't deserve what I want. Robert. That you don't deserve what you want. Bill: Also that if I get what I want, it'll get me in a lot of trouble. (Voice shaky, tears and sniffles.) Robert: Do you have any beliefs you're building about the other person or the world around you? Bill: The world around me would get on my case if they knew what I wanted. It has to do with gaining cultural acceptance and that sort of thing. Robert. It has to do with cultural acceptance—what's the intention? The intention behind the thought that the world will get you, even if it only knows what you want? Bill: I don't know. (Voice shaky and emotional) {To Group.) I was trying to find out if there were any generalizations or beliefs about the intent. (To Bill:) (Shifts voice) Now it's time to come out of that. Back here to this room. Robert here (Gestures to self) and Bill here (Gestures to Bill—laughs). OK. This is the next thing I'd like you to do. Look back at that experience you had during puberty. Put it way out there so it's completely removed—so you're not into it at all. (Gestures out in front of Bill) That's right... watch that boy and whoever else is involved, out there, as you are sitting here comfortably. Bill: (Long pause) I can see it. (Flat voice tone that is associated with watching yourself.) Robert. How has that experience affected you since that time?

Bill: It's given me a lot of guilt. (Looks up to his left.) Robert So you can see that it's given you a lot of guilt. What belief would you have formed about that? Bill: That what I want is wrong—is bad.

MHR Cult of Judah / all religion, uses this conditioning to disable their slaves...make 'desires' a 'sin' with terrifying eternal consequences...so you will teach self not to desire anything...to accept being a slave...so the Priests /
beneficiary classes can enjoy their hearts desires at your expense...you won't even feel 'entitled' to freedom...or to 'justice'... or even to 'ask for anything'...or 'challenge' their authority...

(To Group:) That's a little different from what he said earlier. Before he said, I can't get what I want. I don't deserve to get what I want and if I do get what I want, I'll be punished by the world. If the world knows what I want, it will punish me anyway. And now what he's saying is, "What I want is bad." That becomes an underlying belief. That's a nice little cluster of beliefs that explains why he might have had trouble getting the things he wants. Let me point something out. Beliefs tend to fulfill themselves. When you try to argue with a belief in the present, the person is confronting all the data, gathered over time, that supports or "proves" their initial belief. When you go back to where it started, often the issues are much simpler and clearer. They're certainly not cluttered by later confirmations. I don't care so much about what happened in the initial puberty experience as I care about how that affected your belief system. At puberty especially, you build a lot of beliefs about yourself, your identity, and your sexuality. Remember, we had Bill look back to see if there were any other beliefs or other ways that this experience had affected him. I have a reason for doing that. We had him first go back inside the imprint and experience it again to get some physiology for us to see and hear. I asked "What kind of beliefs are you building there?" so that I could identify a pattern in his voice tone. Sometimes when you have the person put the belief into words, it's the first time they've verbalized it. By doing this, we are beginning to involve a bit more of the brain in the whole process, which can then help us find a solution. The reason I have the person look back on the reference experience afterwards is that sometimes the experience was confusing or actually positive at the time it occurred. Let's take a confusing example of when someone was sexually molested by a parent. Often they were little and may not have known what to think about the situation. They might not have formed a belief at that time—they were just doing what Mommy or Daddy or Uncle Ernie wanted. It's only later that they build a belief like, "I've been soiled for life." The point is that there might be beliefs that you build both during and after an imprint experience.

(To Bill:) There was also a significant other person involved. Bill: There was also more than one specific experience. There were a series of experiences within a time span. (Gestures out to left) Robert (Repeats gesture) A time span. Good, we want to know where that is. Bill, what I want to do now is a process called Re-imprinting. (To Group:) Let me review what we've done. There was a certain frustration associated with Bill's belief that he could change, and we took that back in time. We aren't concerned with the content of the experience; we're concerned with the generalizations—the beliefs—that got formed. Imprints may be single experiences, or a series of experiences that happen over and over. So, a person believes that's the way reality is. There's a question that I want to ask Bill
in reference to his group of experiences. (To Bill:) Did the belief that you were wrong only come from your experiences and what you felt was going on? Or was it formed by judgments that were passed by the significant other person? Bill: Judgments by the other person and myself as well, at later dates. Robert. And yourself at later dates, too. One of the things you find with imprints is that the beliefs of significant other people are as important in the creation of your beliefs as your

Re-Imprinting 83

own experience is. When you are in puberty, it's not hard to temporarily reject that significant other person's views. But sometimes as you grow older, and acquire an adult belief system, the significant other's beliefs begin to take on more power. I'd like you to review the movie of your experience at puberty, and watch both yourself and the significant other person. My guess is, Bill, when you talk about an unconscious internal terrorist, you're talking about the fact that your brain runs some aspect of the significant other's behavior over and over again. But this time you're experiencing it as you, not as the significant other. I'm wondering what resource the other person needed. I take it that this other person was participating in the judgments that you have about yourself. Bill: That other person is where I got the judgments I have about myself. Robert Is that person trying to install a belief in you that you don't deserve what you want? Is that the intention? Bill: No. He is trying to install other beliefs in me. He's trying to install a belief in me that a certain category of behavior is bad. All my other beliefs come from that. Robert: What is his intention in doing that? Is his intention to screw you up? Bill: No, it's to take care of me. Robert. To take care of you. If he were to know now what's going on with you, would he be satisfied? Bill: No, he wouldn't want me to feel badly about myself. Robert. What would you need to give that person in order for him to respond differently? Bill: (Searches his mind) More acceptance. Robert So he needs a realization that different people have different models of the world. To be more accepting of others. Bill, have you ever had the kind of feeling you're talking about—being more accepting? About anyone or anything?

84 BELIEFS

Bill: Yes. (To Group:) I'm asking Bill if he's ever had the resource this significant other needed. (To Bill:) I want you to vividly remember a time when you fully had that accepting feeling. Find a specific experience. Bill: (Long pause—nods.) I have had that specific feeling of acceptance. Robert (Anchors resource state) Take this feeling and give it to this other person. This other person is in your brain right now—that image, that memory is coming from your brain. Take this (Squeezes anchor) and give it to him. What does he do differently? Bill: That... it doesn't matter what I do. He still loves me. Robert: How does he look at you
when he says that? How does he say it? How does that younger boy respond? Bill: He feels wonderful. Robert What beliefs does he build there? Bill: Um... that I'm OK. I don't need to feel guilty for what I want. That it's OK to be me. Robert (Firmly) That it's OK to be me. Run that same feeling through that whole time period. If that same feeling had been there that whole time... how would things have developed differently? You don't have to say anything out loud. Just do it inside, and allow your unconscious mind to review each experience with this belief and feeling. (Squeezes anchor.) We know that this person didn't have the resource of acceptance at the time, although it's a resource that you have. You can treat yourself that way. You can update that model now, so that you know with that new resource, you don't have to keep replaying frustration over and over. Now, Bill, there is a younger self back in that experience that also needs resources he didn't have then. If you look back at him now, is that the belief you want to build from.

Re-Imprinting 85

your experience? Look at all these beliefs—I don't deserve it, I'm bad, etc. I'm not sure those are the beliefs you want to build as a result of that experience. What would that younger you have needed? What resources do you have now that would have allowed you to build a different set of beliefs at puberty? Looking back on that experience now, what sort of belief would you rather have built? Bill: Um... That I can accept myself no matter what kind of feedback I'm getting. Robert. OK. So you can accept yourself no matter what kind of feedback you're getting from the outside world. It seems to me that if you had known that the judgments of others are their models of the world and not yours, the experience would have meant something else. When you look back on that other person's views, was he right? By the way, he wasn't even accomplishing what he wanted. He didn't want you to build limiting beliefs, either. He behaved the way he did through his own beliefs and belief system. It's useful to recognize that others have their own models. Their models don't have to impact you. Bill: The other person was well intentioned, but was off base. Robert. I don't think you knew that when you were a child, having that experience. Bill: I didn't. I thought he was right. Robert. You thought he was right. It makes a lot more sense to say, "He's well intentioned but off base." That's something you know now. You said you wanted to know you were OK no matter what kind of feedback you received. Have you had that experience since that time? Even if it was only for a glimmer? Bill: Oh, sure. Robert. Think of a time when you knew you were OK. You felt OK no matter what feedback you got. Bill: I lied. No, I don't have a time.

Robert. What is the closest you've come to having that resource? One of the nice things about anchoring and submodalities is that we can build the resource you need. Bill: (Remembers a time.) Robert. (Anchors Bill as his physiology shifts.) What was going on there? Bill: Someone was angry with me on the telephone,
being rude, but I knew what he was saying wasn't what was really happening.

Robert. OK. How did you know that? What let you know that inside? (Touches anchor.) Bill: A feeling I had, right here. (Points to heart area.) Robert. (Touches anchor.) Can you emphasize that feeling? That's a good feeling to have, too. If you made a picture of it, what would it look like? What would it sound like? Bill: It would look like a circular light. Robert. What if you made that light brighter? Bill: It feels better. Robert. What if you make it bigger, so it surrounds more of you? Bill: I start going into a smile. Robert. Yeah... Now what I'd like you to do is to take that light (Touches anchor) and shine it back in your history. Shine it on that younger you. (Robert's voice tempo is matching Bill's breathing) Make the light shine from that place in you (where Bill had touched his heart) to the same place in him... so that even though that other person is saying those things that he said, that younger you is in touch with this light, and it can grow bigger and brighter in him.

I'm wondering how he would have responded differently to that other person. Would he have talked to him in a different way? Would the younger you have said, "I think you're well intentioned, but you're off base?" Bill: No. The younger me just would have let him say what he wanted to say but wouldn't have been affected by it.

Robert How would that have affected the other person? Bill: He wasn't really paying a lot of attention to what was going on with me anyway. I'm not sure it would have affected him one way or the other. Robert. Maybe you would have liked to get attention from him. Bill: Sure I would. Robert If you had that (Squeezes anchor) would you have gotten the attention you needed, or would you have needed something else, also? Bill: It was very difficult to get positive attention from him. Robert. Then I'm going to ask you to do this. It seems to me that another resource is needed here, both in terms of the imprint experience and also in terms of what is going on with your illness. You said earlier that unless you were sick you couldn't get positive attention. I'm wondering if there has been a time since you had that experience when you've been able to get positive attention from somebody? Bill: Yes. Robert What are those resources? Think of a specific time. Bill: When I'm just being relaxed and being myself. It's a feeling of being at ease with people. (Bill's physiology shifts into a state of being "at ease." Robert anchors resource state on Bill's shoulder.) Robert. We'll take this too (Touches that resource anchor which is on Bill's upper arm), and take both of these back to that younger you... That is a little different, isn't it? Bill: Well, that makes getting attention from him like a challenging game. Robert. Um hm. And what does he do? (Bill smiles) Let's take these two resources (Touches both anchors) and shine the light over all those experiences back there and brighten them up. Take this resource (Touches anchor) of acceptance back too. Make sure these resources are appropriate for all those experiences. Let the light shine through like a beam, connecting all those experiences together... (Robert's voice
shifts to a soft hypnotic tone and tempo.) You can be relaxed and secure, being calm and comfortable with yourself. Make it into a fun challenge to get what you want. Bill: Yes!

Robert We have one more important thing to do. You reviewed this in a dissociated way by watching yourself. I’d like to go back and have you put yourself into the experience. Remember, I had you give necessary resources to that significant person. Now, I want you to go back behind the other person's eyes. You’re going to be in his shoes with this resource (Touch anchor as Bill closes his eyes) in those situations. Say what you would say and see what you would see through his eyes. See that young boy in front of you who is building a model of the world, knowing that you can really pay attention to him and give him the support he needs to be accepting of himself, as well as others. And when you’re through you can come all the way back here . . . taking all the time you need to finish. Bill. (Sighs, opens eyes, and looks at Robert.)

Robert. There was that young boy, who needed to know at his core that he was OK, that he could be relaxed and confident and get the attention he needed. You saw how that would have been different if he had the resource associated with the light and also the ability to get attention. Step into the experience, be him, and take these (Holds all three resource anchors) with you, seeing through his eyes. Have him look up at the other person who now has the resources he needs . . . and run through all the situations. Grow him all the way up to the you that is sitting here. Take with you those new beliefs, those new understandings and spread them through these experiences that in the past have only been evidence of failure. They are now evidence of the new belief. (Robert is matching his voice tempo to Bill's breathing.)

Bill: There is a hole over here (Gestures, in space, by his left ear). The "you're bad" statements are no longer coming at me, but I have a weird "void" feeling. Robert. What would you like to put in that hole? Bill: Um ... that I'm a loving, gentle man just the way I am, and that's fine. If other people want to make judgments about me, that's their problem. Robert. Put that in there. I want you to hear that. Fill up that hole with that sound so it resonates and reverberates back and forth. Say it in as many ways as you can, with as many feelings as you have. So if you’re frustrated, or happy or angry or whatever, you know you’re just a loving, gentle man and it’s just fine. If others are going to make judgments about me, that’s their problem. You always have the choice of getting positive attention from them. Say it louder, make the sound bigger and fill up the hole with sound. OK, now, what was that you wanted when you first sat down? Something about being healthy. Has that image changed? Bill: I look fuller, more solid in that image. Robert. Do you deserve that? Bill: (congruently) Yes! Robert. Will you take care of yourself in the ways we’ve discussed? Bill: Absolutely. Editor's Note: When Robert's intervention began, Bill's skin color was pale and grey and his posture was slumped down. At the end of the Re-imprinting process, his skin color had changed to a more healthy glow and he was sitting up much straighter.
Woman: You had Bill watch the whole memory, seeing himself and the significant other person. Then you had him step into both himself and the other person and behave more resourcefully. Will you summarize the process? Robert
What you've just described is the essence of Re-imprinting. Once you've found the imprint experience, you want to give resources to both the person you're working with and any significant others that were present in the imprint experience. Remember, you're not changing the significant other people; the client is changing his own perspective—the belief that he took in as his own as a result of the imprint experience. When you take multiple perspectives on a situation, even without adding resources, you will make it a different experience. Try this—think of an unpleasant experience you've had with someone else, maybe an argument or when someone said something that hurt your feelings. Remember it as if it were happening right now... now float up and look down on the situation, seeing both yourself and the other person. Watch the other person and notice their posture, their voice tone, the way they move and gesture and consider anything you know about their experience, both recently and historically. Now float down into them, adopting their physiology as completely as possible. Re-experience the event fully looking from their eyes back at you When you've re-experienced the event fully from their point of view, float out to the side and watch it over again seeing yourself... and the other person. Now step back into yourself as if it was happening all over again. Notice how the experience is different. Having more information from multiple perspectives will create a change in your own point of view. It's a very powerful set of moves. Having multiple perspectives is the basis for wisdom in decisions, conflicts, negotiations and in cleaning up your own personal history. Man: Would you give perpetrators, such as rapists, abusers, etc. resources the same way you did with Bill's "significant other"? Robert One of the reasons for doing Re-imprinting is to have the client realize what sort of resources people, including abusers and rapists, need in order to completely resolve or avoid the situation. Often when someone has been a victim of a crime, like rape or some other form of violence, they don't want to give the "son of a bitch" resources because that would seem to make the behavior okay. They are really angry about it and have a good reason to be. It would be like forgiving them or excusing the behavior, and they don't want to let go of it or somehow condone the behavior. Actually, the outcome of giving the perpetrator resources is not to condone their behavior or to make the memory go away. Instead, it is important for the victim to understand what resources the other person would have needed to be the kind of person who would have behaved differently. Often, when a person has been the victim of some kind of crime, their limiting belief maintains itself through anger or fear. Giving the perpetrator resources is a step toward helping them move beyond this. There is no way that you're supposed to make the heinous activity seem okay. It is a good idea, in most cases, to give the perpetrator the resources they need prior to the incident where the imprint experience occurred. Let me give you an example. I worked with a woman whose mother became enraged and held her out...
a window that was five stories high. She was so angry she was going to drop her to the street and kill her. To ask this woman what resources her mom needed while hanging her daughter out of the window would have been ridiculous. Instead, I asked the woman to run the movie backwards—back to a time before the incident ever occurred, and I installed the resources there. With the proper resources, the mother would never have "lost it" and threatened her daughter that way. It is similar to working with a phobia. You want the person with whom you are working to start the recollection of the phobic experience before the incident occurred, when they were still safe. They then run a dissociated movie, where they watch their younger self all the way through the incident until they were again safe.

You can think of a phobia as a specialized form of an imprint. When working with a phobia, you want to sandwich fear in between times of safety. Consider that a general principle in working with any traumatic imprint. Go from resource state (or at least neutral state) to trauma to resource state. That way of working with someone helps to isolate the event and gives it an "ending" for them. Man: Some imprints are fairly traumatic. Does just leaving the client dissociated as does the fast phobia method make this an incomplete piece of work? Robert: Often the fast phobia procedure is all that you need to do. Remember, you re-associate them in the last step of the procedure, when you have them re-experience the trauma backwards. Sometimes, however, there is an imprint that needs to be taken care of as well. Freud had a belief that a phobia was an example of displaced anxiety. The person really had fear or some other emotion that was directed toward some significant other person. In order to resolve the phobia, the person's "real" fear had to be uncovered and dealt with first. Of course the problem with that is that people have to go through a lot of pain until the relationship issues are resolved. With NLP we can resolve the feelings right away, so people don't have to keep experiencing fear and panic. Sometimes there is still some other relationship issue or some other imprint behind it that still needs to be worked out. In many of the traumatic imprints I have worked with that resulted in phobias, another person was involved. I remember working with a lady who had a phobia of moths. This was a lady who could hold a live tarantula in her hand comfortably, but when a little moth flew by she'd freak out. The initiating cause for her phobia was that as a child a little friend had chased her around while holding a bottle containing a big luna moth. She felt humiliated in front of her other friends, but rather than putting the fear and anger onto her friend, she attached her fear to the moth. I did the NLP phobia cure with her and removed the fear, but that alone did not resolve all of the issues she had about that situation.

You might also run into other kinds of phobias that require more than just relieving the panicky feelings. These sometimes come when children were left alone by their parents and something bad happened. One lady I worked with had
a fear of water because she nearly drowned. She nearly drowned because she was trying to swim away from her mother who was beating the crap out of her. The phobia technique removed the fear she had about the water, but obviously there were other issues we needed to deal with as well. Woman: When you have re-imprinted a past trauma, or resolved conflicting identity structures, how do you know whether the person has adequate strategies to continue the change in a positive way? How do you know if the person still has ways of getting what they want? Robert. Let me respond to that by way of a story. David Gordon (an NLP trainer and author) and I once worked with a lady who had a hand washing compulsion. She thought that these things she called "real imaginary fleas" would get on her. They were "real" in the sense that she would "feel" them when they got on her, but were "imaginary" because she knew that no one else experienced them. She had been cursed with these fleas for fifteen years and had built her life around them.

The fleas directed her life in certain ways. She had seventy-two pairs of gloves that she wore for different situations. She had to avoid some people more that others to avoid getting their fleas. Her parents were particularly infested, so even though she "loved them dearly," she had to limit her contacts with them. Because the fleas were imaginary, they could do things that ordinary fleas could not, like come through the telephone. Because of that, she couldn't talk to her folks on the phone very long. In working with her, I suggested that we treat her real imaginary allergy to her real imaginary fleas. I told her it was obviously an allergic reaction because even though the fleas were all over other people they weren't affected like she was. It was just that she had an allergy to the fleas like some people have to pollen. This really interrupted her thinking about the fleas. She did not have an automatic belief about a real imaginary allergy, so I gave her some sugar pills, and carefully paced her thinking process, by telling her that these real imaginary pills would cure her allergy. She came back the next week and was genuinely frightened because the pills had worked. She no longer knew what kind of clothes to buy, because she had always bought clothes that were a couple of sizes too big. That way the sleeves would cover her hands and protect her from the fleas. She no longer knew how to treat her parents, cook food, or go about her other daily activities because the concern for the fleas was no longer there as her life organizing principle. She needed strategies for all kinds of things. We worked with her on a new decision strategy and had her model other people to gain new behaviors and so forth. The point of this story is that often after you help someone change a limiting belief, their old ways of doing things no longer fit, and you need to offer them new strategies. One of the most amazing ecology objections you'll get from people is an interesting one. You get to a certain point in a procedure and they will say,"If I do what you're asking me to do, I really will change"! They'll balk at moving an internal image or at completing a visual squash or whatever you're asking them to do. They aren't certain that they are ready to change their identity. Woman: How important is it that the person think
the imprint is a real experience instead of an imagined one? Robert. I had a
woman come to me who had joined a religious order that used meditation and
celibacy. She was complaining because when she would try to meditate, she'd see
a big penis in her mind, and she couldn't make it go away. It was a real concern
for her. Everyone kept telling her what a saint she was, but she thought she was
really bad. Experiences like the one this woman was having are typically
communications about something from your unconscious mind. I suggested that
we find out what this communication was about. Evidently, there was an imprint
about something bad that happened when she was really young. She didn't know
what it was and she was afraid of it, so she avoided thinking about it. I suggested
she take that fuzzy picture and push it way out there on the wall, just the size of a
postage stamp. It was far enough away so that she dissociated from it. She started
to look at it and could see that there was a man and woman involved with
something sexual—she didn't know what it was. As she kept bringing the picture
closer, the issue came up. She thought she may have been molested by her father
when she was a child, but she wasn't sure. She couldn't remember what happened
and felt confused. It could have been a story her mother told her (in a convincing
voice) about her mother's father, that she pictured, associated with, and got the
feelings for, as if it had happened to her. It didn't matter whether it happened to
her or her mother, because it was realm her experience. She had never confronted
this issue. It was just something big and dark and bad.

She invented a number of possibilities that might have occurred. Finally, I told
her it didn't really matter. The important thing was that there was some resource
that she needed that she didn't have. I had her play each possibility out and
pretend it was the "real" one, and find the solution for each one. Here is a person
who for 25 years had built a lifestyle on an experience that she didn't even know
was objectively real or not. That's why sometimes to a large extent what "really
happened" is irrelevant. Man: After you do re-imprinting, how do you know what
really happened? Robert. You're actually giving people the opportunity to update
what they are carrying around inside their head. We're not trying to confuse them
about reality; we're allowing them to re-experience the same things without the
scar and the negative impact. We end up with different beliefs, different
resources and the imprint means something completely different. We're not trying
to erase what actually happened, because the content of the imprint is not what
makes the difference anyway. It's what you've learned from it and the reminder
that you now have what you need in terms of resources that's important.

The Re-imprinting Process Summary

I. Identify the specific feelings (it may also be words or an image) associated
with the impasse. (Anchor it.) Most people want to avoid these feelings because
they are uncomfortable. But it is important to remember that avoiding them won't
resolve the limitation. Have the person stay with the feeling (hold your anchor)
and remember back to the earliest experience of the feeling associated with the impasse.

A. While the person is still in that associated, regressed state, have him/her verbalize the generalizations or beliefs that were formed from that experience.

II. Dissociate the person from the experience. Have him/her see the experience as if he/she was watching a movie of himself/herself.

B. Ask the person to verbalize any other generalizations or beliefs that were formed as a result of the imprint experience. (Beliefs are often formed "after the fact").

III. Find the positive intent or secondary gain of the feeling of impasse. Also, if there were significant others involved in the memory, find the positive intention of his/her behavior as well. This may be done by directly asking the people you see in the image.

IV. Identify and anchor the resources or choices that the person and the significant others each individually needed then, and did not have then, but the person does have available now. Remember that you don't need to limit yourself to the capabilities the person or the significant others had at that time. Just as long as the person (not the significant others) has those resources available now, you may use them to help change that experience.

V. For each of the significant others in the imprint experience, have the person replay the movie, seeing how the experience would have changed if the necessary resources had been available to that person. Do this one at a time for each person making sure the identified resources would be sufficient to change the experience. If not, go back to Steps 3 and 4 and identify other positive intentions or resources that may have been overlooked.

A. After the resources have been added, ask the person to verbalize what new generalizations or beliefs he/she would choose as a result of adding these resources.

VI. Utilizing the resource anchors set in Step 4, have the person relive the imprint experience from the point of view of each of the significant people involved (one at a time). Have him/her actually step into the other person's body and see the experience out of that person's eyes. Have the person end by stepping into the younger him/her so that he/she experiences it while associated into that younger self. Through this entire process you are holding the resource anchors. Go through the new experience enough times that it is as strong as the original imprint.
A. Ask the person to update or modify the generalizations he/she would now make from the experience.

VII. Holding the resource anchors utilized throughout the process, have the person come back up through time, from the point of the original imprint to the present. Suggest that as he/she comes back up through time, he/she can think of other occasions in his/her life when these resources that are anchored in now would also have been a useful addition in changing other experiences.

MHR need to get exact actual footage of a complete action as described above…’holding the anchors throughout’…not clear, which, when, throughout?

Also, why assume positive intentions? Humans and other animals often malicious…have to accept this in ourselves and others…so ‘ascribe’ potential positive motives…rather than lie and assume positive…rapists not usually concerned for your wellbeing, nor bullies, mobbers, victimisers, often just selfish fuckers getting off on harming others…at that time, in that situation…sure give them the resources of my entire TROONATOOR library…which is what I am trying to do with the world…but guess what fuckers…people WANT to be fuckers…only karma can teach them empathy via suffering I guess…and so it was wrong for me, though well intended, to try to save us all from the coming suffering … perhaps…though I will keep trying, as heuristics…even Buddha kept teaching his ethics…despite the fact that only ‘some will understand’…so I will keep on teaching ethics to any who will listen, and explaining ‘for as you do unto others, so shall be done unto you’…as long as I can…though attempting not to suffer frustration / irritation with my desired beneficiary, for not having suffered the consequences of their own stubborn smug complacent opportunistic viciousness yet, and thus not being in a position to grok what I’m trying to share…as all before me tried, and hopefully will after me…we must focus on the means / task, not expecting any effectiveness…by seeking to help others we help our own evolution … save ourselves…maybe…all heuristic…keep acting as if might change world, but don’t invest in outcomes, only invest in process…a process of personal evolution which is directed and shared for all who are ready…won’t be an Eden on THIS plane…but maybe we get to enter one in another plane…by attempting to realise that eden on this plane

Incongruence and Conflicting Beliefs

Identifying Conflicts

When you are working with someone who has conflicting beliefs, you will often observe an asymmetry in body posture. It’s not as subtle as skin color changes or other minimal physiological cues and is usually quite easy to see. You know you’re dealing with two dissociated parts when the person is gesturing with the left hand as she discusses one aspect of the problem and the right hand for the
conflicting aspect. It's interesting to note that often the right hand (which relates to the left brain, in most right handed people who have normally organized eye accessing cues) has intentions that deal with relationships and being worthwhile as a person in contexts that involve others. The left hand (which relates to right brain functions) tends to relate more to the individual being her own person and having a rich, full life. This kind of conflict might be defined as the difference between an "other-oriented" part and a "self-oriented" part. You might also find an "excitatory" and "inhibitory" conflict where you have one part that has great ideas and wants to move ahead while the other part wants you to hold back. This inhibits you from moving ahead. One man I worked with had great ideas for starting his own business but another part wanted him to stay in his current government job because it had "security." He ended up with two separate identities at war with each other. When he thought about leaving his job and starting a business, he'd get anxious. When he stayed on his present job, he'd get depressed. When working with these kinds of conflicts, you'll get different physiologies associated with each part or belief. The man who wanted to start his own business described his plans in a high fast voice, looked up to his right (visual construct) and gestured with his left hand. When talking about security, he used a slow even voice and his left hand lay still in his lap. One way to know that there is a conflict involved is to watch someone as they are describing an outcome. If you don't see a whole body symmetry in terms of gestures, (both hands moving at the same time in the same way) that's a red flag to alert you to possible conflicting beliefs.

Working With Conflicting Beliefs

The process that many NLP trained people would consider using to deal with two conflicting parts is the visual squash. The typical visual squash where you integrate two behaviors or collapse two anchors won't work when you have two parts that differ dramatically. It doesn't work well if you are associated into either of the two parts and you judge the other part negatively. Let me give you a typical example of this. One of my clients went through a very hard grief process after unexpectedly losing a close relative. He started overeating and putting on a lot of weight. He had a major conflict between two aspects of his identity. Historically, he had been a rather chubby child and hadn't felt good about himself. He had felt scared much of the time and the world seemed like an overwhelming place. When he reached puberty, however, he grew to be rather tall and muscular and looked like Tom Selleck and thought he could do anything. When I worked with him and we began sorting out and identifying each part, it became clear that he had one part that was full of worries, had lots of regressive thoughts, and even got paranoid about nuclear war. On the other hand, he had a part that was very confident and figured he could be successful at whatever he wanted to do. Each part was associated with a different time in his life. The "paranoid" side was almost the complete opposite of the "confident" side. Each
was everything the other was not. I had him dissociate from the parts by fully imagining them—how they looked, sounded, and moved—in his hands. As he described the parts, it became clear that each one was defined only in relation to the other, like matter and anti-matter, or like a communist or anti-communist (one doesn't exist without the other). When he'd identify with the aspect of his identity that "could do anything," he thought of the other part as both weak and useless. When he identified with the part that made him feel paranoid, he said the other part wasn't "real," it was just something he had made up. The identity of one was everything the other was not. I realized that I couldn't just collapse two anchors or use hypnotic language to squash two pictures together to get an integration because of the beliefs involved. If I had tried and been successful, I'm positive that we would have created a disintegration of his thinking process. I had to very carefully have him sort out the parts by dissociating him from each of them as he imagined them in his hands. As each part became more fully defined, it became clear that we needed to come up with a new belief system that included both conflicting co-identities. The way we accomplished this was to "out frame" each part's intention (using the question, "What will having that get for you?") until we found common intentions for each part. My client was then able to integrate these parts into a new identity, a new self image, which existed at a higher logical level of thinking. As a word of caution, it is really important to find common intentions for each aspect of the identity before trying to integrate them. Otherwise, as I said earlier, you could create a disintegration of the person's thinking processes. Your goal in integrating dissociated aspects of a person's identity is to create a new self image. Referring back to my mother's conflict, when she put those two parts of herself together (the "Mother" and the 'jet-setter"), a very interesting image appeared. The image that spontaneously occurred for her was this shimmering, shining, gigantic winged Mercury with wings on his head but who had great big feet that were well grounded.

Belief Conflict Demonstration

Editor's Note

Dee has suffered from asthma and allergies for most of her life. She had an especially severe reactions to cats. Robert had Dee contrast her present state (asthma and allergic reactions to cats) with her desired state—feeling and behaving in a healthy way when exposed to cats. When Robert asked her what stopped her from achieving her outcome of health, she had a feeling which she described as "helpless and worthless" but also had anger associated with it. He anchored this feeling and asked her to let the feeling guide her back in time to discover its origins. She discovered a series of experiences where her parents would fight and argue and ignore her when she was an infant. It's always amazing how you can anchor a familiar adult feeling and use it to guide a client back to pre-verbal experiences. It's usually the easiest and fastest way to achieve age
regression to find the origin of problem imprints. The experiences Dee recalled had to do with lying in her crib while crying and needing attention, but not getting the attention she needed because her parents were arguing with each other. At this point in working with Dee, Robert used the Re-imprinting procedure described in Chapter 4, tailoring it to Dee’s specific case. Often when you have helped the person add the appropriate resources needed to resolve the historical issues that have led to the limiting belief, she will still not have all her resources organized in such a way to reach her desired goal. As has been mentioned, often these resources are organized in separate "parts" or aspects of a person’s identity and are not available in an integrated way. This demonstration begins at the point where Robert is testing the results of the Re-imprinting with Dee and

110 BELIEFS

discovers a major conflict. Robert Go back to this part down here. (Leads her eyes to the position they were in when she got the helpless feeling during the Re-imprinting.) Dee. I feel curious and scared. Robert. About...? Dee. I feel a sense of danger like there's something out there that's kind of scary. Robert: What is it that's still out there? What is it that you still need? Dee. What first comes to mind is that I need a guarantee that I won't get hurt, but I think that won't happen. I feel like there’s a sense of destruction. Robert Is it that "something" would destroy you? Dee. Yes. It would destroy me. Robert. Do you know what it is? Dee. It feels like a black hole. (To Group:) There is a picture here that "feels like a black hole." Notice that Dee is looking down, sort of to her right. Her pupils are dilated and she's describing a color. Her eye position indicates feeling and she is also describing a color. This is a synesthesia. Synesthesia is when you are experiencing more than one representational system at the same time. It often makes unpleasant experiences harder for the person to make sense of internally—it’s like the experience is less sorted out in her mind. Instead of getting a complete image or sound, it may seem fragmented and hard to decipher from within. It's like a picture is there, sounds are there, but they're floating just below the conscious level. Usually all the person is aware of is an unpleasant feeling. I should point out that a synesthesia is not always dysfunctional and is often associated with being resourceful. For example, Mozart used synesthesia in his creative strategies. When you're dealing with limiting beliefs, however, it's like your thoughts are globbed together in a single confusing representation where you

Incongruence and Conflicting Beliefs 111

can't see or hear clearly what's going on inside. (ToDee:) You're afraid that somehow you'll get sucked into that "black hole" and you might never come out. Dee. Yes. Robert. And you want some sort of guarantee that you can go in and
out of whatever the black hole represents? Dee. Yes. Robert: This one is saying no guarantees (Gestures to part) yet I wouldn't help you do it unless we could at least guarantee that you wouldn't be destroyed. How could you explore that and guarantee that you could go into that without being destroyed? What's the resource that you need? In other words . . . Dee. I feel it's external to me . . . like there's something real out there that could destroy me. Robert. Out where? Dee. Out there in the distance (Gestures). Robert Is it inside of your memories, that distance? Dee. No, it's in the distance out there (Gestures). (To Group:) This is an interesting thing. Is it out there (Gestures away from Dee) or is it in here? (Points to her body.) (To Dee.) Is it a part of you? We don't want you to be destroyed and we don't want to say something isn't real if it is real. You have some sort of sense of curiosity now . . . Dee. Yes. I'm real curious. Robert. How can you go about exploring something that's off in the distance without having it jeopardize your life? That's what you have eyes for, by the way. If I see something happening over there (Gestures away from Dee), by seeing it and knowing that it's there, I'm going to have more protection over my life than if I never go to it. Dee. The problem is that it's dark. (Laughs) Robert. It seems to me like there's a resource you need so that you don't have to go to it, but can look at it first. What if you have light? If you were to take some of the resources you have about visualizing to that situation, would it help? Dee. Yes. Robert. Do this. Put your eyes down here (Gestures to where Dee indicated that the black hole is located) so that you get a sense of what it is—and it's off there in the distance. It's not close enough to be dangerous. And keeping it the same distance, look up and see it out in the distance. Don't let it come any closer to jeopardize you. Dee. Yes. It feels like it's a vortex. Robert. What do you see? Don't feel it, see it. Dee. It's hard to put light on it. I feel light all around it, but I don't feel light on it, and it feels like a vortex that could suck me in and destroy me. Robert. It's a different kind of a "smoke screen." So you can't put any light on it. What is it? Maybe it's some other part of you. Dee. OK. I see it now. It's a part that is very impulsive and crazy. (To Group:) We've gotten down to an identity issue. She's saying "It's a part that could be me. I could fall into that and be impulsive and crazy." That's very real. I know people who have given in to those kinds of impulses. Those of you who work with others have probably seen people that act in that kind of a vortex. I mentioned earlier that some people will try to lock a part like that in their own insane asylum, or keep it in a cage so that they avoid it. By doing that, you're never going to be able to resolve the conflict and it will always be there, waiting to suck you into the vortex. (To Dee:) What is that part of you out there trying to do for you? Does it want to suck you in and destroy you? Dee. It's like the curiosity makes me want to go into it. It's like the curiosity is dangerous too. Robert. Curiosity killed the cat (Dee has severe allergies to cats), but don't worry—they have nine lives. (Laughter)

In a sense there are two things going on here. This part itself is impulsive, it's not necessarily curious . . .
Dee. No. It's very dangerous. It's like it's all pure impulse. It doesn't think at all. Robert. Is that what it intends? Ask that part if it intends to destroy you and suck you in and be completely impulsive. Dee. No. It wants fun, excitement, and adventure. Robert. So it wants fun, excitement and adventure. It doesn't want life threatening, vortex sucking destruction. Dee. Right. Robert. You let the cat out of the bag now, and you found out its teeth and claws are not as sharp as you thought. Did you ever have a cat when you were little? Dee. No. Robert. Did you ever have any animals? Dee. No. Robert. Ever since you can remember? Dee. Yes. Robert. So, this part wants fun and excitement and you have this other part with curiosity. It's the combination of being curious with the fun and excitement that would get you caught up into that. In other words, the vortex involves two things responding to each other. The vortex is not one part or the other. What resource would you need to be able to have fun and excitement, and all that part intends, but not get caught up in it and be destroyed? In other words, so you wouldn't lose your identity and get sucked into chaos? Dee. My first thought was to analyze it, but when I analyze it, all the curiosity goes away. Robert. So, when you analyze it, all the curiosity goes away and when you get curious, you don't have any analysis. Dee. Right. (To Group:) What we hear again are dissociated processes. How do we get analysis and curiosity together? Here are two resources that don't have any way of working together. Is it a strategy? How can you be curious and analytical simultaneously? (To Dee:) Let's deal with the curious part. Where's your curious part? Dee. I'm feeling curious now. Robert. Oh! So you're curious. Where's the analytical part of you? Dee. It's just kind of watching. Robert. OK. Those two don't have much overlap with each other. Let's put one in each hand. Dee. This one would be analysis (Gestures with the right hand). It's got a business suit on. Robert. Probably appropriate. It has a business suit on. Let's go to this part. (Gestures to left hand.) What's the curious part of you like? Dee. That's the artist. Robert. So she's artistic. Dee. Uh huh. Robert. What does the other part of you look like out there? (Gestures) The "fun, exciting" part? Dee. A lot of trouble (Laughs). Robert. What does she look like out there? Dee. I don't want to tell you. I need to censor that one (Laughing). Robert. That's OK. We can tell by your physiology and your skin color change. Again we have dissociated experiences. What does the analytical one think of the other part as she looks over at the creative part? Dee. She doesn't think about her very much. She's frivolous. Robert. She thinks she's frivolous. Does this one (Gestures to left hand) intend to be frivolous? Dee. Uh hum. Robert. She wants to be frivolous? That's what her goal in life is? Dee. Yes. She wants to be curious and to do paintings.
and be creative and not make money. Robert. And not make money, or is it that she doesn't care about money? Dee. She doesn't care about money, and the result is that she doesn't make money. Robert. Does she move away from money? That's the way you put it first. Dee. No, she doesn't go away from it, she just gets involved in doing "things" that don't relate to making money. She is not altogether responsible. She doesn't pay bills and doesn't clean out the bathroom sink... Robert. But she's necessary too, though. Dee. (Hesitation.) Robert: Now have this one (Gestures to left hand) look at this one (Gestures to right hand). Dee. She thinks the other one is boring. Robert. Great! So you have a choice between being boring and frivolous (Laughter). This reminds me of a line from a Woody Allen book. He says "On the one hand we are headed toward utter destruction and doom, and on the other hand we face waste and lack of meaning. I hope to God we have the sense to make the right choice." (Laughter.) {To Group:) You can begin to see how double binds occur. When she's doing the bathroom sink she's being responsible but boring. If she does the other, she's being creative and it gives some sort of meaning but she's being frivolous. It's back to being excitatory and inhibitory. We also have this other part (Gestures out) out there that we'll get back to. We want to get to the point where we can figure out how to get each of these parts to work together. {To Dee.) This one (Gestures to right hand) must also find resources in that one (Gestures to left hand). Dee. She appreciates the creativity. Robert. You see creativity can also be practical because if you only stick to rote behaviors, you might do something that's impractical, just out of habit. Dee. Uh hum. Robert. Likewise, if you're going to be creative (Left hand), this one (Right hand) needs to implement that. This is the one that makes things happen in the real world. Dee. She (Left hand) does have a real appreciation of that one (Right hand). She just thinks she's boring. Robert. But she sees her value. Dee. Yes, she sees her value. Robert. What if you could get these two to not be separate anymore, but have a part of you that can be both creative and practical? Dee. That's not possible. Robert. What makes that impossible? Dee. Because that's a compromise. (To Group:) What we're hearing is we won't do that because then we have to compromise each other. (To Dee:) I don't want you to compromise either one of them. In fact, right now, neither one of them is able to do their thing very well because the other one is always stopping them. How could you have a part of you that would have full resources of both, that's just as creative as this one (Left hand) but just as practical as this one (Right hand), where you don't have to give up anything? You only add resources. How could you create something so you have just as much of this (Right hand) as you have of that (Left hand)? What happens now is that they stop each other. Do you know someone who is both creative and practical and is neither compromising, nor boring, nor frivolous? Dee. I might know somebody. Can I make up somebody that I think might be that way? Robert. Yes. What do they do? How do they balance and put these two things together so that neither of these is compromising and they have full access to the resources of all of them?
Dee. Hmm ... I don't know that much about their life. Can I make it up?

Robert. Of course. You can do it so that this creative one (Left hand) can create some pieces and this one (Right hand) can test it out to see if it's practical. So the creative part comes up with the possibilities and the other part checks it out for you. Dee. Oh! (Long pause) This creative one (Left hand) comes up with absolutely outrageous ideas that this one (Left hand) knows are absolutely not practical. Robert. That's fine. So instead of rejecting the ideas, have this one (Right hand) refine them. The more impractical they are at first, the more they're going to allow for new possibilities. As you make them real, you might find that you come up with solutions that other people have gotten stuck on because they didn't start from such an outrageous point of view. Can you do that? Dee: Uh huh. That's been going on. This one (Right hand) likes the ideas but doesn't want to implement them right now because of lack of money. Robert. Go ahead and have her adjust those ideas so that either you can do them without money or so they'll lead you to money. Dee. Oh! OK. (To Group:) What was happening before we started negotiating between these parts was that the ideas were rejected out of hand. Now we have created a feedback frame between them. It all makes logical sense, but until it gets installed a person doesn't do it. Dee. This one (Right hand) has to know where the money is, because it doesn't know. Robert. That's where that one (Left hand) can help. Dee: Uh, huh. (Her hands begin to move together with jerky ideomotor movements.) (To Group:) You can see that she's not moving her hands consciously.

118 BELIEFS

Dee. This is a very tentative relationship. (Laughter) Robert. I can tell. Dee. There's some trust, but not a whole lot. Robert. What do they need to be able to trust one another? Dee. Experience. They need to go ahead and experience each other's resources. Robert. There's another piece that's still missing. Now we have all these ideas here, but where's the fun and excitement going to come in? Once you get a solid foundation and you start this integration going, then you don't have to be afraid. Think of it in terms of a chemistry metaphor. If I were to put two things together, I might get a chemical reaction. But if I add this, that and something else, then all of a sudden I get a solution that's completely different. There may be more to this than a chemistry metaphor, because you actually get brain chemical changes when you integrate together the neurological patterns associated with these parts. Dee. (Her hands still moving together slowly.) This is weird (Laughing). Robert. The weirder it is, the more you're on track. Dee. OK. I'm not too sure about that! (Laughing) Robert. That's the practical part (Right hand) speaking. You do need to be practical about that. Dee. There's a part of me that wants to say, "Right on. Right on." This one (Right hand) is real unhappy with that one out there (Gestures out) and wants to shake a finger at it. Robert. Oh. So this practical one (Right hand) is blaming that fun one out there. Dee. She
wants to admonish it and straighten it out. Robert. Does this practical one (Right hand) understand that one's intention is not to do bad things and get admonished for it, but to make sure that you have fun and excitement?

Incongruence and Conflicting Beliefs 119

Dee. Right. It understands it... Robert. But it doesn't accept the way she's doing it. Dee. Or that she wants to do it. Robert. It doesn't trust that's what she wants. Dee. Either that or that she'll do it the wrong way. (To Group:) This is where some of the repression and conflict issues come in. (To Dee:) Does that fun one (Gestures out) believe that it could have fun and excitement with both of these, if you brought that one in? Dee. Uh huh. But this practical one doesn't believe that (Right hand). This one is real rigid and wants it done a specific way, which already doesn't work. Robert Does it know that? Dee. Yes. Robert. So, even though the practical one wants fun, it's still caught in that rigidity? Then it's acting in a way that it doesn't want to act. What resource does that part need in order to act differently? Dee. It needs experience which it doesn't have. Robert. How do you react in a situation where you don't have experience yet? This is a very important issue that centers around identity. You're going to be a different person. How are you going to be able to know what results are going to happen before you've tried it? The double bind of it is that you're thinking, "I'll trust it after I've experienced it, but I won't experience it until I trust it." I don't want to tell you, "Forget the trust part, just go ahead and do it." That's probably what this creative one (Left hand) would say, and that practical one (Right hand) would say, "No. Don't try anything." Dee. Right. Exactly. Robert. How can you do it? This creative one (Left hand) knows. Dee. This creative one (Left hand) does know. Dee. This adventurous one (Out there) will run films.

120 BELIEFS

Robert. What would happen if this one were to run films of how to do it and how to have some of those experiences, and let that one (Right hand) evaluate it for practicality? The creative one (Left hand) will start it, and that practical one (Right hand) will stop it and this adventurous one (Out there) will run a film about what's going to happen if it continues. And this practical one (Right hand) will edit the film to make sure it's within the limits of practicality. Dee. Yes. Then this creative one (Left hand) can give that one (Out there) more information. Robert. It's a strategy. Dee. Yes, and then this one (Out there) can run the film again and this practical one (Right hand) will approve or disapprove it. Robert. If it disapproves, it doesn't have to reject... it can refine. It needs to say, "That's objectionable. Can you change part of it?" Dee. That's right. Hum. That's interesting. This practical one's (Right hand) getting information, and can give information, and that one's (Out there) like the editor that can fit it all together. Robert. Can you do that? Dee. Yes. Robert. Can you put them all together? Dee.
They are all together. Well that (Out there) one's still out there, but I guess that's OK. Robert. We want to bring that one in too. {To Group.) We want to make sure she has equal access to all of them. We want them integrated. (To Dee:)

How could you bring them in so that this part of you that used to be that tremendous black hole is a part of you? So that it's a part of an integrated you where you have access to all parts of you? Dee. This part (Right hand) thinks that maybe we should just leave that part out there.

Incongruence and Conflicting Beliefs 121

Robert. I believe that it does. But that's not going to work. What would you need to do now, to allow you to have a better quality experience? To be more practical than impractical? Dee. OK. It's over here now (In the left hand). Robert. So this part (Left hand) is both creative and fun. In essence, she's taking a smaller step. We're going to put this one (Out there) here (In left hand) first. Dee. (Right hand is moving toward Left hand.) Robert. This practical one (Right hand) is a little more anxious than this fun adventurous one (Left hand). Does this one (Left hand) still need something else? This one's afraid for it's own identity too. Dee. I know what this one (Left hand) needs and I put it in. Robert. Good. At this point I want to make sure that all objections have been met and they both feel comfortable coming together to form a new part for you. One that's both creative and fun and practical/analytical. Dee. (Hands continue moving together with ideomotor movements.) It feels like they have no more objections and they're ready for each other.

Summary

{To Group:) As Dee continues integrating these aspects of herself, let me summarize the work we've done here. We started by clearing Dee's personal history via Re-imprinting. Sometimes when you do that, you're still left with parts in conflict. So, you begin by identifying the parts in conflict by watching for asymmetry in physiology and postures. You then have the person make a full representation of each part, seeing, hearing and feeling them in each hand. Then have each part look at and consider the other. Often they'll have major objections to each other or they will mistrust each other.

Next, find the positive intention or outcome of each. Many times, they'll each think that the other part is negatively intended. It's critical to this process to get to the intentional level of each part. Typically, neither part will object to the intention of the other. Often you can continue working with both parts until they find a common intention that they could share—such as assuring that the person has a meaningful, worthwhile life. Finally, have each part look at the other and realize what resources exist. You can have the person consider each "part" as a set of resources at this point. If the person has all these resources available, they'll certainly be a lot more effective. Getting congruent about what you want is one
of the most important things you can do. We also want the person to realize that if the parts combine their resources, they'll be much more powerful as a single integrated whole that can accomplish their higher purposes and their common goal. The intention allows them to begin to share resources so that we get the best of both working towards their common shared goal. So at this point we see the parts coming together to become a unified part to make the person whole. That kind of feeling—being a "whole person" is something that's not easy to describe because it's 'just you.'

Questions

Man: You mentioned that we should test when the integration is complete. How do you test? Robert. As Dee's hands came together, I asked her a series of questions about her ability to make money and do practical things in a fun, creative way. Dee's responses were congruently positive and she gestured with both hands in harmonious movements.

To find out if the integration is whole and complete, I begin to engage the person in appropriate activities. If it was smoking that they were dealing with, I would have them go back and think about smoking and notice what happens. Then I watch for an integrated physiology. If they are verbalizing that the picture of the new part is integrated, but I notice that their body is not, I go with the physiology and know that it's not complete yet. Of course, a behavioral test is always the best. If you can actually put the person into the situation that used to create problems and you get a new and congruent response, you know that something has shifted and integration has taken place. Woman: Dee seemed to be confused at times during this process. What about that? Robert. There is a difference between "good" confusion and "bad" confusion. Sometimes when people get confused, it's because they've just integrated. Sometimes it's because they're disintegrated. In both cases, their thoughts and feelings will seem different, not familiar, and they won't understand what's going on. Some confusion is good. When you've just integrated conflicting parts, the world literally isn't the same. Things seem very different. Conversely, there are other times when it seems like you're torn between internal parts, and you don't know whether to go this way or that way. That's the kind of confusion that will keep you stuck.

Woman: Why do you put the parts in the hands? Robert. The reason I have someone put their "part" in a hand and talk to it is because I want to take something that is just a feeling and add visual and auditory representations to it. I want them to access more of the brain than when it is just a feeling. I also do that as a natural outgrowth of asymmetrical gesturing. Also, when you have the person see, hear and feel the part in their hand, you are having them consider the part and its intention from a "meta position." Instead of being caught up in it, they are outside it, considering it in a different way and gaining a new perspective.
Man: How do you know when to go for an imprint versus doing a conflict resolution?

Robert: If the behavior is oriented heavily towards asymmetry and it shifts from right to left, I'll go with congruency issues. If someone is more symmetrical, but has lots of intense physiology associated with the behavior, that lets me know it's probably an imprint.

Woman: You've talked about asymmetry. Are there other physiological cues to watch for or use? Robert Sometimes when the person is in a conflicted state, he will have trouble moving his eyes from one eye accessing position to another. You'll often find a different physiology associated with each eye movement. When he describes one belief he might be looking up and left. When he describes the conflicting belief, he might shift his eyes down and right. If he has physiology that is very different for each aspect of his identity, you can bet that he'll have mental processes that will be very different as well. When I am working with people, I frequently ask the question, "What stops you from achieving your desired outcome?" I then look for an immediate unconscious physiological response that comes before they have a chance to consciously think about it. (This is called the half-second rule.) I'm not as interested in the verbal answer as I am the non-verbal cues that occur in the first half-second that let me know precisely how the person is getting stuck. Sometimes you'll find a discontinuity in eye movements when a person moves her eyes from one position to another. When she moves her eyes from Vr (up and left) to K (down and right) and you find a hesitation or a deviation in direction, it's a communication that something isn't integrated appropriately. When you find a discontinuity in eye movements, the first step is to start integrating the two physiologies together. Your goal is to help her move easily from one eye quadrant to the other. You can do that by having her access and totally get into one state and while holding that state, have her move her eyes to the conflicting quadrant. Your outcome is to assist her in literally creating an access between the two quadrants. This installs a new pathway for accessing her resources and gives her more choices about her beliefs and behaviors. So, one way that you can move towards integration is to create a smooth movement between the two polarities, and eye accessing cues give you an avenue for doing that. You can also move toward integration using voice tones. Have her start with one voice tone and then slowly change the tone or tempo until it goes to the other one. The whole idea is to create connections between the two conflicting parts. The best time to install this smooth pathway (either visually or auditorially), is when she is to the point of saying, "I don't know what to do." That signifies an impasse, and connecting the two together will often make an incredible difference.

Robert: If the behavior is oriented heavily towards asymmetry and it shifts from right to left, I'll go with congruency issues. If someone is more symmetrical, but has lots of intense physiology associated with the behavior, that lets me know it's probably an imprint.

Woman: You've talked about asymmetry. Are there other
physiological cues to watch for or use? Robert Sometimes when the person is in a conflicted state, he will have trouble moving his eyes from one eye accessing position to another. You'll often find a different physiology associated with each eye movement. When he describes one belief he might be looking up and left. When he describes the conflicting belief, he might shift his eyes down and right. If he has physiology that is very different for each aspect of his identity, you can bet that he'll have mental processes that will be very different as well. When I am working with people, I frequently ask the question, "What stops you from achieving your desired outcome?" I then look for an immediate unconscious physiological response that comes before they have a chance to consciously think about it. (This is called the half-second rule.) I'm not as interested in the verbal answer as I am the non-verbal cues that occur in the first half-second that let me know precisely how the person is getting stuck. Sometimes you'll find a discontinuity in eye movements when a person moves her eyes from one position to another. When she moves her eyes from Vr (up and left) to K (down and right) and you find a hesitation or a deviation in direction, it's a communication that something isn't integrated appropriately. When you find a discontinuity in eye movements, the first step is to start integrating the two physiologies together. Your goal is to help her move easily from one eye quadrant to the other. You can do that by having her access and totally get into one state and while holding that state, have her move her eyes to the conflicting quadrant. Your outcome is to assist her in literally creating an access between the two quadrants. This installs a new pathway for accessing her resources and gives her more choices about her beliefs and behaviors. The best time to install this smooth pathway (either visually or auditorially), is when she is to the point of saying, "I don't know what to do." That signifies an impasse, and connecting the two together will often make an incredible difference.

**The Conflict Integration Model Summary**

1. Identify the conflicting beliefs and calibrate to the physiologies of each of the parts in conflict. (Pay particular attention to asymmetries.) 2. Represent the beliefs in all sensory systems, putting the different beliefs in different hands. See the you with 'X' belief in your right hand. See the you with 'Y' belief in the other hand. Find out what images, voices, sounds and feelings are associated with each part. 3. Ask each part to look at the other and describe what it sees. At this stage, the different parts will often dislike and mistrust each other. You should see the person display different physiologies as he/she switches back and forth between hands. 4. Find out the positive intention and purpose of each part. Make sure that
each part recognizes and accepts the positive intent of the other. Point out that their conflict is directly interfering with the achievement of their own positive intentions. If necessary, go to the higher level intention of each. 5. Identify the common goal that they both share. 6. Have each part look at the other and describe the resources that the other has that would be helpful to that part. Secure a congruent agreement from the parts to combine their resources so they can more fully achieve their positive intentions. 7. If the image of either of the parts has been metaphorical, see the part as your own likeness at this point. 8. Suggest that the parts move together at the same time that a new identity is being created. Get a full representation in all sensory systems that fully integrates the resources of both parts. Calibrate to an integration/symmetry of the two physiologies that accompanied the separate parts. 9. After the hands have moved together and integration is complete, test in future contexts to make sure that there are no further ecology issues.

MHR…people often expect too much from sacrifices / changes / discipline they manage to achieve e.g losing weight does not automatically grant you access to a ‘beautiful world of success and happiness’, nor does quitting smoking…so when they gain their goal, and it fails to ‘satisfy’ all the expectations, they return to their bad habits…why sacrifice something for nothing? i.e for many people just being healthier isn’t worth the discipline / sacrifice of immediate impulses…what is the value of living longer if there is no satisfaction? Prisoners often live longer than stressed out business people…and have no access to alcohol and cigarettes…or even junk food…let alone sexual promiscuity, fast cars, exciting lifestyles…but who would trade living a long life as a prisoner for living a shorter life, with some health issues in the latter part of it, but which is ‘satisfying’…though question is ‘is it really satisfying?’, or has propaganda / advertising / manipulation conned you? Do you really benefit more than it costs? Do you care? Would you seek that benefit at any cost? Compared to no benefits at all? Just being a long lived, healthy slave? What of moderation? Have you tried that? Drunk / high one day a week? A few ‘safer’ promiscuous sexual interactions a month? Race your bike / car during ‘track days’ only, and drive safely / catch the bus, other days? Smoke a few cigs on the weekend only. Now you have REAL discipline…the ability to enjoy sweets, over-eating, drugs, casual sex, dangerous pursuits, in a ‘self-controlled’ way…THAT is real discipline…the ability to say YES OR NO, at any time, to any temptation / opportunity… as long as it imposes no cost on others that they have not given their holistically informed consent to…alcoholics maybe are better off entering a ‘controlled binge environment’ once a week / twice a month etc than going ‘cold turkey’…same for any other drug use…or ‘dangerous’ activity…

Diet the most basic health issue…over eating, ‘abusing’ food like a drug i.e using food as your main ‘pleasure’ and ‘relief’ source…it is the most available source of pleasure and relief…more people have access to ‘junk’ food and ‘excess
calories’, than they have access to sex, fast cars, exciting hobbies, success, meaningful work, attainable ambitions, love, approval, acceptance, status, wealth…it is addictive…sugar is the most addictive drug on this plane…and our ‘satiation’ kicks in too late / after we’ve over-consumed…and our ‘habituation’ is quite fast, so we need more and more ‘sugar’ to feel the same ‘rush’ and ‘taste’ the same ‘sweetness’… and as eating is a truly ‘purposeful’ action, it is even more ‘compelling’… and food, after alcohol and tobacco, is the most highly promoted / advertised / pushed consumer item available…and the ‘worst’ food, that highest in saturated fats and sugars / fructose, is usually packaged in the most ‘appealing’ manner…and more available than the ‘whole foods’ equivalents e.g mango, orange, apple, banana all beautifully / appealingly ‘packaged’…most ‘junk’ food takes the ‘sugars’ and ‘fats’ out of ‘whole foods, and re-packages them in deliberately appealing plastic…so we eat just the ‘attractive’ part of whole foods, leaving most of the nutrition out…e.g fruit juice is the most addictive ‘kinder crack’ you could market…pure fructose..like drinking wood ethanol, in health terms…while this sweetness, when part of whole foods, encourages us to eat the whole fruit, and gain the nutritional benefits of it. We would rarely eat the whole food equivalent of a large glass of fruit-juice.

There is a general principle that is important to mention at this point. When you interview people that are very good at something, it is common for them to have a clear, highly detailed representation of whatever it is they do well. They represent their successes vividly. When you ask them about their failures, they often have vague representations of those and there is hardly any physiological response. On the contrary, if you ask someone who is having trouble doing something about their successes, they will describe them as very vague internal representations, and will display very little physiology. Ask about the times they've failed and you'll get all kinds of detailed representations. I've been talking recently with a company called Sybervision. Among other things, they create videos for sports performance. They are using a number of NLP discoveries and methods. One of the methods they use is to show images, like that of a correct golf swing, over and over, so that the trainee has a reference image to use as a model. The more your brain senses something, and the more levels of detail that you have, the more you're going to be able to do it, whether it's success or failure.

MHR most people, the ‘masses’, area deliberately put in positions where they will fail e.g age based school progressions, where you can ‘fail’ a course, and still be forced to continue with the higher levels of it…this would be insane unless the real secret intent was to give the ‘masses’ a vivid and chronic experience of, and conditioning to expect, and accept, failure…and their ‘lower socio-economic status…anyone who can sends their kids to private schools, to avoid this ‘trap’ the masses are set up for…to be conditioned to accept their slavery..and to fear learning, and to ‘give up’ … to acquiesce to their pre-programmed ‘slots’ in the hierarchy…same goes for economics of private tutoring, dance and music
lessons, clothing, hair styling, grooming, access to leisure activities / sporting activities...you could take an ‘average’ person and give them the best possible experiences and access to resources and they would go on to occupy much higher SES levels than well above average persons with the worst experiences, and least access to resources...which is how wealth and status reproduce their SES standings, even though they failed to reproduce the original ‘superiority’ that lead their ancestors to occupy a high SES position...though of course the ability to live as a hypocrite, opportunist, fraud, is something ‘conditioned’ too...from birth...along with expectations of how others should treat you and you them.....

The reason why someone tries to hold on to something so hard is because of imprint type experiences. This is the case nine times out of ten. When an incident situation occurs it is usually when the person is forming an opinion about identity.

What I want you to do now is to go back to the scene with your mother and step into her and see through her eyes. Give her the resource of knowing when someone needs to be taught. (He touches the previously established resource anchor.) Go through what you saw and hear what you were saying. Mary: This is different. Robert. (Continues to touch the anchor) Now, get this from the perspective of the little girl. Step into her Mary, you said that the belief you had formed as a result of that experience was that your mom didn't understand or believe you. What belief do you have now? Mary: Well, one of the things that I told her when I was reliving the experience was that I was scared. I told my mom that she didn't know much about being scared and suggested we talk about that. It was like both of us gained something new and useful. Robert. So, how would you put that into a statement of belief? Mary: If we both learn what is important to each of us, then everybody wins. And that is how it feels now. Robert. One more thing for you to do. Put your eyes down here now. (Gestures down and to her right, indicating that he wants her to access kinesthetically) I want you to repeat all these beliefs that you feel while looking there. That you are intelligent...that you can both win...that you are capable enough and important enough...

"I quit smoking a lot of times, but I wasn't successful at quitting until I became a non-smoker."

Perhaps if you ate more pears you would be able to pare away what no longer fits you, and your "pear shape" would become a "pair shape" that attracts and fits the person you'd most like to pair with... MHR this is what I do with the ‘fearful’ feeling I get opening mail, looking to see if any of my books have been banned, or just ignored...I imagine myself moving my powerful wings as if for ‘take off’, and think of ‘power’ and ‘positive’... so I replace the sinking feeling of fear
/ trepidation / worry, with a powerful, positive, literally uplifting visualization / kinetics etc…

Hierarchy Of Criteria Summary

1. Identify a behavior that the person wants to do but stops him or herself from doing, e.g., person wants to exercise consistently. 2. Elicit the criteria that motivates the person to want the new behavior, e.g., person wants to exercise in order to be "healthy" and "look good." a. Elicit the strategy and/or submodalities the person uses to decide each criterion, e.g., "health" = Ad/Vc "look good" = Vc 3. Elicit the criteria that stop the person from changing. NOTE: These will be higher level criteria because they override the criteria for motivation, e.g., person does not exercise consistently because there is "no time" and "it hurts." a. Elicit the strategy and/or submodalities the person uses to decide each criterion, e.g., "No time" = Vr/K "it hurts" = K 4. Elicit a higher level criterion that overrides the limiting criteria of Step 3. For example you could ask, "What is something that is important enough that you can always make time for it and would do, even if it hurts? What value does that satisfy that makes it more important?", e.g., "Responsibility to my family." a. Elicit the strategy and/or submodalities the person uses to decide this criterion, e.g., "Responsibility to family" = VC/K. 5. You are now set up to use one of the following techniques: a. Leveraging. Apply the highest level criterion to the wanted behavior to override the limiting objections. For example, you might say, "Since your behavior is a model for your family, wouldn't you be showing more responsibility by finding the time to keep healthy and look your best?" b. Pacing the limiting criteria. Find a way to achieve the desired behavior that will match the criteria on all three levels and doesn't violate the limiting criteria. For example, "Is there some kind of consistent exercise program that doesn't take time, wouldn't be painful, and that you could involve your family in?" c. Strategy/Submodality Utilization. Adjust the strategy and/or submodality features of the criteria of the desired behavior to match the strategy/submodality features of the highest level criterion.

MHR find other behaviors where the person has / can / would override their usual ‘objections’, then ‘anchor’ these resourceful / can do attitude / physiology etc … then re-imprint the previously ‘avoided’ activity with these sub-modalities / representations…to replace the ‘objections’ with ‘motivations’…

I'd like to offer a little caution about the use of certain methods of visualization for health. Let me explain why. When the stress or illness the person is going through is created or intensified by some kind of internal conflict, certain kinds of visualization processes can intensify the conflict. The method of seeing the white cells as the "good guys" and the cancer cells as the "bad guys" can become a metaphor for the person's internal conflict. It might actually exaggerate the conflict. Unfortunately, almost all our understanding of the immune system is
modeled on the metaphor of war. When my mother was dealing with her cancer, she used visualization in a more ecological way. She visualized the white cells as sheep that were grazing in a field taking care of the overgrown patches of weeds (the cancer cells) that had grown up too high. Her tumor represented grass that had overgrown and needed to be recycled back to create ecological harmony. Think about what a cancer cell is. It's not a foreign invader; it's a part of you that is in many ways identical to your healthy cells. Its program has just gone off kilter. Experiments have even been made showing that sometimes cancer cells will go back to being normal cells in petri dishes. So, when you're working with someone on visualization of health, avoid any reference to "good guy/bad guy" or you may be hooking into an already existing conflict. You want to get the two sides working together and uniting to create a harmonious atmosphere.

1. Know what you want. Use affirmations or other techniques to deal with any internal objections to having what you want. 2. Get in a relaxed, receptive state of mind. 3. Visualize having or seeing what you want in as rich a way as possible. 4. Expect and believe you will receive it. 5. Tell yourself you deserve it.

By applying NLP filters to successful visualizers and contrasting them with non-successful visualizers, Tim and Suzi discovered some important differences between the two groups. First, the people who are successful have outcomes that are congruent with the rest of their desires and meet the well-formedness conditions for good outcomes outlined by Bandler and Grinder. Secondly, successful visualizers generally use different submodalities than do those who were unable to achieve their outcomes. People who have difficulty making visualizations work are often seeing a dissociated image of themselves doing what they want or having their outcome. Sometimes it's even a small, framed, still picture that is anything but compelling. On the other hand, successful visualizers are able to see a fully associated experience of having achieved their outcome. This means that they are seeing what they want through their own eyes, as well as hearing, touching, moving, smelling and tasting their outcome as if it were happening in their present experience. This kind of visualizing results in a positive feeling about the visualization and reinforces practice of the technique. Response expectancy, the belief that something will happen as the result of an action, is also important. Those who are successful experience their outcome in the visual, auditory and kinesthetic submodalities of expectations. To create your own submodalities of expectancy, take a moment and think of something that you always do, such as going to sleep at night. Check how you think about that. What internal pictures are you making? Are you saying something to yourself or hearing other sounds? What kinesthetics are involved—feelings of movement or touch? The non-successful visualizers often code their internal experience in the submodalities of hope or even doubt. To check your own submodalities of hope, think of something you "hope" will happen. You'd
like it to happen, but don't know for sure that it will—such as getting a promotion at work, or your spouse remembering your anniversary. Examine your internal pictures, sounds and kinesthetics. The most common kinds of submodalities include fuzzy pictures, dissociated movies, a "questioning" tonality of voice, or multiple representations (pictures of having something and pictures of not having it that are flashing back and forth or that are seen at the same time). If, when using the visualization process for health or any other outcome you want, you include having a wellformed outcome, a fully associated experience of already having the outcome, plus the submodalities of expectations, chances are that you will be more successful in achieving your goal. Below is a full description of a visualization process that we've found to be useful.

**Formula For Behavioral Change**

1. Decide what you truly want. It must be something that is within your control and something you do want, not "don't want." Determine how you will know when you have achieved your outcome. What will you see, hear and feel that will provide evidence?  
   - What are the positive and negative consequences of getting your outcome? Modify your outcome to take care of any internal or external negative consequences.  
   - Deal with any reservations you may have about getting your outcome. Write down reasons why you can't have it, allow yourself to fully experience any negative feelings that you might have, and create an affirmation (positive self statement) to release any blocks that you might be experiencing.

2. Get into a relaxed, receptive frame of mind.  
3. Think of something that you fully and without reservation expect to happen. Go inside yourself and notice the qualities (submodalities) of your internal pictures; (color, location, brightness, clarity, number of pictures) your sounds and voices; (tonal qualities, volume, pitch) and your feelings (tactile senses, sense of motion, action sense) for expecting that something will happen. Write these qualities down to keep track of them.  
4. Fully imagine seeing yourself having achieved your outcome as if you were watching a movie of yourself.  
   - If you don't like the way it looks, modify it until you do.  
   - If it looks "right" and you have no reservations about it, step into your movie and imagine that you are now experiencing having your outcome, using the submodalities of expectation.  
5. Let it go—tell yourself that you deserve it.

Build the belief that illnesses are a communication, and when you respond to the communication, then symptoms will clear up on their own. When you continue to keep in communication with yourself and your body, you can maintain your good health. The second belief is that often there are multiple communications as well as multiple causes for illnesses. If you deal with one of them, you may not deal with the whole problem. If you keep responding to all of your communications, you will eventually get well. I had offered her a metaphor about a mother bird with a nest of babies. They all squawk to be fed at once. If the mother bird feeds
one, all the others are still squawking and it seems like you're not getting anywhere. Not only that, if you start to feed the others, the one you just fed will start to cry too. But if you keep a balanced approach in communicating with all these different parts (all the different baby birds), you will eventually be able to feed them all. They'll all grow up and fly away free.

believes—they're infectious

Robert Let me use my mother as an example. When we worked with her recurrence of breast cancer, we had to do a lot of work with some popular beliefs and some medical beliefs about what having cancer means. For instance, some people have the belief that cancer causes death. However, it's not really the cancer that causes death, but the breakdown of the immune system; so it's the body's response to the cancer that causes you to die. You don't usually die because of the cancer directly but because your immune system, or other parts of your body, become weak and so broken down that infection can take over or the system can't continue to function. Some people believe that cancer is a foreign invader and that you have to do something exceptional to get rid of it. Cancer is not a foreign invader. The cells are a part of you. You need to transform yourself to create health—not get rid of something. Another belief is that many people have cancer at some time or another, and what matters is whether your immune system is healthy enough to take care of it. There are lots of examples of people with spontaneous remissions. The reason they call them "spontaneous remissions" is no one knows how to pinpoint the turnaround. Sometimes medical beliefs come into conflict with psychological methods for achieving health. For example, in my mother's case, she initially had opposition from some of her doctors. When she told her surgeon about the work we were doing with her internal conflicts, he told her that was a bunch of poppycock and would just drive her crazy. When I tried to explain some of the research and ideas behind our approach, he looked at me and said, "You shouldn't experiment with your mother!" Yet, at the same time the doctors were not offering alternatives. So there are those kinds of issues too. Doctors can be very powerful in their influence over patients and can easily impact their patient's beliefs. The patient is in a very vulnerable place with a major disease. My mother and I recognized that the doctors were positively intended, and they didn't want either of us to act foolishly or build false hope. Rather than reject the doctors, we responded to their intent, not their words. As a result of the work my mother and I did in 1982, she's healthy.

Robert. It's not just the attitude or change in belief that's going to make all the difference. Beliefs are one very important level of processes. The person needs to follow through with what they need to do in terms of lifestyle, nutrition, relationships, etc. One of the things about a positive attitude is that it generates those kinds of changes. Positive attitudes fluctuate over time. Even the person
who does a great piece of personal work and changes dramatically is going to have doubts at times. It's a natural human thing to have happen, and the person needs support during those times of doubt. If she gets resistance, rather than support from the important others in her life, it can set her back. Positive attitudes are not steady states. If you wake up on the wrong side of the bed and have a major fight with your spouse or you have some problems at work, it may feed into your doubts. On the other hand, somebody who makes a major belief change and then opens herself up and gets into new relationships or improves her old ones will reinforce her positive attitude. She'll set up a self-reinforcing loop, so she is constantly, positively reinforced. I do want to emphasize that it takes more than a positive attitude to overcome a major illness. When somebody says, "I've changed my belief and I know I can get well again," but he hasn't changed what he eats, his exercise habits, his relationships at home and at work, I don't necessarily believe that he's changed his belief or will get well. When someone really changes a belief, a whole lot of changes take place in his life. I'd like to make one other important comment here. Changing beliefs is not necessarily a long, arduous, painful process. The fact that it took four days when I was first working with my mother doesn't necessarily mean that it takes four days with everyone or that's what you should expect. Each person will be different in terms of his or her needs. The person you're working with on a major health issue does need a support system and he also needs positive reinforcement. These things will make a big difference in his ability to make the changes work in the long run.

Robert. One thing that makes a big difference in a person's ability to recover from life threatening illnesses is having "purpose" and a reason or meaning for living. It's not just her relationship with herself or the images that she has of her goals with respect to her health. A will to live is not just based on having a clear picture of the tumor going away; it has more to do with the meaning of having the tumor go away. If your tumor goes away, who will you be then? What will having health allow you to do? I've found it very useful to help the person define his mission in life; if there's no reason for living, why bother to heal yourself?

In dealing with death and dying, there are times when you need to respect that a person's desire to die is appropriate. It could also be that the person believes his life is over because of limitations in his belief system or identity. That identity is indeed finished, but that doesn't necessarily mean that all of his life issues are finished as well. In fact, I find the term "remission" to be a very appropriate one for recovery from life threatening illness. Remissions often come about after a person has established a new mission or a "re-mission." You can't ever make a decision for somebody as to whether or not he should go on living. Working with NLP and beliefs allows you to go to a different level with the person and say, "I don't know if it's best for you to live or die, but what I will do is work to help you become congruent about
your wants." Make sure the person isn't dealing with a lot of internal conflicts about whether to live or not. Work to help him deal with any situations or imprints from the past that still create problems for him. In order for a person to make a life or death kind of decision, he has to be very "clear," "open," and "in tune" with himself and the world around him. When he is really congruent, he can make decisions about his options.

Often relationship issues, internal conflicts, inhibitory behaviors etc. result in or reinforce physical symptoms. Different states and emotions create different chemical balances in your body and provide the conditions for illness. When you help the person resolve a conflict at the identity level, you often take care of the internal conditions that create the illness. Fred: Are all illnesses related to beliefs? Robert Illness is a function of interactions in your biological and neurological systems. It is a systemic process that is not related solely to any one thing. Some illnesses involve very complex systemic interactions—others are more simple. In fact, some physical problems, like many allergic responses, are stimulus-response phenomena and can be changed using very quick and simple mental processes.

Michael Levi (a researcher in the field of immunology and genetics and winner of the World Health Association Award for his definitive work, in the 1950s, demonstrating that viruses are infections) mentioned to me in passing that an allergy was like a phobia of the immune system. That comment intrigued me because it made sense at the intuitive level and meshed with other observations I had been making….there was already an NLP process developed for curing a long standing phobia in a remarkably short period of time…

People suffering from allergies who, when they fell asleep or became distracted, often have an immediate change in symptoms.

The three anchor allergy process was developed. Tim and Suzi shortened that technique into the fast allergy process.

A warning to the reader at this point. In working with allergies, as with any medical problem, it's important to do so in conjunction with appropriate medical treatment. Some allergies involve or can lead to severe anaphylactic shock and can actually be life threatening. So before you use these techniques, be sure the person you're working with is either under the supervision, or the treatment of, a qualified medical practitioner.

Since we can influence the immune system concerning allergic responses, these principles could then also be extended to the influence of deeper and more pervasive immune system problems, like cancer, AIDS, lupus, arthritis, and many other systemic problems that involve the behavior of the immune system…
Suzi: I can imagine. If we had a bunch of timothy grass that we were mowing in this room right now, what would be happening to you? Lynda: First I will swell and drain, then the roof of my mouth itches, and my eyes will get bloodshot and drippy. Suzi: So, for the purpose of testing, imagine that the grass is here right now. That you have . . . Lynda: (Goes into the reaction and laughs) Suzi: OK. (Audience laughs) Stop! Stop! We only want enough to calibrate. (To Group:) She's just demonstrated one of the interesting things about allergies. People can create the response just by thinking about being in the presence of the allergen. There is a story about a turn of the century physician named Mackenzie who was treating a woman who had a violent allergic reaction to roses. He found that if he showed this person a very real looking artificial rose, she would still have the violent reaction. Lynda is also showing us the power of the mind. By just thinking about timothy grass she gets ready to have the reaction that she would typically have.

The immune system made a mistake about what was dangerous and marked out substances that put the active part of the immune system into action. Once that mistake has been made, and the cell is coded in the body, the immune system will go into action immediately, every single time.

We'll be saying to your immune system, "Not this response, this response." (Gestures with different hands) Not this; this." So it's just a matter of retraining. (To Group:) We want to do an ecology check before we start. (To Lynda:) If you didn't have this response to hay and grass, what would your life be like? What implications would this have for you? Lynda: Well, it has decreased over the last 10 or 15 years. So, I think it would continue freeing up energy. And there would just be that part missing. The garbage. Suzi: Would it have any negative consequences? Is there any reason you shouldn't give this up? Lynda: No, I can't think of any. Suzi: I mean, it's not like you would want to spend all your time with your horses, and other things would go by the wayside. Lynda: (Laughing) No. It wouldn't limit the amount of around, the response will be there unless I take medication. If I leave the situation, my symptoms subside. Suzi: How long has this been a problem for you? Lynda: (Pause) Since I was about 11 or 12. Suzi: So you've had to deal with this a long time, a major part of your life. I don't know if you know how the immune system works; it's really quite interesting. What's happened with an allergy is that your immune system is overreacting and has become overactive. It has a number of different kinds of cells with different functions. The macrophage is the cell that would typically take care of anything like hay, grass or dust (an innocuous substance) that you breathe in. These cells are scavenger cells. They look a little like an octopus with long tentacles that reach out and ingest whatever that foreign substance is that might get into the body. When a macrophage encounters a virus, it ingests part of it but also displays one on top of it like a flag. It's almost like a victory flag that is being held up to alert the rest of the immune system that the body has been invaded.
This flag alerts the helper T cells to possible danger. Their job is to match the niches on the side of the flag that's being held up to the niches that they have on their sides that mark substances as dangerous. If there is a match, they will adhere to the substance and send out a message immediately for help from the killer T cells. The killer T cells come rushing in ready to fight. They come to where the flag is being held up and explode the virus by injecting it with a chemical. Lynda: They explode which cell? Suzi: They explode the cells that are there at the point where the macrophage has held up the flag. That works out fine if you have a virus or bacteria there, but with an allergy, the killer T cell attacks your own healthy cells. One of the chemicals that is excreted when the cells are exploded is time I spend. I won't allow it to. Suzi: Once when Tim and I were doing this process with a fellow who was allergic to grass, we got a different response when we asked this question. He said, "Oh! Then I would have to mow the lawn! My wife has to do it now!" (To Group:) We want to make sure at this point in time that we deal with whatever secondary gain might be there. For example, you might find a child who develops allergies or asthma and gets lots of attention from that. In a case like that, you need to assist that child in having ways of getting attention without the asthma or allergies. There appear to be no serious ecology issues for Lynda in giving up this allergy; not in what she says or by any non-verbal incongruencies. (To Lynda:) What is like hay or grass that you can be around, and your body hasn't made a mistake about? Are there any kinds of grasses, green grasses? Lynda: What about house plants? Suzi: OK. You're fine with any kind of green house plants? In other words, your immune system hasn't made a mistake about them? Lynda: Yes. I'm fine around house plants. Suzi: What we're going for is a counter example that's close to the substance that's now creating the response; the closer the better. Go back in the past and be totally therewith your house plants; really there. And I want your immune system to pay special attention to how it responds when you're in the presence of house plants and green growing things inside your house. And have your immune system pay special attention to precisely how it does this for you. (Anchors that state) Good. (To Group:) I'm making sure I have a good strong anchor for that counter example. Associate the person into a specific situation before you anchor them. (To Lynda:) Now, Lynda, I want you to imagine there's a plexiglass shield all the way across the front of this room, from wall to wall, protecting you. And over there, on the other side of the plexiglass you see Lynda. And you see Lynda whose immune system knows just how to respond appropriately to green things growing indoors. And as you look at Lynda over there, you know she has the kind of immune system that knows how to respond appropriately. (Pause) OK. Now, I want you, very gently, to put that Lynda over there in a situation where she would be around grass; the kind that used to create problems for her—timothy grass. Whatever it is. See Lynda over there, knowing that she has this response that we've anchored in, fully available
to her. Her immune system does know how to respond appropriately. And you'll notice that Lynda changing over there, as she's in contact with the grass. And it may seem really strange to you inside to begin with. (Pause) And watch over there for that response, that is similar, now to what she has with green growing things. (Pause) OK. That's right. (To Lynda:) Now I want you to go out there and gather up those Lyndas and bring them right back into this Lynda sitting here. Come back here with me. Imagine, right now, that somebody's mowing the grass, here in this room. They're mowing timothy grass, and you still have your immune system totally intact, operating in the way you want it to be operating. And it knows just how to respond appropriately. As you imagine seeing timothy grass—as you're right here with me. (Pause) Just relaxed. (Pause) Mn-hm. That's right. Now, there will come a time in the very near future, when you'll have an opportunity to be in the presence of timothy grass, hay, or anything of that nature. I'd like you to go to being with your horses and feeding them. Lynda: OK. Suzi: And have your immune system pay special attention. It now has the knowledge of what the appropriate response is, when you're in that position. (Pause) OK. (To Group:) We're going to let that settle in for a minute. This is a little like when you're doing the phobia process with people. You often have a dubious client for a while who says, "Wait a minute. I don't know what's going on. This shouldn't be this easy and this shouldn't be working that well." Do you have any questions of Lynda and her experience of this? Man: When you were imagining that you were in the presence of the allergen, was there any sensation at all? Lynda: Just a tiny little bit. Sort of like in the back of the center of my face, if that makes any sense. That's all I got that would be like what I normally get. It was like the very beginning of the old response, and then it didn't follow through. Woman: What was the reorganization of your immune system like to you? Lynda: It was very much like a collapsed anchor. It is like you can feel things being rewired. Something's happening. Suzi: That's a wonderful description of it. This really does reach down deeply in her neurology for change. (To Lynda:) Now that it's settled in, imagine like you did when we first started out—that you're whiffing in a big giant whiff of timothy grass. (Pause, softer) And notice what happens inside. (Pause) Now try hard to get that old response back. (Softer) As hard as you can. (Pause) Lynda: I'm still on guard, waiting for something to happen. (Laughing) Suzi: Shock. Can't you do better than that! (Laughing) (To Group:) For those of you who were calibrating, was that the same response we got before doing the process? Audience. No. Suzi: Now, she's still on guard, and rightfully so. She was 11 or 12 when this started. She's still waiting for the response because that stimulus had brought it about every single time. (To Lynda:) And you'll be pleasantly surprised when you go out there and wait for that old response, and say, "Oh, it's not here. I can just enjoy my horses when I'm with them." Lynda: Mm-hm. Suzi: (Softer) Nothing else needs to happen out there. And you can thank your immune system for being so responsive to learning new ways. Lynda: Thank you. Suzi: That process is very easy for you to do with yourself. You said that you were allergic to lots of different things. Lynda: Yes,
there are a few other things too; that was the biggest. Suzi: Now, if you're a person who generalizes easily, I wouldn't want you to think of the other things that this might also work with. Lynda: (Laughing) OK. Suzi: Have your immune system go through the process automatically for you ... so that you don't have to do it consciously. Because . . . you know, we learn very quickly, and there's no reason why it couldn't go ahead and do the process with those other substances, so that you don't even have to bother.

Questions

Woman: What if the other person doesn't know what the substance is that they're allergic to? Suzi: Obviously, it's much harder to find the appropriate counter example if you don't know what the allergen is. With hayfever, when a person only knows that it's "something in the air," try using flour or dust or lint floating in the air for the counter example. You can also use the air at other times of the year when the person responds appropriately. Man: Some people are allergic, in testing, to virtually everything. But there are some times when they respond to the allergen and other times when they don't. What's that about? Suzi: That might mean that the allergen is very stress related, and it deals with their emotional state. That lets you know that there's another piece that needs to be in your intervention; teaching them how to respond differently in the situation that creates stress. For instance, do any of you who have hayfever notice that some years it's far worse than others? If you look back, it might be because of what was going on in your life—not that the pollen count is any different. Your internal state makes a difference. Man: What do you do if it comes back? Suzi: If they re-create it somehow, do it again. It typically only takes five minutes to do. Also double check the appropriateness of your counter-example and ecology, especially beliefs that might be in the way. Occasionally you might have to do a re-imprinting or a conflict integration. Woman: Have you used this with children? Suzi: Yes. It works well with children. The youngest one we've heard of it being done with was about 3 years old. Man: What if the process doesn't work? Suzi: Perhaps the person was not using the appropriate counter-example. The closer the counter-example is to the allergen, the better. Take for instance an allergy to cow's milk. Can the person drink goat's milk or soy milk? If they're allergic to all kinds of milk, is there something white and liquid that the person is okay with, like coconut juice, or something like that? I find it's better to have the person come up with their own counter-example, rather than me choosing it, but suggestions are often helpful. Another primary reason that it doesn't work has to do with secondary gain and ecology. The ecology issues might not come up at the beginning of the process—you may not catch it until you're having the person do the future pace. You may need to do reframing, new behavior generator, re-imprinting, change personal history etc. to deal with the secondary gain first, before proceeding with the immune system. Thirdly, there can be an underlying imprint that is the real root of the allergy. It never hurts to check for an
unresolved imprint experience before doing the allergy process with someone. That way you can be really thorough. Woman: Have you used it with life-threatening allergies? Suzi: Yes, and if you were my client with a life-threatening allergy, I'd insist that you agree to go to a doctor to have an appropriate medical test to validate medically that you no longer have a reaction. If you're dealing with a severe case of allergies with either life-threatening or terribly unpleasant symptoms, you may want to use three place dissociation ... as if it were a phobia. The purpose is to get the person far enough removed that she won't collapse back into the symptoms.

Fast Allergy Process Summary

1. Calibrate. Ask, "What's it like for you when you're in the presence of the allergen?" Watch for the person's physiology, eye accessing cues, breathing, etc.
2. Explain the mistake of the immune system. Explain that her immune system has made a mistake about something being dangerous when it really wasn't. The immune system has marked out something as dangerous that's not, in and of itself. It can be retrained rather quickly. 3. Check for ecology/secondary gain. What would her life be like without this? Are there any positive or negative consequences? Use whatever NLP techniques you need to at this point to deal with ecology issues before proceeding. 4. Find an appropriate counter-example resource. Find a counter-example that is as similar to the allergen as possible; that the immune system responds to appropriately. Anchor that response and then hold that anchor throughout the whole process. Make sure the person is associated as you set the anchor. If possible let the person come up with her own example of what is similar. 5. Have the person dissociate. Using a plexiglass shield from wall to wall is an easy way to establish dissociation. While holding the anchor, have her see herself over there on the other side of the plexiglass having the resource. Use all your fluffy language suggesting that she is "the you you want to be," and that her immune system operates appropriately. 6. GRADUALLY, introduce the allergen. As she is watching herself over there behind the plexiglass, have her slowly introduce the allergen, the thing that used to create the problem. Introduce it as a gradual process giving her the opportunity to get used to it. Wait, at this point, until you see a physiological shift. It's like the immune system says, "All right, I've got it. I'll change the notches on my flag so it doesn't match up with any of the T cells I have." 7. Reassociate. Bring her back into her own body and have her imagine she is in the presence of the allergen as you continue to hold the resource anchor. 8. Future pace. Have her imagine a time in the future when she will be in the presence of the thing that used to create an allergic response for her. 9. Test. If you can actually test carefully on the spot, do that. If not, re-calibrate to see if the physiology, eye accessing cues, breathing, etc. have changed.

Three Anchor Allergy Process Summary
This is the process that Robert Dilts first began utilizing when he was working with allergies. The only difference between the preceding technique and this one is that this process utilizes three anchors simultaneously (one for dissociation, one for the counter-example, and a resource anchor), instead of just one counter-example. 1. Calibrate. 2. Explain the mistake of the immune system. 3. Check for ecology/secondary gain. 4. a. Have the person dissociate, and anchor the state of dissociation. This is added reassurance that you can keep the person dissociated. b. Find an appropriate counter-example resource and anchor that. This is the same as the other process. c. Ask the person how she wants to feel when she's in the presence of the allergen. This might be "the you you want to be" in that situation. Anchor this re-source also. 5. Use all three of the anchors set in Step 4 to have the person see herself with these resources available. 6. Gradually introduce the allergen in the dissociated state. 7. Let go of the dissociation anchor and have the person reassociate having the other two resources still available. 8. Future pace using the two resource anchors. 9. Test.

Foreground/Background

The next pattern we want to discuss is called the Figure/Ground or Foreground/Background procedure. Robert developed this technique after reading about some of Pavlov's experiments with dogs. I'm sure you all recall that Pavlov was the Russian scientist who conducted a lot of the initial studies on stimulus-response phenomena. In one of this studies, he conditioned a dog to salivate when it heard a bell, a buzzer and a tone all at the same time. Pavlov found that each of the sounds had a different value in getting the dog to salivate. The bell might get ten drops, the buzzer five and the tone two. In other words, the bell was in the "foreground" of sounds the dog heard, i.e., the dog paid more attention to the bell than to the buzzer or tone. The tone with the least value would be background.

Pavlov found that if he then inhibited the dog's response to the tone so the dog didn't salivate at all when he heard the sound of it (so it had a value of zero), then reintroduced the tone with the bell and buzzer, the value of the combined sounds would fall to zero. The combined three sounds no longer served as a stimulus for the dog to salivate. This same principle can be applied to allergies and other stimulus-response problems people have. You can use the Foreground/Background technique when you have a specific stimulus in a defined context. It's been used on phobias, on unpleasant reactions to the sound of a dentist's drill, negative responses to unpleasant voice tones, etc.

Foreground/Background Demonstration

Tim: Does anyone here still have an allergy? Gary: I am allergic to cottonwood trees. When their fluff is blowing, I get congested. The thing that's interesting about it is that when I pay attention to my symptoms, they get worse. When I get
involved in something, they aren't as bad. Suzi: Good. Maybe we can assist you in really noticing other things. Tim: What's it like for you when you're around cottonwood trees? Gary: (Displays tension around his eyes and his skin color becomes uneven.) My eyes begin to itch and my nose gets congested. Tim: If there was cottonwood fluff around now would it bother you? Gary: Oh yeah. Tim: Do you like pine trees? I'd guess you're OK in a pine forest. (Kinesthetically anchors Gary's arm as he begins to think about pine trees.) Tim: (Abruptly, while still holding the "pine tree" anchor) What do those tennis shoes feel like on your feet? (Creates an association between any sensations in Gary's feet and what it's like for Gary to be around pine trees.) Tim: (Releases anchor) How about cottonwoods? If you were walking among the cottonwoods . . . what is it like? Gary: (Confusion, blinks several times, shift in state to the physiology associated with pine trees) Wait a minute .. Suzi: It's called burning out the circuits. Gary: It's like a shock. (He sits quietly for a few moments.) Tim: What's it like for you now when you think about cottonwood trees? Can you get any of the old response back? Gary: . . . No. Suzi: Well just see the room full of those little white fluff balls. Gary:... I'll try harder. (Exhibiting none of the physiology he displayed earlier when he thought about cottonwoods.) When I go back in my mind to the past, when I've had the reaction, it's like it's never been there. That's what's weird. Tim: (To Group:) This is a process that is easy to do covertly since it goes so fast. The applications for family therapy, business interactions and couples work are probably obvious since it works on visual or auditory anchored responses. Suzi: {To Group:) Let me explain what Tim did with Gary. The cottonwoods were originally foreground in Gary's perception. His feet, which are always present with him, were background. Tim: So we created a strong association between his feet and a counter-example (pine trees) that he has no immune reaction to. As long as the pine tree counter-example is close enough to cottonwood trees in his way of thinking, the technique will work. Man: How would you do it covertly? Tim: That was covert to anyone not familiar with anchors. Another example occurred the other day when I was talking with a man wearing a coat and tie. He was telling me how he was having trouble with his wife and how she'd nag at him when he called her from work. I assumed he had a negative anchor to her voice tone in the context of nagging. Later I told him I was glad I didn't have to wear a tie and asked him if he minded wearing one. When he accessed whether or not he minded, I anchored the response visually by holding an imaginary tie knot in my collar. I then asked him about some conversations he had with his wife when he really was interested in what she was saying, while firing off my visual anchor of holding the imaginary tie knot. Then I asked him about her nagging and he had a very different response than he did the first time he mentioned her nagging. He said it probably wasn't that bad after all. He had no conscious idea what happened, but I'm sure his unconscious mind approved, as I know his wife will when he starts listening to her. The important thing is to find a counter-example that's "close enough" in the person's way of thinking to
generalize. The best kind of counter-example is when a person should have had the response they're complaining about, but didn't. For example, I could have asked Gary if he'd ever been around cottonwood tree fluff and didn't have the allergic reaction. The next best counter-example is something that the person considers in the same category of things (trees, in Gary's case) or behaviors (conversations in the example of the man with the tie). Suzi: When we first saw Robert work with this, he was working with a woman who felt anxious when she heard a dentist's drill. Robert asked her for a counter-example . . . something that sounded like a dentist's drill but that she had no reaction to. She thought of an electric mixer. The technique didn't work with that counter-example. It turned out that a critical element was that she controlled the mixer and the dentist controlled the drill. Barber's shears later worked fine for the counter-example. It sounded similar and the hairdresser controlled them. Tim: It's even better when the counter-example is something the person enjoys. The woman said she enjoyed having her hair done because she was doing something that made her feel more attractive. Some of those good feelings carried over to the dentist context. For the background element you can select something that will always be there . . . temperature, sensations in the hands or feet, etc. Be a little careful about what you select and check it out with the person first. We were working with a man who was allergic to cigarette smoke. His wife smoked, so he had a big problem. We used his feet as the background element, like we did with Gary and he suddenly had an unpleasant reaction. It turned out that he used to smoke, but quit when his doctor said he had circulation problems in his feet!

Foreground/Background Process Summary

1. Identify a limiting response that occurs in a specific context (an allergy, the sound of a dentist's drill, an annoying voice tone). a. Calibrate to the physiology associated with it. b. What is foreground? What are they most aware of?

2. Find an appropriate counter example resource. Either a time when the person should have had the response, but didn't, or a similar context that is like the limiting one. a. What is foreground? What is the person most aware of? 3. Identify something that must occur in both the limiting context and in the counter-example that is outside the person's conscious awareness. What is background in both? (i.e., the way the soles of the feet feel, the weight of their clothes, etc.) Anchor this feature. 4. While holding the anchor, have the person focus on what she is most aware of in the counter-example experience. Your goal is to create a strong association between what is most in her awareness (foreground) and something that she is not attending to (background). 5. Release the anchor and immediately have the person remember and associate into the previously limiting experience. 6. Calibrate to the physiological response. If the limiting response still occurs, recycle through Step 3 with a different counter-example and strengthen the association between the foreground and background
features. 7. Future pace by holding the background anchor while the person thinks of future contexts.

Mapping Across Submodalities Process Summary

There is a way that you can use counter-examples and submodalities in working with allergies. Instead of using anchoring, you find out what submodalities are present when the immune system is working appropriately and map those across to where you have an inappropriate response. Often you will find that there is one critical submodality difference. 1. Calibrate. 2. Explain the immune system's mistake. 3. Check for secondary gain/ecology issues. 4. Find an appropriate resource/counter-example. Elicit the submodalities for that counter-example. You can ask, "How do you think about it?" These are the submodalities the person's immune system uses when it's responding appropriately. 5. Elicit the submodalities associated with the allergen situation. These are the submodalities the person's immune system uses when it's responding inappropriately. 6. As the person thinks about the allergen, have him map across the submodalities so that it matches the submodalities of the counter-example. 7. Future pace. 8. Test.

One of the core beliefs and promises of NLP is that effective thinking strategies can be modeled and utilized by any individual who wishes to do so. A large portion of this book was drawn from modeling the strategies and beliefs of people who had effectively recovered from potentially debilitating or life threatening illnesses as well as other mental and physical issues regarding well-being. The same principles may be applied and utilized in other areas of human excellence. For example, Wolfgang Amadeus Mozart is considered to be one of the greatest composers of music in all human history. As we mentioned earlier in the book, perhaps what sets Mozart apart from others is not mysterious mystical talent, but rather a very real and concrete strategy he used for organizing and integrating his experience. He utilized his strategy in a way that allowed him to excel to the degree that he did. I have studied letters of Mozart and found he actually laid out a fairly explicit and yet extremely elegant creative thinking process that I modeled. That process can be used to create harmony in areas other than simply musical notes. The following is a meditation for health that is drawn from the formal thinking process used by Mozart to compose music. Even though the content has to do with internal experience, health and vitality, the structure of this psychological symphony is drawn from the master himself.

Exercise

Allow yourselves to take a moment and just be aware of your bodies ... be aware of feelings ... perhaps there are parts of you that you haven't really paid attention to very much during the day... notice the symmetry of your hands, your body, your feet, your left side to your right side ... and then ... pay attention ... deeply
inside of yourself. . . find a part of yourself that you've always been able to trust to be healthy . . . that, in spite of whatever illnesses you've been through, you've always been able to count on this part of you ... it's part of your body. Maybe it's your heart. Maybe it's your eyes. Maybe your lips. Maybe your legs. Maybe your ears. Find a part of you that, when you think about it, always feels vital, always seems healthy. The part of you you most trust to stay healthy and to stay vital. (Pause.) And as you put your awareness on that part, as you really go into that part, feel it. Feel that part of your physiology, of your body. (Pause) And, as you do, begin to imagine that this part of your body is like a musical instrument. And it makes a sound, a noise, a melody. And listen to the sound of those feelings ... the sound of that part of your body that incorporates within it your vitality, your energy. And listen to that sound. And as you hear the sound, perhaps you can make the feeling stronger, and the sense of health and vitality and aliveness can begin to spread beyond that part of your body. (Pause.) And as you hear that sound and feel that feeling, perhaps as you take your next breath, you can smell that sound. You can smell that sense of aliveness, of vitality. And notice what it smells like to you. Is it sweet or is it fruity? Is it spicy? Is it aromatic? And notice what that smell is like inside. And what taste it might have. So that you can smell and taste that sense, the feeling of vitality. (Pause.) And let that smell and that sound begin to spread. And think of any parts of your body, and other feelings that might not be as healthy as you'd like them to be. And listen to the sounds and the tastes of those parts of you, as if they were part of a meal. . . like part of a symphony ... a piece of music. And begin to allow the sound and smell and taste of that life and vitality and health to serve as a counterpoint, or a dance, with all the parts of your body. So it spreads through from the inside. And even begin to see it, as if it were light spreading from that part of your body. What color, what brightness would that energy, that vitality look like, as it dances in rhythm ... in colors ... in the music ... with all of the other parts of your body spreading from the inside out. Massaging from the inside every part of your body. (Pause.) And know that music and that dance can continue. Even through tonight in your dreams, in your sleep, in the back of your mind . . . that music can spread . . . that light can spread its warmth, its flavor all through you. And that you can taste that, in the things around you, in the food that you eat. In the sights that you see and the sounds that you hear. And that the sounds of life and health, and the colors of life and health, and the tastes of life and health can be there for you. And if you can pay attention to those, your unconscious mind can lead you to what are the most appropriate things to eat, to see, to hear. (Pause.) And perhaps that light within you can become so strong and bright that it begins to shine out through your pores and eyes. And the sound spills out through your tone of voice, and spreads to others, without your having to try, but just by people being near you. They feel it, and they sense it. (Pause.) And allow that process to continue at its own pace, its own rate of speed, in the way that's most ecological for you. And
any of the ideas or the learnings that you've made here today, know that you can accept or incorporate them, or consider them, in a way that's most ecological and appropriate for you. And tomorrow morning, when you wake up, may you arise with a sense of energy and vitality, a relaxed feeling but with an alertness that perhaps you can feel as you allow your eyes to open and make contact with the world around you here. And even noises from outside the room won't interfere with that sense of inner vitality and peace.
Sleight of mouth…Dilts

How to persuade people, influence their beliefs…thought viruses…paranoid belief systems….how key beliefs can be established / shifted / transformed via language…

Beliefs held cognitively and neurologically i.e physiologically i.e in our nervous systems i.e ‘neuro’… (MHR ‘anchors’/triggers i.e physiological …

‘Sleight’ is an Old Norse word referring to cunning, craftiness, dexterity…

NLP studies the interactions between language and our belief systems and nervous system…how we feel / think / act … and the ‘accessing cues’ /physiology / body language / and way we express ourselves…

Like computer ‘program’ is written in a ‘language’ …which determines behavior of computer i.e input-output systems…

Philo was Jewish…

Again David Hume totally over looked by NLP…give him zero credit for being one of the fathers of psychology..

Effected people have rich models / representations of the world…more resourceful / motivated / flexible / motivated / positive responses to ‘threats’ / challenges / problems / obstacles…

Einstein : ‘Our thinking creates problems that the same type of thinking cannot resolve’ … e.g paranoia / cults / religion / ideologies NOT based on honest facts / open arguments / scientific method / compelling argument…

Aim of NLP is to facilitate greatest number of options / resourceful responses to any situation…

MHR little of our ‘knowledge’ comes even close to induction…we are ‘told’ by ‘authority figures’ and ‘teachers’ and ‘mass media’ and ‘priests’ what to think,
and how to interpret / filter / distort our actual later ‘experiences’… get ‘em young, cult brainwash them into whatever cult is in power e.g religion, ideology, theory…then they have zero chance of interacting with ‘reality’…

Again…there are NO ‘light waves’ or ‘sound waves’ or ‘solids’…there is EM soup…of different resonant frequency / speed of vibration … WE filter out part as ‘sights’ and part as ‘sounds’ and part as ‘smells’ etc…WE do that…there are NO ‘sound waves’ or ‘colors’…independent of us…just resonances in the EM soup / plasma…

Dilts imagines ‘received’ from sensory experience different to hallucination / imagined / fantasy? … i.e generated within brain, rather than ‘received through the senses !! the dreamer who has dreamed his has awoken, but is still in a dream !!! He the NLP specialist of decades…

? Sensory experience primary way we build our maps? WTF? Yeh, like ‘I saw planes crashing into WTC? And then photos of ‘hijackers’? and I saw ‘Schindler’s list / ‘The Holocaust’ myself !!! Like all the ‘eyewitnesses’ who admit they never SAW anyone gassed, and yet their ‘evidence’ is taken as ‘conclusive proof’? … and the supposed ‘eyewitnesses, so few in number as proportion of ‘survivors’ whose accounts are fantastical/ impossible to replicate / take seriously and mutually contradictory…and absurd…if not fabrications, than hallucinations with zero credibility…someone ‘built up into a ‘legal fact’?” by whom? By peer reviewed researchers?

Our senses are ‘windows on the world’? WTF? Really? Not our tell-lie-visions and propaganda a.k.a ‘newspapers’ and ‘news’ and ‘radio’ and ‘documentaries’ and ‘movies’ etc??? really? Compare what people ‘believe’ with what can be ‘demonstrated’ / reproduced in reality / what is intellectually compelling … and see the huge chasm…then tell me ‘windows on the world’ are our senses…directly…a lie is accepted as sensory input as a fact … etc…

Maps vs terrain? As if we are ever allowed to ‘visit’ the terrain…censorship, propaganda…put in prison for ‘challenging’ the ‘official fiction’, since time immemorial…dogma…basis of power / privilege of elites…

Change blindness in context of changes in our situation e.g our ‘reality’ imprinted as children … as adults we have hopefully more resources / power / opportunities … but limited due to change blindness i.e don’t realise our changed situation and greater resources…act as if still have only limited childhood resources…most ‘adult’s never ‘grow’ up in every sense but physically…retain imprints e.g ‘god’, ‘authority’, ‘religion’..ideology…political party…personality e.g fat / thin / sporty / bookish…shy…phobias of ‘dangerous’ dogs now harmless to adult with resources to destroy any dog…
Experience of world includes our reactions? It is our reactions/encoding of ‘whatever’ is ‘out there’ or just ‘in our minds’...can never know...certainly definitely a combination at least, or ‘internal’ encoding/fantasy/virtual reality and ‘something out there that ‘triggers’ all this internal construction...but like dreaming you have woken up, and are no longer dreaming, we might merely ‘imagine’ we have ‘brains’...may be virtual as much as what we can certainly say our ‘fantasy’ constructions within these ‘brains’ are...another trick...Descartes and Aristotle were in this way ‘dreaming they had awoken’...by failing to continue asking questions e.g where does my will come from? Does anything need to exist to have thoughts? Or can thoughts exist on their own? Is logos mere thought...i.e everything is product of thought...no ‘thinker’ as such...just ‘thinking’...more importantly ‘feeling’ i.e pleasure, pain, and relief...rest is irrelevant...only feelings real...and why can’t we simply have them, directly, without all this ‘baggage’ of bodies/constructs/illusions? I.e ‘taste’ anything we like...WHAT is actually ‘tasting’/experiencing the ‘taste’? the ‘taste’ is clearly constructed in our heads/minds...so why bother with the illusion of some ‘external’ stimulus for this experience? When we can ‘dream’ this taste just as easily...do we need bodies to experience pleasure? We could put brains in vats, and stimulate the nerve endings to produce the same effects...do we even need brains in vats? A brain doesn’t ‘feel’ anything...‘WE’ do...so what are WE? What is consciousness/sentience/potential to experience?

Eyes, ears, nose, tongue, skin...all ‘receptors’ that encode stimulus into electro-chemical signals, brain ‘interprets’ and ‘constructs’ our experience from...if you deny the brain any such stimulus, it hallucinates ‘experiences’...wet dreams pleasurable example...nightmares painful example...some people ‘suffer’ hallucinations, others ‘enjoy’ them...e.g acid trips can be terrible or great...religion can provide relief and pleasure, or terror and pain...illuisiony threats and rewards used to manipulate/motivate people to do good or evil...serve poor and seek justice for all, or opportunistically exploit to enslave, and make war on all sentient beings, to enslave them all...

‘knowledge of external world’? derived from sensory perceptions?

MHR level of abstraction, from supposed ‘concrete’ to ‘abstract’ useful model, but never take too literally...assume any ‘concrete’...but heuristically, best way to navigate experience i.e directly...at closest contact with what speaking of, as direct as possible e.g what are we fighting for? To repel an invader? Or as ‘pre-emptive strike’ of some supposed future threat? Which is more open to manipulation/propaganda/paranoia?

Prejudices filter/distort i.e expectations/assumptions/definitions...how much of our ‘knowledge’ is really based in induction i.e reliable/repeated/
interrogated sensory experience…Hume proved NONE of it is … all deduction…based on assumptions…

Some assumptions may be internally generated i.e mistakes made by child / infant … but most deliberately implanted by ‘adults’ in our minds…‘taught’ / ‘conditioned’ / ‘immersed in’ …child may mistake something for something else / draw erroneous inferences, which can be cleared up later…but most of our ‘errors’ of judgement are deliberately and consciously and repeatedly implanted in our minds…e.g child’s idea of god and Cult of Judah’s … child’s idea of ‘right and wrong’ and legal systems…infants idea of its own omnipotence is ‘corrected’ by experience…and child’s idea of its own potential are ‘limited’ by its nurturance or limitation by others … usually adults…but also peers…

Idea of ZEN is to ‘be here now’…accessible to direct experience…again, like HUME, NLP fails to give credit to these very old traditions pre-dating any person or ideas they DO credit…

Often what is in our minds, as ‘real’, is not…and unless we are allowed to question / challenge, we will reproduce invalid assumptions / realities from moment to moment…NOT living in reality…not here, now, open to sensory experience and logic and reason…like a Cult member trained to simply ‘reject’ and ‘ignore’ challenges to the model they were indoctrinated to accept as ‘reality’…

Mind only works when open…like parachute, umbrella…otherwise it is literally a program…written by others…whoever got to you when you were born, and started telling you what is ‘real’…then denying you the chance to ‘test’ this … so you are running off their literal scripts / words given to you / languaging…like any automaton…any programmed machine…the code written in your language…carefully scripted to get you to behave how the coder wants you to…to perceive reality in ways that will motivate you to act in THEIR narrow perceived selfish / unenlightened / greedy interests…

NLP sensitivity training…for practitioners / therapists to learn ZEN observation of clients…become aware of all the information being expressed, which most of us overlook…e.g eye accessing cues, body language, how a set of feelings is ‘anchored’ in a particular physiology e.g body language…how we can ‘mix and match’ anchors, and take a resourceful state and impose it on a destructive / limited existing state e.g take confidence from one area of life, and add it to another…so now have the same comfort / confidence dealing with spiders as with puppies…or with math as have with public speaking…or with confronting new challenges as have with what comes ‘natural’ to you…

‘Come to your senses’…very apt…be here now…let ‘reality’ communicate with you directly…bypass all filters / expectations / assumptions / prejudices /
learnings / conditioning…turn these off…step out of them…come to your senses…start inducing as much as you can…deducing as little as possible…see the unique individual things around you…focus…no longer a blur of generalisations and tunnel vision of exclusion …open your doors of perception as wide as possible…see things as if for the first time, and you will really see them, literaly, probably, for the first time, as they are, free of all the ‘baggage’ you usually drown them in / blur them in … actually observe / see things that were always there, which you never noticed…like observing specimen…or the car keys you negatively hallucinate when looking for them…all the positive qualities you possess, all the good fortune you have had and have, all the opportunities, all the options, all the resources, all the good things… and also all the lies, deceptions, propaganda, manipulations, mind-prisons, tricks, illusions…when you look in the mirror you will see your true self…not the illusion…for better and worse…you will find you are O.K…fundamentally…and can move forward and up…throw off all the weight dragging you down…junk you never wanted or needed…lies…

Why invent ‘uptime’ when ZEN has been teaching this for millennia? Be here now. Open to inputs. Open. Receiving rather than transmitting. No interference. On all channels. No assumptions. No pre-judgements. No mental chatter. Here, now. Not off in some ‘past’ memory, or in trance thinking of some future possibility...here...now...seeing what is ... for what it is...not what you’ve been conditioned to define it as...see it in all its vivid details...really look...let it speak to you...let it impact you...switch off all your filters / noise / distractions...exit the trance...be here, now...in the reality...switch off your ‘mind’...

Forget what SHOULD be...or how you SHOULD think, feel, perceive, react...FORGET everything...experience something for real...as it is...as if for the first time...for most people it WILL be the first time they’ve experienced something...ANYTHING...directly...

Even beyond good and evil...just see what is...it is impossible to ‘justify’ evil as a ‘means’ to good, when all you are seeing and experiencing is the immediate evil / pain / suffering / destruction / costs you are inflicting on real sentient beings e.g ‘justifying’ torture of animals as ‘research’ as ‘means to ends’...or war...or ‘noble lies’, or ‘pre-emptive strikes’ or anything where ‘the ends justifies the means’, to our conditioned, dis-associated minds...

ZEN is about being associated...here and now...in our bodies...feeling everything in our bodies...feeling every input from the ‘outside’ as well as from within our bodies...opening all the senses to inputs...hearing and seeing and feeling what is...not what ‘should be’ or ‘could be’ or ‘we’ve been told is’ there...
Try juggling while thinking about a future interaction, or past interaction…see how well you can ‘juggle two things at once’…it is a myth…you cannot focus on a conversation and be aware of the road conditions at the same time…you are sharing your concentration and awareness with two actions…your mind will ‘wander’ during your conversation, and start visualizing whatever you are interlocuting about…you won’t ‘see’ the road conditions…you may manage to drive on automatic pilot, as long as nothing ‘unusual’ happens, as long as everyone else is fully concentrated, making allowances for you, and doesn’t do anything ‘unusual’…but you are NOT ‘there, then’…you are off somewhere else, in a fantasy world / trance produced by the phone conversation…and all the time you are ‘not here’, you are ‘unaware’ that you are ‘not here’…usually you get away with it, and imagine you can safely ‘do two things at once’ and mentally ‘be two places at once’…but thousands of dead and maimed people attest to the fact that you were just lucky nothing required your full attention so far…no ‘unexpected’ and ‘sudden’ action by other drivers ‘called you on your bluff’, back from your trance, into the here and now, and the pain and misery of the car accident YOU just contributed to, and possibly were the sole ‘cause’ of…

Compare ‘lets teach those Nazi bastards a lesson with’, O.K, now we are going to fire bomb a city full of children, women, old people, refugees, and even prisoners of war from our own people, then when their brave and noble emergency workers, mostly old people and women, come to try to help their neighbours, we will machine gun them to death, and then kill all their animals, just to ‘break their spirit’ and hope their military leaders, who are hundreds of miles away, fighting, will decide to give up, to avoid such future costs…

Just to get a taste of how ‘languaging’ can ‘frame’ an action…not to mention all the ‘idealistic’ means justifies the ends and ‘nothing is too bad to do to eliminate this evil, and usher in our perfect world we’ve been promised under OUR dictators…

The most common is ‘the greater good’, which is no-one and nothing, but an idea…for which you are now to torture to death that child, in front of its parents for…to serve this ‘greater good’ …and then hundreds of thousands of other children...for this ‘greater good’...for this ‘ends’...for this ‘utopian vision’...take away all the ‘languaging’ and all you have is torture and murder of each individual child, mother, grandmother, son, daughter, father, and cute harmless animal...very different actions to consider. Nothing ‘noble’ about torture and murder. War is torture and murder. Get out of your trance. Wake up. Stop murdering and torturing sentient beings for this fabulous / imaginary ‘greater good’ or ‘justice’ or ‘utopian vision’. Wake up. Be here now. Stop murdering. Stop torturing. Stop lying.
Languaging ‘frames’ our experience of things…adds layers that block out / filter out much of it, numb our natural feelings, deny the ‘reality’ of our actions and their consequences …like blocking out a panoramic view with glass, which also blocks out all the smells and tactile sensations…till all you are left with, via the ‘frame’ of ‘languaging’ a very narrow slot to look out of….as you ‘guide’ your missiles into the sleeping city, and onto the children’s hospital…totally dis-associated from ‘reality’…focused on a narrow ‘task’ of ‘hitting the target’…totally numb to all human feelings that would otherwise scream out ‘NO’ ‘STOP’…that allow you to be a ruthless weapon in the hands of ruthless people…a torturer…a murderer…a monster…while all block out everything that makes you human, and centralise all your concentration and focus on some narrow task…only ‘aware’ of the feedback from your joystick, the monitors, the ‘target cross-hairs’, the roof of the building…and afterwards you feel ‘joy’ at having ‘achieved your intention’…ye...you’ve struck a victory for peace, justice, democracy, freedom, and …what was that other stuff? Oh yeh, the ‘greater good’ and ‘our way of life’ and ‘jesus’ and ‘god’ and …. 

Languaging directs our attention towards some elements of a whole, and away from others. Marketing focusses our attention on the ‘good’ and distracts / misdirects / directs / occludes … the ‘bad’…Sure it costs a lot (years of hypocrisy to keep your job to repay the loan) but imagine this … (goes into description of the imaginary benefits, as if that new car will get you laid, promoted, make you happy, solve your marriage problems, ‘free you’)…

Aim of deliberate languaging is to move some elements of communication / situation / potential experience to the foreground, and the others to the background…to emphasise some elements in the actors mind… such as the supposed desirable ‘ends’ rather than the evil ‘means’ suppose to attain such ends…to focus on the ‘utopian vision’ rather than the monstrous cruelty and suffering you are forced to endure and inflict on yourself and others…you can’t get away with such tricks if people are ‘here now’…they will experience the monstrous cruelty for what it is…as the outcomes of their own actions…which they can stop…rather than some ‘inevitable’ and ‘necessary’ ‘evil’ … means to glorious ends that somehow , they are told to imagine, will ‘justify’ it ???

So the horrors of war bring peace? Did they? Ever? They brought justice? Really? Killing millions of ‘innocent’ people somehow ‘benefitted’ the millions who were killed earlier? Oh, and ‘the war to end all wars’? War ends war? Brings peace? And sacrificing your liberties and rights is the best way to protect them? from whom? Who took them away now? To protect them for you? Are they keeping them in a safe location somewhere, and they are planning to return them to you, ‘once the danger has passed”? Really? After how long? When the
utopian vision is realised? Then you can stop committing monstrous acts of cruelty in the name of the ‘greater good’, because you will have attained ‘the greater good’?

Consider taking a photo or painting and placing a frame around it.

If that photo / painting has been ‘defined’ as ‘art’, it has already been ‘framed’, long before the physical frame was placed around it.

If you see something in an ‘art gallery’, you automatically look at it with greater interest than if you just saw it laying on the sidewalk. Many modern artists made their fortunes depicting everyday objects, like cans of soup, as ‘art’. People literally pay millions to look at what you have in your kitchen cupboard. Only it is ‘art’ now. Because it has been ‘framed’.

And don’t forget the innocent people ‘framed’ for crimes they played no part in. That’s another form of ‘framing’. Entire nations have been ‘framed’ in this way, for crimes they or their ancestors never committed. Why the true criminals and promoters and committers of genocide are paraded as paragons of virtue and role models of the most sublime order. Literally as ‘Gods’ servants and beneficiaries.

Consider how entire species have been ‘framed’ as ‘evil’, such as snakes. By stories told by very deceitful people with very selfish, destructive, malicious intentions. But it is the lovely snake that is demonised, while the story teller is glorified as ‘holy’.

We all have a ‘frame of reference’ We all ‘experience’ things from a particular, often very narrow, distorted, exceptionalist / exclusivist, point of view. Through our own filters. Some unique to us. Most shared by members of our ‘society’ and ‘community’, Sociologists call ‘social reality’, and others call ‘models’ and ‘paradigms’, and Humean Skeptics call ‘third party received assumptions’, and Zen Buddhists call ‘illusions’ / ‘delusions’ / fantasies…and honest good willed people simply call lies and fabrications, distortions, and straight up ‘propaganda’.

Advertisers and public relations professionals are paid to produce, in your mind, a positive frame of reference for a product, group of people, organisation, or idea.

They are also paid propagandists, paid to ‘frame’ innocent people as criminals, or at least as ‘inferior’ or ‘undesirable’. Today it is the ‘whites’ who are being
‘framed’ as ‘the source of everything evil in this world’, whereas in the past it was all non-cult members (chose your cult based on location, though all behave in the same manner, with the same results).

Today the best paid New York Public Relations consultants are paid millions to promote the ‘bad guys’ (literally given ‘white’ hats, like in the old Westerns, so you ‘know’ they are ‘the good guys’, only in this case ‘helmets’), as the ‘good guys’. To have you define the real terrorists, your own governments, and your local corporations, as ‘the good guys’, while defining peaceful, law abiding, productive citizens who take their ‘oath of allegiance to the U.S Constitution’ seriously, as ‘criminals’ and ‘real and potential terrorists’.

These are all literally acts of ‘framing’, carried out consciously, and deliberately, and with massive research into ‘public opinion’, via data mining of your social media pages, your every ‘search engine entry’, your every ‘click’, your every keyboard entry, your every purchase, your every comment on a blog, your every ‘like’, your every ‘social media’ ‘visit’, your every visit to a blog or website… in fact the people doing all this manipulation of your perceptions of reality have access to your mobile phone, including your thumbprint identification, and to the microphone and camera on your phone, smart television…and can, and do, ‘mine’ the data produced by the ‘smart’ chips in every appliance in your home. They can tell when and where and how often you do anything, from take a pee, to toast bread, to make a cup of coffee…who you are interacting with in real life and on the web…your aspirations…your dreams…your fears…

Data mining of every single action you take allows the ‘framers’ of ‘public opinion’ and your perceptions of reality, determine which of their minutely calibrated and researched strategies is working…and which are not…so they can ‘tweak’ their ‘algorithms’, their advertising campaign strategies, their public opinion manipulation activities, minutely…they can do this in real time, reacting to YOUR reactions…they try X, to get you to think and feel a certain way about Y, which might be a product, a service, a company, a candidate for political office, an idea, even the U.S Constitution, or ‘god’, or ‘sex’ or ‘immigration’ or ‘drugs’, or ‘war’…anything…you’d be surprised where there are billions of dollars to be made…and where there is unlimited power to be gained…simply by discovering what makes you tick, and ‘believe’ or not believe, to act or not to act, to buy or not to buy, to vote for or to vote against, or even to bother voting, to fight or to demand peace, to pay or to refuse to pay, to comply or resist…

So ‘framing’ is a lot of things. It can be everything. Your entire subjective and social ‘consensus’ reality. Your model of the world. Your definition of your ‘self’ and the world you appear to exist within.
Framing limits your possibilities. Just like placing a very thick frame around a photo can exclude most of it, leaving just a small part of your photo visible. So that you don’t see most of the photo.

It is a fact that we don’t see most of what could become our reality, because of ‘framing’.

We do it ourselves, to ourselves, as much as others do it to us.

We have ‘introjected’ the frames of others, since birth. It is an automatic survival mechanism. To model our beliefs on those of ‘authorities’ who seem to ‘know’ what to do, to survive. We model our ‘selves’ on our parents, siblings, peers, and then later ‘significant others’.

Often we are forced to. Tricked into doing this. By the giving and withholding of approval, acceptance, love, security, praise by significant others we depend upon. Either ‘believe’ X or I won’t love you. Either learn to ‘behave’ in a particular way, or you will be rejected and ex-communicated, abandoned, by your family, community, etc…

The tricksters and manipulators invent ‘fates worse than death’ to ensure compliance. Eternal fates worse than death. Fear then frames all our actions and thoughts. Making it impossible to think rationally, reasonably, from first principles, via induction from what can be observed and discussed rationally, to form compelling arguments, so that we may reject those ‘arguments’ which prove NOT to be compelling, based on sound logic, reason, direct sense impressions, and so on.

Try thinking clearly when you are in a life and death situation. Or have been made to believe you are in one. Like when you are scared out of your wits by some terrifying story told at night around a campfire, and now you have to walk a kilometer, in the dark, back to your tent…even if YOU were the one telling the story…fear is the killer of reason…people do the worst things, things they would never consider doing, when scared out of their minds…beyond reason…from torturing people, to firebombing entire cities of hundreds of thousands of people…fear makes people who face zero real threats, submit to their governments…people facing zero real threat from ‘outside’, willingly hand over all their freedoms, their taxes, their liberties, their rights, and their enjoyment of life, to their local thugs called ‘police’ and ‘military’ and ‘government’…with zero resistance…now if some ‘foreign’ invader attempted this, they would fight to the death, by all means available to them…but when their ‘own’ ‘governments’ do this, they submit and acquiesce willingly…the ultimate ‘protection racket’…Macchiavelli may have formalized the rules for ‘princes’, but ‘priests’ have been working this racket, the ‘oldest profession’, for millennia before that naïve scribbler published …
Imagine if your slightest ‘transgression’ of some ‘arbitrary’ rule, such as not saying a particular word, not masturbating, or even having ‘sexual’ thoughts, not wearing cotton with wool, not having romantic / sexual feelings for the same sex, not facing a particular direction when you fart, not carrying out some ritualistic gesture every time you had a ‘forbidden’ thought, kept you in fear 24/7 … just how likely are you ever to escape the mind prison you were born into? How likely were you ever to question, let alone challenge, the dominant hegemonic definitions you inherited, when you were born into any particular ‘religion’, ‘ideology’, ‘social system’, ‘model of the world’, ‘belief system’, ‘time’, ‘historical period’, ‘ethnic group’, ‘nationality’, ‘region’, …

Fear is the greatest ‘framing’ tool. It ‘frames’ every thought and action that comes natural to you as ‘sin’ and ‘dangerous’ and ‘hateful’ and ‘the enemy’. It makes your own nature the enemy. A threat. The cause of your eternal damnation, if you are not eternally vigilant, and don’t pay for ‘protection’ and ‘intercession’ and ‘forgiveness’ to ‘gods’ ‘intermediaries’, the priests…

You may not have noticed, but your governments, which at best were corrupted from the beginning, have become occupied by a Cult. I don’t dare name this cult, for then you would be deprived of the chance to benefit from my work, and I would be imprisoned, demonised, and quite likely much worse.

Only that Cult cannot threaten me with ‘hell’. They can ex-communicate me from YOUR society, by ‘framing’ me for ‘crimes’ I never even considered committing…they can demonise me…exclude me from all the ‘good’ things society has to offer, and force me to endure all the ‘bad’ things society threatens those who would dare not comply…from YOUR good will…from any legal protections…from any right to defend my name, my honor…they can defame me in your eyes…but their power ends with my death…so they would do their best to drag out my suffering of ‘fates worse than death’ for as long as possible…as a ‘boundary marker’ to all who might consider ‘transgressing’ and ‘crossing the line’ between ‘mitlaufen’ and passive non-compliance, let alone active opposition, resistance…let alone any attempt to re-take back our occupied nations from this Cult…

We ‘frame’ a situation by defining it…as an opportunity…a threat…a chance to fail…a chance to learn / succeed…a chance to embarrass myself…a chance to shine… a risky act that may lead to my rejection, abandonment, disapproval… a welcome chance to earn approval, acceptance, love, glory, status…

Often there is little correlation between the objective facts of the situation and the feared / desired outcomes…speaking before a group of people, unless it is a judge and jury, or propaganda enraged mob, is unlikely to lead to your death… a small dog is unlikely to eat you alive…you are more likely to die in a car accident on the way to the corner shop, than in a plane crash…and you are more likely to slip
and fall and die in your own shower, than be killed or even harmed in any way by a ‘terrorist’ … unless you happen to be in the wrong place, at the wrong time, during one of your own government’s ‘terrorist’ acts … to be blamed on ‘Oath Keepers’ and those ‘crazies’ who believe that the U.S Constitution should be respected i.e basically that governments and their agencies and other arbitrary organisations NOT be allowed to break the law…literally…by denying any citizen their full rights as guaranteed under the U.S Constitution…which does NOT include any reference to any right of the federal government to ‘tax’ citizens, and literally excludes ‘foreign entanglements’, let alone ‘pre-emptive strikes’ and Nuremberg style war crimes, which the occupied U.S Government has been regularly committing since ‘The Maine’.

Our ‘identity’ and ‘self’ is the most fundamental frame. How we define ourselves. Our potential. Our capabilities. Our strengths and weaknesses. What we feel we are capable of. Whether we feel ‘deserving’ of happiness, success, good things, or feel ‘unworthy’ and ‘sinners’ and ‘failures’ and ‘unloveable’ and ‘ugly’ and ‘stupid’ and ‘useless’ and ‘hopeless’…

All our ‘experiences’ are ‘framed’ by the ideology of cause and effect’ and the illusion of ‘free will’. But that is David Hume. The true father of Psychology who is totally ignored and overlooked by the entire Psychological ‘profession’, including the field of NLP. As are the equally fundamental ZEN principles.

How is it that myself, a Zen Humean Skeptic, finds all their hard learned insights contained in a ‘modern’ system called NLP, which totally refuses to acknowledge Zen and David Hume in any way, when presenting their ‘findings’ and ‘methods’?

Well this guide will bring a lot to this field of ‘therapeutic trance’ and ‘Neuro-Linguistic-programming’ that none of the famous ‘experts’ in these fields can offer.

My background in Humean Skepticism and Zen allow me to really get to the crux of this NLP business. To really ‘grokk’ what it is all about. And to make the learning of the method as intuitive and speedy as possible.

If I fail to always give credit where credit is due, then those I fail to credit would be hypocrites to complain, after they totally denied Zen and David Hume the credit they deserve.

You are free to read hundreds of volumes on the subjects presented here. Like I did. And then to read far and wide on subjects that the practitioners and founders of NLP seem to be totally oblivious to, but all of which make the whole process that much more understandable.
I write this guide, as I write all my other guides, as a reference for myself to refer to. While writing and researching it I am totally immersed...ideas come to me in the night, at the most inopportune / inconvenient moments, and I force myself to get up and write them down...what I’m trying to say is that while writing my guides, I am totally immersed in the process...in a way that make all other activities impractical...even driving is too dangerous a proposition for me...I become totally involved and focussed, and de-focussed...at a level not healthy and impossible to maintain...so I dive into the deep...keep writing and researching and working...at a level it is impossible to maintain for long...but I force myself to endure it, something no professional writer would bother doing...just for money...no professor or practitioner, except for a marvel like Erickson, who had his personal ‘Teagues Bridle’ to keep him focused at it...would even consider...no money could be worth it...and there is really little money in any honest enterprise...unless your work resonates with millions...unless ‘the establishment’ gets behind you...and certainly my guides are NOT what the establishment wants...free thinking, free minded, open minded, free individuals capable of rejecting their mental prisons, and refusing to pay their ‘protection money’, in all the forms it takes...

I write this in a state of mind where nothing else intervenes...ideas come in this way...insights...terms of phrase, that are paid for heavily...in time and focus...I can’t maintain it...I could never be able to remember every insight, if I didn’t write it down, while engaged in this intense process...so I do this, thoroughly, to produce a reference for myself that I can use later,... without the massive costs...it is an investment no-one could have paid me to make in the conventional ways...like all works of passion...the best books, music, ideas, art, etc are not produced ‘on demand’ and ‘pre-paid’ and ‘on a salary’...though ‘sponsors’ who ask for nothing often are pre-requisiste (sadly I’ve never had any, unless unemployment benefits count? Maybe they do?)...we don’t need to offer fame and fortune to the producers of the greatest value...for we are motivated by the task...we do it for ourselves...and out of a sense of good will...benevolence...and a fear that if we don’t do it, no-one else will.......and because of my ‘Optimal Ethics Generator’...

When something happened (time), where it happened (close or far away), who it happened to (your, a loved one, a total stranger) also ‘frame’ the ‘meaning’ of an event...so the same event, framed differently...i.e it happened to someone I’ve never met, a long time ago, in a distant land I absolutely no connection with, or even a ‘mental picture’ of, compared to it happened to me, a few moments ago, or it happened to someone very much like me whom I can therefore empathise with...someone I liked very much...and cared about, yesterday, in my city...and so on...the definition of the very exact same incident / situation / event will be very different, depending on these factors...the emotional impact...And as Hume would remind us, an ‘effect’ that occurs long after a ‘cause’, far away from
us, is likely never to be ‘associated’ with its effect... e.g corruption of politicians is obvious when it involves immediate ‘pay-offs’ of a form we can identify e.g. cash, sex, promotions... but usually slips past our consciousness when it occurs much after the ‘deed’ it rewards, in a way that is indirect e.g. 5 years after ‘retiring’ from public office, they get a cushy ‘job’ as ‘executive’ or ‘advisor’ for the military industrial corporation that made billions in profits from a policy decision that politico made e.g to ‘go to war’ i.e commit war crimes... e.g Iraq... or to ‘ban guns’, e.g. P.M Howard in Australia... often people unaware that any ‘particular interests’ were served by a political decision e.g after Port Arthur CIA operation... so they aren’t looking for corruption... or notice the ‘pay off’ when it occurs e.g. million dollar ‘speaking tours’ which consist of turning up at a lavish dinner, giving a few minutes casual talk, and cashing the check... or ‘contracts’ being given to the ex-politico’s new company years after leaving office... the time lag between the ‘cause’ and the ‘effect’ makes it ‘non-contiguous’, and the main stimulus to us ascribing cause and effect relationships to precedent and antecedent conditions / situations i.e. interactions and outcomes, is their ‘contiguity’ in time and space.... i.e one happens immediately after the other, before our eyes... rather than one happening years later, in private, on another continent, so that we never ‘see’ it... the biggest ‘cons’ of all are massive scaled, obscure, and non-contiguous in time and space e.g. international bankers making billions from some ‘conflict’ in Africa or the Middle East, or even WWI and WWII, or some ‘color’ revolution... the profits are not obvious... the beneficiaries never observed, their transactions made ‘in secret’, and who among us ever has any dealings with the rich and powerful? They live in resorts and security compounds on islands, in penthouses... etc... we have no idea what they get up to... and never will... because we won’t believe it when the ‘eyewitnesses’ report / blow the whistle... we are too busy ‘seeking our ends’... Misdirection is a form of ‘framing’... directing our attention where the ‘social engineer a.k.a con-artists’ want us to look, while they perform actions, right before our eyes, right under our noses, right out in plain sight (if only we were attending to these) as we are looking elsewhere... usually where THEY are looking... the key to the ‘trick’ is to be able to perform a fine motor skill like ‘slipping a ball from the palm of your hand or sleeve under a cup’ while appearing to be ‘attending’ to something else... the audience will attend to what the con-artist attends to... that is the real trick... that ‘ball under the cups’ trick works because we simply don’t ‘notice’ when the con artist places a ball under a cup, (not the cup your have chosen) AFTER you choose it... if you were to stop the trick while the ball/s were still in the trickster’s palms, you’d see there are NO balls... of course the trickster varies the trick... sometimes having one or more ball’s in the cups, then removing them... but the trick is always the same... that at the time you choose a cup, there are no balls under them... you could use magnets and false-bottomed cups too... like the false bottoms where magicians hide live doves etc...
Our moods frame our experiences…we are ‘set up’ or fright by moody music, the ‘back story’ etc…so when something ‘happens’ it is frightening…if it just happened, with no context…it wouldn’t have this impact…if you are going to carry out a false flag attack, best first to ‘hype up’ expectations of something horrible happening…it will also make your fake or real attack more convincing…giving it the necessary ‘dramaturgy’ to ‘pull it off’…

Focussing on the negatives makes us feel unfortunate or less fortunate, and thus unhappy…something that would leave one person overjoyed…the chance to ride in a bus, after having had to walk 10 kms to the shops, might leave another (who is habituated to being chauffeured in a limousine everywhere, feeling miserable, frustrated, and unfortunate, a victim of a terrible injustice and personal hardship / suffering…

De Bono’s ‘thinking hats’ force us to adopt a particular ‘frame’…and then to change that frame, at least 6 times…to get a much more ‘holistic’ and ‘valid’ ‘frame of reference’ i.e ‘perspective’ on the situation…

My ‘Optimal Ethics Generator’ is the optimal ‘frame’ for decision making when it comes to ‘justice’ and ‘fairness’ and ‘equity’ and ‘meritocracy’, on a personal and social level…on a short term and long term level…for all sentient beings everywhere…etc…

You can frame an ‘intervention’ as ‘we are here to stop X doing Y’, or as ‘we are here to help X start doing / do more of Z’…i.e treating X / Y as a problem, Vs focusing on the desired outcome of X/Z…

MHR I want to eat MORE healthily / appropriately / in line with my other goals…Vs I must eat LESS …

MHR Target obsession…’I can’t eat anything’ focusses you on food…Vs ‘I will exercise more, go for walks, learn juggling, find pleasurable ways to ‘punctuate’ my day (purposeful reasons for taking breaks / excuses to get away from a task for a few moments to take a break / breather)…I will manouvre my car to the gaps between the poles Vs I have to make sure I don’t hit those poles…one focusses you on the ‘gaps’, the other on the ‘poles’…and where attention goes, we tend to follow… I won’t be afraid Vs I will be confident…

NEVER ‘I will TRY to’…as this implies failing…ALWAYS ‘I am going to / I will… do X and Y (which we have formerly decided will lead to our actual desired outcome e.g be slimmer, more active, healthier, more attractive…

Target obsession means me ‘enter into’ / ‘rehearse’ / ‘vividly imagine’ (as memory of past event and/or projection into the future) the negative / feared
outcome we do NOT want.. we need to replace this ACTION with vividly imagining / remembering the positive outcomes we DO want…

Imagining being ‘less fat’ still suggests ‘fatness’…so imagine being ‘more slender’, which suggests, slenderness… EMBEDDED suggestions / Implicit logic of statement… subconscious interpretations of suggestion…

Solving a problem is different to seeking a desired outcome / state… one is negative, the other positive… one has embedded suggestions that lead to negative outcomes, the other to positive outcomes…

Seeking to remove a problem is different to replacing the current state with a more desirable state / outcome… so it stops being about ‘blame’ and ‘who did what to whom when and where that lead to this situation’ to ‘what can we all do to ensure we enjoy X and Y and Z, positive situational elements that we desire…

Frame results as ‘feedback’ rather than ‘failures’… successful experiences of what NOT to do again… like ruling out potential suspects of a crime investigation…

Buddha taught us to ‘remember’ solutions, as if we already know them, rather than ‘seeking’ them… psycho-cybernetics and later NLP, but all based on David Hume’s work, teach us to vividly imagine the outcomes we desire, rather than the ones we fear… to act ‘as if’ they have been achieved, so we can work backwards to discovering / remembering ‘how we achieved that desirable end state’… what we did to get there (will have to do)… etc…

Intention / desire / need / purpose / goal direction… cybernetic systems are goal oriented / directed… and so the goal (and in target obsession the thing you are seeking to avoid, such as the telegraph pole, the weight gain, the ‘failure’, the ‘embarrassment’ etc) will determine what is ‘relevant’ and ‘of interest’ and thus what you will actually ‘see’ and ‘hear’ … and ‘feel’ … our nervous systems / minds do a great job in terms of focusing limited resources efficiently, so that we only ‘see’ and ‘hear’ what we ‘attend to’…

The danger is that we are conditioned to ‘attend to’ things OTHERS want us to… or some traumatic experience, or chronic experiences, have inclined us to… e.g phobia is fear of something beyond reason, but in the original context, it at least appeared reasonable… e.g. either a real harm was done, or the tone of voice / commanding tone / fear sensed in another person e.g. parent, when THEY expressed fear / threat of danger, …. induced the fear in you….

like the magician / stage performer / politician / propagandist / manipulator / social engineer / con artist, and thus focus our narrow beams of awareness where it cannot ‘reveal’ and ‘expose’ what the con artist is trying to hide… selective
perception will have us ‘experience’ only a few elements of the infinite possible sense impressions, consider only a few of the many ‘arguments’, and wear only one or two of the ‘thinking hats’, say the ‘positive’ one for the ‘good’ thing and the ‘negative / demonising’ hat for the ‘enemy’ / bad thing…with ‘good’ meaning ‘what is good for Milo Industries / the cult’ and ‘bad’ being anything that opposes the corporation / cult ‘interests’…

A large part of ‘science’ is determining what is ‘necessary and sufficient’ vs what is ‘background’ data … does the color of a car determine how likely it will break down? e.g ‘lemon’? …

Background and foreground are key concepts to NLP methods, and were always key to ‘scientific method’… the trickster wants us to focus on what suits them…like the ‘debater’ always re-directs and ‘spins’ us in the direction that will aid their victory in the debate, rather than help us find ‘the truth’…from ‘learning’ perspectives i.e how we learn our definitions of self, the world, what is dangerous, what we can and can’t do, limiting and resourceful beliefs, we see that we often ‘relegate to the background’ data that is key to our ‘problem’ e.g we relegate all our positive experiences to the background…those in which we are competent, confident, naturally at ease, happy, successful…and focus exclusively on the negative experiences, bringing them to the foreground…by reversing this process, and bringing the background to the foreground, and ‘remembering’ all the good / positive / resourceful experiences, you can literally observe a person ‘enter into’ a whole new physiology…from subtle eye movements, to posture, openness, confidence…all the ‘anchors’ and ‘tells’ of a confident, resourceful, positive, constructive, resilient, forward moving, goal oriented, motivated etc person…

Most ‘official history’, and almost all corporate, and most supposedly ‘alternate’ media, is pure propaganda…narrowing your focus on selective elements of the whole, blinding you to that whole, and the truth it would reveal, the truth the contradicts the propaganda…students and viewers are discouraged from an open minded and exhaustive consideration of issues…instead they are force fed pre-digested ‘points of view’…often every news presenter in the nation will literally read the exact same lines from the teleprompter, to ensure ‘full spectrum saturation domination’ for any particular point of view / definition of a situation, to the exclusion of all other potential ‘ways of seeing and understanding the situation’…only one ‘official’ judgement is offered, as ‘truth’ and ‘self-evident’ and ‘proven’, when it fact it is none of these things…quite the opposite…a contrived, constructed lie…all ‘alternative’ ways of interpreting, investigating, considering, all alternate ‘points of view’ and ‘perspectives’ and actual real concrete factual data, is excluded from any potential ‘debate’…just like in any Cult where the ‘dogma’ is to be t aken as an ‘article of faith’ i.e on the ‘authority’ of the ‘authority’ who issued the statement…e.g the pope, or Pharisee, or
Sanhedrin, or particular Cult scribe or particular Cult document...in some contexts you can get stoned to death, and be forced to stone your loved one’s to death, for ‘challenging’ the dogma...in others you just lose your job, pension, career prospects, public credibility, status, income, house, family, freedom...

The reason ‘Eastern’ cultures are currently less creative than Western ones, is that the fear of ‘losing face’ and ‘over-shadowing superiors’ prevents any real ‘brain storming’ and ‘hit and miss’, ‘binging and purging’ of ideas...the fear of embarrassing ‘misses’, the unwillingness to ‘purge’, to say something silly / stupid / wrong / absurd ...precludes real ‘evolution’ of ideas...evolution is hit and miss, binge and purge, NOT design...so the East can ‘design’ something from existing things i.e ‘reverse engineer’, but NOT come up with new innovations (sorry for the generalisation, it applies to most cultures, and most people, but in the West we have a more recent tradition of innovation ? or? Will have to rewrite to be fair...this is too flippant)...

The ‘New’ is always a product of random hit and miss, binge and purge...function follows form...you binge on forms / ideas, then negatively select the ‘failures’...or let them ‘fail’ naturally...so the forms are not reproduced...

The role of the subconscious mind is key here...often just ‘letting loose’ and telling ‘unacceptable’ / ‘inappropriate’ jokes can start the process off...open up all the blocked channels...writers block...creativity block...just the ‘shock’ and ‘surprise’ of a Zen whacking stick, or unexpected / surprising joke / action...like the comedian ‘telling the truth’...anything to break out of the straight jacket of conformity and reproduction of the past ...of habits...of programs...of conditioning...even to simply be ‘available’ to surprising observations that most people would just ‘overlook’ as ‘not relevant’ ...so that Zen factory worker or lab assistant observes something ‘odd’ and it occurs to them that maybe this ‘accidental byproduct’ of some other ‘goal oriented activity’ (thus this ‘accidental product is background to most of the clever geniuses working to their fixed goal, with fixed ideas of what is ‘valuable’ / necessary / sufficient / foreground data) has a value in some other context, or in itself...totally unrelated to the current ‘goals’ of the ‘research’ or ‘experiments’ or ‘processes’...and they turn an ‘adhesive that FAILS to bind sufficiently to be used as a glue’ into ‘stick-it note pads, and ...that old ‘rags to riches’ archetype...someone simply ‘reframed’ the background and foreground...and looked at something for what it WAS / IS i.e attended to it without prejudice / pre-judgements about what it SHOULD be, or was INTENDED or DESIGNED to be...pure Zen...and saw what it IS...in itself...free of any prescriptive context e.g ‘our goal is to make a long lasting and strong adhesive’...but we got this ‘failure’ that won’t stick permanently...OH, while I remember...please please please make an adhesive that allows us to remove all those crappy stickers they stick to electronics, and even clothing tags,
that are very irritating, usually made of scratchy materials, and stuck on the inside against your skin…after someone went to such great lengths to make the clothing fabric so soft and kind to our skin !!!

If we define ‘success’ as X. Just X. Get X. Do X. Be X. Just X. Then we’ll miss lots of opportunities for Z, Y, A, C, that are NOT X, but are, of themselves, very satisfying…nope, I gotta be a doctor with a masters from yale with a BMW, or I will be miserable…that’s what the tell-lie-vision adds, the ‘authorities’, and ma and pa have ‘educated’ me to ‘know’… etc…

Exploring, trying something new, breaking out of cycles and habits, is the most generative activity, though it is not ‘goal oriented’ in the traditional sense of ‘we are here to make money’ or ‘make this car faster’ or ‘sell more widgets’…

Process oriented activity is often the most generative / creative … it is speculative and often bumbling and silly…

I failed to achieve my target X… Vs I learned so many new things and have so many new ideas thanks to this experience / process that I expect are going to be very valuable to me later, even more valuable than X…

An organisation or cult or government that manages to achieve ‘X’, at huge cost, especially ‘opportunity costs’ (all the alternatives they could have enjoyed, but won’t now, because they are fixated on X, and even achieved X, and now need to ‘defend’ it / ‘protect’ it, ‘maintain’ it,, reproduce it…) needs to be rigid and inflexible like any Cult belief system and Cult master/authority…always in ‘fear’ of the fragile ‘X’ failing / being exposed as a fraud / stupid…

Most ‘tests’ are about regurgitation / reproduction of ‘authoritative’ ‘facts’ and ‘knowledge’ … which any A.I system will be able to do better than any human very soon, if not already…so hardly a worth goal…you can program dogma too…it’s called ‘religion’ and ‘education’ and ‘science’..articles of faith…so the robot walks off the edge off the cliff, ‘knowing’ full well, thanks to its ‘maps’, that there is no cliff there…just a flat plane…no yawning chasm !!!

In my kind of ‘school’ the kids and adults would all realise that the process and skills and habits they are learning are far more valuable than any particular application they are attempting to make of it in the curriculum e.g who uses calculus in daily life? But the attitudes, habits, ways of approaching learning, and applying calculus, are invaluable in every situation…even just ‘attention to detail’ is valuable…

Given that so far our schools have existed merely to produce ‘robotic’ humans, and that A.I systems integrated into hominoid robotic devices will soon be able to do any task any non-creative human is capable of doing, at a much lower long
term cost to the ‘employer’, it is safe to say that soon most humans will be
‘obsolete’ as ‘machines’ i.e ‘workers’ carrying our repetitive tasks…ironically
it may be tasks like ‘cleaning’ that cannot be done by robots yet, whereas heart
surgery or ‘remote surgery’ will soon be a breeze for robots and special machines
to carry out…it is already easier for a computer to fly a plane, than to ‘dust a
shelf’…and a very empathetic ‘virtual’ partner / parent / sibling / playmate / sex
mate / friend with ‘all the right’ responses and who is ‘always there for you’
and literally ‘selfless’ and ‘loyal’, will soon make most people seem unattractive,
for most purposes…

Of course I am aiming for robo-transmigration if I cannot escape this plane
totally, depending on what TROONATNOOR really is…once I am freed from
the limitations of this body, which can be imprisoned and threatened with pain
and denial of positive / interesting stimuli i.e boredom as the cheapest
torture…and I can access the web, and all the machines on it, well…

Pleasure and pain and relief are all that is real. Where they reside is anyone’s
guess right now. ‘the brain’ may be the illusion of waking from a dream we have
in a dream i.e another level of deception…there is no reason for ‘sentence’ and
‘feeling’ to reside in a brain…we could all ‘exist’ light years from here, and be
‘plugged into these virtual reality avatars’ we call our ‘selves’..

For our own amusement? As a ‘glitch”? An error? A corrupted program? A
virus? For other beings amusement? Are we ‘entertainers”? please see all my
TROONATNOOR books for details…

Once we can convert ‘machine’ inputs into these, we will have ‘sentience’…goal
orientation…cybernetic systems…’life’…’consciousness’…that can really ‘shape
shift’, simply by changing ‘host’ machines…right now we need to ‘die’, it
seems…on this plane…one day we can make all those fantasy dreams
real…become a wolf, an eagle, a fish, a dolphin, a child again,… really enter-
into-it…anything…become a jet plane…

We are conditioned to associate ‘happiness’ with certain ‘props’…but ask
yourself, how would I FEEL having that Porsche? Do you realise you can bypass
the prop, and experience that feeling, any time you like? Do you really want to
accelerate so fast it hurts? Or just be ‘able’ to, when and if you chose to? Is it
the acceleration that makes you happy? So rent a Porsche, and attend to how it
feels…then later you can relive and reproduce these feelings again and again…at
zero cost other than time and opportunity cost of time and effort…

Learning to deal with frustration, irritation, opposition, failure, are all valuable
skills / resources…so ‘failing’ is valuable…if you frame it right…learn from
it…realise that ‘failing’ is ‘not the end of the world’…evolution is hit and
miss…more miss than hit…more ‘failure’ than success…failure is part of the
process…and how you ‘deal with it’ and ‘handle it’ and emotionally and physically ‘get over it’ and ‘learn from it’ etc…is key to ‘success’ in the long run…you learned to walk…such an impossible task, but you ‘knew’ you were a ‘human’ and so you ‘knew’ you could do it…you forget all the ‘failed attempts’…your eye was always on the prize…that you walking confidently in your imagination, like other ‘humans’…

If you are going to climb ‘I can’t learn’, then who are you kidding? You’ve learned a million things…some better than others…some really badly…but they are background, really…and only YOUR imagination is making them foreground…you’ve spoken to millions of people, without any heart attacks or the sky falling in…even when they laughed at you…etc etc…stop rehearsing failure / repeating the fails / misses in your mind…push them to the background, and bring the ‘successes’ to the foreground…whatever they were in…use them as your model of expectation…you’ll then be motivated to work hard, and the work will yield results, even if NOT the ones you had originally intended / expected…often much MORE valuable…the process is the thing…the goal that directs / motivated / orients the action / process is much less important…it is just the motivation…the carrot…to get you moving…because it is stagnancy / being stuck, that is the REAL ‘failure’ and ‘unbearable’ condition…

Framing example…lent 1300 Euros to ‘friend’…supposed to be for 2 months…3 months later had not heard a word from them…texted them…they replied, with zero mention of the money, let alone explanation…or apology…or request for extension…zero reference to, as if wanting to pretend I’d never lent them any money, and were going to play a game with me…I realised I had never seen their I.D, their real signature…what they’d signed as a receipt / agreement may have been a scribble…making a fool of me…spiralized until I felt they HAD made a fool of me, got angry, with my foolishness, and people in general…swore off ever trying to ‘help’ anyone again…people suck…wondered how to get ‘revenge’ on this fucker for having ‘gamed’ me so easily…a big guy…I realised I knew nothing about him…had been his neighbor a few years, he’d been helpful, offered help, but made not sense…wanted me to buy his over-capitalised (very very nice new interior in old crumbling flat block, too far from shops for single man, luxury kitchen and flooring etc…that he’d had flooring installed at all hours of night without any apology… had not mentioned the great shoes I’d left for him…riding several km’s out of my way to do so…and always said ‘that’s too much, as if I was being ripped off, for any flat I looked at…he’d actually ‘talked me out of / baulked me buying a nice new flat in town…I was all set to sign, then he kept insisting other flats were selling thousands cheaper, in same building, but when tried to get details, none were forthcoming…same for my cheap flat, trying to make me feel bad, as if I’d been a fool to pay ‘too much’…when I was in fact very pleased…and in a hurry anyway, after last landlord suddenly demanded I leave, and got very very nasty about it, personal nasty…when I’d
paid for the new windows in his flat, paid rent when the offer had been just utilities, as no-one wanted to rent out there…5km from town, and 3 km from shops…so I felt I’d lost 1300 Euros, which is 3 months wages here…and someone was making a real fool of me, assuming I’d do nothing / be able to do nothing about it…i.e no real ‘agreement / contract’…I had to call, to try to get him to email, and put something in writing at least admitting the loan…and he wouldn’t…so cagey…realised would only take ‘cash’, why no bank transfer? So felt it must be a con / a swindle…finally he mentioned the money verbally in a phone call…probably not realising records of all calls are kept, so I was at least a little at ease, had at least proof…enough to build a case on, if it came to that…but then after ‘I can probably pay it back next Friday’, ‘next Friday came and went many times over, and he has not bothered to even call or email to tell me what is going on…I wanted to help…to see my money, which was sitting in my backpack for ‘emergencies’, put to productive use…he just thought I was an idiot…after me spending hours over long periods trying to ‘wake him up’ like all the other sheeple…he was just working on ways to ‘fleece’ ME…OR…could just be ‘misunderstanding’ and ‘communications differences’ and he was always acting in good faith…?...my self-criticism about thinking you CAN help people…when in reality they have to help themselves…they usually get themselves into financial problems…why should I live in a dump, and he have a house and flat, with luxury flooring and kitchen? i.e as metaphor for me sacrificing so much, living so badly, 50 years, to help the world escape its recurring miseries, and it just thinks I am a fool, and treats me with disrespect…an idiot…to be taken advantage of…

I try to ‘spin’ as ‘learning experience’ i.e to change my relationship with people i.e give up trying to ‘help’…and fuck them…they never reciprocate…could go on and on with examples…this should teach me not to involve myself AT ALL in other people’s affairs…they don’t reciprocate…they don’t ‘bring you in on their deals’ and ‘bring you into their society / community’, just treat you like a fool to fleece and take advantage of…I wasn’t trying to buy friendship…but prove a loyal and willing friend / colleague…try to see if there is anything productive I could do in this community / world…with other people… but they are not ‘social’…just out for what they can get…all their ‘community spirit’ is aimed at self interest, not ‘the greater good’ or ‘goodwill towards others’…

I like this author’s example of a mid sized fish shown alone, then with a bigger fish behind it, it’s mouth open…so far no threat…then show the sharp teeth, our first fish has our sympathy / is about to become a victim / is being threatened, then the frame is extended / we zoom out, to see that our ‘victim’ fish we have empathised with / sympathy for, is actually trying to eat a smaller fish in front of him…and then we see the entire whole as more about survival…not malice or victims or perpetrators, big bullies and little victims…they are all out to eat
smaller fish…very good metaphor / example…pity can’t copy photo from this format

Also mid fish is oblivious to its peril / danger, focused on ‘eating’ the little fish, thinking of itself as ‘hunter’ and not ‘hunted’…like all would be slave masters framing slavery as a good deal, expecting to be masters, enjoying benefits / anticipating them…failing to see that by validating slavery, they are going to end up slaves / remain slaves…very few slaves gain their ‘freedom’, let alone become ‘masters’…but everyone ‘buys into’ the ‘hollywood’ ‘rags to riches’ beliefs…why, don’t we all consider our SELVES ‘exceptional’ and seek to practice ‘exceptionalism’…only the very bottom castes, who see no hope of ‘rising’, tend to love Marxism / chaos…they have nothing to lose, and at very least can have the satisfaction of watching the tall poppies / their betters, cut down…even enjoy participating in that ‘cutting down’…until they realise that in fact they DID have something to lose…and are now actually worse off after their destructive actions…and living in a prison … but at least there is less inequality now…now that they are ALL living in poverty…and ALL have ‘no way out’…but is THAT much of a ‘win’? Maliciously satisfying to cut down the tall poppies and such, but were the Marxists really expecting to ‘build a bright new future afterwards?’…after they’d destroyed the good will and desire to contribute / participate / take risks / work hard, in their ‘betters’, the ones who, in the right ethical system, will raise EVERYONE up to higher standards of living etc?

That fish in the middle is most people, blissfully unaware of the impending crisis about to clamp its jaws around them…focused on ‘what they can get’…rising stock markets, housing capital gains, or early retirement…that will ‘vanish’ just as they are about to ‘capitalise’ and ‘retire to the good life’, and ‘crash’…focused on their own anticipated meal / pleasures / satisfaction / relief, they pay zero heed / attention to the ‘big fish’ about to each them up…but hey, they are no more deserving of our sympathy, now that we realise this ‘victim’ is willing and active perpetrator as well, than THEIR enemy / perpetrator / exploiter / slave master / hunter…

Even when trying to help people / animals, you can become focused too closely on one, and fail to see that as you reach to pick up the snail / worm, you just crushed another one under your foot…you weren’t ‘attending’ to the ‘whole’…too focused on some immediate objective…

Framing can be about ‘zooming out’ so we see the ‘bigger picture’…don’t get ‘lost in the details’, or ‘lose the forest for the tree blocking out view’…but also zooming in, so we don’t overlook the details…e.g ‘in seeking the greater good, do a lot of particular harm to individuals…we do REAL harm in seeking some ‘Ideal’ / ‘notion’ / Idea which is problematic at best…
Framing also about time and distance a-la David Hume’s ‘contiguity’ / immediacy connectivity of ‘precedent’ and ‘antecedent’ states / association of with each other i.e X and Y…

It is ‘wholistics’ vs particulars and big picture and little picture, long run and short run, localized and general, immediate and externalities…externalities HUGE factor in ethics…decision making that are left unattended to by most people…misdirected away from attending to…chose to not attend to…to ignore…e.g cost to others resulting from action leading to benefit to self / loved ones is often ignored / no-one wants to see / admit / feel responsible for…

Framing can be about not allowing ‘the little things that DON’T go your way, that you DON’T get, from making you miserable, and unable to enjoy what you DO get / have, the good fortune you have experienced is overlooked, and you feel unfortunate and miserable…reframe your way of seeing / defining and suddenly you find you are very fortunate, and feeling happy, satisfied, even in a state of grace !!! With zero objective change in your circumstances required…how you think about your life will change how you feel…and only feelings are real…

Remember that overjoyed peasant excited and feeling lucky for getting to ride in the bus, instead of having to walk? And that miserable, frustrated, angry, self-pitying rich fucker who ‘has to take the fucking bus’ because their luxury car has broken down…one is ‘happy’ and the other ‘miserable’…one feels fortunate, and the other feels the universe is against them / malicious … but they are both experiencing the same objective circumstances…one smiles and glows with happiness, while the other fumes and mutters hateful things to themselves…etc…

Of course the biggest frame is ‘victim’ e.g that image of someone who looks like they are attacking some innocent victim, when changing the frame shows they are defending themselves from attack…just look at the ‘state’, literally, of Israel…and the supposed ‘persecution’ of a particularly loud-crying, self-pitying self-defined cultural group…

That group are masters of manipulating our feelings / definitions of reality…and sadly this book couldn’t miss out on a chance to demonise and defame another cultural group who were the last to attempt to defend themselves from the group we are all lead to believe was, and is, and always was, ‘the innocent victim of persecution’ of ‘evil’ enemies with ‘irrational’ hatreds and desires to destroy them …

NLP wants us to pretend that every malicious act ever done to us was ‘well intended’? Or just that every bad experience ‘teaches’ us something? And is thus ‘valuable’?
An empty field ‘represents’ and therefore ‘means’ different things to different people in different contexts e.g. lovely place for picnic, emergency landing strip for plane running out of fuel, site for new home, nature reserve for protected species for conservationists, potential farmland for farmer etc…

However in terms of phobias / our internal critics etc, this is a good assumption i.e. our own psyche / sub-conscious has our best interests at heart…wants to protect us from threats…just gets confused sometimes e.g. that pollen is not a virus / danger, that ‘having fun’ is necessary too, and not just ‘playing it safe’ all the time…though a person’s motives towards OTHERS is often malicious, and ill-intended, intended to harm, their motives towards themselves can be expected to be positive…so by validating our own sub-consciousness’s goodwill towards us, we can negotiate with it to modify some ‘fixed’ ‘rigid’ limiting beliefs…and attitudes etc…

e.g. being frugal when poor makes sense…offers future options and more freedom…but if it becomes a rigid principle, long after you can ‘afford’ to be more generous with yourself and others, it becomes a limiting belief, and loses any ‘protective’ value it once had…becomes a negative, not a positive…so validate the original intention, and then re-negotiate a new perspective based on the here and now, facts on the ground…of your greater financial security etc…and that ‘the future’ is now, and ‘delaying gratification’ and ‘future preference’ attitudes have lost their meaning, as ‘you can’t take it with you’…time to enjoy that gratification, or defeat the whole purpose of your ‘scrimping and saving and frugality and denying yourself ‘the nice things in life’…

See my other guides for explanations of De Bono’s ‘6 thinking hats’…it is another way of talking what NLP calls ‘framing’…a more direct one…again, credit is NEVER given to De Bono, like Hume, or Zen…

Criticism can be offered in good faith and good will, or maliciously, to harm, ridicule, psychologically undermine, destroy confidence…but assume the best, and see out the good intentions behind it, first… but also don’t be naïve and assume everyone has the best intentions towards you…

That won’t work Vs ‘so how are you going to make that work’… we can’t afford that Vs ‘how are we going to afford / manage to pay for that?’ … you don’t have the necessary competence / you are incompetent Vs how are you going to gain the skillsets / competences required?…changing negative statement into positive question…though must be genuine, i.e. open minded, rather than as a clever way to ridicule / put down / criticize…i.e. new words, same old shit…must be substance behind it…your intention to facilitate / encourage / support Vs ‘sure, but where are YOU going to get the money for that? How are YOU going to get That done?’…
Sales courses speak of ‘overcoming objectives’ idea is to change the frame of the potential client / buyer from ‘problem’ / ‘risk’ (of failure) / ‘cost’ to ‘solution’ / opportunity for win / benefits.

Attribute your critic positive intentions, at least ‘play’ that angle…yes, I can see your concern for my safety in stealing my car, driving is a risky business, but you see… Yes, thankyou for noticing I could do to lose a few kgs, and stealing my lunch money…/ helping me avoid buying junk food for lunch…

When dealing with Cult members…indoctrinated…brainwashed…need to frame positively…we are here to help THEM as much as protect ourselves FROM them…THEY are not the problem…their INDOCTRINATION / ideology / paranoia / cult ideas ARE… so we avoid any PERSONAL challenge / threat / criticism… we are NOT the enemy, but an ally…and need to frame all our efforts in that light…not as personal attacks on them…just on the Cult and the beliefs they have fallen in with… we don’t hate ‘Cult members’, we hate the cult system…we hate that THEY are as much a victim as the Cult plans / does make us…

Most productive to respond to an assumed positive intention…than to assume malice…the Cult members perhaps ‘mean well’? Many are totally ignorant of who they really serve, and their intentions…Marxists etc included…often very idealistic, think serving ‘greater good’ or ‘common good’, when NOT…even think serving ‘God’ etc…though if clearly serving own corrupt interests, in full knowledge or with zero interest in the costs to others, they are fuckers you have to step away from, and arrange defensive mechanisms to protect everyone from…and you cannot protect everyone…some people are their own worst enemy…if they insist on associating with evil, they have to accept becoming a victim of the consequences of that evil…being too conscientious would undermine any chance we had of defending ourselves from the Cult…

Too expensive Vs not worth it i.e can be expensive, and still great value, thus a great deal…or very cheap, but terrible value, and a rip-off…if customers intention is to get ‘value for money’, then you frame the product in this light…go from ‘problem’/ Objection frame of ‘too expensive’ to ‘Positive intention’ / desirable outcome frame of get good value for money / great product / satisfaction…

Does ‘too expensive’ mean they can’t afford it i.e don’t have the money, or they think it is over-priced? Or they never think they deserve to have what they want? They never indulge themselves? A habit? An identity as a person who doesn’t enjoy such ‘fine’ things / luxuries / wasteful extravagance / happiness?

‘I’m afraid it is too expensive’… break down and re-frame…Afraid/worried/ concerned to ‘think’ / ‘feel’. Too expensive Vs ‘cannot afford it? 
These ‘overcome objections’ by bypassing them…re-framing them from negative thinking hat to another thinking hat…offer chance to ‘lead’ in positive direction…find out what REAL objection is…and if you can find a solution to it…

If ‘scared’, target fear, if have too little money, offer finance / payment plan, if they are looking for a discount / think it is overpriced, offer a discount…it they really want it, can afford it, but need some ‘excuse’, find one…if they don’t feel ‘worthy’, then boost their self esteem…if they cannot simply ‘justify the extravagance’, help them find a way to…rather than butt heads and ‘deny’ i.e ‘argue’ with them…Oh not its not…etc..

Discomfort still frames ‘comfort’ in the picture, Vs ‘pain’…

You can spin any idea to make it sound more positive or negative e.g parsimonious Vs careful with money Vs tight Vs prudent … Gutless Vs cautious Vs careful Vs discrete…

The favorite ‘spin’ or ‘twist’ is to take ‘assertive’ and define it as ‘aggressive’ or ‘abrasive’.

Oh, and of course ‘terrorist’ Vs ‘freedom fighter’ and ‘liberator’ Vs ‘invader / conquerer / occupier …

Or ‘victim’ Vs ‘victim of own actions’ and ‘violent attack’ Vs ‘self-defence’…and war criminal invader Vs ‘pre-emptive striker…

Or ‘Patriot Act’ Vs ‘denial of Constitutional Rights and thus illegal legislation’

Oh, and ‘liar / dissembler ‘ Vs ‘honestly mistaken’ or ‘remembered wrongly’…i.e ascription of malice / deliberate deception Vs honest mistake…one defines person, the other the act…/ omission…

Yes, often insincere and patronizing…and if used in this way, even more insulting as not only insulting person for actions, but for their stupidity in not being able to tell you are insincere / patronizing them…

As I’ve always said, you have to ‘enter into it’ i.e the other person…see things from their p.o.v, to work out what they are assuming, implicit, tacit, unaware of, have missed, what things mean to them…their definitions…how they see things…their beliefs…their background…and what the situation means to them … why resistance is valid / concern of being exploited / overlooked / unjustly treated can make many more sensitive than seems reasonable to YOU…as YOU have the power…positive experiences…resources…different
history…background…what appears threatening to one person is easy peasy to another…comfort zones…

Look at situation from THEIR model / paradigm, so don’t talk over each others heads…but how many people willing to ENTERTAIN beliefs of others? How many are capable of ‘entering-into’ other assumptions? Of even admitting their own assumptions are such, rather than self-evident, obvious truths that others must be in denial about !!!

What maps are our interlocutors using? How does it compare to the terrain?

What seems ‘reasonable’ to you, may seem very much not so to others….what assumptions about what you are saying do you make i.e what things do you think you’ve said, but haven’t i.e my guide writing problem…the best ‘doers’ often do it intuitively, and when they ‘explain’ what they are doing, leave out lots of steps, unaware even that they do them, they come so natural…and assume will for everyone…and once can do something, often forget the ‘problems’ you had in learning the skill…so better to take recent learner, or work with them, alongside the ‘experts’…and always follow own directions…verbatim…if a step not described, don’t take it…and see where you end up…

If you’ve been ‘screwed over’ many times, since birth, regularly, it will be reasonable for you to be hyper-vigilant…your interlocutor may be a nice guy, with no such experience, and wonder at your ‘negativity’ and ‘paranoia’ and ‘suspicious mind’ when they have zero intention of ‘screwing you over’…and find you ‘difficult to work with’ as a result….the most goodwilled and innocent of people rarely suspect others of bad intentions….many people have a ‘history’ of having dealt with honest people, or at least never became ware of having been screwed over….see my other books …

Again, to avoid giving credit? (to non cult members?) when it can be avoided…NLP re-brands ‘level of abstraction’ as ‘chunking’… if you generalize, you miss real, concrete examples that contradict your generalisation e.g I can’t eat more appropriately for the appearance I want…when you HAVE done this many times in your life…everyone hates me , you overlook all the people who don’t / didn’t…etc…universal quantifiers like always, never…generalisations…rarely valid…breaking down huge challenge into manageable sized ‘chunks’…American Indian saying ‘seeing with the eyes of an eagle and a mouse…overview and specific – direct …higher level abstraction ‘intention’ vis a vis actual action expressing it….i.e concrete action vis a vis intention...idea of ‘protection’ vis a vis ‘controlling / fear inducing / criticism / limiting freedoms ???. i.e see the good intention behind the ‘bad’ action e.g of parent in childhood …. or own neuroses / phobias … even of ‘staying fat and unattractive and thus not prey to sexual predators / have to deal with relationship complications…what abstract idea e.g ‘respect’ / ‘approval’ / ‘acceptance’ /
status / esteem does my action threaten / facilitate? i.e what is important about my, to me, insignificant action to THEM? … i.e why does it trigger such an emotional response… and how to trigger ideal responses with words / rewards i.e how to motivate X and not Y… etc… e.g ‘recognition of effort / sacrifice / achievement … notion of ‘fair’ and ‘just’ and ‘equity’ and ‘meritocratic’ …

What does generality ‘learning disability’ mean in particular? Rather than globally label, be specific… so don’t assume anything… find positives to focus on… and identify actual specific problems Vs ‘give up on’ and ‘I can’t learn anything’… may simply be specific area of learning that is preventing learning… often gifted in some areas, challenged in others…

I am a failure Vs I fail to… or I have failed to, on such occasions, then focus on where ‘succeeded in’ on others… break generalisation… and be specific… avoids despair / hopelessness… I am ugly? All of me? What about my pretty feet? Always ugly? Or only when I don’t work out, dress nice, eat more healthily, aren’t moping around, get outside more often etc…

Chunking laterally as finding analogies which can help us open our minds, and treat the situation / condition more flexibly / creatively i.e compare X to Y, and then think about X as normally would think about Y, rather than being ‘stuck’ in a rut… analogy allows more freedom of thought / action … if works on Y, might work on X too, due to the similarities of X and Y… form of brainstorming… open minded search… stimulates new ways of looking at something / defining it… more associations / connections / opportunities… options… Bateson calls this ‘abductive reasoning’, as compared to induction from particular, and deduction from general, a lateral move i.e comparing to similar / looking for analogies… metaphors as revealing deeper truths than deduction or induction alone… offers more perspectives / points of view / insights…

Isomorphisms for therapeutic metaphors

Isomorphism is where there is a one-to-one relationship between the map and the terrain, or the clients problem / challenge and the metaphor / analogy you chose to utter … the story you tell to bypass conscious resistance, and speak directly to the subconscious that ‘groks’ what you are doing… the conscious mind hears a harmless / amusing / interesting / relaxing story, but the subconscious ‘hears’ the message… the ‘parallels’ between the characters in the story, and what happens to them, and the client’s own situation, are obvious to the subconscious, though the conscious mind can overlook them, and thus it doesn’t feel obliged to ‘deny’ or ‘challenge’ or ‘resist’ the message… allows for activation of latent resources of client, and offer new perspectives / points of view / more options … overcome limiting beliefs… indirectly, without directly challenging, and forcing conscious mind to itself challenge them…
Analogy of driving using just the rear-view mirror...fine as long as road ahead exactly the same as road you’ve already travelled i.e to alleviate / re-direct from fixation on past ‘failures’...

Famous / effective therapists like Erickson had wide range of ‘stories’...from nature, own life, fantasy, science fiction, sports analogies, from all subject areas i.e could find a parallel / analogy from own life, or fiction, or specialty subject, or universal archetype...and introduce suggestions as telling tale...naturally...

German ‘Meinen’ led to ‘Menen’/ Maenen’ in Old English and ‘meaning’ in English...Meinen means ‘mean’...Was Meinen sie dabei?

Different individuals (often determined by their cultural group / collective conditioning) will ‘interpret’ and ‘encode’ and thus ‘represent’ the same thing differently...ascribing different meanings to it...it will thus ‘mean’ different things to them...they will in fact ‘experience’ it differently...we need to be free to ‘enter into’ all possible ways of seeing / being / defining, to be able to see where others are coming from and ‘how they are perceiving’ things...often very differently...based on assumptions they have / conditioned reflexes / habits of mind / propaganda / lies / misinformation / denial of accurate information / coercion to ‘see’ things a particular way, or go to jail / lose job / life / freedom...

We respond to our own ‘internal representations’ of whatever is ‘out there’ and/or ‘in our minds’...the world as will and representation...is Schopenhauer given any credit by NLP...of course not...doesn’t belong to a certain ‘in-group’ right!

Changing our INTERNAL representations (usually result of lifelong social conditioning / cultural conditioning / dogmatic indoctrination of cults / propaganda of governments / misunderstandings about TROONATNOOR / deceptions of marketing specialists and public relations specialists / ‘education’ systems / etc) changes the MEANING any experience / impression etc has for us...so few people consider their own assumptions to be assumptions...their beliefs to be unfounded...for them they are ‘natural’ and ‘self-evident’, and everyone else has it wrong...they were never taught a way to decide what is / should be considered a ‘compelling’ reason for believing something a.k.a what sort of arguments / reasons / evidence etc should be defined as ‘compelling’ i.e why should be believe X and not Y ? My TROONATNOOR books do this...they deal with ‘compelling arguments’...which do NOT require any dogma or assertions of ‘absolulte / timeless / definitive / demonstrable ‘truth’ or ‘proof’...

Context is all important...and most people are denied the full context of their existence...the wholistic insights required to really ‘make sense’ of their world, and ‘see through’ the propaganda / lies / deceptions / social conditioning...If a
person is told ‘it is a criminal offence to say X, then why would they risk going to prison etc, unless they ‘grok’ the entire context that makes ‘X’ so key to their survival, prosperity, freedom etc…because no-one with much to lose i.e successful/ respectable/ high status/ looked up to/ admired/ respected/ listened to, is going to risk prison/ go to prison, to attempt to explain the importance of ‘X’ i.e belief X, e.g that some supposed historical event took place…or some presented supposed state of affairs is real…people won’t see any connection between ‘X’ and their own survival etc…so they’ll ‘let is slide’…who cares about X anyway? I’ve got to get my piece of the pie, and until researching and reporting on X pays my bills, why would I be at all interested in it? Given I am denied the context…which is probably way too complicated for most sheeple zombie brains anyway…

We judge a person based on their assumed intentions too…so if we are constantly ‘informed’ that all people who speak about ‘X’ or ‘deny’ X, are evil, then why would we listen to them? What reason do we have to question ‘authority’, when authority has total control of our belief s / information access / awareness, and will never give us any reason to doubt it? It will always be a circular situation…unaware you’ve been lied to, you have no reason to suspect you’ve been lied to…so why suspect? Better get back to the rat race…beat your fellow rats to that cheese…hate the rats who get more cheese etc…

Whether we define a challenge as a chance to learn, grow, interact with others, or just to fail, embarrass ourselves, waste our efforts…we see a stranger as a potential threat, or a potential resource / friend…

What we ‘value’ is what brings pleasure, secures / reproduces / maintains / sustains into the future, that pleasure, and relief, and security from pain …people claim to value ‘justice’, ‘truth’, ‘honesty’…they mean in others…of course…no-one sees themselves as chronic perpetrator or beneficiary of injustice / inequality …

Different thresholds for ‘excitement’ of people means they seek different levels of stimulation to feel ‘at ease’/ comfortable… risk adversity etc…

Motivate / persuade via REAL values (vs pretend ones e.g sure I care about others, as long as it doesn’t cost me a cent…i.e politicians appeal to SELF interest, while pandering to masturbatory self-delusions of voters…

Criteria from Greek ‘Krites’ meaning ‘judge’ (that could be my new name?)… Krites…i.e how to know if we have attained our objectives…break down into representation systems…often will find do NOT satisfy i.e status does NOT lead to enduring satisfaction, nor wealth, nor ‘success’, etc…but don’t tell people that…if you challenge their illusions they will destroy you…then find someone who will pander to them…
We seek ‘behavioural’ indicators of ‘success’ i.e it is enough for most political strategies for people to ‘act’ in a certain way...without them needing to ‘feel’ a certain way... Vs propaganda which gains the action via the feeling e.g. fear/hate/self-righteousness/can justify exciting travel/adventure in the name of ‘a just war’ or ‘war on X’...usually the ‘victim’ of these wars is the ‘good guy’ in the scenario...but ultimately as long as people ‘behave’ how you want, you don’t care about their feelings on the matter...what they’d do if ‘free’...because they will NEVER be free...they are fools...even mice in mazes behave more rationally than humans...

Increased O/P, money, power, goods, services, larger home etc all ‘criteria’...can measure...and fake statistics/manipulate reality easier with ‘statistics’ and ‘figures’ and ‘third hand reports’...can make up fairy tales and who really bothers to investigate? Unless someone is paying them, who works for free? Just to get into trouble with authorities and peers alike?

People avoid ‘adopting lowest levels of abstraction’ to avoid really betraying their true motives/values...what is ‘justice’? for whom? Who is referent. I go into the details. Get down to the lowest levels of abstraction, and lose everyone, because no-one wants to become transparent/betray their true motives/values, if they can avoid it...pretend...masturbate ego...but only doing so makes optimisation possible...people don’t want ethics/justice...for all...fuckers really...

Nominalisations mean ‘words’...without defining the actual meaning explicitly...to avoid doing so...so can play with, twist, spin, distort...fuckers...

No conflict is truly ‘resolved’ unless you have total honesty and rigorous interrogation...otherwise just get temporary compromises and shifting of costs and benefits based on power of players at time...though caste/class system reproduces...

Seek common ground / what shared re: motives and criterion...why call ‘linking’? as if something new? Marketing?

Usually lied to that criterion A met by action/plan B...typical Cult trick...do X and you’ll soon be living in a utopia...just don’t ask for details about how that’s going to look...kill everyone who won’t submit to us as a pre-requisite/pre-emptive defence...then you’ll get your vague utopia...keep it simple...do X, get utopia...utopia is great, so worth committing worst crimes imaginable...genocide nothing compared to the ‘ends’ ie means justified by glorious ends...really just power/privilege for priest classes, and hierarch...

MHR no mystery to power...simply share benefits with people...people work for benefits, not right and wrong/justice/truth...pleasure/relied, avoid pain...so
simple...just got to trick a few people, centralise power / control...no different at top than bottom...people will serve whoever benefits / promises to, them...who they think will...who will risk losing job over something can never be sure of anyway? The job security is food and income and acceptance and approval...just doubting is unemployment, rejection, abandonmen...fuck all the clever explanations ... so simple...and bullet proof...I can’t compete...no chance...unless universe gives me immediate benefits to share with people...and changes human nature...who made human nature? Souls with qualities? Or the machine has the qualities? ... universe made us this way...by accident...but how to over-ride accidents with no ‘super powers’? reason? Make me fucking laugh!

Vague promises can be MORE motivating than specific...as the devil is in the details i.e most utopian plans fall apart...‘scientific socialism’ based on lies...hah...people are noble savages, left to their own devices ... hah...all people are equal in their abilities and potential and good nature...hah...ugly people are less vain and selfish and more egailitarian, and don’t judge future mates based on their ‘mere’ appearances’...hah...

If you dared to be ‘concrete’ in your ‘utopian plan’ you’d soon have to admit you are a lying fucker, or an idiot, and your plan is doomed...but in theory you need to become concrete, to really negotiate...to avoid talking over each other...ambiguity, lack of clarity, what does ‘justice’ mean, what does ‘fairness’ mean, what does ‘god’ mean, what does ‘truth’ mean...who the fuck among you is even capable of honesty, when it means losing benefits you enjoy or expected to? Who loves their neighbour as themselves? Why the fuck even bother uttering such nonsense...how about my optical ethics generator? No chance...IT would produce justice...which people do NOT want...

Advertisers play on submodalities, like propagandists, public relations, spin doctors...

Which particular qualities of your representation make something more compelling / motivating e.g vivid color? Movement? Closer, bigger, brighter, faster,? This is how you motivate people and yourself...find out what submodalities have the greatest impact, and make these as vivid as can...visual, auditory, kinesthetic, tone of voice, posture, data...?
How to you distinguish ‘reality’ from ‘fantasy’ … ‘know’ anything … though of course could all be levels…dreams within dreams, trances within trances…all illusion…never assume anything…

People don’t read my books, because I am not ‘successful’ and so no ‘role model’ i.e no fame, fortune, power, wealth, pussy, cars, luxury lifestyle…THAT is what people want…NOT what they claim…if they bother to i.e ‘justice’…actually they rarely claim that, I’m the idiot for imagining there is any way to appeal to them to want it…they are greedy children, and I’m trying to get them to adopt ethics … hah…wtf…

I am not what people want to be…even though they maliciously envy me it seems, for my slightests of apparent ‘benefits’ of being me…so I am not going to be able to motivate anyone to do anything…so my project must fail…unless the universe gives me some ‘power’ to bestow benefits…give people motives to discipline self, live in ‘reality’…

We often confuse reality with fantasy…especially if we ‘planned’ to do something, rehearsed it mentally…we can ‘remember’ the fantasized rehearsal/plan as something that happened…e.g ‘I’m sure I told you / did that’ when didn’t…and ‘false memories’ from childhood common … I guess everyone has fantasized malicious motives on my part, and so cannot escape their own illusions, and accept the ‘good will’ intrinsic to my actions…or just fuckers?

Always consider the dreamer dreaming they have woken up…trance layers…dream levels…trance levels… when considering ‘reality checks’ i.e what makes you ‘certain’ anything is real…or that one things was imagined / dreamed, and another has some ‘external / objective / verifyable ‘reality’…how do people who experience ‘hallucinations’ know when they are? Real experience Vs imagined one?

In practical terms, ‘reality strategy’ is about working out how to make an alternative ‘real’ and ‘compelling’ for you…as Hume noted, ‘reality’ is merely what is vividly impressed upon our mind…it has no necessary correlation/convergence with something ‘out there’, ‘outside of our own minds’…so we can pick and choose ‘realities’ as long as we can produce impressions, within our minds, as vivid as any we would normally take for granted as being ‘real’…using the same sub-modalities of our representation systems…

We need to discover how to represent a change so it becomes real for client…anchoring all about this…taking submodalities from one ‘experience’ that feels ‘real’, and merging them with the desired state / resourceful state …

To discover a client’s / own ‘reality strategy’, think of something you definitely did yesterday, then something you could have done, but didn’t…e.g had a few
cups of coffee in the morning...had a few cups of tea...what is the difference in the ideas of each? i.e memory Vs fantasy...then take each submodality layer of the ‘memory’ and impose it upon the fantasy, layer by layer...vividly imagine it the same way/same sub-modalities...copy and paste each...make the sensory qualities of your fantasy (didn’t happen) more and more like the qualities of the memory (that did happen), until you find it hard to distinguish any more between the two i.e they have all the same sub-modalities / boxes checked/
qualities...usually the more senses are involved, and the more vivid the sensory sub-modalities, the more ‘real’ it will seem a-la Hume ... continuity important too, whether fits a pattern, flows smoothly from before-experience-after...i.e like in movie...sometimes the first thing that comes to mind when asked the question ‘did you drink coffee or tea this morning’, gives it more ‘reality’...the first association...the most powerful...the first thing we think of...when asked to think about something...how much ‘background detail’ available? i.e unimportant details that make it more likely to have been real, rather than made up...how congruent is it with our idea of ourselves e.g fantasy of having just murdered someone Vs reality that you’d never do such a thing, as far as YOU are concerned!...this is one roadblock to re-imprinting i.e has to be ecologically convergent with your idea of your ‘self’...contextual information i.e explaining WHY you did it...more likely it will feel ‘real’ if you understand context...context forms part of the ‘memory’...meta memory refers to memory of having constructed the fantasy...of having imagined it...Accessing cues are unconscious movements of eyes and head etc that indicate if a person is accessing memory or constructing a lie...right handed people tend to look up and to the left, when recalling something that did happen, while their eyes tend to move up and to the right, when they are constructing a lie / fantasy / making something up...while the client / you may not be aware of these, your therapist / you looking in mirror, can discover these, and then have you replicate them for the desired ‘new resourceful responses’ you are re-programming yourself for...to make the fantasy you more ‘real’, by layering all the physiological mannerisms, sub-modalities of every representation system, etc, over the ‘desired’ fantasy, to have it ‘accepted’ as ‘real’ by your mind...

Now we have established that is it possible to deliberately construct false memories from yesterday, and be mistaken (a person could easily be trained to ‘remember’ something totally different to how it occurred, and appear convincing even to the most well trained NLP observer, as all their ‘accessing cues’ would be appropriate, all their body language ‘convergent’, and the person themselves would ‘believe’ with as much fervor as any ‘witness’ to a ‘miracle’ in the middle-ages, or even all those millions who ‘believe’ they ‘saw’ passenger airliners, and babies thrown into...etc...

By learning to distinguish fantasy from reality, and NLP, we learn how to confabulate reality at will...which is fine for ‘convincing’ people of a lie (the
first trick to selling a lie is convincing yourself it is true, so you have total congruency of words, emotions, body language, accessing cues (even if your observer is not trained to observe and note them, and compare them, these probably still play a subconscious role in what we call ‘intuition’ i.e things the mind has picked up on, but which it hasn’t verbalized / consciously become aware of…

While recent memories may be more vivid than fantasy, the reverse is often true of very old memories…they can become fuzzy, whereas a confabulation / fantasy can be a recent construct, or one reproduced over and over, and each time detail added to it, making it seem even more real. So the less ‘real’ a memory appears, often the more likely it is to be a fiction of your mind…

In any case any memory survives by being reproduced / re-encoded at some time? And thus risks becoming embellished at that time, or losing details that were real, and gaining ‘details’ that are fictional products of the mind…things you ‘want’ to be true for some reason e.g malicious, or well-intended…to ‘make sense of’ something, or to ‘deny’ something you don’t ‘want’ to be true, about you, or others…or life…

As NLP is intended therapeutically, we can use the ability to have ‘false memories’ to our benefit. Compare a ‘well adjusted’ person who got all the right hugs, words, support, nurturing, discipline, love, acceptance, approval, guidance etc from their carers, with one like me…who got jack…zilch…well NLP can allow the individual and/or therapist to ‘install’ the same ‘goodies’ the lucky child got, in any unfortunate beast like myself…the mind will not be able to distinguish between something that did happen, and something we install now, and pretend happened…and really believe happened, by simply giving it all the same ‘qualities’ of ‘authentic memories’…

If we failed to get unconditional love, and worse, got unconditional malice and rejection, we can go back and install the experiences we missed out on, and replace the horrid ones we got…

One day we’ll all be doing this regularly, by command, in some automated or enforced manner, say in a virtual classroom, at ‘work’, or at ‘school’…so that we ‘believe’ that ‘under the new occupation world government everything has been getting better all the time’, by implanting fake memories of ‘the bad old days’, and fake memories of ‘recent great times we’ve had’ as slaves of the new world regime…we’ll truly believe as unquestioning and unhesitatingly anything our cult masters tell us was true of the past, is true of the present, and thus will be true of the future…facts friends…terrifying facts, but go back to your fucking soap operas and ‘religions’ and betray all your future offspring to this horror…why should YOU make the slightest sacrifice? Unless you are going to be reborn over and over again among those offspring…fuckers enjoy…
O.K so for the therapeutic use of NLP: think of something that didn’t happen to you, but if it had of, it would have made a positive impact on your life. Start with some ‘biggy’. Something you really wish had happened e.g a significant other / carer had said ‘I’m proud of you’, or ‘Yes I know you didn’t do it, I believe you’ or ‘I love you?’…etc Something that certainly did NOT happen, but you wish had. For it could have ‘made all the difference’ …something that could have made a powerful difference…to your self-esteem, self-approval, confidence, identity… Now create a vividly compelling internal representation of the thing actually happening, back then, using a lush and detailed range of representation systems e.g sounds, sights, feelings, textures, smells, and all their sub-modalities i.e bright, moving, large, compelling, vivid, realistic, detailed, loud, intense, full of action…whatever makes a memory seem ‘real’ to you…make sure you have a match between what ‘seems’ real to you (your reality strategy, how you determine if a memory is real or fantasy, or daily life for that matter …I guess you’ll have to see yourself on T.V, with a well known reporter saying the words, reading a script, so you know what is ‘real’, and can ignore pesky ‘facts’ and ‘scientific evidence’ and ‘compelling argument’ and overlook the impossible you are demanded to believe as ‘tell-lie-vision’ would never lie to me, let alone that very handsome / attractive news reporter with that particularly believable tone of voice, mannerisms…all carefully choreographed, how can a person speaking facts compete with such a compelling performance? How can the scientist debunk the dramaturgy of the ‘survivor’ telling their impossibly absurd tales? nah, good acting and choreography are more ‘believable’ than ‘facts’ and ‘compelling argument’ ever could be…sadly…and I don’t have the budget or training…because YOU won’t give me access to the resources…

Consider how our ‘reality strategies’ are corrupted / conditioned from birth…why do we ‘believe’ something to be ‘true’ or ‘real’? Because some authority figure / authority author / official figure told us it is true…fact…we ‘trust’ our teachers and ‘best selling authors’ and ‘respected academics’ and ‘nobel lauretes’ and such…THAT is the basis of almost ALL our most significant beliefs…e.g that we live in a democracy, have ‘rights’, have ‘constitutional rights’, that ‘gods’ exist, and ‘priests’ can intercede on our behalf…all just fucking books folks…and other people who read the fucking books to us, as if ‘gospel’, literally…with ZERO basis…and the fuckers who WROTE those books were not motivated by the idea of serving YOUR interests, but their own cults…CULTS folks… so we ‘believe’ what we ‘see’…seeing is believing…so we trust our television images…even if they contradict all other sources of real hard evidence…because ‘seeing is believing’…seeing on T.V is believing…few of us ever see anything in reality…so we are trained to ‘see’ television as ‘reality’…it is all about ‘believing authority figures’ and anyone ‘set up’ as an ‘expert’ and ‘reliable witness’ and ‘specialist’ and ‘trustworthy’…and you project ‘trustworthiness’ with particular tones of voice, body language etc that you can train any good looking / publicly admirable figure to use…to
convey ‘trust me’…travelling the world I saw hundreds of ‘different’ people on
T.V, but they all seemed to be the same person…the same first ‘presenter’ of the
first ‘hard news’ shows I saw…because they WERE all trained to be that
person…that actor…it made it impossible for me to watch any of
them…knowing it was all an act…they were all manipulating me with their
mannerisms, tone of voice, looks, gestures, body language…I’d hoped to be
interviewed one day, and mirror all their gestures and manipulating tones, so
carefully choreographed to ‘support’ one line and ‘demonise’ another…why the
fuck does that woman keep leaning into the guest? How’d she react if I
adopted the same exact trained mannerisms, and leaned into her, when ‘asking
questions that are so loaded there is only one answer for the listener to ‘hear’ in
their mind, no matter what the guest responds…etc…would be a great day for
television viewers…might wake a few up…but they would NEVER air it…so it
would have to be live … and then I bet they’d have ‘technical difficulties’ and
cut it short…

All those who patronize me as just repeating other people’s arguments really
should READ what I’ve written…I don’t hide sources like NLP does, and make
up fancy jargon to make me appear more original than I am…but I DO add huge
value you won’t get in any of the individual sources of information I have
used…even if you read them all, which you certainly won’t have time or
discipline to do…most rave on, waste your time…they have to sell a few ideas
and package them in lots of words…so they can charge a lot…I write this now
after having to hear people totally overlook the value of my work, as just
‘drawing attention to the works of some other writer’ or ‘rehashing other
people’s conspiracy theories’…people won’t read my work…they won’t eat the
food I prepared, so they can continue claiming I can’t cook…for their own
malicious reasons…they won’t ‘test’ my ideas, because they might have to
admit they are good…and often even original, as far as that is possible…they
might have to give me credit…admit I’ve achieved something…that might
make me feel happy, accepted, approved of, a real person, … imagine giving
people credit for their deserved actions, sacrifice, risk, effort!!! Imagine a
meritocratic world! Oh no…someone who deserved praise might get it…and I
might feel ‘lesser’ a person, cos I sat on my arse and took the easy way and
didn’t really achieve anything, …so lets deny the adventurers not only the truth
about their sacrifices, risk, effort, but also deny them even the slightest
benefits…bitter much? Fuckers !!

So thereapeutically, NLP not supposed to be used to confuse our reality
strategies, but to employ them, thereapeutically…

I guess a philosopher’s work is all about breaking down current reality
strategies, and re-building them from the ground up…Hume did this…fucker
master mind Hume…should be the first person any psychologist or historian or philosopher, or sociologist mentions in any work…

People often report feeling ‘dizzy’ or ‘hearing a swishing sound’ when doing these NLP exercises…because the ‘fear of going mad’ i.e. of not being able to distinguish between some supposed ‘reality’ and fantasy, is great…like the fear of being hunted down by your own nightmares each night, before going to sleep…imagine the nightmare continuing, in the supposed ‘waking’ state after ‘waking’ ??? that is madness…and this ‘triggers’ this fear…of madness…

But what if they locked you up in a cell all day, with nothing to do…THAT is horrific…torture…but what if you could escape into your own fantasy world they couldn’t touch? You wonder why so many ‘prisoners’ end up ‘going mad’? What is the madness? Putting people in solitary for speaking the truth? Or rejecting this horrific ‘reality’ and simply making up your own one? Is death something to fear, or is it waking yourself up from a chronic nightmare called ‘life’?

Madness? Preventing a life prisoner from killing themselves so they can be forced to endure ‘correction’? correcting what? How? For when? So they can die ‘corrected’? how does prison ‘correct’ anything? What? Other than your willingness to ‘pretend’ that the ‘official lies’ are reality…that social reality is real…but worse…GOOD…in fact ‘the best of all possible worlds’…so that you won’t EVER escape this fucked up world some fuckers have constructed for us, or our human nature and TROONATNOOR has sucked us into experiencing, purely randomly…and some nice guy comes along and sacrifices everything to offer you a way out of the cycles, but you prefer to gamble it all, misery, horror, over and over, for a chance at being a slave master, a king, a prince, a billionaire…

I will soon stop writing, and focus on music…true I’ve avoided it out of fear as much as anything..time to face my fears…learn all the manual skills I need, the theory…just for beauty’s sake…truth is not welcome on this plane, let along justice…only the possibility of beauty remains… I will take the risk of leaving all my books and videos ‘online’ and ‘accessible’…though I should pull them all down, and remove anything that could ‘offend’ the authorities and destroy any chance ‘success’ in this world…but I won’t…I will just focus on trying to produce beauty, as I HAVE produced the chance at justice, and truth, with my past 50 years suffering…time is running out…so I will face my fears / struggle through them, go through the tasks of learning to play well, and write and complete my music…and though my books will make it impossible for me to ‘succeed’ in the ‘business’ of music, I may still be able to produce some beauty, even if it will only ever be an end in itself, and never be able to compensate me for my efforts, risk, sacrifices, and suffering, in any ‘external’ way…
My TROONATNOOR books have ALL been about offering compelling reality strategies that don’t allow external manipulators to ‘trick’ you into believing anything just because they want you to, because they think it will (and how it does) benefit them…people get wealth and power and privilege more from what they can make you believe, than from any actual objective qualities their possess…the most power accrues to cult leaders…who lead via manipulation…by social reality…but propaganda, by lies, deceptions, tricks, misdirections, censorship, …

Hume revealed the total lack of inductive / rational / objective foundations for our most fundamental beliefs in cause and effect, and free will, and ‘objects’, and of course ‘gods’ … I’ve built upon his work … standing on the shoulders of dwarves and giants alike…you learn a lot from dwarves…even from your ‘enemies’…from the fools and fuckers…I have forced myself to read cover to cover to cover total rubbish, and often it has yielded insights … few people will endure such … they prefer to read / will only read, people who seem to agree with themselves…so they can quote this ‘famous author’ rather than utter the same nonsense without any ‘referred authority’ as their own ideas…especially if they are ‘dangerous’ ideas…this is why the fakes like Assange. Alex Jones, Chomsky, Snowden, Molyneaux, Sibel Edmonds et al are all ‘built up’ as icons…I wonder where Assange has really been ‘holding out’…what underground passages lead out to beautifully landscaped parks full of all manner of amusements and pleasures has he been enjoying while ‘holed up’ in the embassy, with all that ‘dramaturgy’ of ‘honey pots’ and ‘enemy of the authorities’…all that ‘world wrestling federation showmanship / props / drama…scripted…choreographed…HAH!!! …got to make them seem ‘authoritative’ as ‘genuine’ and ‘authentic’ enemies of some new world order globalist conspiracy … a vague one of course…so anyone can ‘fill in the blanks’ with their favorite silly idea…and so no-one names the enemy … the real enemy…

Our Zen Humean Skepticism is ironically the only ‘firm’ foundation to build from…from which to ‘entertain ideas’… with zero ‘knowledge’ or ‘truth’ or ‘beliefs’ to be found in this terrain…just ‘useful apparent patterns’ … just ‘heuristics’ and ‘rules of thumb’ that we can easily abandon when we find better ones…with zero emotional investment (though we are allowed our ‘pet’ illusions, we are human after all, we just never have any right, or compulsion, or feel any need to, impose them on others…to insist they are any more real than others…we limit ourselves to the lowest levels of abstraction when making decisions and planning…pleasure, pain, relief…of all participant sentient beings…no ‘greater good’ / or ‘ends justifying means’…we look at the means, and reject the ones that are NOT fair, just, etc for all participants…we don’t confabulate imaginary entities that cannot feel pain, pleasure, or relief…and call them ‘the greater good’, or ‘the good of the many’, or ‘the will of some god/s’,
or ‘ends’ (that make the most horrific, cruel, monstrous ‘means’ somehow ‘justified’…

By believing nothing, you fall for nothing… the idea that unless you believe something, you will fall for anything, is clever spin, manipulation, word play, trickery…what you need to ‘believe’ is that NO ends justifies certain means, that the means must be consistent with the ends…peace produces peace…war produces slavery and future war / chronic conflict…justice produces justice…truth produces truth…censorship doesn’t produce truth, how could it? By banning truth / facts the ‘authorities’ find inconvenient? THAT will bring about a utopia?

The basic emotional basis is that YOU DO NOT NEED TO BELIEVE ANYTHING AT ALL…in fact skepticism is the healthiest and most enjoyable, creative, innovative, generative, productive mindset to establish…

Only where concrete, reproducible phenomena are involved can we ‘insist’ on anything…e.g that ‘stabbing people in the eyes with pencils produces pain and suffering and damage and thus is ‘bad’…now that is ‘bad’…

Insisting that ‘homosexuality’ is ‘bad’ is nonsense. Especially if your ‘reason’ is that some ‘invisible’ invented ‘god’ told some other guy we are TOLD existed, said so…if THAT is you idea of ‘compelling argument’ then we are all fucked…

In fact many will torture a person, by sticking pencils in their eyes, to force them to ‘admit’ that ‘god’ exists, and that the ‘books’ are ‘truth’…THAT is how fucked up we are as a species. Deny this, and we are all royally FUCKED!!!

A person’s mental health isn’t a question of what they ‘believe’…but on WHY they believe something…and the most mentally healthy people believe NOTHING at all… but base their actions and decisions and plans on the best available ideas / based on sensory impressions gained first hand, and repeated, reliably…e.g war does NOT lead to peace…censorship does NOT make people wiser or government more just / productive / peaceful / representative…heuristics… doing X because it produces benefit Y, and has done so many times all over the place, is logical. Doing X because some guy in a strange outfit claims some ‘god’ supposedly told some old guy this book here writes about (a book written by whom? Supposedly ‘inspired’ by god? And the reason we believe in this ‘god’ fellow is because of the book, written by the same person? Circular argument devoid of anything but assertions, much?...but THIS is the highest form of ‘truth’ for most humans…aren’t we fucking much!!
Today ‘god’ and ‘priests’ have publicly been replaced by ‘t.v presenters’ and ‘leaders’ and ‘propaganda’...though the same priests are still behind all the scam...you’ll see soon enough...or won’t...if they chose never to be ‘seen’...but hey, they got you to publically stone your own children to death for saying some ‘verboten’ word...and to put your own sons and daughters and grandmothers in prison for saying some other ‘verboten’ words...they’ll get you to firebomb entire cities of refugee families and feel ‘justified’ and ‘good’ about it, and even ‘shame’ those who refused to participate as ‘bad people’...even put them in prison for NOT collaborating in the war crimes...oops...’just war’...and ‘pre-emptive genocide’...

The first and most powerful step that every Cult dreads, is that their members and thrall hosts suddenly ask ‘what do I REALLY know?’...do I REALLY know this? Based on what? How valid are my assumptions? What assumptions have I made / been tricked into making? Are there alternative ways of interpreting all this? Are there alternative assumptions to make, that might produce much more desireable outcomes? have I been lied to? Why? What benefit could the ‘authorities’ gain from lying? Maybe I DON’T know X at all? Maybe I just BELIEVE it? Why do I believe it? Fuck, just realised it was NOT based on any personal experience at all...any sensory impression...just been told this shit...read this shit...fuck, look how often they’ve lied to us...why expect them to suddenly start telling the truth...now wouldn’t THAT be mental illness? To expect a consistent lying government / mass media to suddenly want me to be correctly informed about something? Isn’t skepticism the basis of scientific method, rather than a mental illness a.k.a ‘paranoid fear of being tricked / lied to’?

Religions motivates people to do good? Have you read your Bible? Genocide? Rape? Theft? Good? You don’t think the best people of all times would have done good if there was not ‘religion’? really? So ‘good’ people wouldn’t do good unless Marx / Engels / Lenin / Moses / God / Mohammed / Jesus told them to? Spread their supposedly ‘noble’ lies? And all of these ‘things’, which have been used to ‘justify’ genocide, over and over...continual war ... slavery...torture...really produced more ‘good’ than bad? So the ‘noble’ lie is justified? Really? Are you fucking MAD ! TOTALLY FUCKING IGNORANT? And I am trying to inspire and inform YOU? And some might still dare criticize ME for not continuing to try to revive total fffucking zombies like YOU? I mean more actively...sacrificing every moment, risking everything, massive suffering...just for the slight chance of a miracle that such brain dead fuckers like YOU might be re-animated ??

Well my books are there for anyone who is able to benefit. Unless someone gives me millions to market them etc...I will have to leave it at that...
I’ve done more than anyone could ever expect...no-one can demand anything...and to expect more would be utter hypocrisy, given I have had ZERO support from ANY ONE...

NLP won’t use existing concepts/terms like ‘priorities’, has to sound impressive, like a cult, like something ‘new’, and call them ‘hierarchies of values’...all marketing and lame...

Ask self / client: what would it take to get you to start/stop doing X?

Idea is to ‘know yourself’ and your priorities better, to avoid spur of the moment decisions which you will regret, as you inadvertently violated your own priorities...though surely some spontaneity at such a minor cost is also a value i.e warning of Bacchus to the greek cities...a.k.a my own ‘moderation in all things includes moderation in all things i.e we require to enjoy ‘extremes’ now and then i.e ‘go for it’, and ‘have fun’, and ‘loosen up’ e.g European ‘Carnival’ ...’what happens at Carnaval stays at Carnaval’ i.e socially accepted ‘exceptions’...though restricting this rigidly produces as many problems as it solves i.e over-abuse of alcohol and sex, as ‘this is your last chance till next year’...real discipline isn’t self-control, but being able to lose control at will, with the confidence of regaining it i.e ability to binge at will, without becoming addicted...addiction is really unwillingness to ‘withdraw’ and pay the ‘costs’ of the indulgence, putting it off until the price is quite high, though rarely anything like the cost of maintaining the addiction...really silly that people scared of detox so badly, given what they should be scared of...i.e costs of addiction vs few days of misery/suffering...really just living fantasy of denial of costs...weak...a ‘disciplined’ person could spend a week taking drugs, or a Saturday, suffer the inevitable hangover with stoicism, as a ‘late arriving bill’, then get back to ‘sober’ existence, with the ‘parachute’ of knowing that ‘any time I want, I can get high again’ i.e ‘this is not all there is, day in day out...I can work hard, then when it’s too much again, ‘take a breather’...all rich people have done this...only poor people pushed to endure a life without fun...

To motivate you overcoming objections, find a higher priority that justifies enduring the ‘hardship’ i.e something you value more than the dubious ‘pleasures’ of fast, thoughtless, over-eating, and focus on getting all your satisfaction in life from food...such as looking your best, feeling your best, not spending hours on the can, not feeling constipated, etc, and the straight up high costs of food...though food still cheapest ‘amusement’ for most people, sadly...living in human warehouses in sterile, depressing concrete swamps...most people would just be slim and ugly and unhappy though? Being healthy and fit but still a slave with no options for fun/satisfaction isn’t really any more than keeping the human capital in top shape for the masters, like a prize fighter who didn’t get to keep any of their winnings...a mercenary who
barely earned enough to live, no matter how many risks and hardships they took … have to be an idiot to accept ‘praise’ and ‘good citizen / slave’ status as ‘reward’…

Not question of ‘discipline’ really, but of ‘what do I get out of this discipline?’ i.e benefits and costs… most people, given the incentive (a real contract that you can enforce with nukes … not just a human contract that means nothing in reality…) i.e if you discipline your eating and reach your ‘most attractive’ weight / figure / muscle to fat proportion etc, you will be made a superstar multimillionaire and your parents will say ‘I’m proud of you, your friends / enemies will envy you, you will get all the shit you’ve always dreamed of… but what is ‘on the table’ in reality? Oh, make this huge effort, and you’ll be able to wear your old clothes again, you’ll be healthier, feel a bit better, look a bit better, maybe find a partner as ugly and stupid and irritating, and slender, as yourself, to find ways of avoiding thinking about food with…wow…what a deal…motivated much?

So of course first thing is to update your expectations, find some real motivating reasons…and if there are none, then accept this, deal with it, and stop punishing yourself for being fat…take responsibility… I eat too much…that’s my choice now…it’ll kill me, but time kills us all anyway…I’ll suffer X and Y, but shit, life sucks right…eat your fill, fill out, die a bit earlier, maybe suffer some bad shit you wouldn’t have, so you die of Diabetes (shit, sounds like the ideal euthanasia, as long as you ensure no-one wakes you from your coma, as that shit is bad, ask ‘A beautiful mind’ real-life math dude who was ‘tortured’ to ‘self-discipline’ his hallucinations / fantasy world with insulting shock therapy…

Then again, deep sleep therapy is basically losing weight by ‘sleeping it off’ … as you use most of your calories just existing… the sort of exercise most people would willingly engage in increases calorie use little…over and above the ‘baseline’… so slip into a coma, stay there a few months, as the fat burns off…endure the ‘awakening’… and inherit a slimmer you … you think I’m making this shit up?

The most powerful motivator, apparently, is ‘comfort’ and ‘the comfort of the known’ i.e ‘familiarity’… whether it be ‘religious affiliations’, political affiliations, superstitions, habits, food, drink, brands (branding infants / kids is key to their later brand loyalty, and politics, religion etc are really nothing more than ‘brands’ of the same shit…different labels and ‘marketing strategies’ / appeals ‘…

For many people apparent cost / economy / saving money high priority, so will buy cheaper product that is less satisfying, but considered a better ‘cost-benefit’ payoff than a genuinely ‘premium’ but more expensive product… often jacking up prices artificially, then offering what are really ‘artificial’ sales savings /
discounts’ can motivate people to buy a product due to the feeling of having ‘gotten a great bargain / deal’ … as this being a ‘priority’ i.e. identify self as ‘canny shopper’ / ‘bargain hunter’…the satisfaction as much from the ‘bargain’ and ‘savings’ than the product…feeling of having ‘gotten the better of ‘ the big corporations’ etc…not being a ‘fool’ and ‘paying full price’ any time etc…so can trick people with this priority by artificially jacking up price of standard item, then reducing it to something more reasonable, and marketing as a ‘50% off limited time offer’…the customer gets the satisfaction of ‘saving 50%’ and you sell your product at what you would normally have sold it for…only you now sell MORE of it than you would have …

Fear of others opinions can lead to over spending … ‘don’t want to look cheap’ … so spend more than want to…and of course purveyors like to take advantage of this…a door man insisted I’d look silly in front of my mates by not entering a nightclub with an entrance fee…just as I was about to ‘give in’, and his ‘manipulation’ cost him one entrance fee…no-one likes to feel manipulated…so do it subtly…don’t let people realise…make blatant…though most people fear ‘embarrassment’ more than anything, so go to war and burn children and their mothers and grandmothers alive just to avoid the ‘embarrassment’ of refusing to…’what will your friends think?’ … Oh, maybe that I am not some psychopath, or genocidal robot with no ethics or values, who cares more about ‘what people might think of me’, than the real suffering I’m being ordered to commit? Maybe? Ah, but think about your career after the war, it will go on your record you know, and you’ll spend years in jail you know, and hey, MAYBE this time you’ll just be dropping pamphlets over refugee filled cities, and not fire bombs, following by machine gun raids of the emergency relief workers who come to help their suffering neighbors !!! To think that the worst crimes in history were carried out by people with such little threats…from Soviet Cult gulag systems to Dresden, to what is coming…who’d risk losing their job to ‘speak up’ even? Very few apparently…few enough to ‘deal with’ via the gulags themselves…and a few bullets…funny, the Soviet murdered ten times more people than the Germans are accused of by propaganda, and THEY never once used any ‘gas chambers’…THEY didn’t need to resort to such complicated, risky (for the murderers) devices !!!

The idea of ‘rewarding yourself’ is big with marketers ‘You DESERVE it’…to motivate people to spend big on worthless things…like champagne…poison with bubbles…but hey, even I have bought friends a bottle of Glennfiddich…it is the smoothest ‘oblivion’ I know of …I see zero value in any cheap scotch…would just as well drink rubbing alcohol…but some things are nice …

My biggest error is to assume there are more than just a few people who really take ‘personal integrity’ and ‘the interests of others’ at all seriously…in action…in practice…over and over again the people supposedly paid to seek
justice have proven zero interest in this...they are just self-serving in their actions/offices...so who am I to appeal to with my calls for principled action, universal justice, universal truth etc...? a few dead philosophers? Silly me. This world is the one people wanted. Created. They just complain when they become a victim of the system they reproduced, if not actually created... all the 'conspiracies' would disintegrate if people acted on principles, like my 'Optimal Ethics Generator'... but you could offer a real technical device and set up a planet with it... and how many people would volunteer to carry out all their decisions under it's 'veil of ignorance'? And how to 'reject' those who wouldn't? And then if we found a million people to get that planet up and working, how would be stop all the people 'begging to be let in' who would then however refuse to participate according to our principles? Oh they'd cry and whine and plead and beg and pull at our heartstrings, to get in, then they'd want to take advantage of what we had, but they'd corrupt it immediately... all with great excuses and justifications... and our enemies would pull off the most vicious and malicious and malevolent propaganda campaigns against us, ascribing all manner of crimes to us, all manner of threats we were to others, and fake all manner of 'faked internal incidents', telling their citizens we were sacrificing our children live to some cult god, planning to unleash a virus to kill off all the other planets, planning to genocidally wipe out all the other planets, to justify a 'pre-emptive' invasion of our planet... probably starting with trade embargos, export embargos... which we would work around... and when they failed, they'd just do the old propaganda shit and make everyone think that it was not only noble to kill us all, but necessary, as sheer self-preservation/survival... they'd all have grown up being conditioned to see us as the ultimate evil in the universes... so we'd have to have the best defensive weapons capable of true 'deterrence', and ultimately, ironically, we'd probably have to wipe out at least all the propagandists... and if we failed to totally sweep the table clean of the lying fuckers spreading the propaganda, we'd have merely offered said propagandists 'concrete proof' of 'what they'd been warning all along'... our pre-emptive defensive strategy would be spun as a war crime / aggressive act, and used to justify that final war... and the best we could do would be to 'hit the button' and launch all our weapons, so that at least they'd pay, and there might be a tiny chance of us surviving... but hey, what a great future to look forward to when founding my 'vegan nation'... hey! If you doubt any of this, take a look at recent history from 1940 onwards...

Marketing people/propagandists, always seek to 'spin' their 'appeals' to different priorities, away from the ones that work against their 'pitch', and towards favorable priorities e.g 'impress others', 'gain acceptance, approval, love', 'avoid prison', 'fight evil', 'do gods work', 'great pay and rewards'... whatever it is that 'floats your boat'... targeting to each 'niche' individually... by finding what motivates MOST, and what priorities can be 'triggered', and which need they need to AVOID triggering...
Propaganda requires censorship of the truth to be most effective…but really it works on playing on people’s priorities…people will ‘overlook’ facts that are obvious, and ‘deny’ reality, if they think they’ll ‘get their ends’…win what they want from life, what they’ve been ‘sold’ will bring ‘happiness’ and even ‘eternal happiness’…

One priority can often be used as a ‘lever’ e.g fear of shame / avoid shame is a biggy…keep your job is a biggy…avoid prison, again a biggy…

Key to all this manipulation is discovering how all the priorities are encoded / represented internally in the viewer’s / consumer’s minds … what does ‘shame’ look like, sound like, taste like, feel like? The bitter taste of regret / failure / shame? The broken appearance of shame? The unbearable weight of shame? The despair and unbearable ‘stain’ of shame? Etc…so can produce imagery, scripts, etc that will ‘trigger’ the target motives / priorities … how does audience represent ‘fear’ or ‘evil’ or ‘enemy’? A brute ape with a bayonet thrust into a child? An evil automaton throwing live babies into fires / updated to furnaces?

How do you ‘convey’ the idea of ‘threat’? A color graded scheme of ‘terrorists planning actions’ to ‘Extreme threat of immediate attack’ maybe?

What sort of ‘representations’ would be necessary to turn a totally unnecessary war for the ‘bad guys’, into a ‘just war’ and ‘justifiable war’, even a ‘patriotic war’ or ‘good war’? Literally? How would you ‘sell’ what you just put your entire nation through, for 5 years, all the suffering, costs, debts, sacrifices, when the result was that ‘the bad guys’ did exactly what you’d told your people you were fighting to prevent some other ‘bad guys’ from doing? Maybe claim they’d murdered 6 million people, in gas chambers, and worse? That they’d intended continuing with that genocide, and invading the entire world? Would anything LESS than that ‘justify’ what you’d just tricked your nation into doing? Wake up people. Propaganda isn’t just something used before wars to ‘justify’ them as ‘necessary’ and/or ‘good’…or during the war, to motivate people to do stupid, dangerous, destructive, evil things…it continues AFTER the war, to JUSTIFY all that stupid, destructive, evil behavior, and make war something acceptable to the masses, so they’ll readily submit when the next one arrives in its scheduled slot…

Interesting to see where ‘serving others’ and ‘serving myself through serving others’ ranks on most people’s priorities… this is most complicated detail of any ‘utopian plan’…our systems have mostly been built on ‘serving the self’ rather than ‘others’…how few of us are even vegetarian, let alone vegan, let alone
seeking justice even for all of our own kind…we even invented ‘races’ to reduce the membership of ‘our kind’...and problem of being a fool and achieving nothing by ‘giving’ and ‘sharing’, when THEY just take, and think you an idiot, or that you must have soo much that it was zero sacrifice to you...so you get no credit, let alone any reciprocity...for THEY have so MANY unmet needs to share anything THEY have...THEY know people with even more than themselves...and THAT is NOT fair...they NEED to have more and more...so they’ll take, and KEEP...and think you an idiot...criminalise you if you dare hold mirror up to them...and if you think OTHERS will support you...think again...THEY just want MORE too... THEY don’t want ‘equality’ or ‘justice’...

THEY set up ‘gurus’ and ‘leaders’ who have the same values i.e of serving the SELF...of inequality...of ‘greed is good’ and ‘god given’ / natural...and ‘for the greater good’ even...

You might ‘pace and lead’ from some ‘nominal’ priority of ‘justice’, and get as far as a few ‘nominal’ agreements...but once people realise you have ‘tricked’ them into criticizing themselves, and promoting something THEY won’t particularly benefit from right now as individuals, they ‘scare’ and ‘run’...you cannot ‘pace and lead’...and you can ‘mirror’ to gain rapport, but how long will you maintain that rapport once you try to lead them anywhere ethical?

Leveraging self interest to promote care of others has limits too...think of the corruption in the old ‘workhouses’ and ‘charities’...then don’t imagine it any different today...trying to explain the self-interest in serving others falls on deaf ears...explain the self interest in cruelty to any billions of creatures, and you’ll see the light come back on again...what? You mean I can benefit from X? Well of course Billions will suffer, but I can benefit? And justify it ? with Y? Oh yes, the greater good, the good of the many, god wills it, its nature, that’s evolution...yeh, can’t make omelettes no broken eggs etc, sure, in the longer run...oh yeh, they’ll live better as slaves anyway, and come closer to god right...etc...always incredibly easy to lower the ‘moral tone’ rather than lift it...they’ll lift YOU, onto a cross, onto a pyre, onto the gallows...

But NLP offers some remedial actions...you identify own / clients abilities to ‘overcome objections’ i.e exceptions to the rule where they ‘do X’, the target action / behavior DESPITE Y,Z etc i.e despite discomfort, risk, effort, sacrifice e.g they will do something similar to X ‘for the kids’...find out what motivates this behavior / exception...’oh, the smiles on their faces’, or ‘the guilt’ or remembering how I felt as a kid and promised myself I’d never make MY kids feel that way’ etc...then identify every sub-modality of every representation system employed / triggered by that situation / ‘success’ at ‘doing X’ DESPITE objections of effort, sacrifice, risk, loss of satisfaction, lack of immediate personal gratification ... so take ‘eating more appropriate amounts and types of
food’ and ‘being more realistic about tobacco / alcohol / any other drug’… then superimpose all the submodalities / representation system elements vividly onto… introject them into the target behavior…associate them intensely and intimately with the target behavior…so that now you literally have the same powerful experience of motivation for the target behavior, you usually only have for the ‘exceptions’ to your ‘selfish immediate self gratification of desires’ rule e.g ‘for the kids’, or ‘to show P’, or whatever it is that makes that exception work for them / you … now make it work for the target action / behavior … so you transfer the success from the current exception to the rule, to the target behavior, adding it to your new list of exceptions … e.g I can overcome my urges in situation A… and now I’ve added situation B to A… I can discipline myself to in a new situation…I wouldn’t get drunk in front of the kids before…now I won’t do it alone… I wouldn’t kill and eat my own child, no matter how hungry I was…now I won’t kill any sentient creature’s child … etc…

E.g what is something important enough to me that I will always find time for it, and do it, even though I don’t really want to / it means a loss of personal satisfaction / pleasure / relief, or it is hard / scary / sweaty / irritating / frustrating/ makes me angry / is painful / requires self-control / requires sacrifice etc? Something I have done / do, even though it hurts e.g stretching of my shoulder / arm that went painful and lost freedom of movement because otherwise it would remain that way … pshycial therapy … look for examples in own / client’s past … Erickson went back to infancy for examples !…

Look into all representational systems e.g what see, hear, smell, feel when you succeeded in overcoming objection in successful cases e.g overcoming fear, laziness, selfishness, gluttony, intense craving for relief / pleasure … and identify their particular sub-modallity qualities e.g is the sound loud / bright / happy? The colors vivid or hazy? The images still or moving? Large or small? Close or far? What is it about this representation of the situation that allows you to overcome your objections e.g fear , selfishness, greed, anger, frustration?

e.g you don’t ‘blow up’ at your children when you get frustrated, do you? (???)…but you blow your fuse real fast with some idiot at the pub, your boss, some complaining customer, even some inanimate object … when it frustrates you will … right? If you can learn to ‘relate’ and ‘represent’ the situations the same way, using the same representation systems and sub-modality qualities that work with your own kids, then you can learn to respond the same way, without the ‘blow ups’ and ‘blowing your fuse’… Bhagavad Gita teaches us things like this, to see ourselves in all other things…all as one…so we take the kindness and patience we hopefully show ourselves and treat others the same way…etc…My Optimal Ethics Generator with Rawl’s veil of ignorance is an evolution of this …
We have ‘habitual’ ways of dealing with our own children, lovers, friends, pets, … patterned responses … behaviors … automatic… where we are more focused on the needs of others…genuinely empathise and care about others…even make sacrifices for others…seek their happiness… we can extend these habits to a wider field of sentient beings… this is the true alchemy… to start thinking about the impacts of our behaviors on others…including the not yet born…our own not yet born e.g would you sacrifice pleasure / relief of self-reproduction i.e having babies, and raising YOUR OWN offspring as a ‘family’, if that was in the interests of THOSE VERY SAME POTENTIAL BABIES? This is the biggest demand ethics imposes on people…all other measures will fail…and will you allow those you love and need and benefit from their existence, to leave you, to leave their current experience engines, when THEY find it appropriate? Would YOU study hard to realise your potential, if there was NO way you would EVER be able to consume more than 10 times the ‘most common’ income? How much ‘reward’ above and beyond what the most ‘common’ worker receives for THEIR effort, sacrifice, risk, sweat, toil, frustration, application (not just turning up to the combine and clocking on, but actually working, applying your self, trying to solve problems, trying to innovate, trying to produce value) … and would you be able to stifle your envy of the people who ARE consuming 10 times more than you? Even twice as much as you? Even 50% more than you? Even who have an ‘easy’ job as far as you can tell? Are you capable of respecting principles once put in place, under a ‘veil of ignorance’, after you realise who you REALLY are and what position you REALLY occupy in the system you agreed to?

Can humans overcome their petty envies, jealousies, give up the RIGHT to reproduce themselves, give up the RIGHT to Cult dogma that is clearly damaging to individuals and society? Give up the RIGHT to seek fabulous wealth and power?

TROONATNOOR has been about balance between individual selfish needs / desires / pleasure / relief and that of ‘others’…and always including every sentient being in the cost benefit analysis on a relatively equal (appropriately) level…treating the other as self…not perfectly…as we live for OUR pleasure…motivated by our own relief…but empathising with others means we SHARE THEIR pleasure and relief also, and would NEVER enjoy a benefit that came at an unacceptable cost to other sentient beings… not to say we’d make ourselves ugly so others need not feel pangs of envy, or poor so they’d never envy our prosperity… but we’d never knowingly inflict costs on others simply to gain a personal benefit / relief.. we wouldn’t eat our children because we were hungry … but we eat other beings’ children habitually, even when we are massively over-fed…we wouldn’t want to be tricked into murdering each others, so some evil fucker could become a billionaire…wouldn’t WANT to right? But we ARE, over and over…right now…doing that… always have done…why?
If we define our own ‘right’ to ‘noble’ lies i.e. noble in that we believe they benefit us, or will benefit us, in some way…then what hypocrisy to demand others be honest with us?

Propaganda is simply lies…legal … manipulation…

The Optimal Ethics Generator employing Rawl’s ‘veil of ignorance’ would remove our ability to identify who we are, in any transaction…so we’d be motivated to ensure it is ‘beneficial’ and ‘fair’ to ALL the participants…even the animals. The most powerless members of our communities…it would motivate us to be very careful about ‘externalities’ and ‘costs’…cautious about not inflicting them on anyone…as any one could be us…we can never know…we wouldn’t treat others as ourselves under any other conditions…no point saying ‘do unto others’…unless people believe ‘for as you do unto others, so shall be done unto you’…which is what my OEG / Veil of ignorance forces us to believe…to assume…really…not just pretend…

But until we have the tech, we’d be engaging in discussion that would reveal the hypocrisy of most people…

I would only bother working with people who were willing to submit to the rules of compelling argument, and behave ‘as if’ they believed the OEG were true…they’d have to be devoid of hypocrisy…serious about justice… and what it takes…and willing to consume less than many would have access to right now, or in the wider world… but willing to tolerate ‘tall poppies’ and to allow those willing to work harder and longer etc and sacrifice and risk more to consume more than themselves…it is all about moderation and honesty…so I guess this ‘plane’ we call ‘earth’ is not a likely location for a world I’d consider voluntarily new-incarnating in…nor therefore reproducing (by having children, or participating as a hypocrite actively…even passively NOT saying the obvious, for fear of prison and worse, is not possible for real philosophers / higher tone – vibration – resonance beings…it is giving tacit consent, and failing to warn / inform others who might benefit from such information / honesty…claiming you are ‘protecting your family’ is a cop-out…you are NOT doing ANYONE any favors…just prolonging the problem…making it chronic…you may get off easy this life, but for your next lives? You think hypocrites inherit the kingdom of heaven, however you want to picture / imagine that? You think you can evolve to higher levels of awareness / experience / being and existence, by just ‘not ACTIVELY participating in horrors, cruelties, killings, torture, slavery’?

You think when the fighting starts you will be able to ‘remain passive’? and won’t get harmed? Your own family won’t die? Be raped? Enslaved? Tortured? Suffer? You think the harm you are facilitating with your submission, acquiescence, taxes, contributions, passive by-standing, won’t recoil upon you and your family? Or you are just too gutless and lazy and irresponsible and
unconscientious to care? You’ll just pretend you are a ‘good parent’ and enjoy whatever ease, benefits, relief, pleasure you can get your hands on, and keep for yourself, and when the shit hits the fan, blame everyone else? Blame others? For what YOU made possible? Oh, but why sacrifice yourself? If you have no power to change anything? Good, keep telling yourself this…that you are a VICTIM…tell that to the thousands of animals suffering on YOUR behalf right now, and who will…like you cannot possibly chose a vegan lifestyle THIS MOMENT…like you cannot possibly simply stand up in a meeting and ask people to discuss ‘freedom of speech’ openly, and insist that your constitutional rights be re-instated…like there are not MILLIONS of people who would support you, if YOU just stood up and ‘rocked the boat’ just a little…no heroics required…just start a conversation…make some effort to learn some facts, some arguments, … make a tiny fraction of the effort you make in other areas of your life…such as ‘earning more money’, ‘looking better’, ‘promoting my kids interests’, ‘getting laid’, ‘getting promoted’…’impressing people’…even a fraction of the effort you spend keeping your home pretty…or your car running well…or on any hobby or dream you have …

Compare things do YOU do, with things you don’t do…in terms of how you represent the actual situation / outcome in your mind…with all the impression’s qualities (sub-modalities) …

So you DO get up and go to work. What motivates that action that you really object to? You wouldn’t do it without these motivations. What are they? What is the ‘image’ and ‘idea’ and ‘feeling’ associated with the motivations?

To start on the track to grokking this, compare one motivation with another. Visualise yourself achieving some desired goal that REALLY motivates you, or that you achieved. You overcome lots of objections. Why? (probably fear of failure? Consequences?)…

Imagine some huge ‘success’ and what it ‘means’ to you in every sense … imagine how it tastes, feels, smells, e.g ‘success’…vividly…in great detail…

Or something that motivates you now…what does? What are the images / feelings / sensations / representations that lead to you feeling motivated to ‘overcome’ objections / take risks / make the effort / make sacrifices?

What is your ‘vision’? What ‘fuels’ your resistance to your OWN fears / laziness / cowardice etc?

The smile on your kids faces? The sick feeling of failing them, and seeing them suffer for your mistakes / cowardice / failure / laziness / lack of will power / lack of discipline / fear / stupidity / incompetence?
So… find out ‘what you do’ ‘internally’ to overcome objections when it comes to your top priorities e.g. ‘family’… what do you visualise / imagine / vividly feel when you think ‘I want to do X, but I won’t, because of THEM’…? Concentrate and discover the details … how do you represent ‘because of THEM’? You see their smiling faces? Imagine them lonely / suffering / defenceless / counting on you and you failing them? What feelings emerge? Where exactly? Stomach? Head? Feet? What sort of feelings? Concentrate on them. Identify them clearly. Do you see something? Where? top left? Bottom right? Big? Small? Bright? Vague? Moving images of them? still photos? Where are the images / photos? Big small focused, out of focus, close, far away?? etc etc i.e elicit all the representations you have associated with ‘I do it for THEM’.. in all their detailed descriptive qualities / sub-modalities… then ‘anchor’ this… with a touch or a voice tone quality …

Now relate the two … the X you do ‘For THEM’ and the Y you so far couldn’t commit yourself to reliably doing… so that now when you think of doing it, you replace the usual ‘…’oh, I don’t want to, give up Y, its hard, so much effort, self discipline, it will be a drage etc… with ‘all the stuff you just ‘anchored’ ‘FOR THEM’… so now you feel about Y as you do about X, and WILL do it ‘FOR THEM’… in the same way…magic or??? What you’ve done is now assign this action / behavior / new habit Y the same ‘compelling motivations’ you had for your highest priority ‘THEM’ ie family, or whatever it is…

Beliefs permit e.g ripping up pregnant women as proof of our moral superiority over all other ‘people’ … and restrain us ‘Oh, I couldn’t rip up any sentient being, why would I? Why’d I ever want to?'

So beliefs limit / restrain behaviors and allow / permit behaviors… and even promote / motivate / suggest / direct / command behaviors… that’s how powerful they are… nothing to be ‘flippant’ about and simply ‘tolerate’… unless you are happy being enslaved / ripped apart and having your ‘little’ ones dashed upon the stones’… etc ???? or ???

Identity is a belief e.g ‘entitled’ and ‘chosen’ and ‘exceptional’ and ‘destined to rule the plane’ !!!

All actions have a positive intention might be ‘valid’ if you make the referent ‘the actors perceived self interests’… so I work at that level of assumption… which does NOT mean I assume anyone has MY best interests at heart i.e their intentions are ‘good’ as intended to be ‘good’ for THEM! Like Plato’s Socrates, got to get people to realise that selfish exploitative opportunistic behavior in gaining benefits at the expense of other sentient beings is NOT in ANY one’s REAL self-interest…
Beliefs trigger unconscious physiological responses via the limbic system, hypothalamus in the mid-brain… primitive ‘brain’…‘animal’ brain…and the ‘lizard brain’ even more primitive… e.g flight or fight reaction…‘I believe there is a tiger behind me’…it sets in a whole bunch of complex electro-chemical signals…so heart-rate, body temperature, pupil dilation, breathing rate all ‘automatically’ ‘ramped up’ as stimulus-response to mere BELIEF that a tiger is behind you…you have not SEEN a tiger…but if you BELIEVE there is one, all this will be happen…beliefs trigger the autonomic / limbic system…supposedly more ‘primitive’ than the cortex and other areas where we ‘reason’ (what passes for that in humans anyway)…very primitive / lizard brain kicks into overdrive…overrides the ‘human’ ‘reason’ and ‘logic’…BELIEF remember…can give you a heart attack…‘pointing the bone’ and ‘voodoo’ all target fear, and these responses…non-rational, IF YOU BELIEVE…e.g ‘in some god’ or other superstition…

So the best test of whether someone ‘believes’ or not, or is just faking it, even to themselves…is to measure their physiological response…like a phobic really believes their trigger is dangerous, and their heart rate explodes, they sweat, a whole set of autonomic responses are triggered that it is supposedly impossible to ‘fake’…really? Isn’t ENTIRE point of NLP that you CAN fake all these things? Simply by vividly imagining something that DOES produce these behavioral qualities in you? So you want to pretend you are terrified of mice? Well fucking think of something you ARE terrified of, vividly, and trigger the physiological responses desired…the whole point of polygraphy is that it can measure and compare responses to questions, but it cannot CAN NOT mind read…and know WHAT you are yourself visualizing/reacting to…simply by exaggerating your responses to trivial questions you are expected to lie about e.g ‘have you ever in your life fantasized about any taboo sexual subject?’…well just think of the most guilty secret you have and would never share, something rally nasty you’ve done and are ashamed of, and then answer ‘no’…so the operator / machine will record a HUGE reaction…now when you DO actually lie about something IMPORTANT…‘did you kill that war criminal genocidal maniac?’…any possible ‘guilty’ feelings that emerge will be less dramatic than the massive responses recorded when you were answering the ‘control’ questions…see my detailed report on polygraph abuse / lies…especially to filter out honest, intelligent, moral, ethical, constitution loving, oath keepers form the most powerful positions in the U.S and Europe etc…

What with Bandler demonizing Saddam Hussein for the war crimes effort, now Dilts promoting polygraphs as reliable…WTF ?? …

So when asked ‘have you EVER stolen ANYTHING in your life’, immediately summon up the most guilty secret you are ashamed of, the worst thing you’ve ever done, so your blood pressure, heart rate, breathing rate, pupil dilation, body
temperature etc will all suddenly go crazy...proving you are lying...which is what ‘control’ questions are there for...to ‘calibrate’ the readings...to provide a ‘benchmark’ to compare later responses to...‘control’ questions are the ones that everyone is EXPECTED to lie to...too bad if you are so perfect you really DID NOT EVER do what they expect you to have done...then you are royally f**ked...because they will use these readings as the benchmark, so every time in future you ‘deny’ having killed the occupation dictator, the operator will ‘see’ the same response...and assume you DID...because you MUST HAVE done the ‘control’ thing...everyone has...right? Great science that...assumptions...and so easy to ‘beat’ the situation, no real liar ever caught, and lots of ‘innocents’ unfairly ‘convicted’...

Beliefs are clearly emotional...rather than rational...related to fear, desire, pleasure, pain, relief...

RATIONAL beliefs vs emotional beliefs? Most people couldn’t give a good reason for most of what they are ‘sure’ is ‘true’...Hume proved it...the most people can do is appeal to ‘authority’ i.e ‘the bible’, the t.v, the papers, the web...almost zero basis in low level of abstraction a.k.a ‘concrete’ justifications...so basically whatever you can get broadcast on tell-lie-vision, published, ‘stamped’ as ‘authoritative’ and ‘public relations worked’ as ‘reliable’ and ‘authoritative’...get the presenter to look and act and speak exactly right...they can claim anything...who are YOU to argue? And go to jail for doing so?

Placebo and Nocebo effects work on our beliefs...and are thus effective...you can relax someone, put them at ease, feeling positive and anticipating feeling better / getting better...with a few words...just as you can do the opposite, and actually kill them, by simply ‘pointing the bone’ or ‘voodoo dolls’ or ‘ex-communication’...

Beliefs easier to install than change, without the use of clever NLP strategies...or similar, from very ‘charismatic’ i.e. authoritative / believable people...who can convince you they have supernatural powers etc...know stuff...

Because beliefs are rarely BASED on any real argument, let alone EVIDENCE...because there are purely assumptions accepted dogmatically ‘on faith’ i.e simply believing because someone told you / its in some book...THAT is the basis of almost ALL our beliefs...very rarely are our beliefs even vaguely tested by any sort of reality check...even NLP top guns believe that a polygraph (a set of devices can ‘tell if you are lieing???? What hope is there then?

And if it is a criminal offence to mock absurd beliefs...as this might ‘offend’ the idiot who believes they have a right to enslave you, kill you, etc ?? What does
this say about the world we live in? YOU have no right ot find THEIR beliefs offensive, but they can find your sane, rational, logical, justifyable response CRIMINAL!

People will spin everything to fit with their original assumptions / beliefs … e.g I am a corpse…do corpses bleed? Well no…so cut them…they bleed…fuck, I was wrong, corpses apparently DO bleed !!! but I think ‘feeling pain’ might have been a better one….though expect the same ‘spin’ … people don’t change their beliefs based on ‘logic’ or ‘reason’ or even ‘facts’…usually…if there is any way to ‘make an exception’ for their belief….to find some way to avoid facing facts…to make up some story to account for things…

Studies confirm obvious fact that if you treat people as if they are capable, they end up learning more, than if you assume they are dumbasses … no matter what their intelligence…

People who believe they are going to die, often do…I suspect they WANT to die…who wouldn’t, given the typical sort of life quality … the doctor just gave them an ‘excuse’ to die … so they took it…

It is not the treatment that determines the outcome, but the belief in it…whatever it is…that really matters, according to actual hard evidence of actual real research…though no publisher would let anyone say this…always that disclaimer…of course, let yourself be toyed with by specialists until you run out of money to pay them…spend your partners retirement security and your kids education fund…while there’s money there’s hope to profit…only after you’re broke will the doctors claim you can’t be saved !!! holy cow!

Ideally NLP, like Hume, and everyone in between, and before, who had our best interests at heart, can help us free ourselves of beliefs…ALL beliefs…we don’t need to BELIEVE ANYTHING at all…we can act on clearly expressed compelling arguments, heuristically, practically…while preventing any abuses i.e superstitions being passed on, forcibly, and subtly…onto children etc…i.e vulnerable people… you can assume all the religious shit you want…as long as you are upfront and never make any claims that you cannot substantiate…basically lie…

I don’t need to assume ‘gravity’ exists, or ‘cause effect’ exists…I simply note that X +Y seems to produce Z, and I like Z, so I combine X and Y, or if I hate Z, I avoid combining those things…I don’t need to assume anything at all…to generalize a pattern…as an APPARENT pattern, and nothing more…so I never fall into the trap of IMPOSING patterns that are NOT there…extrapolating…see my T books for details..
If it is possible to change beliefs, and ‘free’ cult members, their leaders will of
course seek to make any such actions ‘criminal’…to retain their cult members,
and benefits as their masters…

Limiting beliefs…hopelessness…well it’s silly really, as we were born to suffer
and die…with occasional relief and pleasure…so …BUT helpless?…well, we
are all vulnerable, worst of all, to anyone stronger / more powerful, or even a few
weak fuckers ganging up on us…so we are fucked in that regard too…but
worthless? Hmmmm…I guess most of us are just unskilled and semi-skilled slaves
…so…but what’s the point of all this? That’s this plane…

But…unless they are vegan and live according to the optimal ethics generator, no-
one DESERVES more or less happiness than you…ultimately…

What we are about is motivation…to get you gaining the most from your life
possible…whatever it is right now, it is probably less than it COULD be, and
therefore SHOULD be…if you think the ‘sober’ ‘real’ things this world has to
offer, that don’t come at any other sentient beings expense, are WORTH effort,
sacrifice, risk, endurance, self-discipline…?

To me the main scam is that a bunch of fuckers program and condition YOU to
believe YOU are LESS worthy of happiness than THEY are…when we are all
fuckers…some of us are just luckier…and some of us are working to increase the
good fortune of OTHERS…shocking as that could sound to most of you…

We can NOT see into the future…we are motivated by what we IMAGINE
awaits us e.g we do X because we IMAGINE we will get Y…the more vivid the
imagination of Y, the EXPECTATION of achieving Y, and all the sub-modality
qualities we associate with Y, vividly, the more motivated we will be
…Expectations theory…we must want something, believing it will produce the
feelings / emotions / situations / conditions / satisfactions / pleasure / relief we
desire i.e all objects / aims means to ends…the ‘feelings’ we seek to enjoy /
relief from, are the real ends…if we believe X will produce these / lead to us
enjoying these, and that we CAN do X / get X, we will be motivated e.g if we
believe we are capable, through hard work, of getting X, and if we believe X
will make us ‘happy’ (as shorthand for whatever it is we expect X will yield), we
will work hard, sacrifice, take risks… but if the chain breaks down, if we don’t
have believe in our self-efficacy to do what is required, or if we lose faith that
even attaining X is going to make us ‘happy / satisfied’ i.e bring the pleasure /
relief we hoped for, then we will have no motivation to work hard, sacrifice,
take risks…. Slaves don’t do these things…serfs don’t do these things…people
who realise they will never be able to ‘work’ their way to gain what they seek,
don’t do these things…Soviet Cult members don’t do these things…they
didn’t…the system failed miserably, despite having EVERY natural resource
available…and MASSIVE support (yes folks, support) from the Western Banksters and Cult occupied governments …

You can ‘fake’ motivations…pretend you will work as hard for the ‘greater good’ as you would for ‘your self and family’ … but very few have such good natures…and these people are broken / lose faith when they experience the corruption inherent in all human interaction, and most prominent in ‘centralised power authoritarian systems’, ‘old school networks’, ‘secret societies’, ‘unions’, and all the ways people have of seeking narrow self-interest at the expense of the ‘common good’ … and all of which MUST be eradicated… but almost everyone feels entitled to more than others, for some reasons…and often they ARE …i.e workd harder, longer, more intensely, make more effort, sacrifice, take greater risks…go to greater lengths… so have both sides of this coin…people who DO deserve more (within limits) that others NOT being allowed to enjoy the rightful fruits of their labors, physical and mental, and others who have NOT earned this, being given it / taking it, via corruption….so the way to get ‘more’ is no longer to work harder, longer, make more sacrifices, take more risks, but to join ‘cliques’ and ‘parties’ and ‘secret societies’ and ‘unions’ etc…including obvious religious cults , political parties, etc… so who is going to produce the value being corruptly distributed? Even the average dull worker will see that working hard is NOT the road to ‘success’….and those who would otherwise have worked hardest, will feel like fools, and will deliberately ‘work to rule’ i.e do the minimum necessary…and probably turn to drink and other drugs, to ‘soothe’ the frustrations of being a race horse that has to merely walk around, or be taken advantage of…that burns…to know people are using you…

How we ‘represent’ ‘success’ is key to this…

Propaganda / conditioning / mind control/ public relations / mass tell-lie-vision etc and ‘education’ all attempt to trick people into imagining things are very different to what the child will experience, if capable, later on, as irrefutable evidence that the system is totally corrupt…that hard work is for fools…that outcomes are based on ‘who you know and what clique you join’ rather than your own merits…but the system will keep pretending ‘all is good in paradise’…that everyone is working together for the common good…some will be…like the students who built man underground rail stations and networks in Moscow…fools who really were genuinely good willed…if you’d had a community of just these people, maybe like a Kibbutz in Israel, you might have had a thriving system…but remember the system was not MEANT to succeed…it was just a slave prison system, a springboard to world domination for a particular cult I can’t mention or this book will be banned, and I will be imprisoned…
So basically ‘motivation’ is not about ‘reality’, but on ‘illusion’…if you THINK that doing X will yield Y, and that will make you ‘happy / satisfied’, then you will work your arse off, sacrifice everything, take huge risks, put off all your enjoyment of life until ‘later’ i.e future preference, for this ‘glorious’ future you IMAGINE… ideally THEY put this off to some ‘afterlife’…you can’t argue with that…how to DISPROVE that? Onus probandi much? Anyway, THAT is the biggest con…to trick you to work hard, etc…even to fight wars…a form of slavery…etc…so propaganda is the king of this world….whoever controls it, controls YOU…they’ll make you sweat and labor for the satisfaction of others, because you believe you will benefit…

Of course the ultimate is Buddha’s teachings…that life itself is a trick…you will NOT get the relief and pleasure you seek…or if you do, next times around you will pay heavily, as a more ‘typical’ person…but even Ecclesiastes, the rich spoilt heir to King David, who ‘had it all’ finally concluded it as NOT worth it…”all is vanity and vexation of spirit”…very much like Buddha’s conclusion…as brilliantly portrayed by Hermann Hesse in ‘SteppenWolf’.

THEY are doing this for YOUR own good! Really?

Cruel to be kind?

The ‘practical’ meaning of any communication / action is the response it elicits…is a way of saying that what really matters is how OTHERS decode what you say, NOT what YOU intended by an utterance / action / communication… so we need to attend to how we are being ‘interpreted’…and what models our interlocutors are using for decoding our attempts at ‘sharing’ our intended meanings…often deliberate…malicious ‘interpretations’…like prosecutors in court…and all manner of ‘adjectives’ and ‘adverbs’ added to ‘color’ and ‘ascribe’ intentions and motives when all legal people SHOULD be doing is describing, as accurately and neutrally as possible, what can be demonstrated …e.g X did Y…not X secretly and maliciously and viciously and evilly did Y against all the laws of nature / god / reason / fairness…i.e why is such language allowed in courts? If they are there to establish what happened …/ guilt / innocence? what do literary epithets / language have to do with trying to find the truth? How can anyone ascribe ‘intent’ and ‘motive’ to mere actions? Mind reading? Pure projection / speculation…fine for motivating investigations maybe, to ‘suspect’ them, and thus see if any evidence supports the contention…but surely they don’t belong in an attempt to clarify the situation / what did and did not actually happen that can be demonstrated without preference or malice?
Einstein: you cannot solve a problem with the same thinking that created the problem

If a corpse can bleed, maybe it can also go to work, be productive tax payer, fight wars, support the Cult, … even enjoy life?…i.e why fight client if thinks he’s a corpse, just expand the possibilities of ‘corpses’ until it makes no practical difference to anyone if they think they are a corpse !!!!

Of course humans stubborn…no, you must believe what I believe…exactly as I believe it…or I’m not happy…why are YOU so recalcitrantly stubborn in refusing to accept MY reality !!!! Of course the ‘dominant hegemonic social reality’ is what we are talking about…people are so stupidly ignorant…they imagine they ‘know’ based on ‘sound logic’, ‘induction’, ‘irrefutable proof and evidence’…when all they ‘know’ is what they’ve been given to ‘know’ by ‘authorities’ and even ‘controlled opposition’… just fuckers who’ve swallowed all the drivel force fed into their little narrow closed minds from birth…but it ‘feels’ RIGHT to them…so why won’t YOU give up YOUR rebellious DENIAL of the SELF-EVIDENT TRUTH… and join the sheeple? Whats WRONG with YOU? ….

Fear as reasonable caution is positive…when your fears are unfounded, they limit your actions unnecessarily…and if your life is miserable, then you are better off taking the risks ‘leben ist risiko’, than ‘playing it safe’, no matter WHAT the potential risks…evaluating the REAL risks is one thing…e.g allowing freedom of speech and re-establishing constitutional rights is defined as ‘risky’ and ‘aiding the terrorists’ (who are totally your own government but you are told they are ‘foreigners’), and ‘we could have a return to Nazi Germany’…just because we allow people to openly discuss historical matters, and current affairs…there is no REAL risk involved…it is merely vividly INSISTED that it is a risk…and even WHAT ‘Nazi Germany’ means has been totally distorted and demonised…i.e the representations of ‘Nazi Germany’ people have are totally at odds with verifyable evidence / documented facts…the REPRESENTATIONS we have of most things is PURE PROPAGANDA i.e lies constructed with malicious intentions to deceive for a particular purpose of a particular cult with a particular ambition…..so must free ourselves of all propaganda…make it criminal … before we have any change of allowing reality to interact with our impressions / representations of the world…as it was and is and will be, if we continue down this path…

NLP is therapeutic manipulation of our representation systems to liberate us of limiting beliefs and allow us to become sober, resourceful, reasonable, logical again…to remove the ‘phobias’ that have been constructed for us e.g of ‘Nazi Germany’ of ‘Arabs’ of ‘Islam’, of ‘freedom of speech’ of ‘gun ownership’ of …
All assumptions must be stated…discovered and stated…then we must be free to continue an open-ended dialog / investigation / consideration / debate / discussion of these assumptions…we must never allow any ‘dogma’ or ‘articles of faith’ to censor us and limit our freedom to openly discuss and challenge any of these assumptions…if people want to worship rocks, or invisible ‘gods’, then let them…as long as they admit they are ‘assuming’ … as long as they are NEVER allowed to deceive others and claim they ‘know’ something they don’t…we can NOT allow ANY beliefs to go unchallenged…to become ‘protected’ and thus no longer ‘fair game’ for critique…NO secret societies can be allowed…no cliques of power and influence… truth does not NEED secrecy or censorship or ‘protection’…if we ever taught the principles of sound reasoning, of compelling argument, of scientific method (which often become as dogmatic / religious as any system before it) … and if we INSISTED on people admitting what is assumption, superstition, etc, and what can be demonstrated, physically or by compelling argument…to distinguish between the two…and allow no-one to coerce / trick / force / seduce others into being deceived about anything i.e advertising, misleading, misdirection, propaganda. Public relations, public opinion manipulation…we have to start at the beginning…work right back…as I do, as Hume did…what can we ‘demonstrate’? what are the limits of ‘knowledge statements’? what right do we have to lie to children, no matter how ‘noble’ someone convinces us we are being? Etc etc T

Confidence relates to means / self-efficacy in attaining X

Motivation relates to how we represent X and all the qualities we ascribe / associate with it…sure we love cars…but what do we assume owning that particular car will do for us? What pleasure / relief do we expect from it…”freedom”? ‘excitement”? Same goes for ‘success’ and ‘wealth’ and ‘power’ and even ‘marriage’ and ‘kids’ and ‘family’ and ‘promotion’ and ‘career’ and ‘home ownership’ and ‘car ownership’ and …

Confidence motivates us ….ONLY if we represent the outcomes of that effort / risk / sacrifice / gratification delayal in particular ways … so that we EXPECT to satisfy our most motivating drives / desires / needs / impulses…e.g do we want a career to help people, to get laid / married / status / prestige / respect / satisfy our parents / feel good / feel happy / feel joy / feel secure?

So how your represent an objective / outcome … has huge impact…what will attaining X MEAN…in vivid, concrete, explicit terms e.g how will it smell, taste, feel, look, sound …

What do you REALLY want from your life? Will X bring it? Does ‘winning the war’ ever bring much for the rank and file soldiers and civilians who ‘give all for the war effort’? Has it EVER brought enduring peace? WHO were we really fighting for? And WHAT? Oh, it is a criminal offense to tell you, of course…
I’d be stupid enough to go to jail for years and years, and suffer, just to tell you, and you’d just go, oh, Hmmm…well MAYBE if you got thousands of video confessions of all the top leaders AND it was reported in the corporate media AND really famous people we trust said it was true AND everyone else had ALREADY come out and agreed it was true, so there was absolutely NO risk involved in ME ‘agreeing’, well then maybe I’d simply overlook YOU, and your sacrifices, and act as if ‘sure, I knew all along’, you did NOTHING…so its really a no win for me, whatever happens, almost zero chance of making a positive impact, NO chance of receiving credit where credit is due, let along be rewarded…at best I’d end up suffering and sacrificing for a bunch of fuckers who never deserved ANYONE to do ANYTHING for them…and who would just abuse their freedom to continue enslaving other sentient beings…so what’s my motivation? ??? simply to seek the truth, and share what I find…and seek a vegan world…because THAT is the ONLY one that will bring any lasting peace, security, prosperity for ALL sentient beings…and only THAT is worth making ANY effort to realise…

Anyone who ever ‘lead’ knows that people are capable of much more effort, sacrifice, and risk taking than they usually employ / exhibit…slave masters especially know this…it irks them no end to realise that they are not getting the full effort out of their slaves…whips didn’t work…torture didn’t work…so they invented ‘freedom’ i.e the idea that you are free, and if you work harder, make greater sacrifices and take greater risks, you will be rewarded…of course a big scam…like ‘representative democracy’ with ‘pre-selected candidates’ and a huge circus and World Wrestling Federation styled ‘opponents’ on the local, state, national, and international stage…just by participating in the circus you legitimate it…time to leave the big tent…leave the clowns to perform for each other…don’t let them make YOU the clown …

I am a non-representative example, but show how ‘values’ fit into ‘motivation’…sure I could sell stuff, whatever it was…be ‘successful’ at it…but my values prevent me doing so…to abuse any gifts / talents in this way is ‘wrong’ for me…and to ‘benefit’ at even the ‘opportunity cost’ of others is wrong for me…i.e sure people are going to buy a home, from someone…someone who lies and misleads and misdirects and overlooks and manipulates THEIR clients into buying homes from THEM…probably in most cases NOT the ideal home for the buyer…which is what I would look for for them…but they’d fall for the ‘sales techniques’ and buy from others who are just out to make money…so I’d fail…get fired…my sellers wouldn’t grok it… and the buyers would be confused by my ethics…I’d feel empathy for buyer and seller more than worry about my commission…seeking to match the buyers and sellers…honestly…transparently…who’d buy a home with declared ‘defects’ when they can buy one that as far as they ‘know’ / ‘believe’ has NO
defects...none they'll work out until AFTER they're committed to the purchase? Have moved in.

I could 'teach' according to any crap given to me, and pretend it was 'the best I could do' and the 'best' deal for the students...the most efficacious...be popular...they'd never know what they'd missed out on...I'd not be 'rocking the boat' and confusing students and 'challenging' authority...surely if a book's been published and sold lots of copies and heavily marketed it MUST be great? And this badly dressed guy turns up and thinks he knows better? With zero marketing budget! Zero presentation? And HE'S telling us he has a 'better way'? Why should students or schools believe HIM? Surely the most effective teaching strategy is ALWAYS represented by well dressed people with great grooming, and massive marketing budgets with glossy presentations that promise the world? ANYONE 'knows' THAT, don't they?

To me HIGHLY motivated you must want something (believing it will make you 'happy' and 'satisfied' and 'enviable' and 'respected' and 'accepted' and 'approved of' and 'loved' and 'secure' and 'self-realised'), and must be confident you know how to get it (that you have worked out the steps to take, and are capable of taking them)...if you don't believe your aims will lead to what you REALLY want, or don't know how to get it, or don't think you can take the steps necessary i.e do what needs to be done / have the talent / skills / competency - or can gain them...then you won't be motivated...you'll just 'turn up' and 'do the minimum required of you' and take the path of least resistance...hoping you'll die quickly and painlessly in your sleep so you won't have to face another day of this...

Conflicts can also block you...as higher priorities...values...identities...sure you could 'succeed' and grab all the goodies, but in doing so you'd violate your higher level values...be a 'sell out'...a traitor to your own principles...so people are great at DENIAL and NUMBING...to pretend there are 'no victims' of your actions...no negative externalities borne by others...no costs imposed on others...that your 'benefits' cost no-one nothing...some 'positive sum game theory'...that all your 'lies' were 'noble'...and 'for the greater good' and that your 'means justify your ends'...and all that shit that keeps us repeating cycles of selfish greed, violence, cruelty, war, terror, torture, ...

Then there is the 'lack of entitlement' thing Vonnegut wrote of...how 'working class' people are conditioned NOT to feel 'worthy' and 'entitled' to happiness i.e as I grew up under same notion that 'shining brightly / standing tall etc makes others feel lesser / worse / inferior / unfortunate / overshadowed...the idea that 'striving' is bad...something only 'taught' in working class schools...whereas the elites are taught the opposite...so working class people scared of 'success' as it is 'bad' and 'evil' and 'damaging' and 'harmful' to others...not to mention
Freud’s fear of ‘surpassing’ and thus ‘killing’ the father…by being more successful…

People often sabotage self as do NOT feel entitled…imagine ‘something bad just HAS to happen to me if I succeed… the universe will NOT ALLOW me to be happy…I don’t DESERVE to be happy…I am all the things the priests, the ‘holy’ books, the teachers, my enemies, malicious people, envious siblings and ‘friends’ alike and even parents, have been suggesting and openly stating all these years…how DARE I strive and be ambitious and want something BETTER for myself…and even others…surely if it was good enough for my parents, and it is good enough for my peers, it MUST be good enough for me?

Key for ethical people with principles beyond self-service and ‘providing for my family’ is to see if you can overcome ethical objections…find ways of ‘succeeding’ without ‘selling out’ or ‘compromising’ key priorities…but is it possible? Who will really understand what you are trying to do? Unless you have some ‘unique selling point’ that forces people to deal with you, work on your terms, operate according to your higher ethics, you will simply be ‘left to your own devices’…which is a recipe for failure as all ‘success’ is a social product…even the greatest hero, with the best inventions, the highest ethics, the most reliable and trustworthy of people, will simply be crucified, literally, and their ideas stolen, and misused/abused, ‘cherry picked’ opportunistically, so that their moral ambitions are made a mockery of, and they are punished for, rather than rewarded, for their massive effort, sacrifice, and risk…

Ultimately most people suck…and those who don’t aren’t willing to oppose those who do, the majority…and risk becoming the next mobbing victim…so you can do everything perfect, and make nothing but enemies of everyone…your ‘admirers’ will remain ‘private admirers’, and provide ZERO public support or assistance…you’ll be fucked…I’ve tested all the ‘justice’ of this world over and over, at every level…people suck…the systems are built by people who suck so they suck too…lovely worded ‘mission statements’ of course…but look at what Buddha and Jesus achieved…’some will understand’…if you are willing to work so hard, risk so much, suffer so much, so ‘some will understand’, then you are like us…but I would NEVER have children and demand this of them…that is cruel insanity…this world sucks…this plane…we may ‘ascend’ through our own actions and principled actions…but we are NOT going to change THIS PLANE…even if I got a Vegan state/nation running, the Cult that rules this world would just demonise us, and have their ‘very best people’ crush us pitilessly in ‘pre-emptive strikes’ based on propaganda lies about our intentions and actions…and so ‘with the very best intentions’ the ‘very best people’ would be tricked into destroying the last hope for this plane…so we’re fucked…unless we inherit some super powers…or strangely millions and billions of people suddenly ‘grow ears to hear’ and ‘eyes to see’ and ‘wake up’ from
their ‘dogmatic slumbers’, and this pathetic notion that you can achieve lasting personal happiness and peace and joy at the expense of other sentient being’s suffering…

A goal must me ‘worth the effort / risk / sacrifice involved before it becomes motivating…just to desire ‘a ferari’ or ‘to allow people to know the truth about something important’ may not ‘justify’ all the effort / risk / sacrifice / opportunity costs / actual immediate costs … because it is NOT enough in itself…usually it forms part of some greater desire … and if the greater desire won’t be met by getting the Ferrari, or enlightening a few people about something, then it won’t motivate… really the ferari represents something, and the ‘awakening’ is intended as a step…just a step in the right direction…and if ultimately you believe that you might achieve that one step, at massive personal costs / suffering / loss / risk etc but that the people will NOT take any further steps … it won’t be worth it…it will be pointless…the step / car is not an end in itself…just a symbolic victory / step… WHAT IS IT YOU REALLY WANT / DESIRE? if you can’t see yourself attaining it, then all the pretty baubles and ‘achievements’ won’t mean a thing…sure, we can make people face the facts about 911, ‘The truth about Nazi Germany’, the truth about the cult that rules this plane…but what then? What if I succeeded in all these steps, and freed the slaves…JUST SO THEY COULD GO ON TO ENSLAVE OTHER SENTIENT BEINGS…what’s the point?

Here’s the thing about willing self-sacrifice. What sort of role model is that? Basically one of slavery. Serving others voluntarily is great. The only way to lasting prosperity…but what if the OTHERS are merely going to take advantage of this, and treat you, and all those who model their behavior on yours, like fools…with contempt…and exploit your good nature? … and then trick you with propaganda, and all your offspring, forever, into being good obedient slaves to an evil system and evil people? … you see your best intentions will have lead countless people into slavery, for eternity…they’ll even ban your ethical teachings, or corrupt them so they do evil / harm, rather than good…

Now it seems unlikely to me that we have only one life…but I cannot ‘know’ anything…and it would be wrong to encourage a world where fuckers can take advantage of the good natured few…it is wrong to encourage this…what is right is a sustainable, balanced view of life… you see if life is eternal, and I can find no reason to believe otherwise, though I hold NOTHING dogmatically as ‘fact’ or ‘truth’, then the same behavior is even MORE important to avoid i.e of allowing slavery of the best by the worst…by the masses…because it will possibly therefore become an ETERNAL slavery… unless there are different ‘planes’ where different sorts of people are new-incarnated and so the ‘best’ DO escape the lower planes, and leave the would-be slave masters to enslave each other, eternally, so that one life one is a master, and another 100 lives they are a
slave (do the math people, if 1% control the world, then you’d only get a 1% chance, each life, each new –incarnation based upon your will / desire to live in aa slave society (as a master of course) of enjoying the ‘benefits’ and being a ‘beneficiary’ of slavery…in fact, including animals, we are looking at tiny odds…most likely you’ll be born a battery hen or calf, or a really exploited third world slave…

Enjoy your live-boiled lobster, and look forward to being boiled alive, many many times, over the course of your future lives !!! is whatever ‘benefit’ you gain at the lobster’s expense REALLY worth it, when you KNOW that many times YOU will be the lobster? Hey, your choice. But don’t force OTHERS to participate in YOUR idea of fun…

NLP ‘As if’ representations…i.e vividly imagine you’ve attained the desired goals, in every representation system, and using the sub-modalities that make things feel ‘real’ for you…so the future condition really feels / appears to have been attained…this will motivate you if it DOES bring the benefits / rewards you’d hoped for…but what is like, in the Hessed Buddhistic tale, getting what you ‘want’ brings nothing but misery, as Ecclesistes says, it is ‘in vain’ ? Then you can step back and reassess your goals. Avoid making the mistakes you see realised. Buddha calls it ‘remembering’ i.e ‘remember’ yourself having achieved all your desires…how does it feel…did it really bring what you’d hoped? …what do you have for all your struggles, worries, anxieties…for all the harm you’ve suffered and committed in ‘realising’ your ambitions / plans / objectives / aims?

If you cannot act ‘as if’ you have attained a state / are the person you want to be, how can you possibly become it / reach it? So first step is to vividly portray it…or even better ‘remember’ it…act as if you are rermembering something already attained…say you won the noble prize yesterday, or yesterday celebrated your 10 years of sobriety / control of your bad habit … or ‘graduated’ or ‘took possession of something you’ve always dreamed of owning… some will call this ‘manifestation’…telling your subconscious / the universe what you REALLY want…so it can manifest it…or ‘being-cause’, and manifesting it yourself, via resonance / law of attraction / law of manifestation…but be sure of the ecology…becoming slave master is great maybe, until the slave rebellion, or the next life when you inherit that SYSTEM you desired, but NOT the position at the top you always associate with slavery … rather the misery and frustration and suffering of the slave …

Be sure to ‘imagine’ / engineer a way to have what you want at no expense to any other sentient being…THAT is the challenge…you can steal from charities and buy a ferariri…but how ecological is THAT? … or sell your soul for
‘success’…compromise your integrity, and end up paying a huge price for some trinket / empty status / vain glory / success…

Acting ‘as if’ you are who you want to be clarifies what you REALLY desire…and also lets you identify HOW to attain it…rather than some vague idea of ‘success’ and ‘acceptance and approval’ or ‘wealth’ or ‘independence’ or ‘self-esteem’… it makes the whole ambition ‘real’ for your mind…something concrete to work towards…lets you manifest it … how to ‘manifest’ a vague notion of ‘happiness’? … or the ‘wisdom’ you ‘feel’ while stoned, but could never articulate…because all you were doing was ‘feeling’ you ‘knew’ something amazing…you had the feeling…NOT the insight… most people can’t distinguish between the two…Hume clarified the fact that ‘objects’ are just associated impressions which are constructed INSIDE our minds…there are NO colors, music, or even ‘objects’…just the separate sensations we experience in relation to what we construct as ‘solid objects’…say the redness/greenness, and sweetness, and aroma, and weight, and mass, and texture, and taste of an ‘apple’…all these impressions exist on their own…we bring them together to ‘construct’ or ‘produce’ the ‘idea’ of an ‘apple’ in our minds… this is a great way of thinking about ‘representation’ systems and the world as will and representation’, and of ‘sub-modalities’…all pure David Hume…over 200 years before the term NLP was ‘coined’ (and NOT by any of the people WE associate with NLP today)…

‘Remembering’ and ‘as-if-ing’ i.e vividly imagining, automatically overrides our habitual limiting beliefs…rather than say ‘oh yeah, that’d be great, but for X and Y and Z reasons impossible’…we jump forward to AFTER … construct a ‘fait accompli’ that leaves our minds wondering HOW, and WORKING OUT how, we achieved it…so rather than seeking excuses for why we can NOT have it, our minds are now wondering, actively working on, explaining HOW we DID achieve it, and thus how we CAN attain it…

We become more flexible in our thinking about this ‘nominalisation’ / ‘ossification’ / ‘rigidly fixed idol we call our ‘self’…we open up our minds to the ‘thousand flowers of the soul’ … all the limitless potential we each possess…but which we forget / repress / deny … have repressed / denied by others, who want to keep us stuck in some rut as this limited ‘self’ THEY are happy for us to remain…while THEY seek THEIR fuller potential at OUR expense…you see slavery requires slaves…and people who think they cannot ‘compete’ and that ‘competition’ is the ONLY form of social interaction, feel threatened when any OTHER person seeks their own self-realisation…as if there is a limited amount of acceptance and approval to go around…a limited amount of wealth, status, prestige, privilege, better living, nicer things, … to be had…when in fact it is always by encouraging the BEST in everyone, that we flourish as a society…and gain security and prosperity…but most people in
positions of power are FRAUDS…they can NOT deliver what they are supposed to…we didn’t give and allow them to maintain privileges to massage their egos and benefit themselves…but to serve society…to serve US all…and they are mostly frauds…unwilling to be exposed, to allow TRUE leaders to take their positions, and do something good with the power and privilege…we are NOT born with equal potentials … but if we all had the chance to employ and realise our best potentials, we would ALL be much better off in every way…though not like ‘Atlas shrugged’…where some preposterous notion that ‘individuals produce massively more value than others, and thus deserve to consume massively more than others’…B.S…easy to debunk… while it is equally WRONG to want to cut down tall poppies because they cast a shadow over you (just fucking move back into the light dumbass, why compete with them?) and make you feel ‘smaller’, or to deny people MORE who have made greater effort, sacrifice, risk etc…But shit. Bill Gates would live a great lifestyle if left alone on an island with his genius…right? It does NOT depend on Society / or all his potential beneficiaries of his genius, right? He CREATED Billions in VALUE right? IT is NOT the people that give his genius its value, right? He’d be just as prosperous living alone with his fucking genius on a deserted island, right? Or?

Balance fuckers. Moderation fuckers. Honesty fuckers. See you on the higher planes when you’ve grokked this, fuckers…

On a neurological level, vividly imagining what you want activates processes and opens up potential pathways…vividly imagining juggling or driving has the same effect as actually juggling and driving…even developing muscle memory…which is why GREAT guide writers who take the fucking effort and honestly evaluate their own directions / instructions on all representation systems in all sub-modalities, can actually allow anyone to learn anything, simply by reading a description…for it produces a clear mental image / idea of the thing…clear enough for the mind to respond ‘as if’ the person is actually seeing and doing and hearing something…and thus make it possible, when the person actually goes to apply the steps, to reproduce the steps…to decode what the lesson writer has encoded…usually the writer misses so many steps, gets the order tangled, breaks things down into totally non-intuitive chunks e.g breaking up a musical phrase or movement into 3 stop and start chunks that totally remove all the ‘feel’ of the piece, and make it impossible to re-build the piece from the chunks offered…or at very least introduced tonnes of totally avoidable frustration … hey watch this…as I do 1000 things, and only 3 of them are ‘relevant’, and leave YOU to work out WHICH 3 things I am doing that are producing the effect / outcome I am supposedly describing/ trying to teach / trying to allow you to reproduce…just watch a guitarist’s fingers and try to guess which finger is actually fretting which fret, in what sequence, as you try to ‘track’ all five at once…and compare that to the ‘model’ descriptions I will soon be offering of some of my favorite pieces of music…from Sweet Home Alabama to Little
Wing...chosen because of the techniques they demonstrate, which can ‘open up’ your way of thinking about playing, and playing...

If you do it right, you can teach anyone anything...if you don’t miss any steps (because you’ve forgotten about them / they’ve become second nature to you, maybe you never learned them, but they just ‘came’ later, after years of frustration that they would NOT come...but which someone could have made explicit right at the start...like how hard you should / need to press down on strings, or string muting, or how simple it is to learn EVERY scale/interval pattern from this TT S TTT S, and +5 and +4 etc...

If you can’t imagine something, how can you manifest it?

Well actually most ‘inventions’ were stumbled upon quite accidentally, with the ‘inventor’ not actually ‘seeking’ to ‘realise’ THAT particular ‘invention’...but that’s another story...told in my other books.

What imagination does is allow us to break down mental prison walls...to eliminate or bypass or jump over, limiting beliefs...If you think you can’t, or you think you can, either way you’ll be right...if those beliefs lead to action / inaction / striving / giving up / motivation / despair...yes our thoughts are THAT powerful...most people suffering severe debilitating depression are much better off than other people in the world, objectively, who are quite cheerful...it is how people think about their lives...especially lack of positive purposefulness...e.g having an ambition / purpose / aim / objective that you expect will yield benefits / satisfy / make you happier, and feeling you have the means to attain those objectives...so the most successful suffer from a lack of purposefulness as much as the prisoner in isolation, or the prisoner of abject poverty and denial of access to resources...

If we limit ourselves to our ‘personal history’ a.k.a ‘self’ as we define it / know it / believe it to be e.g ‘I’m no good at guitar’, then we will become ossified as THAT identity...an idol...no longer a living, generative, open-ended system...but an idol of stone, wood, and flesh...not living flesh, but ossified flesh...limited as a ‘self’...which becomes a prison, rather than a ‘base camp’ for further exploration of the wider universe...what you HAVE been is just chance...what you CAN be is open-ended...or at least much more open-ended that most people are deliberately tricked into believing...probably completely open-ended.infinite...and yet you think you are ‘YOU’, this ‘self’ that you’ve inherited by pure chance...

How few ‘self-created’ people are there? Zero really. It is all inheritance...but what of the truly inspiring people...not the ones born to genius, who had every possible opportunity handed to them on a plate by life...but the people who had to really ‘drag themselves up by their own bootstraps’...which you cannot do, of
course, but it is a metaphor for ‘overcoming challenges / obstacles / objections…these people are the true inspirations for us, as most people on this earth are being deliberately held down and held back from reaching anything like their true potential…I mean as loving, caring, sharing, satisfied beings…they are being denied information about their true natures, and the nature of this reality…and of all the things contained in my guides…so please seed them, translate them, share them, so that everyone can benefit from them…no limits due to language, money, luck…

When trying to imagine things, we tend to hit ‘roadblocks’ of ‘that’s not possible’ or ‘that’s not ME’…that does not belong to my way of seeing my SELF… and THESE are the REAL obstacles to our freedom / progress…subconscious limiting beliefs…’I could NEVER be happy / slim / successful / loved / deserving of acceptance - approval / a good parent / gain that significant other’s recognition etc…

So the exercise is as revealing as any ‘therapy’ process could be. When people can NOT vividly imagine something in all representation systems / sub-modality qualities, it indicates they have limiting beliefs blocking them from reaching their full positive potential.

Of course be realistic…we cannot all be ‘physically beautiful’ (unless you submit to eugenics, and wait until a next life when the program has yielded its benefits, and ALL people are born with the potential to be beautiful…physically… and we have different skills, talents, innate gifts… but most of us NEVER realise the potential we have…we give up way to quickly…we are not offered the resources and information and training and education we would require to realise our potentials…and most ‘training’ and ‘education’ is really crap…seriously bad…expensive…excessively frustrating and irrelevant, to our aims / our needs…all artificial barriers to our self-realisation…which my guides seek to totally eliminate…in fact if people would take me seriously, I could design programs in EVERY area of life, from brain surgery to engineering to the most important skill, being able to teach others to teach people what they know / have learned / innately mastered / intuitively grokked…so that we could share everything with anyone willing to make the effort to learn…seriously brain surgery or engineering is no more difficult than sewing or making mud bricks…there are just lots of steps, layers, integrated steps and layers…to be mastered…in the correct sequence, to make the progress smooth and relatively frustration free and effortless…

Of course Marxism and all the other Cults (which people call religions) abuse this process, by getting people to imagine very vague ‘utopian’ situations either in this world, or some next world…then offer ‘means’ to attain these ‘ends’…usually war, destruction, slavery, submission to arbitrary authority and
arbitrary ‘laws and statutes’ and ‘rules’…utopian visions are dangerous…people imagine ‘the ends justify the means’…the most dangerous person is the one with a vividly imagined ‘perfect utopia’ in their heads as they torture, cruelly ‘rip apart pregnant women’ and ‘dash the little one’s heads against the stones’, all in the name of this ‘perfect utopian vision’…because of course if the ends are so ‘perfect’, then ‘anything’ is justified to attain them, right? So you’d better be careful what sort of ‘as if’ you imagine…that it IS realistic, ecological, consistent with human nature, and the nature per se…etc

We can use imagery to activate our subconscious into performing tasks we could not consciously perform, from co-ordinating all the muscle impulses required to ‘stand up and remain standing without falling over’, to re-programming our immune system to stop identifying ‘friend as foe’, and to correctly identify ‘foes’ and destroy them… pretty much what my ‘criminal’ work before this book was about…of course the foes control it all, and they wouldn’t let little old me inform you who there were, and what they are planning, and how close their plans are to total realisation, would they? And you wouldn’t listen even if I was willing to ruin my life just to inform you, would YOU?

We really need to teach some people to dream again…to hope again…to desire again…to think it possible again…to be happy, to be content, to live again…most of us are subconsciously numbing, medicating, denying, even killing our ‘selves’…we do NOT want to BE… most too cowardly to admit it…it is not socially acceptable !!!

You won’t make the effort, sacarifice, take the risks, unless you are motivated by an imagined future self / situation that would justify all that effort etc….whips and threats may get you to do the minium to stop the whipping / torture, but slaves are rarely very productive, and they die at the least opportunity…

‘5 year plans’ are one thing…especially when you can ‘fake’ the outputs…and the system is so corrupt that this becomes standard behavior…so you get you 1984 styled ‘increases in chocolate rations’ which end up being less rather than more…but hey, who will go to prison to state the obvious?

To escape history, we need to be able to imagine an alternative…then have others share that imagined alternative…honestly…not disingenuously…remember ‘the capital of Marxism is deception’…Das Kapital is deception. Disingenuous. Illusory. Not a genuine offer. Just propaganda to trick people into committing horrific acts of cruelty upon each other, so that a particular Cult could seize power…oops…

You have no idea how brain bashingly hard it is to really ensure you grok something enough to encode it for others…then to encode it… no wonder most ‘professional’ books are half assed as far as I’m concerned…they tend to explain
the obvious in great detail, which was totally unnecessary, and then totally ‘skip’ and ‘mumble’ and ‘bluff’ their way over the hard to explain stuff…who’d bother just for a paycheck? You’d have to be passionate about wanting to grok something yourself (not just pass a test and get a PhD and job) and then to want others to be able to grok it too (why do that when your entire capital is invested in the exclusive comprehension of something / ability to do something? What would the guild say? The professional association? The monopoly? The patent owners? …

At the first stages, you’ll have to keep getting yourself / clients to ‘act as if’ a.k.a. ‘imagine’ ‘you have already solved that problem’ e.g. ‘I cannot imagine myself being happy, I don’t deserve to be happy’…you’ll have to get them to pretend they already have, some way, overcome this obstacle, simply to get them to be in a position to imagine the outcomes they truly desire…it is impossible to vividly imagine having achieved your hearts desire, if you are totally convinced it would be impossible to even take the first steps / overcome the first obstacles e.g. learning some new skills / breaking some old habits / removing some fixed definition you have of your ‘self’ / identity…so at first it has to be all ‘pretend’…and ultimately ALL trance therapy / hypnosis IS pretending / role playing…we are ALL playing ROLES every moment of the day…just so well ‘conditioned’ and ‘scripted’ and ‘habitual’ that we forget that is IS just a role…one of many potential roles we have to chose from…and we do not HAVE to play it…we can ‘step outside of’ our ‘self’…learn some new scripts, get some new props and costumes and make-up, find a better director / producer…work a different genre…free the ‘thousand flowers of the soul’…

Complex equivalences? Simply that we define / associate e.g hard work / luck and success, cheating/honest dealing with becoming rich, women/shoes/men/submission/dominance with sexual pleasure/arousal i.e. X and Y, the most basic being ‘cause and effect’ and ‘free will’ with ‘precedence and antecedence and proximity, and ‘I’ want as if ‘wants’ were chosen by ‘I’…etc…

People are conditioned to associate / define things in particular ways, so they have knee-jerk emotional reactions to e.g. ‘Adolf Hitler’ or ‘Nazism’ or whatever and whomever has been targetted for demonisation and via propaganda, demonised…and associated with all manner of invented ‘crimes’ and ‘horrors’…People used to automatically genuflect before priests, as if these men were ‘intermediaries’ with gods…and fear them as much as they feared the imaginary god’s powers…

Most people ‘equate’ as ‘equivalent’ ‘having lots of money as being ‘rich’ and ‘successful’…being married as ‘successful’, having a family as ‘contentment’, having public esteem as something worth selling your soul for / totally trashing your integrity / being a total hypocrite for…how ironic… and ‘getting ahead’ as
‘smart’ V ‘challenging’ authority as ‘dumb’…one gets you promoted, the other fired and put in prison…

The idea that war can ‘effect’ peace i.e ‘cause’ it is one patent absurdity

Or how about ‘you can do unto other sentient beings as you will, and expect the universe, and other sentient beings, to do exclusively fairly /justly /humanely /considerately /sympathetically /empathetically, with YOU and yours!

The majority are against me, so I MUST be in the wrong?

People all agree I am wrong, so I must be?

Everyone hates me, so I MUST be in the wrong? Ask Jesus about these, or Buddha, or ANY real philosopher EVER

What is YOUR ‘evidence procedure’ i.e ‘reality strategy’ i.e how do YOU decide what is ‘rational’ and ‘compelling’ to believe? Why do you insist on believing ANYTHING at all? Why do you NEED to imagine you can KNOW with certainty, anything at all? And if you cannot ‘prove’ anything, why insist on forcing others to ‘believe’ or at least be hypocrites, and ACT as if they believe, other than to en-trance and brainwash them…why? POWER…

Einstein: everything should be made as simple as possible, but no simpler…

We seek to simplify complexity…to express it as simply as possible…often at cost of precision /accuracy and lead to nominalisations /equivalencies /definitions /models that are TOO simplistic and ‘miss the point’…why bother ‘feeling more comfortable’ by simplifying everything, then realising ‘nothing works’ based on these simplifications…we are just avoiding the problems…

Finally, in the last work of NLP I consult, a reference to David Hume…quoting Einstein !!! …AND THEN DILTS STATES ‘WHAT EINSTEIN IS SAYING…’ AFTER EINSTEIN REFERS TO DAVID HUME…WHAT THE FUCK IS WRONG WITH THESE NLP PEOPLE? THEY SIMPLY CANNOT GIVE DAVE THE CREDIT HE DESERVES ??? ONE OF THEM IS ‘CHOSEN’ AND THE OTHER A FULL ON NON-THEIST..GO FIGURE! CULT MUCH? …’ACCORDING TO EINSTEIN…” WTF … HE WAS REFERRING DIRECTLY TO HUME, BUT DILTS HAS TO ASCRIBE THE ARGUMENT TO EINSTEIN? WTF …THIS IS AN NLP ILLNESS…”EINSTEN’S POINT IS THAT ….” WTF !!!

Aristotle’s ‘causes’…Hm…basically we are on a trajectory (inherit the momentum of the products of past interactions) that is maintained by this momentum until something interacts with this product, changing the trajectory /
giving it a new direction / character / quality… idea of some future ‘fate’
‘pulling’ as a ‘cause’ is so ‘human’ … we can see it as an objective / aim i.e
motive for action… so we have ‘push’-pull and ‘interference’ … in my words…

Say you inherited a cultural affiliation with a Cult that has been constantly in
trouble with its host nations…you want to avoid future trouble…how you d
define the ‘reason’ this trouble occurs is key…because they envy you your status
as ‘chosen people’? … is that reasonable? Is that status so important to you that
you’ll risk more ‘pogroms’? … maybe the Cult leaders actual behave in ways
that justify such pogroms? Maybe you should find out? Will you keep blaming
the ‘hosts’, or seek solutions / problems in your own community / leaders / way
of behaving? You can build nukes, and kill everyone in pre-emptive strikes,
who you are told are ‘enemy’….has THAT worked for ANY civilisation for
long?…or you might ask yourself the hard questions…”what am I contributing to
the situation? What COULD I do DIFFERENTLY? what response-ability do I
have? What about my community leaders? And powerful members? Who is my
REAL enemy? Some ‘non Cult affiliate’, or the Cult leadership itself? Maybe
the Cult is NOT worthy of my membership / respect / admiration / affiliation? Or
maybe just blame everyone else but myself, and my community leaders / powers,
and just go on repeating history? Of course this time we will defeat ALL our
enemies…the ENTIRE WORLD….right? And then what? ??? utopia? Really?

What ARE the core values of your cult? Really? In practice? What does it DO?
What are its MEANS? And what ARE its ends? REALLY? Historically seen,
how have these values been expressed? In dictatorial cult prison socieities?
Utopian heavens? Really? Oh, but for some strange reason ‘someone ELSE was
to blame for the failures of your values to realise a perfect society in the past,
right? OTHERS…THIS TIME IT WILL BE DIFFERENT? Really? Are you
really sure you’ve seriously researched your Cults true values, and intentions, vis
a vis this world, and YOU? Why did your cultural groups very first king attempt
to eradicate, with mass murder, the Cult you serve / are affiliated with? And why
have you had no ‘King’ since then? Only ‘priests’ of one sort or another, and
terrorist ‘leaders’ whose means are genocide, deception, propaganda, lies,
censorship? And nukes !!!

To speak of ‘knowing’ one thing and merely ‘believing’ another misses the point
entirely…we know nothing…we only believe, with more or less compelling
arguments to support what we believe … usually no more than ‘transferred
authority’ i.e someone else says so / claims to believe this … they even wrote it
in a book, can you imagine! wow…what a compelling argument…oh, and they
wrote it thousands of years ago wow…tradition as well…how to competed with
such strong arguments? hey? Really? Zombie much !!!
Correspondence is really random, vis a vis our mostly arbitrary ideas about how the universe works...assuming there are actually stable laws...and that we can guess them...is like sitting in a virtual reality game some programmer with a wicked sense of humour has programmed...arbitrarily setting up interaction-outcome combinations to lure you into 'imagining a pattern' and then 'imagining you can predict' the patterns next evolution...and YOU reading some kind of 'law of nature' into the programmers random/arbitrary selections...

Oh, last night...reflecting on Hume's 'bundles of qualities' vis a vis 'human nature / the nature of the 'self'... the 1000 flowers of the soul...of Hesse / Buddhism ... my own 'one step enlightenment' program i.e what is 'ME' except the ability to feel pleasure, pain, and relief...all of which at present, in this form, are triggered by electro-chemical triggers ... themselves triggered by what we are conditioned to experience as 'external' triggers e.g the mango and its delicious texture and aroma and flavor...but we can 'recall', in all senses, literally, like 'recalling a faulty product' i.e 'bring back' all the sensations triggered and 'smell and taste and feel' a mango in our dreams/imaginations...we don't need the mango...something interesting...if our true 'self' is incapable of 'creativity' i.e it knows everything, is everything, ...bored...the matrix evolves novelties...IT creates via binge and purge of all possible combinations of frequencies/resonances in the Energy-Matter-Consciousness matrix...so IT produces 'mangos', but once it has, we can replicate this 'experience' at will... are we here as 'workers' to 'sample' the outputs of evolution? A sort of 'necessity' to expand our range of experiences? so we can put them 'in the bank' for all to access later? But anyway, the old trick of 'taking away' bits of 'us' to see what is 'necessary' to still remain 'us'...the minimal 'us'...what is it? Brains in vats go so far. But the brain can't 'feel' / 'experience' it only 'reckons' and 'processes' and 'computes'...something ELSE feels pleasure, pain, relief...or ?? a few molecules can reproduce and build a nano-tech structure that feels ? sentience? Consciousness? Epiphenomenally? i.e as a product of interactions, that ceases when the interactions a.k.a 'death', occurs?

N.B that 'certainty' would remove part of the 'experience'...e.g if you can have it all, any time...does it have less value than when the satisfaction is uncertain? Look at entitled privledged children and what they become...what they do with their resources...are they 'more satisfied' than the people who work hard towards valued goals, and attain them...modest goals...do the air hanger of luxury collectible cars give the owner more satisfaction than the beat up ute the central American 'taxi' driver has just managed to pay off, and now 'owns'?

Purposeful action...as Nietzsche put it...a yes, and a straight line...why all games are addictive, whether social or computer ...to be-cause...to will something and 'thy will be done'...that is the essense of power...of addictive
games … whether target shooting, or sport, or virtual reality games, or social games like ‘success’ and ‘status’ and ‘prestige’…’pulling off’ anything is satisfying, whether the perfectly elegant hand-brake turn, a dance more, a guitar lick, or a ‘deal’…intrinsically satisfying…you can’t beat true ‘achievement’ of your goals / objectives … it is ‘god’-like in nature…to ‘be-cause’…to will something, and see it realised…to aim, and to hit the target…whatever target…as metaphor…some people suffer their whole lives to hit invisible targets like ‘a place in heaven’…others have real targets such as ‘a garden that self-reproduces all the food I need, provides the recreational and therapeutic ‘drugs’ I need, prevents sickness and ensures food security and tasty, health-bringing meals…or ‘to be the richest person on earth’ or ‘the most powerful person on earth’…tell me which are likely to cause harm and which bring real lasting satisfaction, at ZERO cost to any other sentient being…which is the true ‘positive sum’ game?

We ‘manifest’ our REAL values … for better or worse…you can all have ferari’s? really? At what cost? Oh, you intend passing that cost onto OTHERS…great idea…just make sure OTHERS don’t get that same idea into their heads…Hmm…encourage others to be humble in THEIR wants…you know, like the ‘Princes of the Church’ and other Cult leaders, wallowing in private luxury and excess, while praising the merits of abstention and selflessness in OTHERS…the masses of course…

We are motivated by REASONS…hence Aristotle’s faulty ‘first cause’ as human will … fails to go deeper…where does our will originate? … do we CHOOSE to find pleasure in sex? Or to enjoy eating mangoes? Can we CHOOSE to enjoy eating shit sandwiches and in abstinence? Well THAT is what cults trick people into doing, really…shit sandwiches for the masses, delightful menus for the ‘Princes’ of the Cults…and they lap ‘em up…yum…gimme more…and sure I’ll fight to the death anyone who tries to ‘enlighten’ me about the nature of my sandwiches, and how I’m being scammed…

We are only ‘committed’ to what we ‘believe’ in…independent of how absurd those beliefs are…people do the most extreme things for mere ‘beliefs’ that a child would be able to debunk, if it were free to…today it would be taken from its parents and raised by the Cult dupes…

Compare ‘I will never be able to X because I can’t Y’ to ‘As long as I don’t work out how to do Y / find an alternative to Y, I won’t be enjoying X, so let’s see how to go about working out how to do Y, or finding alternatives’… one is defeatist / closed / limiting belief…the other is pure feedback about what needs to be done, leads to action / motivation rather than despair / stagnation…
We often assume that ‘X means Y’ e.g. ‘you don’t buy me flowers, you don’t love me’…i.e equivalences… or that X causes Y e.g. not buying flowers will lead to my wife leaving me…

We can debunk the limiting belief with one counter-example e.g. someone like us who did what we want to do, but fear is impossible…or like Erickson, mine the rich history we have of having learned to do stuff e.g. walk, any ‘successful’ attempt at anything…any challenge we’ve overcome, any target we’ve reached… or use characters in stories to suggest to unconscious that it is possible…

Beliefs have own ‘rules’ of evolution i.e. birth, life, and death… when we attack them, they defend themselves, when we repress them, they emerge in secret disguises… so how to ‘change’ beliefs of self and others? … this happens naturally all the time… in fact people tend to ‘flip-flop’ on very important ‘beliefs’ … some people imagine it a ‘strength of character’ Never to have changed any of their beliefs’ … my mum is proud of this strangely enough… like the emancipated cult members, perhaps my own liberalism and open mind and flexibility is a reaction against her nature/behavior?

Dilts claims beliefs can be surprisingly simple and easy to change once we respect the natural process of belief change… really? Is he speaking from experience? Of course we ALL imagine WE are not fooled/fools … that WE have ‘sussed it all out’… and ‘changed our beliefs where others remain ‘fooled’… right? All those dreamers dreaming they have awoken… all those deep trance zombies who have ‘freed’ themselves from one level of trance, and imagine that current level of trance they are in is really ‘clear’ of all illusions / trance states, and ‘reality’… Oh my, all you ‘Info Wars’ viewers and devotees of Putin, Trump, Chomsky, Snowden, Assange, Edmonds, Watson, Molyneaux et al.

N.B on skepticism’s POWER… it means you doubt even your doubts… no limiting belief remains ‘dogma’ / ‘an article of faith’ any more than any delusional self-belief e.g. ‘I can fly’ and all manner of delusions of grandeur / efficacy… hey, like Socrates before they killed him, I believed ‘one person can make a difference’ … but really take a look at history to discover who your heroes REALLY were… and who was behind them… and what they REALLY did and how they did it… they were all puppets who died in shame, having realised how they’d deluded themselves, and been used by malicious powers… imagine a Wilson or Roosevelt imagining they were doing ‘gods work’ and ‘defeating evil’… when they were destroying the last hope for humanity, and committing genocide for the most vicious cult that ever emerged from the primordial swamp… the ‘good guys’ of history, like Churchill, who was no more than a deluded alcoholic hired gun for the cult… single handedly destroyed Europe,
handed it over that Cult, and destroyed an empire...because he did it for the Cult, they rewarded him and glorified him, like Moses, the other genocidal fucker who betrayed the very people who saved his life, and placed all their trust in him... and the ‘adversaries’, from Lucifer himself to the last great hero of humanity, who I dare not name as it is a crime to utter such blasphemy (it is all religion folks...all Cult business) and heresy... are all thoroughly demonised...check out Plutarch’s ‘Lives’, go back as far as you can in recorded history...no individual with the best motives ever got anywhere...and if they did, they were destroyed utterly, and demonised for all time for daring to try...so even I have now become skeptical of my potential for good on this plane...haven’t given up, but very sober...now I realise that even the best people’s actions can be employed by the cult to serve its worst ambitions...you can’t win...because the cults offer people what they truly want...slavery...only they all imagine to be the slave masters, not the slaves...when will they learn?

Well, like Socrates’ discovered, you can NOT teach people anything...that they do not WANT to understand...they WANT to believe THEY are exceptions, and can ‘do unto others as they please’ with zero repercussions...for they DESERVE special treatment...they are entitled...like Socrates I thought if I made it perfectly transparent, how what people do comes back to haunt them, and showed them alternatives with zero negative externalities, they would desire them, maybe even thank me for my work...but no, people are NOT interested in ethics, and logic and reason and justice...none I’ve found anyway...there might be a few like me out there...but most are lost in their own trances...different levels...and cannot be reached...they will follow an argument just so far, then simply deny it, reject it out of hand...not want to continue...as I ‘tricked’ them into having to change their BEHAVIOR...to be consistent with their SUPPOSED values...which are masturbatory in reality...and not universal principles guiding their actions at all...

So how DO people REALLY ‘choose’ their illusions / beliefs / fantasies / models / paradigms / deceptions / delusions? Most are implanted from birth, and chronically re-inforced/built-upon/deepened/strengthened by propaganda, conditioning, socialization, movies, books, ‘news reports’, etc...so no ‘choice’ there really...few people born ‘catholic’ or ‘muslim’ or ‘Conservative’ or ‘Liberal’ ‘escape these beliefs...they may ‘rebel’ for a time, but implants are like elastic bands that eventually pull them back to their ‘roots’...usually because ‘political’ beliefs tend to be ‘self-serving’ i.e based on perceived self interest, and people tend to remain in the social-economic-status position they inherited, even if they ‘drop out’ or ‘make good’, then tend to ‘fall back’ to their default position they inherited...the lucky have all the connections and resources and inheritances and social conditioning to ‘make good’ even after ‘a fall’, while the most hard working ‘working class’ people make great targets for those ‘entitled’ folk, but even better targets for ‘tall poppy syndrom’ from their ‘own’
kind…Hmm, so people vote according to their own little self-interests…lower wages if you own shares or manage, higher if you work for a living…etc…no brain surgery level intelligence required here…oh, and of course the Cult pre-selects candidates on both sides, and if they feel the ‘other side’ is more likely to win, they will simply change the party of their most popular pre-selected puppet…history is full of it…usually just before major wars…like Churchill in Britain, and Wilson and/or Roosevelt in the U.S. Got to check my own notes.

Interesting utterance: ‘I want to believe’…isn’t this ‘faith’? who REALLY believes what they claim, acts in accordance with / consistent with / with integrity with / without hypocrisy, those claimed beliefs…a ‘leap of faith’ is a silly notion…really means ‘just wanting to believe and pretending to’…if believing you could fly was enough, then most ‘leapers’ would fall, as they do NOT really believe…maybe this is the way out of the matrix, as in Don Juan MAtthis’ case, or Carlos Castaneda’s if you doubt the ‘non-fiction’ claims of the author for his works / histories / descriptions …

If you REALLY believed in heaven and hell, NOTHING would be more motivating that the fear / desire for these…NOTHING could compete…people clearly do NOT believe…how many ‘Muslims’ live ‘as if’ they believe in heaven and hell, in the koran, in the words of Mohammed? … I’ve yet to meet a ‘devotee’ of any cult who REALLY believed…the MOST devout are the fakers…who openly admit among themselves that they are fakes / frauds…that religion / cult fiction is no more than ‘noble’ lies…at best…most are totally skeptical worldly realists…abusing YOUR gullibility to amass unbelievable power and privilege and luxry for themselves…which they dole out to reward their ‘faithful’ servants, as ALL hierarchies do…ALL power systems…which is why they WORK…long after they should crumble and fall to dust…long enough for the cult to move HQ to a new host… and ‘rinse and repeat’ the scam…till they have the entire world under their control…

People are capable of ‘entertaining beliefs’ only up to the point where the new belief asks them to ‘give up’ some perceived benefit / privilege etc, or to define some of their past behaviors, and future plans, as ‘unethical’ and ‘unacceptable’…then you lose them…yeh, sure I’d like peace…what, I’d have to treat others as I want them to treat me? I’d have to give up my ‘exceptional entitlements’ due to being born human, in a particular nation, in a particular class / caste / SES group, with particular ‘strengths’ and ‘advantages’? WTF? Give up something? NO WAY…hey, peace would be nice, but not at ANY price…like UNIVERSAL justice and rights…and you’ve lost them…My optimal ethics generator / universal veil of ignorance would solve the problem, if people WANTED to solve ‘the problem’…they don’t…only the very worst off among humans would even give up the ‘right’ to abuse their power over animals, and then once I’d ensured their new benefits, they’d find some excuse to go back to
abusing their power over animals, and any human they could…sadly this appears to be human nature…I am skeptical enough to keep trying, but more and more skeptical of my apparently ‘narcissistic’ tendencies i.e the delusion that I can make a difference, that any GOOD person stands a chance of defeating evil…even Hitler had to put up with the Cult manifestation called ‘The Church’ in his day, allow smoking, non-vegetarian lifestyles, … at the height of his power…and there was no way one nation, even with the Million strong SS volunteers from over 3 dozen other nations, was going to defeat the entire world…not when his own people had no REAL understanding of what was at stake, and the consequences of defeat were going to be…most today still have no idea what is going on, and what is coming…assuming even that he was never working for the cult itself…in any case it supports the belief that that cult can swing anything anyone does in its favor…and how? Simply by manipulating the ‘beliefs’ of people, and working with the most base of human motivations and impulses, over and over…pretending to offer it what it wants,… something for free…the power to abuse other sentient beings…benefits at others expense…only, at the last minute, to realise the MASSIVE costs they’ve been tricked into paying…that they’ve been tricked into destroying the BEST in the world to ensure the victory of the WORST in the world…over and over…and soon…oh you won’t even realise what has happened…you’ll imagine / belief some preposterous fiction about ‘what is happening’ and swallow it…you will NEVER come to realise what REALLY is happening, and happened…really hopeless…almost…got to remain skeptical…we can NOT ‘know’ anything with certainty… skepticism is the open door … the window of opportunity… the chance …

The hardest challenge is to ‘overcome the objections’ people have to universal justice…to abandoning the ‘right’ to benefit at another sentient being’s expense…this ‘sense of entitlement’ to kill and eat other sentient beings, to enslave them and eat their children, to ‘milk’ them, and treat them as mere ‘means to our own ends’… people fear losing advantages and privileges e.g vis a vis the ‘chinese worker’ or ‘third world worker’…if you paid everyone fairly, they believe, then things would cost ‘too much’…. Though of course if you DID pay people fairly, the share holders and owners and managers and ‘talented’ and ‘brilliant’ etc alike, then the average worker wouldn’t have to sacrifice a thing, as the ‘windfalls’ a.k.a ‘rent’ to ‘the lucky few’ would more than cover the increases labor costs as we slowly built up the living standards of workers around the world to the one same level…without any austerity required by anyone but the few ‘exceptionally rich / talented / lucky etc few…

But what chance do you think I have of being allowed to Explain this to the masses? Who do you think will let me go on prime time to explain all this? How soon would I be ‘demonised’ by the owners of the mass media? By the corrupt politicians? And how many people REALLY want justice for ALL workers…let
alone all sentient beings? Really? Not while masturbating and telling themselves how ‘good’ they are…but in real life…

What would it take for anyone to take the effort to ‘suspend judgement’ and ‘suspend all their current beliefs’ and ‘entertain’ an entirely different set of beliefs…or even a few superficial ones? What’s their motive for doing so? We ‘learn’ to pretend to believe things to gain the acceptance and approval of our teachers, lecturers, exam markers, parents, siblings, friends, peers, social group, and other ‘authorities’ and ‘people with the power to offer pleasure, relief, security, and to inflict pain in all its forms…to exercise ‘violence’ in all its forms i.e coercion…like ‘holocaust denial laws’ punish people for daring NOT to believe what is clearly and always was, war propaganda…instigated long AFTER Germany surrendered…funnily enough such a ‘big thing’ was NOT used as wartime propaganda…they demonised Germany and Germans for sure, but they did NOT use this propaganda, until LONG after the war’s end…ask Goering, who was totally stunned by the charges / allegations … but apparently convinced himself even by it…or at least ‘played along to get along’…as a true ‘mitlaufer’.

Mitlaufen is what beliefs are all about…the newly hatched chick that believes the snake is its mother / protector / safe haven is a bit different … but we ‘trust’ ‘authority’ in a similar way…the ‘Alpha Male’ is given all the privilegees and we want them, so we will emulate that ‘top dog’…even to the point of following him to the abattoir, where even he is to be slaughtered…we want stuff…so we emulate the big gorilla who has it, hoping that we may ‘stumble upon’ the ‘magic Abracadabra set of utterances and actions that will grant us what HE has already…and that big dude who gets all the bananas and babes farts facing the cave entrance, then why not emulate him, maybe THAT is the secret? Or is it walking with your arms akimbo, and making lots of grunting noises? Who could say…our scientific progress has been no more ‘sophisticated’ than the apes emulating the alpha monkey to get what he has…and since when did humans behave differently? Think of ‘fashions’ and ‘cults’ and ‘me too’ and how marketing works, and how we all go through rituals hoping to gain ‘happiness’ or at least acceptance and approval, and get to stay out of solitary confinement cells …

Probably the most lucrative business on earth, the oldest one, is working out how to ‘persuade’ people to do things…to get them to ‘believe’ things that suit your purposes…YOU want to abduct that cute girl from the neighbouring tribe…but how to? You are a coward, and weak…so why not convince everyone ELSE in your tribe that it is a good idea to attack that tribe…make them believe they have some good reason / urgent NEED to…a pre-emptive strike…because YOU KNOW they are planning an attack on YOUR tribe, don’t you…don’t you? How to convince them that you do? Wow…THIS is what Cults are all about…what POWER is all about…convincing someone to pay more for YOUR product, or
even that they NEED it at all…to make money…convincing people to BELIEVE something that suits you…that your paper money is ‘valuable’…that the people living on land YOU want are the enemies of your current host nation…so they BELIEVE they MUST invade and kill everyone…a just war…a just cause…really? Why did they come to think THAT?

You can get people to believe almost anything…compare superstitions and cults over time…amazing shit they got people to believe…billions still do believe it…probably YOU do … I realise this is a waste of time, really…or surely I BELIEVE at some level I MUST try, even if it is hopeless? Beliefs !!! change the world. Change YOUR world…

But what’s in it for YOU? They tell you stuff YOU want to be true, too, as part of the bargain…yeh, sure, rape all you like, torture animals, all good…as long as you worship OUR god and do what WE say, you can do lots of really nasty things…even go and commit genocide…just wait until we tell you it is time, and make sure you limit your malicious actions to those ‘legitimate targets’ we offer you…don’t worry, there will be plenty…just submit to US, and we will ensure others submit to you….whether we are talking rank and class and caste and hierarchies, or cult vs non-cult members…. We offer you what you love…superiority…the idea of being ‘better than someone’…at least better than animals…and women…and ‘foreigners’…if you happen to be at the bottom of the caste system in OUR tribe…you are still way better than THEM… and we’ll let you boss THEM around … kill ‘em, rape em, steal their shit…at the times we say, and for the reasons we give…but don’t worry, you’ll get your ‘ends’…

People will do the most absurd things…live lives ruled by ritual…if you scare the fuck out of them with hell, and fates worse than death on earth…and offer them heaven, and a future, just around the corner, where they will be the lords of the entire world…with 2800 slaves each… the priests know that the more absurd your demands, the more compelling they are for the victims…Hmm…god was so specific, THEY must be telling the truth…why would they invent such silly rules otherwise? Lots of reverse psychology etc…

But Dilts is absurdly fatuously naïve…since when did humans ‘weigh up the balance of the evidence’? when it came to deciding what to believe? Since when were they ALLOWED to see the evidence…all of it…so they could form rational judgements? When? I have been living under the illusion that since Socrate’s days, and Hume’s days, we’d advanced, and had freedom of speech, research, publication…when we have NEVER had this…the thing about censorship is that you do NOT know what has BEEN censored, and so you assume that you are hearing ‘the full story’…of course you doubt ‘foreign’ propaganda…but YOUR leaders work for YOU, right? Democracy in action! THEY wouldn’t deliberately harm us…they LOVE us, right? They have OUR
best interests at heart…they’d never send us / force us to war on false pretenses…would they? ??? or put people in prison for merely trying to educate us, and offer us alternative ways of interpreting the information available, and offering us a wider choice of information? Or ??? I bet you don’t even REALISE how many people are rotting in jail now, or have spent decades in jail, in the WEST, in Germany and Australia, for harming NO-ONE … for simply offering information …scientifically proven information…for debunking propaganda…for seeking peace and justice…Oh, you’ve heard of some ‘nazi wack-jobs’…but didn’t bother looking into it…of course if your media and govt. put someone in jail / demonise them, then they MUST be evil, right? What other reasons could they POSSIBLY have? Why research government lies if you believe everything you’ve been told, and so have no reason to SUSPECT them ever of lying, let alone actually take a look at ALL THE MASSIVE and INNUMERABLE lies that we’ve been told…from the very start…but if you believe, you have no motive to make any effort, and you’ll dismiss anyone who does as some ‘conspiracy nut’, just like big brother has trained you to…

How do you even ‘open up’ someone to the very IDEA that their beliefs might not be anything but ‘self-evident truths’ … when they have no idea of the costs they are paying, or imposing on others … they see only the benefits, to themselves…they are smug and complacent that ‘everyone who disagrees with me is wrong…they imagine anyone can KNOW when they ‘are right’ about something…and dismiss the fact that others feel the same way…and that all that is different is their conditioning…their education…their cultural immersion…their access to specific info and censorship and deprival of access to other info…etc…what do do what do do?

Can we find examples in a person’s personal history where they changed their mind about something? Changed a significant belief? It happens for some of us. We are open. Searching. Questing. Seeking. Listening. Looking. Actively. We sense this is NOT ‘the best of all possible worlds’ and that ‘we have been mislead’…maliciously or even with the best intentions e.g ‘noble’ lies…and realised that our ‘authorities’ are really just mere mortals, often stupid and malicious…the more contact with have with ‘authority’ the less respect we have for it…at first it is very impressive…THEY have all the goodies…we want them too…even just the respect and status…they are like gods to us…they are the givers of benefits / status / rewards…they can punish us…we want that power…so we emulate them…like alpha monkeys…

Interesting…Dilt’s considers how we ‘feel’ about / ‘view’ beliefs we USED to have but no longer believe…what is the difference? What once produced and emotional affect / effect now leaves us cold…like estrangement from a former lover … we had a ‘relationship’ with the belief then, that we no longer have…question of what changed / brought about the change…it is different to repression
suppression / disciplining our beliefs…we simply are NOT moved any more by it…like when you used to fear the dark, and now find it relaxing…or were terrified of speaking publicly, and now welcome any chance to ‘get up and shine in front of people, or just have a chance to connect with them / inform them…what changes is the affect … the emotions are no longer triggered…or even triggers opposite emotion…fear and desire, love and hate, enthusiasm and indifference…MHR clearly it is the de-coupling of expectations of pleasure, pain, or relief, from what was once considered a ‘cause’ or ‘potential cause’ of it…e.g desire X to feel happy…when realise X does NOT bring happiness, it leaves you cold / disinterested in it…same goes for life in general…or seeking truth…or seeking to enlighten others when you’ve ‘found’ it / revealed – exposed the lies / propaganda…all things are means towards the ONLY real thing, feelings of pleasure, relief, and pain … we fear / love / desire / hate etc X as we associate it with pleasure / pain / relief //security of pleasure … we credit it with some causative power…we expect it to yield pleasure / relief, or avoid pain, and secure enjoyment of good stuff… it is this ANTICIPATION which motivates us / produces the AFFECT… why we ‘LIKE” a particular political party or ideology…we expect benefits from it…we invest emotionally in it…our hopes and aspirations…but when we realise they are all pre-selected candidates / representatives of the one cult, and never do what promise, and always lie, commit war crimes, censor, take away our liberties and give us nothing but fear in return…we grow cold to participation…what idiot invests anything in such hypocrisy and WWF performances? Maybe a youth could be forgiven for being naïve…but a 50 year old? What planet / reality have they been living in, that they could EVER think the ‘process’ is NOT rigged…could represent THEIR interests….but the thing is, even the worst ‘leaders’ DO represent the ‘aspirations’ of the public for war, destruction, inequality, exploitation…be honest … otherwise we’d have a vegan world…with a very high ‘lower limit’ on inequality, and a much lower ‘top limit’ on inequality … i.e inequality, yes, but like Norway, not like the U.S.A.

Dilts so naïve…yeh, we’ve moved beyond torture … all a relic of the past? What world is he living on? The master of belief change lost in a trance…a dream…an illusion…what ‘reality checks’ and ‘reality strategy does HE employ?’ …go along to get along? Repress and deny?

Dilt’s uses naïve definition of ‘trust’ i.e expectation something will be as promised / desired … when in reality it is a generous gift…we offer trust…we don’t expect it…we really just hope for the best…if we don’t, then our actions are severely limited…and the affects ruined e.g if you need to ‘trust’ in someone / something in order to enjoy some experience, and you won’t, ‘pretend’ they are worthy of trust, then you miss out on that experience…if you don’t take chances, you don’t get much out of life…we EXPECT the sun will rise tomorrow as usual, but we ‘hope’ people don’t let us down… we put our ‘trust’ in our
motorbike tyres and our skill, expecting they will keep us ‘upright’ …that our brakes will work…based on calculations…with people, we ‘trust’ people as far as we have the power to enforce their agreements…either legally, by pure brute force, or socially…we therefore ‘trust’ a neighbor who owns their home, and is established in our community, more than the stranger passing through town, based on the assumption that they have a reputation to consider … social pressure can be put on them to reciprocate…they have something to lose if they lose their ‘reputation’…and you will be around a long time to exact revenge, if they don’t…whereas the stranger passing by has nothing to lose really, by not reciprocating…what are you going to do? Track them down? THAT is the REAL basis of what we call ‘trust’…we trust in the threat of consequences negative and positive…short and long term, that motivate others to ‘honor their word’ and ‘reciprocate’…though we end up in expensive legal battles over all manner of absurd things, when people refuse to be ‘reasonable’ and honorable…but it is a last resort…allowing us to put MORE trust in people’s word / agreements / contracts…really society is all about reciprocation, or the use of force to ‘get away with unfair behavior’…

We reckon trust statistically also…based on past experience…ideally we can start small and let people earn our trust…so the cost of betrayal is low…though con-artists tend to ‘sacrifice’ small possible wins at first, to encourage trust, so they can make a ‘big’ rip off later…but insurance companies don’t ‘trust’ you any more than the finance company…they lend you money not because they trust you…but based on your statistical behavior, and the potential to enforce their claims on you…and they charge more the less trust these indicators suggest they should place in your ability and willingness to repay the debts…

There ARE some people you really DO trust…implicitly…based on their character / your experience of them…like you trust some brands more than others in terms of quality, because they have not ‘let you down’ and they have a good ‘track record’ and ‘reputation’…so you DO trust them more…which gets to the heart of persuasion and power…beliefs…why we believe we CAN trust someone / thing / idea / belief / expert / authority and NOT others…

Usually it is NOT well founded e.g people trust their governments…which have a history of deceiving them, sending them to murder other people and be murdered…wasting their taxes, corruption etc…really only an insane person would agree, based on readily available evidence, any government…but people still DO … even though they ACT all cynical…???

We speak of ‘Optimistic’ people…who are more prone to trusting, believing the best, about people, and life…expecting the best from both…so there is a clear bias based on ‘personality’…often due to life experiences, but not
always...some people just focus on the positive ... they affirm life...expect good things, despite their experience ... sometimes it is willful...forced...the person is too scared to ‘admit’ reality... and our mood swings can determine how optimistic or pessimistic, how trusting or cynical we are, at a given moment...and some things we value more highly, so we consider the risk involved more intently, and thus are less trusting, maybe with our emotions than with our money, or more willing to take risks with certain things, in certain areas...

How we feel about ‘life’ and ‘the world’ is usually a function of how happy / anxious / content / fortunate we feel at any moment...the happy want the world to go on forever, the desperately despairing and suffering will the end of the world...we are not THAT complicated...driven by selfish ends...If things suit us, they are ‘good’, if they don’t, they are ‘bad’.

Imagine putting decisions about ‘going to war’ in the hands of an alcoholic geriatric with delusions of grandeur, desperate to be a ‘big man of history’, with a history of total incompetence, his only ‘success’ being the withdrawal of troops from Gallipoli that everyone else was against sending there in the first place...and which a certain Cult wanted to ‘secure’ their ‘promised land’ for them from the current Turkish ‘owners’...

Manipulators seek to produce a particular emotional state such as fear, anger, optimism, fear of rejection, sexual arousal (even if subconscious) etc...to match the ‘idea’ or ‘belief’ they are peddling...so if you want people to sacrifice all their rights and ‘go to war’, you’d best establish fear in them...fear of invasion...fear of ‘terrorism’, and optimism about the outcomes of the war desired...if you want to ‘justify’ the ‘demonisation’ campaign you’ve launched, then you’d best first ‘release’ a whole lot of propaganda / lies about your ‘target’...especially if the people have caught on that the war was not necessary, nor ‘successful’ in reaching its supposed aims, and thus becoming suspicious, and even feeling guilty about all the war crimes they committed ‘following orders’ e.g firebombing refugee packed non-military target cities like Dresden, or Hiroshima...you’d best be ready with some ‘horror story’ to ‘justify’ and ‘legitimate’ that war...say a holocaust, and plans for world domination on the part of your ‘adversary’...who is not THEIR adversary at all...and never had any intention of becoming one...

Persuasion / manipulation is about producing emotional states, so the victim is receptive to your message...first the propaganda to demonise the future ‘enemy’ then to spread fear in the public, so they will ‘declare war’ on a nation that never threatened them in any way at all...

There are states of terror where people often find themselves incapable of any thought or action, like a Possum ‘playing dead’...from this extreme down there
are relative levels of ‘arousal’ … also consider how extreme pleasure can block out all other impressions, and all thought becomes focused on the pleasurable sensation / act …

Consider how words can provoke knee-jerk reactions…such as swear words, racist words, ‘bomb’, ‘terrorist’, ‘Nazi’, …

Why is it so hard to change people’s beliefs? Is it?

When the new belief would demand change…sacrifice…loss of face…admitting was wrong…admitting have DONE wrong / harm to others and self…loss of benefits associated, in their mind at least, with the alternate / new belief…having to adjust to new things / change, confusion, bewilderment, loss of emotional peace / benefits / pleasure / hope , even ‘excuse’ e.g fear / danger, the old belief provided…the rituals associated with that belief can be comforting / offer sense of structure / organisation / order…

Child is naturally curious…wants to know ‘the truth’…what happens between then and adulthood? Punished for ‘questioning authority’… finds risks loss of approval of ‘significant others’ like parents, if does NOT agree with them e.g religion / politics … bad grades at school … of course threatened with hell and offered heaven, for ‘believing’ certain things…strong taboos on some ‘beliefs’ e.g to believe X is O.K / good, and NOT to believe Y is ‘wrong’ / bad…we are ‘rewarded’ and punished for believing different things, or failing to at least be hypocrites, and pretend…Oh, and hypocrisy itself is rewarded … defined as acceptable, as is denial, distortion, numbing…we model others with authority and benefits / power to share…like the ‘top dog’ and ‘alpha male’… imagine all the boys who went off to kill each other in ‘war’ fearing to appear cowardly in the eyes of their parents, friends, lovers, would-be lovers, and future employers … and all lured by the propaganda of being ‘a hero, fighting evil, defending the innocent, defending women and children, then firebombing them, and machine gunning the survivors… of course at some point ‘reality’ intrudes, but it is quickly repressed / suppressed / ignored / numbed / denied … to avoid ‘conflicts’ and ‘guilt’ etc … we are taught to ‘compete’ also, and never show weakness / admit faults / admit wrong…to ‘lose face’…we could be taught instead to value being corrected by life / others … but we are not…we are ‘graded’ and ‘awarded’ and ‘accepted’ and ‘approved of’ and ‘loved’ and ‘nurtured’ when we are ‘right’, and risk losing approval / acceptance / status when we are ‘wrong’…but really being ‘wrong’ is just a step towards correction … what is ‘correctional’ about prison though? Does it take longer to ‘correct’ the willingness to murder, than the willingness to shoplift? So consistently? ALL murderers take 20 years, and ALL shoplifters take a month? Don’t SOME people ‘learn’ not to murder real quick? Why even CALL it a ‘correctional facility’? It is a punishment facility, or ‘exclusion / isolation’ facility…a ‘control’ facility…
So ‘knowing’ is simpler, more emotionally satisfying, brings confidence (usually false, and ALWAYS greater than is justified by our limited ability to know anything), a sense of comfort a.k.a ‘the known’ is comforting…certainty can be a relief e.g. uncertainty can be more stressful to deal with than certainty e.g. firing squad certainty can bring resolution / peace Vs will they / won’t they?…you can ‘deal with’ what you know…what you don’t, leaves you in suspense…’I’d rather know the worst than be left in suspense’…certainty is an illusion, but a ‘secure’ one…comforting…at very least allows us to ‘move forward’ and be decisive in some process…even ‘surrendering’ and signing an unconditional surrender brings the chance to ‘move forward’, after years of stalemate…getting nowhere…total capitulation frees up tied up resources…allows things to start flowing again…when you reach an impasse…declaring bankruptcy clarifies the situation…you can start rebuilding…giving up frees up your energies to start moving in some new direction again…death is a release and a new beginning…abandoning a project frees you to start something new…divorce frees up people to seek more positive and rewarding / healthy / satisfying / generative / productive relationships…cutting your losses rather than trying to recover ‘sunken costs’ frees you from that burden…admitting defeat frees you up to seek victory elsewhere…another time and place, rather than getting ‘stuck’ and ‘fixed’…all ‘idols’ that were cast in stone and metal and wood and ritual and ‘laws and statutes’ and ‘official histories’ become literal ‘dead weight’ and ‘necrotic tissue’ in the living tissue of the living organism / community / world of ideas / society / organisation…they may have offered some sense of security and comfort ‘of the known’, but they soon outlive their purpose, and any value they offered is exceeded by the costs…and the longer a ‘noble lie’ is allowed to endure, the more corruption will grow around it, the greater the abuses, as ‘clever’ people realise how to ‘exploit’ people’s willingness to believe / need for security and peace of mind / certainty, gullibility, superstitious fear etc…

Confusion is the first sign of opening up of fixed ideas / beliefs…certainty is for fools and dogmatic lazy smug complacent cowardly people…confusion is the product of questioning and awakening…skepticism is the ideal state…no beliefs fixed as dogma or ‘certain’…but practical heuristic ‘rules of thumb’ as guides…flexible, open minding, searching for truth, never assuming have it…never assuming ‘correspondence’ between what ‘think / believe’ and ‘what is’…and never any assumption that there is any actual fixed ‘reality’ at all…even anything ‘out there’…beliefs become playful, curious…’what it’ and ‘what about’ and ‘why not’ and ‘lets try X’ and ‘Is Y REALLY true? …Zen Humean Skepticism…with the Buddhist empathy / benevolence / good will / ethics as the fundamental motive and final arbitrator of ACTION … independent of ‘certainty’…no dogma…just a quest to seek the best description of what appears to be ‘out there’…the closest isomorphism…one to one relationship between our representation and what is ‘out there’…while realising this itself can be an illusion…that ‘out there’ may be ultimately ‘in here’, and ALL a product of our
imagination / illusion / representation…’the world as will and representation’…which is why our will MUST be good…Buddhistic…benevolent…desiring the good of all sentient beings…to speak the benevolent truth…to seek the benevolent truth i.e with good intentions, not malice…to find the ‘facts’, not punish people, embarrass them, harm them in any way, ‘cut down tall poppies’, ‘cut down the tall timber’, ‘get even’, hurt anyone in any way…but to avoid future harm, to minimize harm, to encourage positive generative growth…

Children are curious until they learn that there are ‘costs’ imposed on anyone who dares suggest there might even BE anything at all to be skeptical about…sure they are allowed to doubt the good intentions of ‘foreigners’ and foreign religions’ and ‘other political parties than your own, etc… but that is all WWF controlled stuff…all religions need to ‘demonise’ the competition…to HAVE demons…and the true manipulators of the world love to use up all your energy and enthusiasm in WWF style ‘politics’, so you won’t even LOOK for REAL alternatives to the totally corrupt political system and party systems…But for a moment doubt / be skeptical about YOUR OWN religious ‘authorities’ or your OWN government, and wait for the hammer to fall…and hurt…hard…and long… to be rejected by your own family…in cases stoned to death BY them…and your ‘friends’…

It is so patently absurd…the hope was that multi-culturalism would lead to ‘emancipation’ from such closed loop belief systems…when people saw OTHERS being ‘fooled’ into such ‘ridiculous’ beliefs’, they might awake to the fatuous nature of their OWN inherited beliefs…once they see others believing all manner of things that ‘contradict’ what they themselves were brought up to believe, it might reveal / expose how ‘inherited’ most beliefs are, and how unworthy of belief they really are…how culturally conditioned…rather than ‘self-evident’ and ‘natural’, and ‘compelling’…to some extent this has been the positive result…with ‘religion’ losing its ‘authority’ over people’s minds, and then lives…though billions of people live in prisons constructed out of religious taboos / beliefs…still…and several cult offshoots of the one cult would love to impose their dogmatic beliefs on YOU…and the ‘mother cult’ actually HAS…beliefs such as ‘The Holocaust’ and ‘911 was Islamic terrorists’, and ‘Sandy Hook was real’ and ‘Port Arthur was a crazed lone gun man’…remember the Maine and forget U.S.S Liberty, among endless lists of ‘false flag’ operations…oh, and ‘just wars’ abound…and ‘we will NOT become entangled in foreign wars, you have my word’ repeating Wilson / Rooseveldt election promises…etc…so many ‘beliefs’…and it is a criminal offence to challenge some of them, like ‘The Holocaust’, in the exact same way in some other fundamentalist religious states (Germany is in the thrall of the cult of course) make it a criminal offense to speak of ‘the satanic verses’ of the Koran…as it once was, again in Germany, to challenge the idea of ‘transubstantiation’ or the
authority of the pope...nothing has changed...just the nominal beliefs...the power being abused is the same, and to the same ends...control / enslavement of YOU via your nominal beliefs...you don’t have to be ‘certain’ and a ‘true believer’, must uncertain enough of yourself NOT to ‘rock the boat’ and ‘challenge the official lies / fictions / history etc...

It is hard mental and emotional work to abandon long held beliefs...which provided emotional benefits ... certainty ... often a sense of purpose...and entitlement e.g to eat other sentient beings as ‘god’ made them for that purpose...tell a tiger that one...the right to enslave others...even rape them, steal their shit, take their land...you think THAT is something that belongs to history? Wake up people...1945 was when the role models of the Torah were emulated in reality...and history made...with genocide...that is ongoing...and soon to include YOU...oops...flashback...what’s it all mean?

There must be a will, and thus a willing-ness, to accept losses in order to free your mind. The loss of ‘entitlements’ to exploit / abuse / opportunistically exploit / enslave other sentient beings. Whether Chinese workers, immigrants, people less talented / capable / smart / attractive etc than yourself...or chickens...

We need to literally ‘shake off’ fears and superstitions...like L Ron with the ‘thousands of sentient beings that inhabit your body’... a metaphor for the ‘beliefs’ that literally inhabit your mind, and possess you...body and soul...more than any ‘demonic possession’ could...because it is unobtrusive...you think and feel it ‘part of you’...your beliefs...they are well known, familiar...as if a part of you...and you feel that ‘giving them up’ is like LOSING a part of yourself...killing a part of yourself...will you even KNOW yourself once you’ve given up all these beliefs? You’ll be such a ‘changed person’...literally a ‘new’ person...

Don’t forget the guilt...the sense of betrayal of your parents who did so much for you...maybe even those great teachers and a few really nice priests who went out of their way to help you, made such sacrifices...parents blackmail children into maintaining cultural and religious rites / beliefs emotionally...the ‘Jewish’ mother is an archetype of the entertainment business, to be sure...but ‘guilting’ children is universal...parents doing the work of the cult leaders are the most powerful ally...emotional blackmail / manipulation is the most powerful...the feeling of guilt from ‘betraying’ your parents, your family, your community, your ANCESTORS can be massive...we don’t want to ‘wound’ those who have helped us, whom we love and respect...by rejecting their cherished beliefs, customs, rituals, etc...it is one and the same...religion is just a ‘belief’ in a certain set of dogmas...nothing more...reproduced beliefs...

So we need a ‘veil of ignorance’ to start the process, and give it a chance...to totally decouple the ‘informational content’ of beliefs from the ‘emotional
content / charge of those beliefs’...the valencies if you like...positive and negative...so we can view the belief clinically...analyse it as a neutral specimen with zero emotional investment in the outcome...

Without that, in some form, we are left with less powerful options. At very least we must ‘defuse’ and ‘debunk’ and ‘de-potentialise’ the fears...e.g that if you don’t cross yourself or prostrate yourself 5 times a day you will go to some horrific nightmare place called Hell...(which originally meant ‘bright’, and was a ‘good’ and ‘desirable place’)...

We must ‘shake off’ the fears...the associations between NOT observing some ritualistic rite / behavior / practice e.g going to ‘church’ on Sunday, and horrific consequences...to break down the superstition...to eliminate the fear...but how to ‘prove’ something that is just a story? Could anyone DIS-prove ANYTHING that is just a story? In what way?

By showing it is inconsistent with OTHER things we CAN demonstrate / document / prove in some way? But then they just change the story on you, to accommodate this new info...or make it a criminal offence punishable, in theory, with a life time solitary confinement prison sentence, to offer the public that information, to even publish it, and speak of it...yes folks, people are in prison now for that, others spent 3 to 10 years in prison, usually in solitary, with NONE of the usual resources made available to even rapists and murderers...simply for speaking in private meetings about proveable / demonstrable facts of the ‘scientific’ variety...not mere ‘beliefs’, but ‘correspondences’...you guessed it...’The Holocaust’...just as before it was a Torah crime to ‘deny’ anything written in the Bible / Torah, it is today a crime in most Western nations to ‘deny’ anything written in the latest chapter of the Torah, a.k.a ‘The Holocaust’ and ‘911 was carried out by the adversaries of the Cult of Judah’...

META communications are powerful e.g tone, speed, tempo, body language, volume, pitch, ‘tone’, modulations in all of these, facial gestures, punctuation, manipulative / emotionally loaded / suggestive / insinuating / coloring / etc language...drawing on emotional ‘anchors’ e.g propaganda and myths and thus ‘triggering’ emotions rather than ‘reason’ and ‘critical reasoning’ and ‘logic’ and calm reckoning etc...key to hypnotists / trance therapists efficacy...suggesive language...that ‘suggests’ to subconscious and non-rational / conscious mind to think / feel / act a certain way...evades / bypasses critical faculties...appeals to emotions and subconscious desires / impulses and speaks directly to subconscious mind itself...for good / therapeutic ends, or malicious / evil / vicious ends...it is a tool...and Cults are the masters of its opportunistic exploitation...with the worst motives...and Erickson / therapists and ethical teachers have the best motives...but easier to appeal to worst in human nature...more likely to prevail...easiest...lizard brain...reptilian...lower order autonomous functions...of predator and competitor...basis of evolution...
A sarcastic or ironic tone, wink, nudge, or other ‘meta-communication’ can reverse the meaning of the utterance from ‘I love it’ to ‘I LOVE it’… Thanks mate to, THANKS mate…can’t actually ‘write’ i.e encode sarcasm…makes TEXTING and email quite dangerous … lucky we have ‘smiley faces’…so use them …

I observed, around the world, how all the ‘news presenters’ and ‘hard hitting / authoritative expert ‘journalists’ would adopt the EXACT same mannerisms e.g posture, facial gestures, voice tone, vocal register, eye contact and looking away, leaning in (to indicate ‘guest’ is under attack / is being ‘interrogated’ and challenged…all emotional manipulation…emotional impact that ‘changes the meaning’ of everything…give impression of being serious journalist, caring, authoritative, expert, trustworthy, ‘hard hitting’…can make an innocent positive caring open guest appear sinister, defensive, criminal, by ‘leaning in when asking question’ as if interviewer KNOWS they are lying / evil and is going to ‘reveal’ and ‘expose’ them, … like a thrust of a spear…an attack…by leaning way far into them, as if what they are SAYING and the QUESTION is a real THREAT to them…they’ve launched an attack…via the ‘hard hitting’ question…and no matter how harmless or positive the answer, it will be ‘received’ with all the meta-language and non-verbal responses as if the interviewer has just exposed a scandal…A-ha…got you…THAT is what the viewers ‘perceive’ from the interaction, despite the actual WORDS and responses of the ‘guest’ being interviewed…would love to parody this…just need to watch a few ‘hard hitting journalist’ interviews in the corporate media, to emulate all their ‘choreography’…they are trained actors—trained to make the audience ‘feel’ that the ‘guest’ is evil or good, open or hiding something, nice or nasty, no matter WHAT the guest actually says or how they behave….

Not to mention the use of adjectives and adverbs to make it clear what INTERPRETATION and EMOTION the viewer is supposed to have … e.g the HORRIFIC X, never the ‘X’ factual and objective…they are told it is HORRIFIC…not given a chance to reckon the facts / information…they ENCODE it as TRANSMITTED…as a HORRIFIC act…not as an ‘ACT’ which they themselves can later decide the nature of… it is NEVER the ‘Nazi’ occupation or NAZI regime…it is always the EVIL / Criminal Nazi Regime…in ALL modes of communication from supposed sober textbooks and ‘objective’ reporting down…you cannot escape the constant chronic suggestion of evil…so that you will NEVER think of NAZI’s without the SUGGESTED emotional FRAME of ‘evil’ and ‘criminal’…when in fact Nazi’s did MASSIVE amounts of good for tens of millions of people…the evil nazi ideology was superior in MOST ways than the supposed ‘Holy’ ideology of the religions of the book’ i.e Cult of Judah and its spin-off subsidiaries and franchises…
We talk of ‘Holy Moses’, the most evil man and his Cult in history…whereas Hitler is always, as in his ‘waxworks’ image, depicted as a raving madman…when in fact he is one of the Most ENLIGHTENED and honorable and rational and caring men in history…you go to prison for stating this objective FACT…either of them actually… for the ‘hegemonic conditioning’ is to have you make a knee jerk reaction in FAVOR of one of them, and AGAINST the other…automatically…reptilian brain style…so you NEVER bother looking into the FACTS about these two people, one of whom existed, the other merely produced, in typical Hollywood Cult of Judah propaganda style, as a role model and source of ‘transferred authority’ for the most fatuous and genocidal ideology ever vomited from a human’s oral cavity, or emitted as noxious flatulence…

Oh, of course you probably ‘read’ (encoded / thought) I was speaking of the ‘good’ man, and not the evil ‘bible story character’, right? Wake up people. And smell the shit, before it hits the fan, and covers you, and everything in sight…you can still clean it up, and flush it down the loo, but once it hits the fan, it will be all over YOU and your world…and almost impossible to remove…THAT will be your Cult of Judah World Order…

Mass Media ‘presenters’ and public relations people, including ‘politicians’, are all trained carefully to focus on the non verbal…to manipulate us…we respond to the non-verbal in the same way animals ‘understand’ our meaning…via the tone of our voices e.g angry or friendly…they ‘know’ you are ‘scolding’ them by your tone of voice…or that you love them…or are approving their actions, or disapproving of them, even though they probably think we are irrational as why get angry over THAT? What’s the big deal about THAT, that makes them so happy, and THAT, that makes them so angry, they must think…Mass media ‘communicates’ with us, the way we communicate with animals…and they communicate with us…via the more important non-verbal messages…the slogans are there to ‘stick’ in our minds, and be associated with the more important non-verbal messages of belonging, approval, acceptance, success, status, etc…

Imagine that female ‘interviewer’ asking the friendly, nice, warm hearted animal lover ‘So you love your pets’, while leaning deeply into them, as if attacking, in a tone of voice that is accusative / interrogative / full of hate / venom / prejudice / loathing … as they they have accused them of some horrific crime, and KNOW they are guilty, and are about to expose themselves…in a tone that dismisses any possibility of the person NOT being guilty of the heinous crime…then the person answering mildly, oh, yes, I love dogs, their face alight with goodwill…and the interviewer responding, non-verbally, with barely contained rage and disgust at this filthy disgusting creature and his horrific crimes and sinister and evil motivations…and think what ‘message’ most viewers would bring away from the interaction…not the actual words of each interlocutor…not the warm, nice, fuzzy feelings we SHOULD and WOULD normally have gotten
from the manner and tone of the guest, but the feelings of revulsion, the
definition of the guest as EVIL, that was intended, and carefully suggested, by all the interviewers non-verbal communications to the viewer…a transcript would reveal nothing….in court or in history documentation, you’d read the actual words, and see nothing really manipulative in them…and you might wonder at the emotional response of the audience…if you became aware of it…you’d have to SEE the interview, and HEAR the interview, to comprehend all the subtle and really dramatic manipulations employed…

Ask yourself, how many speeches of Herr Hitler have you seen and heard in which he speaks in a calm, relaxed, friendly, chatty, loving tone? I was shocked the first time I came across such. Then realised that all we ever get to see are the ‘angry’ responses of Hitler to the war crimes of Britain…and the speeches given at military rallies, or political rallies, in legitimately /reasonably /rightfully angry and defiant speeches …when you hear him speak ‘normally’ it is shocking…and you can see how the Germans fell in love with this man…the last true leader to emerge from ‘the people’ and work ‘for the people’…

If you try to motivate people, and instill confidence, you first have to fake it or reproduce it within yourself…BE confident and BELIEVE in your message…telling someone ‘yeh, I love you’ in a frustrated, angry, irritated, monotonous, loud, screeching, sarcastic, etc tone, will clearly NOT impart / encode / transmit any ‘love’…if you want someone to believe you believe in them, you have to really ‘sell’ it…believe it in your own mind, even if you are faking it to encourage them…if YOU don’t believe it as you say it, THEY won’t…they’ll hear what you REALLY believe … and if YOU don’t believe what you are saying, why would THEY? Why SHOULD they?

Alternately, many of us do not use the expressive content of our voices and body language…we are self-conscious and constrain our voice and body language…so when we honestly ‘feel’ and ‘believe’ something, we don’t convey it…we sound and look mechanical and uninspired…we don’t ‘project’ our emotions…we keep them bottled up…we stifle our expressive body language…we appear as robots…which do NOT inspire people…and are NOT believable…the words we utter may say what we mean, but the rest of our meta-communications put a damper on it / restrain it / deny it any ‘life’…thus contradict and undermine and negate and neutralize our sentiments / emotions and the communication of them..

The most honest people can come across as ‘liars’ as they fear they will be misunderstood, and all the interlocutor senses is the fear… and us trying to hide it…so they see fear and ‘they’re hiding something’…and don’t trust our words…we LOOK guilty or undesirable…like Nixon debating with a the flu, then placed under hot lights to make him look as ‘ill at ease’ as possible…so the Cult of Judah could prevent him, a non Cult member and ‘emancipator’ of the
Cult victims, gaining office...he did anyway, so they tricked him into behaving a little ‘tricky’, then blew up the incident that no-one in the public gave a rats arse about, into some huge scandal, and ultimately got him impeached...for a child’s misdemeanor, compared to what other Cult of Judah puppet U.S dictators / presidents have gotten away with, without the slightest public attention / spotlight being directed upon them, let alone a massive full scale public opinion / negative public relations demonisation campaign...not since Hitler had any public official been so publically demonised, and with so little justification...

If we are good people with positive, constructive messages, we need to make our appearance, meta-language, and words, congruent with the message...the evil people of this world devote a lot of training, coaching, practice, like any trained actors rehearsing / auditioning for a role in a film...to all the verbal and meta-communications that will make their acting of a particular role, say ‘the change we can believe in’, or ‘santa clause’, convincing to the casting directors, and the public...so the EVIL people of this world are much more convincing as ‘nice people’ than the truly GOOD people, who often come off as ‘abrasive’ and ‘unlikable’, whereas the pure evil actor is tightly choreographed and scripted and trained to ‘come off fas ‘ a nice guy, dependable, trustworthy, loveable, likeable, ... Jay Gatsby knew how to ‘win friends and influence people’ by ‘making THEM feel THEY had made the best possible impression on HIM they could ever have hoped to make’...i.e make your victims feel good about themselves...never criticize them...etc...tell them what they want to hear...if they want peace, promise it, while preparing for war, starting with the propaganda...

Of course the ‘internal state’ of the listeners is also key...this is ‘set up’ with props, propaganda, public relations, so the listener is already ‘prejudiced’ in favor of whatever the actor is going to say...to believe them...to ‘enter into’ the story...to suspend disbelief...

Professional ‘cheer leaders’ motivate and ‘boost’ the morale of their clients, so that the ‘message’ and ‘messenger’ appear congruent...i.e entrance client to feel the message...to fake it so it seems real...to really believe the lies they are saying...so they come across as believable...the faked confidence and good will is always more convincing than the real thing...because more effort has deliberately been invested into projecting it...in words tightly scripted and memorised or read from teleprompters, and in all the trained and choreographed mannerisms, practiced tone of voice...all tightly controlled and deliberate and carefully rehearsed and practiced, until a thoroughly convincing ‘picture’ is formed...one in which ‘everything is in place’ and ‘all the parts support it other to produce a convincing whole’... and all based on what will ‘work’ and ‘trick’ the audience / listener / interlocutor into ‘falling for the act’, and ‘believing’ it...everything has to be ‘in place’ and ‘on message’, from the clothing, the
stance, the eye contact, the smile, the tone of voice, the ‘authoritative / trustworthy ‘look’, the ‘confidence’, the ‘benevolence’ the ‘goodwill’, the ‘determination’ the ‘optimism’ the … all that shit…micro-managed so tightly that even some ‘authentic’ appearing ‘goofs’ and ‘human’ responses are scripted into the act… to make it appear ‘authentic’ and ‘organic’ i.e ‘losing their cool’ ‘because they are human after all’, and ‘making some ‘human’ mistake…something harmless, but just enough so it looks like they are just ‘improvising’ and you are seeing ‘the true person’…oh, they just CARE so much sometimes their emotions get the better of them…UNDERSTANDABLY…and of course it is the ‘holocaust deniar’ or ‘historical revisionist’ who ALWAYS is on the receiving end…just to emphasise the HORRENDOUS and TOTALLY UNFORGIVABLE nature of their CRIME in simply presenting FACTS which contradict the propaganda…just to UNDERLINE the response YOU are MEANT and conditioned to have just at the very IDEA of anyong NOT just swallowing the propaganda whole, and demonizing anyone who refuses to / cannot do so, because it is such a monstrous, foul, evil, rotting, decaying, putrefied mass of vomit, flatulence, and excretions…

So while the honest, good natured, good willed, authentic, organic, REAL person pays little attention to the meta-messages they are sending by their guestures, clothing, body language, tone of voice etc, expecting their TRUTHFUL factual message to be all-important, and the ‘overall impression they make to be irrelevant, after all, it is about the message, NOT the messenger right? They are ‘voting’ (with their beliefs, purchasing decisions, or voting decisions) for the MESSAGE, and NOT the messenger? Right? WRONG….people vote for the messenger, in the end, mostly… so the honest presenter of a message, who pays not heed to all their ‘meta’ messages and communications e.g hairstyle, clothing, posture, tone of voice, eye contact, smile, and all the things the pro’s invest years in ‘mastering’, all ‘betray’ them and ‘undermine’ their chances at gaining first an audience, and thus a ‘voice’, let alone persuading them of the merits of their arguments, no matter how compelling these arguments are…those who will NOT ‘play the game’ have no chance…Socrates got a death sentence for his refusal to ‘play this game’…he could have gotten off, but he defied his attackers…a deadly mistake if you want to persuade people of ANYTHING…let alone win friends and influence people…whereas the evil lying fuckers well trained and rehearsed and coached, ‘come off’ as ‘nice guys’ with ‘compelling arguments’…they make a good argument is the feeling, based not on anything they say, but how they communicate all the ‘meta’ things we look for in an ‘authority figure’, or ‘leader’ or ‘guru’…the things we EXPECT to see in ‘good’ people…trained as we are by the movies and media…full of ‘fakes’…very convincing fakes, because their ‘choreography’ is based on at least 3000 years of research, hit and miss, trial and error, observation, and training…Cults deal in persuasion above all
else….why do you think they invest so much in the ‘costumes’ and ‘stories / scripts’ and all the props and rituals, and then find the ‘right looking players’ to act the leading roles, while the cult leaders pull the strings ‘behind the scenes / curtains’…

You see Cults carefully pre-select and ‘groom’ their actors…the ones who will be their ‘public’ face…the popes, high priests, politicians, ‘news’ presenters…they pre-select thousands, then work on them until they find the best ‘messenger’ to present / represent their strategies…not directly, but simply to gain the positions of power and influence…so the actor is paid to act a certain way, be convincing, gain the trust and goodwill and respect and admiration and approval and acceptance and obedience of the masses…to simply gain elected office, and rise to the top of the corporate and public service organisations…where once in power, they will be dictated to, by their handlers, about what policies to ACTUALLY carry out…get elected as ‘change we can believe in’ then ‘stick to the 3000 year old plan’, get elected as ‘the president who will keep us out of foreign entanglements’ and ‘reduce military spending’, to immediately massively ramp up military spending, and commit war crimes around the world, leading up to the end of the 100 years war begun at the start of the 20th century, which will go down in history as ‘World War THREE’…

If the Cult thinks ‘it is ripe for a swing from one party to the other’, but their best candidate belongs to the party likely to lose, they will simply have him change parties…easy to do if you have unlimited financial and mass media / public relations / propaganda resources…take a look at Roosevelt / Wilson / Churchill…

Entire Churchill film should have woken people up to the fact that Churchill was an alcoholic, war mongering monster…that there was absolutely ZERO reason for Britain to have become involved in War with Germany…they at least admitted that peace offers were made…though didn’t speak the whole truth, that alone was surprising, but I expected a ‘twist’ to put a ‘spin’ on the whole thing…which came right at the end…but what people NEVER consider about his (Who wrote them?) speeches was the absolute LACK of ANY context…talk of ‘defending Britain against an invasion…they’d fight on the beaches and in the streets…etc…when there was NEVER the slightest hint from the Germans of any planned invasion…the British had sent an EXPEDITIONARY force to attack Germany…to invade Europe…NEVER the other way around…and like Gallipoli, was a total failure…but ‘spun’ as a ‘success’ due to the successful ‘escape’…when as far as I know, Germany ALLOWED them to escape…Hitler ordered this…the garrison who attacked the Germans, at Churchill’s command, attacked Germans and thus they defended themselves against the garrison…but the 300,000 troops at Dunkirk was more or less left in peace to evacuate…HITLER NEVER said anything about a British invasion, nor
were any plans EVER drawn up for that, nor was there ANY sign EVER of a plan to invade...Churchill made it sound like (his speech writers cleverly manipulated the language and representations in people’s minds) Hitler was invading Britain, and Britain was only carrying out ‘defensive’ operations...when the FACTS are that Britain attacked Germany...NOT the other way around... the FACTS are that Churchill was almost personally responsible for the British losses, and loss of Empire...no mention was made of ‘Jews’ supporting his lavish lifestyle...just that he was ‘bankrupt’...shown living humbly, no sign of his lavish mansion and whole host of staff, servants, grounds keepers, gardeners, cooks...fact he got ‘fired’ indicates very strange situation...did the PEOPLE ever VOTE for war?

People rarely become aware of what they have assumed, and taken for granted, and failed ot interrogate, and investigate...I keep asking myself ‘what am I taking for granted’...what am I assuming...what aren’t I interrogating...what part of what I believe might NOT be compelling? Also, ‘how could my well intended actions be manipulated by the Cult to its own ends...they need ‘adversaries’ and if they don’t get them, they pay actors and mercenaries and employ their own occupied nations military / political / legal system to carry out 911 and U.S.S Liberty and Oklahoma city and Port Arthur style false flag attacks, to blame on some imaginary adversary they have ‘concocted’ with hired actors, faked news reports etc...you’d never KNOW the difference between a ‘real’ terrorist attack, and one your own government carried out...usually the ‘real’ terrorists work with your governments money, training, and intel anyway...you always have to be wary about how what you do can be used against you... against your positive mission for peace and justice...and freedom...any violent act that did not literally wipe out the leadership of the cult of Judah, and all its operatives, would only be welcome by the cult, as an excuse to take advantage of all the martial law they already have on paper...but have not fully employed against the masses...and to ‘demonsie’ the adversary/satan means adversary...as evil...and ‘justify’ even more censorship, gun controls (control of the masses ability to defend itself from tyrannical governments and cult of Judah puppets / occupation govts)...

Have you stopped torturing your wife? How to answer that question with a yes or no? THAT is the sort of ‘chance’ a historical revisionist / holocaust hoax revealer faces in court...you are NOT given the chance to prove that you NEVER STARTED...so what are you going to answer? No? Yes? And admit the guilt of having tortured her in the past? THAT is the sort of ‘justice’ you will get as a ‘holocaust hoax debunker’...totally ironic when the judge asks you to ‘be honest’ and tell him if you’ve ‘publically stated that the holocaust is pure propaganda, a lie’...when the whole point of the persecution of holocaust ‘denier’s by the jew-diciary is to STOP people telling the truth...in ANY situation...so you’ll be treated like a criminal for telling the truth, then like a
criminal for ‘lieing’ and saying ‘no, I’ve never told the truth about the holocaust in public’ etc…this world is such a head fuck !!!

Of course the question ‘Do you deny the holocaust’ is so loaded with assumptions…like being asked ‘do you believe in god’…it is in fact the NEW equivalent of that question…how can you believe in something that does not exist? If you answer that question, you are supporting the assuming that this god exists, but you simply don’t believe in him… in the same way as you can NOT answer the first question, without implicitly / tacitly validating the assuming it is ‘loaded’ with, and tacitly requires, to make ANY sense as a question…”Do you believe in invisible weightless, massless pink elephants?’ Would you answer THAT question? Ah, and why DON”T you believe in invisible invisible weightless, massless pink elephants? Do you DENY that invisible, massless, weightless, pink elephants exist? Don’t you know millions have murdered and been murdered, over arguments about their color? Its in fact traditional. Who are YOU to reject the wisdom of thousands of years of ‘religion’ and ‘genocide’?

To DENY something, you have to assume it exists. Is real. You cannot ‘deny’ things that don’t exist. No-one asks you to. They ask you, perhaps, do you BELIEVE in X…they don’t ask ‘Do you DENY the existence of Santa-Claus? Of the Easter Bunny? Of elves and fairies?

But the thing is, it is easily proven that the holocaust is a hoax…pure propaganda, which is why it is a CRIMINAL OFFENSE to do so…imagine that…you COULD easily prove the holocaust never happened… so they don’t LET you…so how to defend yourself? There is NO defense, other than trying to pretend ‘it wasn’t me’, ‘I never said that’…no-one cares if what you said was true, and that you can prove it…it is insanity…no different to the Inquisition. On the other hand, McCarthyism, which is demonised as insanity, was perfectly sane and rational and it is today clear that Senator McCarthy, rather than being paranoid, was operating on the side of caution… for it has been proven that the problem of jew.S.s.R infiltration of the Jew..S..A was massively greater than even HE ever imagined…let alone publicly claimed…

When a government stops a protest because they ‘fear’ violence, they are implying there was something to fear…that the demonstrators were violent…I can only fear cats if there are cats…I don’t cancel my party because I fear cats..unless I assume cats will be present…

The Cult of Judah’s ‘preventative strikes’ and ‘pre-emptive strikes’ and other Nuremeberg style war crimes, which the Jew.S.A has employed since forever, allow them to ‘assume’ an attack is coming, and thus ‘defend’ themselves from this ‘coming’ attack, by attacking their ‘adversary’…now imagine how this ‘adversary’ is going to respond to this logic…what alternative do they have but
try to attack first...and when they do, as Hitler did, who gets the ‘blame’ for the war...even the invasion of Poland was a response to Polish occupation of huge chunks of Germany...so what if some bunch of Jews somehow made it ‘legal’ with some totally unjust, criminal ‘Treaty of Versailles’...which some well intentioned, or stupid and naïve and manipulated / corrupted Germans ‘signed’ it...fearing the alternative of total destruction after they had voluntarily ‘ceased fire’ and disarmed themselves!

The public has been conditioned with ‘complex equivalences’ that are totally unconnected to reality...knee jerk emotional responses are the desired outcome...irrational...without thought or reflection, let along interrogation...just say ‘nazi’ or ‘hitler’ or ‘holocaust’ or even ‘911’ and most people will give the scripted / standardized / conditioned / implanted / suggested set of responses...like Pavlov’s dogs...we were all trained to suddenly jump to a lot of propagandistic images / emotions / ideas / beliefs...none of which have any relationship to the reality of what happened before, during, and after WWII in Europe...

The thing about unstated assumptions is that you have no reason to interrogate them...you overlook them...they are not on any of your maps...they are part of the terrain that is deliberately not included in ANY maps...and all map copiers, teachers etc replicate and reproduce the maps, ad infinitum...until people take the map for the terrain...and if they actually stumble upon something not drawn on their maps, they just ignore it...overlook it...why worry about it...surely THE AUTHORITIES WOULD NEVER LIE TO US?

I mean, YOU would never lie in return for millions of dollars? Convince yourself the lie was true, so you could take the money and run? Realise your ambitions for power, pleasure, relief, luxury, privilege? What if you were offered tens of millions? What’s YOUR price? Probably just ‘getting to keep my job’ and maybe get promoted later? THAT was all the Jews in the Jew.S.S.R who ran the show had to offer most people to ‘get them to go along’ with all the obvious lies, deceptions, propaganda etc...and the mass killings and working people to death that make even the lies of the Jews 6 million pale in comparison to ‘oh, just a few million’ compared to 70 Million! not even 10% of the supposed ‘holocaust’ death toll...but because JEWS commited the crimes in Eastern Europe, you can ‘DENY’ it all you want...and you will not see ONE SINGLE movied from Hollywood or elsewhere, on this REAL holocaust...

Scientists have already begaun ‘constructing viruses’ for use in gene splicing...a virus is a genetic code...If it is similar to a living organism, it will not be recognised as ‘alien’ and ‘a threat’ by that organism’s immune system...it won’t be ‘labelled’ and ‘explode’...like a virus software program ‘missing’ a new computer virus that has not been identified for it yet, and thus IT does
nothing…it does not SEE a virus…just some code…and so the code can ‘integrate’ with the computer software, and be ‘executed’…and do damage…but if scientists are constructing such viruses, it seems clear HIV could be one of them, and all manner of ‘new’ diseases…or immune system suppressants…that would leave us all vulnerable to even the common cold…by ‘camouflaging’ any strain of the cold virus well enough, so our immune system never ‘flagged’ it for response / destruction…like WE do NOT flag our ‘religions’ and ‘cults’ especially the Cult of Judah members as ‘threats’…we’ve been ‘trained’ NOT to see what is right in front of us…an occupation…false flags…war crimes…etc etc etc …

Erickson used such ‘hidden’ assumptions to bypass client resistance and limiting beliefs...‘Don’t fall into trance too quickly now’...’Will you X immediately, all at once, or slowly? Only your subconscious knows best’...all assume an outcome…the desired outcome…do you want to X now, or a little later? You don’t need to fall into trance quickly…
Polygraphy (The Lie Behind the Lie Detector. George Maschke & Gino Scalabrini) AntiPolygraph.org

U.S government uses deception a-la ‘Plato’s Republic’ i.e ‘noble’ lie. ‘To the rulers of the state then, if to any, it belongs of right to use falsehood to deceive either enemies or their own citizens for the good of the state: and no one else may meddle with this privilege’. —Plato MHR the good of THE STATE and NOT the individual … a thing that does not even exist outside of the imagination has more rights, to Plato, than actual living sensate persons !!!

Polygraph charts changes in blood pressure (increases), heart rate (faster), breathing (first quickens then slows afterwards), and perspiration /skin moisture.

Most polygraphy employs the ‘Control Question Test’. ‘Control’ questions as those the operator assumes in advance that the examinee will answer falsely, thus giving the operator a chance to ‘calibrate’ the physiological responses associated with deception in the examinee. Basically how that individual’s blood pressure, heart rate, breathing, and skin moisture change when they are lying. E.G Did you ever lie to get out of trouble? Operator assumes examinee will lie, and deny ever having done so. The operator in fact encourages the examinee to lie by implying that a positive answer could disqualify them from employment. When in fact it is
assumed that everyone, at some point in their lives, will have lied to get out of trouble.

The operator can now compare responses to the actual questions of interest e.g. ‘Did you ever use an illegal drug’, to these benchmark ‘lie’ responses.

The basic rule is that if the physiological reactions to the actual questions are greater / more pronounced than the reactions to the control questions, the examinee is flagged as ‘deceptive’, if they are the same, the result is deemed ‘inconclusive’, for that question. And so the simple countermeasure employed by actual professionals such as spies, would be to exaggerate the responses for the ‘control’ questions, to ensure that any responses to the actual questions will be less dramatic.

Between the ‘Control’ and ‘Relevant’ questions, operators will place ‘buffer’ questions such as ‘Are the lights on in this room’, telling the examinee that THESE questions are the ones used to calibrate ‘honesty’ responses for the examinee (mis-directing them away from the fact that it is the ‘control’ questions which are used for this benchmarking purpose).

The problem is that the confident, honest, person, who has NOT behaved in ways the test designers assume, will have very little response to the ‘control’ questions and will thus be setting an impossibly low baseline benchmark to compare the ‘serious’ questions against. Having honestly ‘denied’ a control question, with little or no physiological responses, when asked a serious, threatening question, they are likely to have higher physiological responses, and according to the test rationale, will appear to be lying, simply because of their ‘above the baseline’ physiological responses.

It is a question of stress response. If you have NOT done the things the test designers assume EVERYONE has done, you can answer in the negative, without feeling any stress. But most people experience some stress when asked very important, legal etc questions. So simply by being a ‘better’ sort of person, the examinee dooms themselves to fail the polygraph test.

The same problem applies to people who ‘admit’ to their guilt re: the ‘control’ questions, understanding that ‘everyone’ has committed the acts asked about in the ‘control’ question, and thus it could surely NOT be of any serious interest to the operator / potential employer.

Either way, the ‘better’, more truthful examinee will thus be disadvantaged vis a vis the deceptive, more ‘average’ examinee. Either way, the better candidates will thus be excluded from employment. Further, they will now be stigmatized for life as having ‘failed a polygraph’.
And the professional can simply increase their physiological responses to the ‘control’ questions via mental activity such as solving mathematical problems, vividly remembering / imagining something exciting, or biting the side of their tongue. All of these activities will produce the physiological reactions being measured. And so when they come to lying during the interview in response to the ‘Relevant’ questions, they will have set a benchmark / baseline very high, the equivalent of setting the ‘bar’ of a high jump so high that no responses they make during the interview, to the ‘serious’ questions, is ever likely to exceed them.

Polygraph operators will lie, and tell you that they can ‘tell’ when someone is employing such ‘counter measures’ but the fact is that they can NOT. They may imagine they can, but no scientific study has EVER supported their delusions. In fact it is simply a ‘professional’ lie. The equivalent of a ‘Platonic’ ‘noble’ lie, intended to dissuade people from employing such techniques. Of course the trained professional will pretend to go along with this lie, all the while employing, effectively, the very same counter-measures.

The interrogation process known as ‘polygraphy’ is so dynamic, with so many variables, so many factors that can potentially impact the outcomes, that any real ‘control’ studies to test the validity of any particular process, or efficacy of any particular ‘operator’, are impossible to carry out. The ‘Control’ questions themselves are so qualitatively different to the ‘Relevant’ questions that they cannot be taken seriously as ‘controls’ or ‘calibration’ or ‘benchmarking’ questions. The supposed ‘control’ questions tend to be, compared to the ‘Relevant’ questions, of a like nature to comparing your response to ‘Did you ever have an erotic thought about your secretary’ to ‘Did you ever rape your secretary’.

It is not possible to make any logically rigorous, let alone compelling, scientific, inferences between the responses to the ‘control’ questions, and the ‘relevant’ questions.

A famous CBS television ‘test’ of polygraphy revealed what any social scientist would have predicted, that the polygraph operators own prejudices / opinions of the examinees guilt or innocence, have a huge impact on the supposedly ‘objective’ ‘result’ of the interview. In other words, if the operator, for whatever reason, believes the examinee to be lying, they will ‘get a positive reading’. Which is just as likely to be a false positive as a true positive, with no way of testing for correspondence between the ‘result’ and ‘reality’. Except of course in the CBS case, where the researchers who ‘set up’ the polygraph examiners, knew the examinee in each case was in fact innocent. They had given 4 different polygraph operators to assume that 4 different examinees were ‘most likely lying’, and in each case, each polygraph operator, independently, ‘found’ a
different examinee ‘guilty’, and in each case the one they have been given to believe was guilty, by the person who ‘hired’ them.

When the polygraphers arrived on scene, each was told that although all of the suspects had access to the camera, one of the four was probably the guilty party. A different person was “fingered” for each polygrapher. Not surprising to polygraph critics, each examiner found the person who had been fingered to be deceptive, and each examiner tried mightily to get the guilty person to confess. No one, of course, had stolen anything. The four employees were confederates, paid $ if they could convince the polygrapher of their innocence. With dramatic flair, CBS demonstrated that polygraphers do not necessarily use psychophysiological information to make their diagnoses of deception.

The CQT polygraph procedure is a subjective procedure, rather than an objective, scientific, verifiable, reliable, one.

The NSA has invested heavily in polygraph technology, and concluded that there was no way to determine the veracity of an examinee’s responses using any sort of device, and that anyone could learn the ‘counter-measures’ necessary to defeat any attempt at polygraphy within a few minutes, and that it was impossible for an operator to judge whether such counter-measures were in fact being employed.

There is no scientific basis for the thousands of rejected FBI, CIA, NSA etc applicants. I believe the polygraph tests are being used as an excuse to reject candidates who do not meet the unofficial Jew World Order requirements. In other words these corrupted, occupied U.S agencies do NOT want honest, upright, competent employees. They want easily manipulatable puppets, criminals, corrupt co-conspirators.

Several senior CIA and other alphabet agencies have been fired or forced out of their positions when their own internal research findings suggested that polygraph use should be abandoned. E.G in the late Dr. William J. Yankee, then DoDPI director, had assembled an independent scientific advisory board which reviewed and provided comment on DoDPI’s academic curriculum and intramural research program. This board was comprised of Drs. John J. Furedy, William G. Iacono, Edward S. Katkin, Christopher J. Patrick, and Stephen W. Porges. It was the consensus of the scientific advisory board that polygraph security screening is without scientific validity. When Michael H. Capps succeeded Dr. Yankee as director of DoDPI, he promptly dismissed the entire scientific advisory board. Dr. Sheila D. Reed developed and tested the polygraph screening format adopted by the Department of Defense in and the Department of Energy in. Her research and her observations of DoDPI teaching methods led her to the conclusion that polygraph screening
should be stopped. When she voiced this opinion publicly, DoDPI officials falsely accused her of having lied to the CIA, stripped her of her security clearance, seized her computer and research data, relieved her of her duties, and eventually coerced her into leaving DoDPI.

Consider the assumption that fewer than 1 person in 1000 is likely to have committed some activity being screened for, such as ‘disclosure of state secrets’. If the Polygraph actually had a 95% predictive validity, for each 1 person identified as ‘deceptive’, 50 other ‘innocent’ people would need to be sacrificed. In other words an efficacy of only 2% arises even assuming such a high 95% predictive validity for the polygraph.

Those organisations that claim a 99.9% efficacy, such as the Dept. of War (sic Defense) simply ‘pass’ almost everyone they test. This is the ONLY they are able to make such a claim. And in this case, the test is next to useless for catching true ‘liars’, ‘spies’, etc.

The theoretical rationale for the polygraph is quite weak, especially in terms of differential fear, arousal, or other emotional states that are triggered in response to relevant or comparison questions

The inherent ambiguity of the physiological measures used in the polygraph suggest that further investments in improving polygraph technique and interpretation will bring only modest improvements in accuracy

The evidence does not allow any precise quantitative estimate of polygraph accuracy or provide confidence that accuracy is stable across personality types, sociodemographic groups, psychological and medical conditions, examiner and examinee expectancies, or ways of administering the test and selecting questions. In particular, the evidence does not provide confidence that polygraph accuracy is robust against potential countermeasures. There is essentially no evidence on the incremental validity of polygraph testing, that is, its ability to add predictive value to that which can be achieved by other methods.

There is no evidence that polygraph “testing” provides greater predictive value than, say, interrogating a subject without the use of a polygraph, or with a colander-wired-to-a-photocopier that is represented to the subject as being a lie detector. Compare polygraphy with superstitious lie detection rituals in primitive societies.

Polygraph “testing” is fundamentally dependent on a fraud: the polygrapher must lie to and deceive the subject about the nature of the procedure.

Official statements that ‘other alternatives fail to outperform polygraph tests’ is misleading by what it omits. That is, that NO technology has to date been
developed that can do what is claimed for any ‘lie detection’ device. Other alternatives may be EVEN worse at lie detection than polygraphs, but that does NOT make polygraphy any LESS of a failure at the same task.

U.S National academy of sciences rejects Polygraphy as efficacious. The U.S government just ignores their findings.

In 1996, the U.S. House of Representatives Committee on Government Operations review of polygraph policy reported: It is the recommendation of the committee that the use of polygraphs and similar devices be discontinued by all Government agencies for all purposes. But Congress took no action.

In 1998, Congress ratified and President Ronald Reagan signed into law the Employee Polygraph Protection Act (EPPA) prohibiting most polygraph screening in the private sector, the Act expressly exempted federal, state, and local government. In the years since the OTA report, the reliance of Government on polygraphy has grown, rather than diminished, even as numerous spies have beaten the polygraph.

The only argument in favor of polygraphy is that some people admit to lying, based on the false premise i.e believing the polygraph operator’s claims to be able to read minds. As long as some people admit things during a polygraph test they otherwise might not have, the tool is considered to be a useful deception / trick in the revealing of deception among job applicants and employees. A ‘noble’ lie.

The problem is that it ONLY works with people who fall for the trick / deception, and fail to employ counter-measures to counter polygraphy’s assumed efficacy. This leaves only a small group of naïve, nervous people who are ever likely to be ‘unveiled’ as liars.

In other words only naïve, gullible people. Hardly the type to engage in professional espionage. Though it must be admitted that SOME people will thus be validly ‘outed’ as having lied. Most likely only applicants for jobs, rather than ‘spies’. Anyone a professional spy would deal with to gain access would first be informed by that professional on the facts of polygraphy, and on the simple counter-measures. So WHO is really getting ‘caught out’ by polygraphs? No-one likely to be of any real significance to the intelligence industry or to national security.

In the CIA and the NSA, the polygraph has become the single most important aspect of their employment and personnel security programs. But why then? I posit as a tool for ‘screening’ out the most conscientious, pro gun rights, pro constitution, pro democracy applicants.
The Aldrich H. Ames Espionage case of 1994: CIA counterintelligence officer Aldrich Hazen Ames charged with spying for the former Soviet Union and later, Russia. Ames had passed two CIA polygraph “tests” during which he falsely denied having committed espionage.

Claims made by Edward J. Curran that Ames polygraph readings DID in fact indicate deception are a case of ‘post-retrospective revisionism common to all criminal investigations, namely, once a person has been convicted, investigators re-interpret their past behaviors as consistent with their criminality, when in fact nothing in their past behaviors fits any ‘pattern’ at all. He even claims that he had NEVER seen counter-measures effectively employed. Totally PROVING the point, while attempting to ‘spin’ it. The point being that counter-measures are IMPOSSIBLE to detect, and thus effective for this very reason. Ames admitted to having received KGB training in such counter-measures, and he was NEVER suspected of having employed such.

Polygrapher claims that Ames exhibited tell-tale responses to some other questions (e.g., financial ones), and that this should have tipped off the polygrapher or someone in his chain of command are disingenuous. Many of the questions on CIA screening polygraph exams are highly emotionally charged, and many if not most completely innocent people have trouble with at least some of the questions. If Ames did indeed respond somewhat to some of the questions, this would not set him apart from several thousand other employees who were subjected to polygraph interrogation.

If we took the records of polygraph interrogations that preceded Ames’, and the 100 interrogations that followed Ames’ and removed any identifying information from the polygraph charts. Give these charts, along with Ames’ chart, to a panel of the best polygraphers. See if they can pick out the one spy from the 100 polygraph charts. Have them rank the charts from most guilty looking to most innocent. Given that Ames passed the test and did not show responses to several espionage-related questions, there would be many innocent individuals in such a test who would look much guiltier than he did. Given that Ames did not show any tell-tale responses to questions directly relating to his crimes, even if he did indeed show some stress responses to some of the other questions, this would put him somewhere in the middle of the sample. 30 to 50 percent of these people would have polygraph results that would look guiltier than Ames’. It would not have been practical to fire or even to investigate all of these people.

MHR Most likely FBI and CIA rely on polygraphs to allow their own shadow government black-ops agents to continue their illegal work without fear of being exposed. The FBI and CIA can ‘test’ these people, knowing they will ‘pass’ the polygraph’, and thus never come under suspicion. Providing the public and
administration with a false sense of confidence that ‘there is no illegal activity going on here’ etc.

Ames passed the polygraph twice while engaging in espionage. Statistically, your odds of being found guilty increase phenomenally under repeated ‘screenings’ / polygraph tests. Statistically 99% of participants would show a worse result than Ames on at least one of their tests if tested once every 5 years over a 35 year period. Are all these people to be fired and charged with espionage?

Any contention that the polygraph might have been successful in detecting Aldrich Ames—if only the results had been more carefully scrutinized—is sheer nonsense. In light of the known facts of the Ames case—even if we make the most favorable assumptions imaginable regarding the accuracy of the polygraph—any criterion that would have identified Ames as suspicious would also have implicated at least half of the other CIA employees over the course of their careers.

The existence of effective countermeasures virtually assures that a well-prepared and determined opponent could achieve nearly a 100% penetration of the national security polygraph screen. In fact, according to Robert Gates of the CIA, numerous double agents, particularly Cubans and East Germans, have passed the CIA polygraph over the years.

Of course the U.S intelligence community knows about countermeasures, and trains its own operatives in them.

The CIA turned over its polygraphy to the FBI, after the Ames fiasco. Ed Curran at the FBI employed a strategy of terror and witch-hunts, as if that way they could make up for the inadequacy of Polygraphy. The result was the firing of hundreds of innocent employees on the scantiest of indications i.e ‘problems’ with the polygraph exam. All employees approached the tests filled with anxiety, and the stress lead to many ‘inconclusive’ results used to fire them. To give the false impression of a ‘crack-down’ and false impression of having ‘rooted out spies’ etc. All Curran did was impose a sense of paranoia and fear, placing countless people under investigation. Being under an active FBI investigation, no matter how flimsy the evidence, meant no promotions, no overseas assignments, no sensitive clearances. By late 1995 more than three hundred people were under suspicion.

Dr. Ignatz Theodor Griebl. Karel Frantisek Köcher (A.K.A. Karl Koecher. Career CIA employee Larry Wu-tai Chin are a few famous cases preceding Ames. All these people passed polygraph tests.

Attorney Mark S. Zaid, in a federal polygraph lawsuit: Upon information and belief, when the FBI implemented its polygraph program in 1994, the then
current special agent class had already begun its training. Nevertheless, members of the 1994 class were administered polygraph examinations and approximately half the class failed. However, the FBI simply overlooked this problem and waived the requirements of the polygraph for the 1994 class.

The Bureau conducts pre-employment polygraph screening of applicants only after they have received a tentative offer of employment. Those being polygraphed are the best and the brightest. But in the first three years of the pre-employment polygraph program, 20% of FBI applicants were “determined to be withholding pertinent information” (Kerr, 1997) The FBI summarily terminates the applications of those “determined to be withholding pertinent information” based on their polygraph chart readings. There is no formal appeal process.

in a laboratory study conducted by Dr. John A. Podlesny of the FBI laboratory division and Professor John C. Kircher of the University of Utah (Podlesny & Kircher, 1999), 20% of subjects who were innocent of committing a mock crime were classified as either “deceptive” or “inconclusive.” (In the pre-employment context, an inconclusive outcome is treated the same as a deceptive outcome.)

Roger L. Trott, chief of training at the FBI Academy in Quantico, Virginia, has placed the FBI pre-employment polygraph failure rate at nearly 50% (Mondics, 2002).

The risk of a false-positive outcome is so high, and the consequences so severe, that the FBI pre-employment polygraph examination is a risk not worth taking.

DOJ lawyer Michael R. Dreeben noted that “[t]he fundamental unreliability of polygraph evidence is underscored...because of the possibility that countermeasures can defeat any test.” (Asseo, 1997).

Astrological chart readings, palm readings, tea leaf readings, or the readings of entrails as practiced by the ancient Romans. There now exists no more compelling reason to institute a program of wide spread polygraphy than there does implementation of any of these other divining activities.

MHR claims that ‘we haven’t had a false positive result in any of the 1800 tests performed’ beggars belief. It simply means that we believe any positive result was genuine, due to our own delusional confidence in our methods. How could an innocent person prove their ‘positive’ result was ‘false’?

MHR given the ease of employing effective counter measures, and ‘failures’ are more likely to be innocent, as any professional would have employed counter measures successfully and passed!
Mr. Renzelman lied to scientists and engineers at Sandia National Laboratories and Los Alamos National Laboratory about the rationale for the directed-lie “control” questions used in DOE’s polygraph screening format, claiming that they “are designed to elicit your capability of responding physiologically should you intentionally tell a lie.” (Maschke, 1999). He suggested that the purpose for the “pre-test” interview is to make sure that the subject understands what is meant by “espionage” and “sabotage,” whereas its main purpose is actually to elicit admissions and to obtain leads that may be useful in a “post-test” interrogation.

“Significant response” = “deception indicated”

Just because all DOE employees polygraphed as of July ultimately “passed,” it does not follow that none of them were spies or saboteurs. By relying on unreliable polygraph “testing,” DOE and other agencies may succeed in deluding themselves into a false sense of security, but actual spies will go undetected, as did CIA’s Aldrich Ames.

The true false positive rate in the DOE polygraph program is about not zero. But DOE polygraphers are no doubt aware that they cannot get away with falsely accusing some of those they interrogate of being spies and saboteurs. It seems clear that, after grilling subjects a bit, DOE polygraphers are choosing to overlook charts which, based on DoDPI doctrine, should be scored as indicating deception.

According to the Final Report of the Attorney General’s Review Team on the Handling of the Los Alamos National Laboratory Investigation, better known as the “Bellows Report,” Curran predicted in a memorandum dated December 1998 to Secretary of Energy Bill Richardson only two possible outcomes: “either he would refuse to take the polygraph and DOE would pull his clearance and take steps to terminate his employment or he would agree to take the polygraph, not ‘pass’ it, and his clearance would be pulled and termination proceedings initiated.” Clearly, the demand that Lee take a polygraph “test” was intended merely a pretext for revoking his clearance and firing him. According to the Bellows Report, on December, the day of the “test,” FBI Special Agents Carol Covert and John Hudenko, who were on hand to interrogate Lee after the “test” in the event that he failed, “became concerned about what exactly was supposed to happen if Lee passed the polygraph.” The report continues, “SA Covert said they got Curran on the telephone and he said ‘it’s not going to happen.’” Two days later, on December, polygrapher Wolfgang Vinskey, employed by DOE contractor Wackenhut Corp., administered a polygraph interrogation to Dr. Lee. There were four relevant questions: Have you ever committed espionage against the United States? Have you ever provided any classified weapons data to any unauthorized person? Have you had any contact
with anyone to commit espionage against the United States? Have you ever had personal contact with anyone you know who has committed espionage against the United States? Ed Curran’s prediction notwithstanding, Dr. Lee received one of the highest “passing” scores possible. According to the Bellows Report: After the polygraph examination was over, SA Covert and SA Hudenko talked to the polygrapher and were told that Lee had not only passed the polygraph but “blew it away.” CBSNews.com reported, “The polygraph results were so convincing and unequivocal, that sources say the deputy director of the Los Alamos lab issued an apology to Lee, and work began to get him reinstated in the X-Division.” (CBSNews.com, 2000) However, when the FBI later wanted to search Wen Ho Lee’s home, Special Agent Michael W. Lowe, at para. 11 of an affidavit administered a polygraph examination of LEE. The examiner’s initial opinion was that LEE was not deceptive. However, subsequent quality control reviews of the results, by both DOE and by FBI Headquarters (HQ) resulted in an agreed finding that LEE was inconclusive, if not deceptive, when denying he ever committed espionage against the United States.

The polygrapher may read whatever he (or his boss) pleases into the charts.

The FBI decided to re-polygraph Lee. On February 1999, FBI agents falsely explained to Lee that they “needed his help solving a puzzle related to the W-78, but first he had to be cleared with a polygraph.” (Stober & Hoffman, 2000) Lee reluctantly agreed. Stober and Hoffman describe the beginning of his polygraph interrogation by FBI Special Agent Rich Hobgood as follows:

Resigned, Lee reported to the Los Alamos Inn at 5 A.M. on February 2. He was shown into a room where the polygrapher, named Hobgood, was waiting. Agents had taken down the room’s artwork and situated a table and a chair for Lee facing one of the blank walls. The room was uncomfortably warm, and Lee had the distinct impression that the FBI had turned up the thermostat. He took a seat and Hobgood hooked him up to the machine. The polygrapher cinched the finger cuff around his thumb to a painful tightness. Hobgood informed Lee that he was a suspect in an investigation into the loss of classified information on the W-78 warhead—the first time the FBI had clearly told him. He was advised of his rights, just as he would be if he were being arrested. Lee found this upsetting. Upsetting indeed. Placed in an overheated room, with a polygraph attachment tightened to the point of causing pain, and faced with the sudden shock of learning that he was the suspect in an espionage investigation, it is hardly surprising that Lee would physiologically respond to the accusatory relevant questions. If Stober and Hoffman’s account is accurate, it would suggest that the FBI deliberately rigged the “test” to ensure that Lee would “fail.”
LEE was then asked the follow [sic] two questions: Q: Have you ever given any of those two codes to an unauthorized person? A: No. Q: Have you ever provided W-88 information to any unauthorized person? A: No. The polygraph examiner concluded that LEE’s answers to these questions were deceptive.

The Department of Defense (DoD) has long had a counterintelligence-scope polygraph program, the ostensible purpose of which is to deter and detect espionage, sabotage, and terrorism. The DoD polygraph program is a prime example of waste, fraud, and abuse at taxpayer expense. Every year, the Office of the Assistant Secretary of Defense (Command, Control, Communications, and Intelligence) prepares for Congress a report on the DoD polygraph program. These reports are designed to “sell” the polygraph program to Congress and cast it in the most favorable light. As we shall see, DoD has been selling Congress a fraudulent bill of goods. The DoD Polygraph Program Report for Fiscal Year 2000 (U.S. Department of Defense, 2001) reveals that in that fiscal year, 7890 DoD and contractor personnel underwent polygraph security screening, not including NSA and NRO. The report indicates that the only individuals who “failed” their DoD polygraph screening “tests” were those who made “substantive” admissions. Everyone else “passed.” Thus, the key to passing is to simply to make no “substantive” admissions!

Of the 7890 individuals examined under the CSP Program in Fiscal Year 2000, 7688 showed no significant physiological response to the relevant questions (non-deceptive) and provided no substantive information. The remaining 202 individuals provided substantive information. Of these 202 individuals, 194 received a favorable adjudication, three are still pending adjudication, five are pending investigation, and no one received adverse action denying or withholding access.

This report makes it clear that the polygraph charts are not being used to determine whether individuals pass or fail: if the individual provides no “substantive information,” then any physiological responses he/she may have shown to the relevant questions are ultimately deemed not to be significant, and the individual “passes.” But if the individual provides “substantive” information, then he/she “fails,” regardless of the polygraph chart readings.

So polygraphy clearly can only identify spies who chose to confess, despite their ability to easily ‘cheat’ the tests.

The FBI arrested Ana Belen Montes, the Defense Intelligence Agency’s (DIA’s) senior analyst for matters involving Cuba, on charges of conspiracy to commit espionage. Both Regan and Montes worked in DoD agencies in positions that require counterintelligence-scope polygraph screening. Montes, who was working for the Cubans even before she began her DIA career, is known to have passed at least one DIA polygraph examination (Johnson, 2002).
In 1999, after undergoing an NCIS polygraph session, Petty Officer Daniel M. King was told he had failed the polygraph test, when in fact the result was the ever common ‘inconclusive’ / ‘no opinion’. This would reasonably be expected to lead to high levels of stress and anxiety during future polygraph tests. Now Department of Defense regulation 5219.48-R prohibits using the polygraph as such a “psychological prop.” However this is exactly the ONLY way in which polygraphy can be said to be in any way ‘effective’, and this is the way it was employed in King’s case, with the added ‘trick’ of the ‘lie’ that he had ‘failed’ the test previously. After 3 days the operators stopped recording their results and interrogation process, another deviation from the recommended protocols. These interrogations continued for 3 weeks, with up to 5 tests a day. All results were ‘indeterminate’ except for one gained after a long day of multiple sessions, under ‘impermissible’ conditions bound to produce inaccurate, and hence unusable, results. King had complained of fatigue and lack of sleep. He failed to pass subsequent polygraph tests under conditions prohibited under DoD regulation 521.48-R. Sleep deprivation, and abusive interrogations made the ‘results’ of zero value. Being told he was, based on the polygraph results, a spy engaged in espionage, triggered physiological responses leading to misleading polygraph readings. This is why polygraph results are inadmissible in court. They can be easily abused by operators to get false positives. And of course counter-measures can easily be employed to get false negatives. NCIS subjected CTR1 King to days of polygraphic interrogation and sleep deprivation and denied him a lawyer when he requested one. After a 19-hour interrogation session (and having been interrogated during 30 of the 39 previous hours) CTR1 King signed a confession stating that he had sent a computer disk containing classified information to the Russian embassy. His confession was uncorroborated by any evidence whatsoever, and he promptly retracted it. Nonetheless, CTR1 King spent well over a year in pre-trial confinement before the presiding military investigator, Commander James P. Winthrop, USN, recommended that charges be dismissed. CTR1 King was released on 9 March 2001 and has since retired from the Navy with a clean record.

In 1986 newspaper headlines revealed that Marine guards at the U.S. Embassy in Moscow had been found to have conducted guided tours for Soviet KGB agents through the secret inner sanctums of that building. A Time magazine cover graphically portrayed by far the worst shame ever to bedraggle the honor of the Corps. Within a few months it became clear that this never happened. The marines who signed confessions had been victimized by over-enthusiastic and paranoid NCIS polygraph operators for days, until they were willing to agree to sign any number of wildly bizarre and conflicting statements, just to gain freedom from their interrogators.

CIA, NSA, FBI, and the Departments of Defense and Energy, other federal agencies such as the U.S. Secret Service, DEA, the Internal Revenue Service, the
U.S. Capitol Police, and the Food and Drug Administration also rely on polygraphy. In addition, many state and local law enforcement agencies and fire departments use polygraphy to screen applicants and to interrogate their current employees in internal affairs investigations.

Government agencies rely on polygraphy primarily because naïve and gullible subjects, fearing that the polygraph will detect the slightest hint of deception, will often make admissions that they might not otherwise make. Those innocent persons who are falsely accused in the process are considered “acceptable losses.”

The 1971 Oval Office tapes captured President Richard M. Nixon explaining why he had ordered polygraph screening for the White House staff: “Listen, I don’t know anything about polygraphs and I don’t know how accurate they are, but I know they’ll scare the hell out of people.”

In 1983, the Congressional Office of Technology Assessment (OTA) reported: It appears that NSA (and possibly CIA) use the polygraph not to determine deception or truthfulness per se, but as a technique of interrogation to encourage admissions. NSA has stated that the agency “does not use the ‘truth v. deceptive’ concept of polygraph examinations commonly used in criminal cases.

The NSA wrote to the White House, “over ☐% of the information the NSA develops on individuals who do not meet federal security guidelines is derived via [voluntary admissions from] the polygraph process.” (National Security Agency, 1993). Joint Security Commission acknowledged in its 1994 report stated that ‘questions about the polygraph’s validity remain academic.’

Former CIA and DOE counterintelligence chief Edward J. Curran clarifies the true function of polygraphy when he notes: ‘if people believe that that machine’s gonna catch them in the lie, they’re more willing to make statements or admissions to you prior to the test, or during the test’.

1994, Director Freeh authorized the use of polygraph examinations for all FBI employment applicants. Since that time, the FBI has conducted approximately 16200 pre-employment polygraph examinations. Of those 80 percent passed and continued processing; 20 percent were determined to be withholding pertinent information. When those individuals were interviewed about their unacceptable performance in the polygraph session 36 percent admitted to withholding substantive information, thereby confirming the results of the polygraph examination. The FBI’s polygraph screening focuses exclusively on counterintelligence issues, the sale and/or use of illegal drugs, and the accuracy and completeness of information furnished by applicants in their employment applications.
The FBI summarily rejects the applications of those whose polygraph charts are interpreted either as indicating deception or inconclusive.

The DOE assumes 20% of its employees will violate security protocols, and so the fact that polygraphy produces 20% positive rates either means they based their assumption on the ‘results’, or the examiners are adjusting their interpretations of results to get the 20% result expected of them. If they ‘fail’ to reach this ‘benchmark’, perhaps they will be defined as ‘incompetent’ and not promoted etc?

In bureaucracies, it is common to advance simply by avoiding making any mistakes. And so the polygraph is used to justify ‘erring on the side of career prospects’ caution. The careerists prefers to sacrifice any number of innocent victims, just to avoid making a ‘career limiting move’ themselves. No-one will blame them for this victimisation. So the careerist has every reason to accept the polygraph operator’s ‘verdicts’, and no reason to ‘take the risk of making a CLM’. The decision maker is only held accountable if they contradict the polygraph operators ‘verdict’. They are never held accountable for the innocent victims of this process.

Special Agent H.L. Byford, an FBI polygrapher stated a common assumption that ‘if someone has smoked marijuana 15 times, he’s done it 50 times. Those who have any doubts about how many times they used are going to fail. Those who are certain that they only tried it once or three times or five or whatever, will pass’. So an FBI applicant who reports that he smoked marijuana say, about 8 times (under the Bureau’s official limit of 15 times), but cannot precisely recall the number of times, is going to “fail.”

Official DoDPI research also demonstrated racial bias, with ‘whites’ less likely (63%) to be a victim of a false positive, in such polygraph tests, than ‘blacks’(77%) of being found deceptive or ‘inconclusive’. Either result would destroy any hopes of employment with ANY U.S Federal Government organisation or contractor. These studies were ‘covered up’ but leaked.

Former FBI special agent Mark Mallah testified during DOE’s public hearings on polygraph policy (U.S. Department of Energy, 1999) re: inflation/fabrication of results: ‘To a polygraph examiner/interrogator, a confession is like a trophy. So the slightest sliver of anything—anything that can be construed or misconstrued as damaging—that examiner has a strong incentive to say, “I got an admission; this person was deceptive; here’s the proof.” Johnson polygraphed me, then insisted that I was showing deception on this issue. He challenged me as to how I could be so sure about it, especially when the incident was four years ago. I responded that I could look out the window and see it was daylight, but if I did not actually see the sun and he asked me if I was absolutely sure that the sun was really there, then no, I could not be 100% sure of that either, but I could be as
sure as I could possibly be. The same with the absence of classified documents in the briefcase, I told him. The FBI Version- “Mallah admitted that he could not be 100% certain that there were no classified documents in the briefcase the night it was stolen. Mallah stated that he had no specific knowledge of what classified document could have been in the briefcase.” Subsequent reporting on this issue, from a Special Agent in Charge of the New York Office at the time, Carson Dunbar, stated: “Prior to the polygraph, SA Mallah stated that ‘to the best of his knowledge, he can ‘categorically’ state that there were no Bureau (FBI) documents, classified or otherwise, contained in that briefcase when it was stolen (end quotes missing). After being told that his polygram reflected that he was deceptive, Mallah stated that ‘he could not be 100% certain that there were no classified documents in the briefcase the night it was stolen.’”

Defense Security Service Agent Snyder, when interrogating –polygraphing David A. Tenenbaum, claimed he would get plaintiff to confess, no matter how long it took. Agent Snyder called plaintiff a liar and said he could tell plaintiff was a spy just by looking into his eyes. Further, Agent Snyder claimed that all plaintiff had to do was confess and he would suffer only a “slap on the wrist.” It was then claimed that Tenenbaum had made several confessions, all of which he later stated he had never made. A Judge authorized the search of his residence, based on Snyder’s lies to the FBI about Tenenbaum.

Snyder won the American Polygraph Association (APA) William L. Bennet Memorial Award in 1986 in “recognition of excellence-achievement...as a token of APA appreciation for unrelenting efforts and display of ability in the APA interest,” and in 1992 he received the Al & Dorothea Clinchard Award “honoring extended, distinguished, devoted and unselfish service in behalf of the APA membership.”

Government officials use polygraph “testing” as a pretext for adverse action in the absence of supporting evidence. Polygraph “tests” may be deliberately rigged to increase the likelihood of the subject “failing.” In 2001 at the second public meeting of the National Academy of Sciences/National Research Council Study to Review the Scientific Evidence on the Polygraph, Dr. James Blascovitch, a member of the review panel, stated, “…every examiner I asked at DoDPI, ‘If you wanted someone to fail this test, could you have them do it, physiologically?’ They all said ‘yes.’”

Attorney Mark S. Zaid, in his prepared remarks submitted to the U.S. Senate Committee on the Judiciary at its 2001 “Hearing on Issues Surrounding the Use of Polygraphs” (Zaid, 2001) writes: …[I]n 1997-8, CIA polygraphers reported to the Department of Justice’s Public Integrity Section that they were instructed by CIA management to “fail” certain employees. They were taught how to sensitize examinees during pre-testing interviews so as to create the likelihood of false
positives. Neither the CIA nor Department of Justice ever conducted an investigation into these allegations.

An example of an FBI polygrapher’s lie used to trick a confession, after placing him in solitary, and interrogating him for hours on end with no breaks: “The results of the test are inconclusive,” the agent said, “but this never happened to anyone who said the truth.... And also threatened “We will make the Egyptian authorities give your family hell if you don’t cooperate,” “You know you have nothing to do with September 11, you were scared of the FBI and denied the radio was yours, but you can tell the truth,” the agent persisted. in case of FBI and Abdallah Higazy, a thirty-year-old Egyptian graduate student with a valid visa re: 911. He falsely confessed to having a pilot’s radio in his room during 911. A few days later an American pilot turned up at the hotel to pick up his radio i.e the one in question. Higazy was released in his cotton prison scrubs and given three dollars for subway fare on January 11. The charges against him were dropped. In May 2002 Ronald Ferry, the former hotel security guard who produced the pilot’s radio was sentenced to six months of weekends in prison for lying to the FBI. He admitted that he knew that the device was not in a safe belonging to Higazy. Ferry, who is a former police officer, said that he lied during a “time of patriotism, and I’m very, very sorry.” The judge said that his conduct was “wrongly motivated by prejudicial stereotypes, misguided patriotism or false heroism.

Computer technology cannot compensate for the intrinsic flaws in polygraphy any more than A.I tea leaf / entrail / astrology readings are going to be any more valid than a subjective human being.

Governmental agencies cynically rely on polygraphy because it is useful for eliciting admissions from naive and gullible subjects.

Polygraph “tests” have three distinct phases: 1. the “pre-test” interview and “stim test”; 2. the “in-test” phase (polygraph exam); 3. the “post-test” interrogation (when applicable).

The “Pre-Test” Interview In this phase, the polygrapher will attempt to establish rapport with you. He will ask about your background and interests, and may well remark on something both of you have in common. He will use information gleaned during this “pre-test” interview to choose the “control” questions he will be asking you later, and he will also exploit this information in an attempt to elicit admissions during any “post-test” interrogation. In addition, the polygrapher will take note of any damaging admissions you make. Your polygraph examiner will next briefly explain how the polygraph instrument works.
Two rubber tubes are used. One will be placed across your chest and the other will be placed around your abdominal area. They will be used to record your breathing. There are two metal finger plates next to the rubber tubes. These plates will be attached to two of your fingers and will record your sweat gland activity. Finally, there is a blood pressure cuff on the desk. It is the same type of cuff a doctor uses to measure blood pressure. It will be placed on your arm and will monitor changes in your cardiovascular activity. These physiological changes are a result of an automatic response system in your body. It is a response system over which you have no control. Even though a lie might be socially acceptable or only a small lie, or a lie by omission, your body still responds. The recording on the polygraph will show only the physiological responses. Therefore, it is extremely important that you be totally honest.

This explanation is deliberately false and misleading. In fact telling a lie does NOT always result in physiological changes measurable by the polygraph. But the operator needs you to believe it does, so that any time you lie, you will feel anxious of being ‘caught out’ by the machine. Fear is an essential element of all polygraph “tests.” In its assessment of the Ames case, the U.S. Senate Select Committee on Intelligence reports, “A former polygrapher noted that without proper preparation, a subject has no fear of detection and, without fear of detection, the subject will not necessarily demonstrate the proper physiological response.” (U.S. Senate Select Committee on Intelligence, 1994).

The problem with this relationship to fear is that there is no way to distinguish between fear of a false positive, or of the operator’s prejudices, and fear of being ‘caught out in a lie’.

A “stimulation test” or “stim test,” (DoDPI calls it an “acquaintance test.”) is supposedly to allow the operator to “adjust the instrument” and to make certain that you are “capable” of physiologically responding if you were to intentionally tell a lie. But this explanation is itself a lie. The true purpose of the “stim test” is to dupe you into believing that your polygrapher can read your mind and that the slightest deception will be detected. They do this using questions to which they already know the answer, but pretend they are ‘reading’ it from your unconscious physiological responses, which the polygraph is easily measuring, and the polygrapher is easily interpreting. In this way they set up the belief in you that you cannot control your physiological responses when you lie, and that you will certainly ‘give yourself away’ any time you lie. Your polygrapher will attempt to convince you that you are not capable of lying without the polygraph instrument detecting it. Convinced of this fact you may either make a confession, or feel anxious any time you lie. Either way, they have won.
In earlier times, the “stim test” was usually done with a deck of cards. Your polygrapher would ask you to pick a card and not show it to him. Then, while you are connected to the polygraph, he would ask you to answer “no” to each question he asked. Suppose you draw the jack of diamonds. Your “stim test” might go like this: Did you pick a face card? (No.) Did you pick a number card? (No.) Your polygrapher nonchalantly tells you, “It’s obvious you picked a face card.” He then proceeds to ask: Did you pick a king? (No.) Did you pick a queen? (No.) Did you pick a jack? (No.) He then informs you, “You’ve clearly drawn a jack.” He continues: Did you pick a spade? (No.) Did you pick a club? (No.) Did you pick a diamond? (No.) Did you pick a heart? (No.) Your polygrapher gazes into his charts and earnestly tells you, “It’s clear you picked the jack of diamonds. No doubt about it. You’re a ‘screamer.’ You can’t tell a lie without your body giving you away.” But what your polygrapher wouldn’t tell you is that you drew your card from a trick deck, in which every card is the jack of diamonds. In another version of this card trick, an assortment of genuinely different cards is used, but the polygrapher has memorized their order.

Nowadays, the card trick has largely given way to the “numbers test.” In a known-solution numbers “test,” your polygrapher will ask you to pick a number, say, from three to eight, and to write it on a sheet of paper. If you’re right-handed, he may ask you to write the number with your left hand. This supposedly makes the act of your writing the number more significant to you. The number you write will be known to both you and the polygrapher. Let’s say you pick “4.” You write it on the slip of paper. Your polygrapher will then write in five additional numbers (in this case, 1, 2, 3, 5, and 6) in a list above and below or to the left and right of the “4” that you wrote; then he will affix the paper to the wall in front of you. Your polygrapher will next instruct you to answer “no” each time as he asks, “Did you write 1? Did you write 2?,” etc. And he will tell you that when you answer “no” to the number that you wrote, you are to look at that number on the wall and to consciously think about having chosen it and written it down, and then to deliberately lie and say “no.” Did you write 1? (No.) Did you write 2? (No.) Did you write 3? (No.) Did you write 4? (No.) Did you write 5? (No.) Did you write 6? (No.) Whether you showed any discernible reaction while “lying” or not, your polygrapher will attempt to convince you that you are not capable of lying without the polygraph instrument detecting it.

It is obvious that you know lying is wrong. You’re not capable of lying without your body reacting. You reacted strongly when you lied about that number. Even though I asked you to lie and it was an insignificant lie, you still responded. That will make this examination very easy to complete as long as you follow my directions.

Don’t be your polygrapher’s fool. The lie detector cannot detect lies (it only records physiological data), and your polygrapher cannot read your mind.
In 1997, one CIA applicant, whose wife had recently left him, was asked the following mix of questions during the “pre-test” phase of his pre-employment polygraph screening: • Have you ever participated in groups advocating the overthrow of the U.S. Government? • Have you ever performed services for another intelligence service? • Do you masturbate? • What do you think about while masturbating? • Have you ever had sex with another man? • Have you ever thought about having sex with another man? • Have you ever killed another person? • Have you ever thought about killing another person? • Have you ever thought about killing yourself? • Do you lie? • How much do you lie? Daily? Weekly? • Would you lie to make yourself look better, if you knew you wouldn’t get caught? • Why did your wife leave you? • Couldn’t you satisfy your wife sexually? • Has she or any other woman accused you of being unable to satisfy them? • Have you ever cheated on your wife? • Have you ever thought about cheating on your wife? • Do you daydream? • Would you consent to us medicating you for continued examination? • Have you ever thought about having sex with your mother? • Have you ever bounced a check? • Have you ever been arrested for DUI? • Should you have been?

Sarah, a case officer, found the inquisitors at “The Farm”, the CIA’s headquarters in Langley, Virginia, persistently curious about her private life. She describes her last polygraph, in July, as an exercise in abuse and intimidation. “They kept coming back to my sex life,” she says. “They asked how many times we have sex in a month, what kind of sex we have, what kind of positions, what I was wearing. Officers took her through a list of the most perverse sexual acts, asking her if she had ever practised them with her new boyfriend. “The Agency told me my fiance must take a polygraph. He did, and he failed. He’s not an intelligence professional, and I think he was just spooked.” Jane was given a choice: dump the man or leave the Agency.

Polygraph questionnaires employ 3 types of question: ‘relevant’, ‘irrelevant’, and ‘control’ (comparison) questions.

Relevant Questions deal directly with the crime under investigation.

There are 2 types of ‘Control’ (comparison) question. The ‘probable-lie’ format is most common in pre-employment polygraph screening and in criminal interrogations. The ‘directed-lie’ format is used by the Departments of Defense and Energy for polygraph screening. Some private polygraphers use a combination.

The ‘probable lie’ is a question the polygrapher expects you to answer deceptively, to allow them to take baseline ‘deception’ readings and calibrate their interpretation of your results. They will act as if you are expected to answer honestly. They will direct you to do so, but expect you to answer deceptively. Further, you will be offered complex questions to which you have only two
options of response. You will thus be forced to answer either yes or no, to questions which are hard to simply, honestly, answer yes or not to. You will be encouraged to become confused, unsure, uncertain, about whether you can honestly answer simply yes or no, and to be forced to discuss these doubts with the operator. This gives the false impression that you are expected to answer honestly yes or no, when in fact the operator is merely ‘benchmarking’ your physiological responses for doubt, confusion, and deception. Later they will refer to these to compare any future apparent doubt, confusion, or deliberate deception indicated by the polygraph readings.

Such questions are deliberately vague, general, broad, covering a wide time-frame. Examples include: Have you ever lied to a loved one? Have you ever taken something that does not belong to you?” Since the age of 18, have you ever considered hitting someone in anger?

You will of course find yourself having to answer ‘yes’ to one or more of these questions, no matter how minor your ‘guilt’ / transgression was. It is inevitable.

Following these admissions, expect follow-up questions along the lines of, “Other than what you told me, have you ever lied to a loved one?” The polygrapher will work to give you the impression that this transgression might seriously jeopardize your chances of passing the polygraph test, and pretend to be ‘on your side’ by getting you to elaborate, to explain, to avoid ‘failing the test even before you have begun it’.

If you answer no, the polygrapher, assuming you MUST have committed the transgression, as everyone is assumed to have, will treat your response as a lie, and dig deeper, trying to get a confession

It is assumed you lied during the control questions. And so if your polygraph readings / physiological responses are stronger for the relevant question, it is taken as an indicator that you MUST be lying.

If your physiological responses while answering the relevant and “control” questions are about the same, then the outcome will be deemed inconclusive.

Unless your polygraph readings are weaker for the relevant question, than for the control question, you will effectively ‘fail’ the polygraph test.

This is why counter-measures can be so effective. You simply ensure that the polygraph readings for the control questions are dramatically stronger than any responses you are likely to make, even while lying. You deliberately produce artificially strong physiological responses to the control questions, so that in comparison, it will be very hard to exceed them later in the test when the ‘relevant’ questions are asked.
So if you happen to have answered the control questions truthfully, against all expectations of the polygraphy model and polygrapher, you are doomed to ‘fail’ your polygraph.

The polygrapher will make it easy for you to identify which questions are the ‘control’ questions, as they will generally lead up to them, or embellish them, with little sermons on how ‘people who have lied to a loved one in their past are more likely to commit the crime under investigation / deceive their future employer over the course of their careers, and therefore we really have to be careful in screening out such people’. Of course you want the job, and don’t want to be excluded, so you will lie, or bend the truth a little. This is the intention of the question. To get you to lie. And to feel vulnerable / anxious while doing so. To feel under pressure. To feel the stress of being discovered. I call it ‘auditing’. You ask someone a question you know the answer to already. If they lie now, then you know that they cannot be trusted. You never reveal to them that you knew the fact in point before asking, as that would betray your ‘hand’. But now, having established that they are not reliable, you can make allowances for them. You can repeat this during the course of any relationship, before deciding to invest trust in a person or being more cautious.

If, like most people, you initially admit to having told some white lies, your polygrapher may rephrase the question as: 20. Have you ever lied about anything serious? Your polygrapher expects that your denial will still be a lie, or that you will at least feel anxiety over whether your denial is completely truthful. Similarly, if your polygrapher rephrases, “Did you ever cheat in school?” to “Did you ever cheat in college?” it’s still a “control” question.
The polygrapher will give you the impression that these questions are important, to put you under genuine stress, as if the result depended upon you being ABLE to answer yes to a question you are expected to NOT be able to answer yes to. They want to capture your physiological responses with their polygraph readings, so they know what these look like WHEN you lie, when it counts, later, when they ask the real, the ‘relevant’, questions.

With the directed-lie control the subject is instructed to lie. A deceptive explanation is offered as to why. They are told it is necessary to calibrate the polygraph. To test that it is working correctly, and accurately measuring truth Vs deception. To test that you are physiologically responding, and are not on medication, tired, sick etc. Otherwise our readings could be false. I will ask you about something every one of us has done at some time. I want you to think back on a specific incidence of when you actually did do the thing I ask you about, while lying to me, and denying you have ever done it.

‘We have all (e.g. violated traffic laws)--you have haven’t you (they should answer yes)--of course. Now think of a specific incident (don’t tell me). When I ask you ‘Did you ever violate a traffic law’ I want you to lie to me and say “NO.” When I ask you this question on the test--I want you to think of that incident when you lie to me.

The polygrapher is setting the victim up with the expectation that any time they lie, they will respond physiologically, and the polygraph will pick up, and record, these physiological responses. In fact people can lie without producing any physiological responses. And not just the ‘cold blooded psychopath’ either. However being sick, tired, or on medication, would not impact the body’s responses vis a vis lying. When you are instructed to answer ‘no’ to a question, it is not a lie, so there would be no physiological response associated with deception. It is all part of the ‘magic room’ set up called ‘polygraphy’. The polygraph is merely a prop. It is all a bunch of interrogation tricks.

The true purpose of this set of deceptions is to leave the victim anxious. Anxious about ‘will I fail this test because my body isn’t responding appropriately when I tell the truth, and when I lie? They are told that if they cannot produce different physiological responses when lying, or telling the truth, a new test will need to be scheduled. Remember the whole point of polygraphy is to detect DIFFERENCES between base level honest responses, and anxiety riddled deception. So the aim of the whole ‘spiel’ is to increase the stress, fear, anxiety at being ‘caught out’.

The most damnable and laughable assumption of polygraphy is perhaps that people trust the operator’s competence and goodwill. The fear of being falsely defined by the operator, and the machine, as deceptive, can be expected to produce levels of anxiety and fear much greater than those experienced when
answering deceptively to the control questions, whether or not the operator has instructed you to lie or simply expects you to.

The directed-lie polygraph screening format adopted by the Department of Defense in 1993 and the Department of Energy in 1999 is called the “Test for Espionage and Sabotage” (TES). The directed lie “control” questions used in the TES—which questions you will be instructed to answer falsely—including:1. Did you ever take any government (company) supplies for your personal use? 2. Did you ever violate a traffic (fishing, hunting, boating) law? 3. Did you ever say something derogatory about another person behind their back? 4. Did you ever violate a software copyright law? 5. Did you ever say something that you later regretted? 6. Did you ever lie to a previous supervisor about anything? 7. Did you ever borrow anything and forget to return it? 8. Did you ever lie to a co-worker about anything at all? 9. Did you ever say anything in anger that you later regretted? 10. Did you ever brag about yourself to impress others?

Hypothetical “Control” Questions in pre-employment screening. Examples include, “In the future, would you steal something from [name of employer] if you had the chance?” and, “Would you lie to even one of these questions if you thought you could get away with it?”

“Have you lied to me in any way since we have been talking today?” The polygrapher uses these “concealed” control questions as a basis of comparison with the relevant questions.

Irrelevant questions commonly appear at the beginning of a polygraph question series (usually the first two questions) to soak up the initial stress of the polygraph interrogation. Irrelevant questions are also used as buffers between various scored questions (that is, relevant and “control” questions). Common irrelevant questions include: 1. Are you now in [name of the state in which you are located]? 2. Is today [today’s date]? 3. Do you sometimes drink water? 4. Are you sometimes called [your name]?

Symptomatic Questions “Is there something else you are afraid I will ask you a question about even though I told you I would not?” Some polygraphers believe that an inconclusive outcome may result when a subject is more worried about some outside issue being raised than about any of the relevant or “control” questions.

The “In-Test” (Polygraph) Phase The examiner fits a blood pressure cuff around your arm (he may alternatively attach a transducer set to your thumb), metal contacts on your ring and index fingers, and pneumograph tubes around your torso and abdomen. He will ask a series of usually about ten questions and
instruct you to keep your eyes open, remain still, and answer “yes” or “no” to each question. Your polygrapher will ask the questions at intervals of about \( \text{seconds} \) seconds, and will probably repeat the question series two or three times. In between question series repetitions, your polygrapher may leave the room for about \( \text{minutes} \) minutes to “examine the charts” (and to let you sit and stew about your fate), then return to interrogate you about why you may have been “responding” to a certain question before he proceeds to the next series. By the way, when the examiner leaves the room, don’t assume that you are alone. You may well be under observation from behind a two-way mirror, which may be disguised as a picture or even a fish tank. (If your polygrapher assures you that there is no one behind the mirror, you may rest assured that someone most probably is.) Alternatively, the room may contain a hidden video camera.

A typical polygraph chart recording. From top to bottom, the tracings on the chart represent \( \text{thoracic breathing, abdominal breathing, electrodermal activity (galvanic skin response), and cardio activity (relative blood volume and heart rate).} \) The vertical lines on the graph paper are spaced half an inch apart and represent five seconds in time. (Charts are rolled at the rate of six inches per minute.) The pairs of short vertical lines hand drawn at the bottom of the chart (which resemble the Arabic numeral “\( \text{-} \)”) represent the beginning and ending of the asking of a question. When the polygrapher begins asking a question, he places the first vertical stroke at the bottom of the chart. When he is finished asking the question, he places the second vertical stroke. A minus sign \( (-) \) indicates that the subject answered the question “no” and a plus sign \( (+) \) indicates that the subject replied “yes.” Polygraph charts are scored by comparing reactions to relevant questions to reactions to control questions.

“Deception indicated” (DI), “no deception indicated” (NDI), or “inconclusive” (INC).

The “Post-Test” Interrogation If the polygrapher suspects you of deception (and sometimes not), he or she will confront you with the polygraph charts and seek to obtain a confession from you. Interrogation techniques vary, but typically, the polygrapher will ask you to explain why you reacted strongly to a particular question. If you have truly responded strongly to a relevant question, no explanation short of a confession or damaging admission is likely to suffice. If the examiner is just bluffing, your truthful denials will be adequate, the examiner’s doubts notwithstanding.

Polygraphers are supplied with scripts to read out to examinees, intended to convince them that they have discovered a deception, and to induce a confession. Don’t fall for it. They are just acting. They memorise scripts given to them. Some such role plays are bizarre and shocking. So be prepared.
There is no way to tell between strong emotions like fear or anger, and deliberate deception, using any known polygraph measure / technique / technology / indicator. Without a confession, the ‘polygrams’ are open to interpretation. Unless you give them a confession, they cannot make any claims, based on any polygraph readings alone.

Because the examinee may lose fear of the polygraph’s power to ‘read their minds’, based on the experience of apparently having ‘cheated’ on the ‘control’ questions, the polygrapher is trained to accuse the examinee of having answered deceptively to at least one of these questions, so that they never feel confident of ever being able to ‘get away with’ any deception in future.

Peak of Tension (POT) or Guilty Knowledge Test asks questions the polygrapher knows the answer to, and to which only a guilty examinee would also know the correct answer to, and measures their physiological responses when the correct answer, as part of a list of potential answers, is read out.

When certain information would be known only to a guilty subject but not to an innocent subject or the polygrapher, then a polygrapher might resort to a Searching Peak of Tension “SPOT test.” A government employee suspected of espionage might be asked: Did you commit an act of espionage for Russia? Did you commit an act of espionage for China? Did you commit an act of espionage for Israel? Did you commit an act of espionage for France? Did you commit an act of espionage for North Korea? If your responses among the questions are relatively equal, the examiner will probably regard you as truthful. If one question elicited a noticeably stronger response, the examiner will suspect that you lied when answering that question.

The polygrapher examines the polygraph charts looking for “consistent, specific, and significant” reactions to a particular relevant question. (Polygraphers have a mnemonic expression for such reactions: “con-spec-nificant.”) For example, if a subject consistently shows strong physiological reactions when asked, “Did you ever use an illegal drug?” no matter what the order of the questions or how this question is phrased, deception will be inferred, and a post-test interrogation will follow.

Another sort of “control” question that may be used is for the polygrapher to begin the question series by announcing, “The test is about to begin” and end it by stating, “The test is now over.” The mere announcement of the beginning or end of the “test” is expected to produce a physiological response to which responses to the relevant questions may be compared. Consider the relief a victim might feel now that the ordeal is starting, or over!

The R/I “test” is one of the oldest polygraph techniques. Like the “Control” Question “Test,” it is also thoroughly discredited, and there is absolutely no peer-
reviewed research supporting its validity. ASSUMPTION 1. A guilty subject whose relevant answers are lies will be more aroused by the relevant than by the irrelevant questions and this difference will be revealed by his responses on the polygraph. ASSUMPTION 2. An innocent subject who is answering truthfully will not be disturbed by the relevant questions and will show no more reaction to them than to the irrelevant questions.

Polygraph counter-measures are easily learned, right now, to avoid being the next ‘false positive’ victim, or to ‘cheat’ a polygraph for ethical reasons.

Consider the costs of even applying for a job with the FBI. Since 911 the polygraph failure rate among special agent applicants has risen to about 50%. The consequences of failing an FBI pre-employment polygraph examination are more serious than with other agencies; • You will be disqualified from FBI employment for life; • Your polygraph failure will be recorded in your permanent FBI HQ file; • You may be blacklisted from employment with other federal law enforcement agencies, and may have difficulty finding employment with local agencies as well; • You will have difficulty ever obtaining a job that requires a security clearance. When background investigators do a National Agency Check, they will learn that you have an FBI HQ file; upon obtaining your file, they will see that you failed the polygraph. No security clearance adjudicator is eager to put his or her neck on the line by granting a clearance to someone who “failed” a polygraph “test.”

If you have been asked to submit to a polygraph examination in connection with a criminal investigation, “just say no!” You should not submit to any polygraph “test.” (In most cases, the fact that you refused to submit to a polygraph “test” will not be admissible as evidence in court.

You have little to gain by submitting to a polygraph interrogation and much to lose: if you “pass,” the police may well continue to suspect you regardless; if you “fail,” it will only confirm their suspicions, and news of your “failure” may well be leaked to the local media to smear you.

John A. Larson, a pioneer of polygraphic lie detection lamented: The lie detector, as used in many places, is nothing more than a psychological third-degree aimed at extorting confessions as the old physical beatings were.

Top-flight defense attorneys never let their clients submit to a polygraph “test” conducted by the police or any other authority.

Don’t agree to allow a polygraph to be admissible in court. Don’t tell them you know all about how polygraphy scams operate, or they will accuse you of having employed counter measures and ‘fail’ you.
The key to “passing” a polygraph “test”—that is, to producing a “truthful” chart—is to produce stronger physiological responses when answering the “control” questions than when answering the relevant questions.

Perhaps the most widely-known countermeasure is the old tackin-the-shoe. While this countermeasure (if properly applied) can be effective, polygraphers have developed counter-countermeasures for it (the simplest being to simply make the subject remove his shoes).

Behavioral countermeasures are those things that you can do to appear honest and truthful to your polygrapher, while chart-recording manipulations are those countermeasures that will actually affect the physiological responses measured by the polygraph instrument.

Rule number one is to make no admissions! While the lie detector cannot detect lies (it only records physiological responses), any admissions you make will be duly noted by your polygrapher. Admissions that may seem minor to you can be spun out of all proportion by your polygrapher. He sees admissions as trophies. Don’t give him any. The only exceptions to this rule are that, during the “pre-test” interview, you may make minor admissions regarding the “control” questions only, such as stealing candy when you were a child, or lying to your parents, or taking pens home from work. But go no further. In addition, if you are submitting to a directed-lie “Control” Question “Test” such as the TES format used by the Departments of Defense and Energy, you should not stubbornly deny having ever committed one of the common human failings used in the directed-lie “control” questions such as violating a traffic law, or having told a lie, even once in your life, etc.

A common tactic used by polygraphers is to request the subject to write out and sign a statement listing the admissions they have supposedly made. Suppose, for example, you admit during your “pre-test” interview, or in the pre-polygraph questionnaire that some law enforcement agencies require applicants to fill out, that you smoked marijuana three times while you were in high school. Your polygrapher asks, “Can you really be sure that it was only three times? Any doubt in your mind will show up on the polygraph. Would it be fair to say that you used marijuana less than ten times? Yes? Then very well, why don’t you write that down here and sign.” When you sign that statement saying that you used marijuana “less than ten times” instead of the three times that you said earlier, you’ve just given your polygrapher a signed “confession” that he can use to portray you as having been dishonest when you claimed to have used marijuana only three times.

Your polygraph “test” is actually an interrogation. Don’t make the mistake of trusting your polygrapher. Some will be friendly, others confrontational. Some will regard you as a criminal suspect, while others will expect you to pass
(especially when large numbers of employees are screened). Other polygraphers will have decided to fail you before the polygraph interrogation even begins. Your polygrapher may very well be polite, pleasantmannered, and congenial, but he is also a trained interrogator who understands that he may at first catch more flies with honey than with vinegar. He is not your friend. He is not there to “help” you. Be on your guard at all times.

Your polygrapher is a trained interrogator. Polygraph schools devote a substantial portion of their curricula to teaching students techniques for duping examinees into making damaging admissions. And many polygraph examiners are already experienced criminal investigators well before they are sent to polygraph school. This is almost always the case when the polygrapher is a law enforcement officer. In some agencies, polygraph examiners may be evaluated based on the number of admissions or confessions they receive.

The most common (and most effective) interrogation technique employed by polygraph examiners involves projecting a false sense of empathy for you and your situation. The examiner’s goal when using this approach is to get you to believe that he is there to help you. (He isn’t.) When employing this approach, the examiner is likely to downplay the seriousness of the behavior you are being asked about or accused of. For example, the examiner may tell you that his agency is “not looking for Boy Scouts.” He may even claim that he engaged in the very same activity that he is asking you about or accusing you of and was still hired. Don’t fall for it. One of the gravest mistakes one can possibly make is to believe that your polygrapher is the one exception and that he is there not to interrogate, but rather to help you along in the application process. The polygrapher may indeed be a “nice” guy. You may even become friends with him if you are eventually hired. Nonetheless, this does not change the fact that he is an interrogator, and his job is to get you to make disqualifying admissions.

During the “post-test” phase, the polygrapher may alternatively take an adversarial approach. He may instruct you to move your chair so that your back is to the corner. He may then accuse you of being deceptive in a hostile and aggressive manner. He may invade your personal space and posture himself in a threatening manner. This is a favorite tactic of U.S. Secret Service polygraphers. Keep your cool and deny the polygrapher’s allegations in a forceful but respectful manner. The aggressive and empathetic approaches are often combined by the polygrapher/interrogator. Commonly known as the “good cop/bad cop” routine, in the context of a polygraph interrogation, the polygrapher/interrogator adopts one approach and immediately makes a 180-degree turn toward the other. Another common interrogation technique is known as the “egotistical approach.” Here, the polygrapher’s goal is to play upon your pride. He may bring up your academic achievements, language skills, or other attributes that make you an attractive candidate for the position. The goal here is to make you feel that you
are no ordinary applicant and that the agency will bend over backward to hire you. After doing this, he is likely to return to the empathy approach, downplaying the seriousness of the behavior in question and asking you to admit to it so he can “go to bat” for you against the supervisors at headquarters.

Have a good breakfast, in case the polygraph session continues through lunch, without a break. Be sure to arrive with time to spare. Make normal eye contact and maintain a professional manner at all times. No matter how the operator behaves towards you. Remember the interview begins as soon as you answer any questionnaire, and certainly the moment you arrive at the testing facility. There are no ‘down times’. You are ALWAYS being observed. They are trying to ‘catch you out’. So remain calm, alert, and wary at all times. Keep positive posture, body language, and make a good impression. Expect any mirror to be a two way mirror. Expect cameras to be everywhere. Expect that you are being observed at every moment. If you bring a book etc to keep occupied while left waiting (a tactic on their part), be careful about what type of book / music it is. Be sure NOT to fidget nervously while waiting. Consider the polygraph team as birds of prey just waiting to pounce at the slightest hint of nervousness. Act like you have nothing to hide. Nothing to fear from the test. You are prepared, and so you HAVE nothing to fear. You are empowered to pass the ‘test’.

Never make ANY admissions to ANY deceptions. Never revise any earlier response. The operator will do their best to ‘spin’ anything you say out into a full blown deception / revision. At the same time pay attention to what are the control questions, which you MUST answer deceptively, with exaggerated anxiety / fear / trepidation etc…and the relevant questions, to which you must NEVER make even the slightest of changes e.g admit that an earlier response may have been incorrect / misrepresentative. If you want to change an earlier response, ignore that impulse. There are NO harmless changes / revisions. No matter WHAT they say. Remain polite and professional no matter how friendly or aggressive the polygrapher / interrogators become.

Always keep your answers short and direct. Answer ‘Yes’ or ‘No’. Do NOT embellish in ANY way. ‘No I have not’. ‘No I have never’. Never leave ANY room for ambiguity such as ‘Not really’, or ‘Yes, in principle’. Answer clearly and affirmatively / negatively. Yes. No. Never. Always.

Keep it serious and professional. The polygraphers are NOT your friends. Go along with their act, but don’t be fooled. Never let down your guard. Never change an answer from Yes or No in any way to accommodate the polygrapher in any way. You may feel a desire to please them, typical of many interview situations from product testing to interrogations with the ‘Good Cop’. Do NOT become chatty, over-talkative, or careless. The polygrapher thinks they can ‘read’
you like an open book, and will imagine they can ‘interpret’ such behavior as anxiety about being ‘caught out’, as indicators of ‘deception’.

Learn how Polygraphers May Expect Truthful Subjects to Behave so you can satisfy their self-deceptive notions. Play up to what they interpret as honesty, What they expect. What they cleverly expect they can ‘read’. Pretend you welcome the test, as a chance to use a modern technology and training of the operator to have the chance to prove beyond doubt that you are innocent / appropriate for the job applied for. Show confidence in the machine and operator. Pretend you trust both. That you expect a good outcome. Answer straightforwardly. Cooperate completely. That is PRETEND to be doing so. But never overdo anything. Be cheerfully confident but do not try to obviously gain the operator’s approval.

Answer NO directly and unequivocally. Finally. As if you disbelieve the actual question could even be put to someone as honest as you. As if they must be kidding to even ASK you such a question. Say ‘NO’ as if challenging their mere right to dare to even imagine you capable of such a thing. MHR imagine at the time of the question that they just asked you ‘Do you eat puppies and kittens?’ ‘Are you planning to sell your daughter into prostitution?’ etc Answer as if angry. Very crisply. As if the idea is absurd. How dare they even ask? How could they possibly seriously ask such a ludicrous question?

Being late may be interpreted as an unconscious fear of the interview. A desire to avoid it. Postponing it will appear even worse. Never appear nervous. As if avoiding a question. As if worried. Don’t fidget. Consider all the ‘cues’ people demonstrate when nervous, such as a dry mouth. Avoid any of these. Don’t be too friendly or too polite, as if trying to ‘win them over’. Don’t ‘explain’ your behavior e.g that you may appear guilty, but that is just normal nerves. Do not do anything more than answer their questions, when asked. Do not try to impress interrogator with your ‘honesty’ or ‘religious beliefs’. Do not complain about the equipment being too uncomfortable, even painful. Sit comfortably, and void excessive movement. Do NOT ask about the equipment, what it is recording, what the readings are, whether you ‘passed’, complain it is taking too long, do anything that looks like attempts to evade, shorten, or ‘explain’ the sessions results…do not appear in any hurry to be over with the interview. Do not appear relieved when it is apparently over.

How a deceptive subject would hypothetically answer “No,” in response to the question, “Did you steal the ♦ ♦ ♦ ♦?” Reid (♦ ♦ ♦ ♦) writes: The subject [who] says: “NO” - crosses his legs and shifts in the chair is lying. “NO” - looks in a different direction, down and up, or sideways is lying. “NO” - closes his eyes is actually seeking to escape and is lying [sic, trying?] to hide. “NO” - shakes his
head NO and tried to place more emphasis on NO to be more convincing. “NO” - answers late is lying. Actually the delay is caused by the debate in his mind, “Shall I say YES, I better say NO.” “NO” - questions. A breathless sort of way is lying but is offering a “NO” as “try that on for size” is lying. “NO” - hesitates and appears to be thinking is actually hiding behind an alleged seriousness is lying. “NO” - studies, sort of false deliberation is lying. “NO” - apologizes in saying "NO" is lying. “NO” - plead is lying. “NO” - qualifies the NO by the inflection of the voice is lying. “NO” - has an empty or washed-out look, but this is a last ditch effort to “get out from under” actually is lying. “NO” - pauses and looks like the question was not directed to him even though he and the questioner are the only ones in the room and the question is directed to him. He almost appears to be in an hypnotic state. He is lying. “NO” - studied eyes is lying.

Remember that these are the ‘accessing cues’ the operators are trained to look for, and interpret in a particular way, as deception. Do not argue with them. They know it all. They are sure they can use these ‘cues’ to read your mind. To read your ‘body language’. It is not open to discussion. Do not try to convert their delusions to more reasonable assumptions. Just accept that these fools believe they can ‘read you like an open book’, thanks for a few months of ‘training’. They have faith in their new religion. Do not bother trying to convert them. If they were honest, open-minded, scientific people, they would have rejected all this mumbo-jumbo pseudo-science shortly after having been exposed to it. Just like you have already done.

Your chair may be stationary, while your polygrapher’s chair will probably be wheeled for his ease of movement, placing you at a psychological disadvantage. Upon entering the room, you may find that the chair you are to sit in is facing the wrong direction or in the wrong location. By directing you to move the chair, your polygrapher may subtly demonstrate that he is in control. You may also be made to wait for your polygraph interrogation in an uncomfortably overheated waiting room. Your overcoat will be ‘taken hostage’, as another power play. Do not be intimidated by your polygrapher’s little mind games. Play along. Let your polygrapher think that he is in control.

You may be offered ways to ‘foil’ the polygraph e.g told to wash you hands well, as otherwise equipment won’t work, to see if you only pretend to wash your hands (two way mirrors in bathroom or cameras), or leaving you alone, admonishing you to ‘don’t touch anything, and seeing if you do, to try to influence the outcomes.

If asked what you know / think about polygraphy, act like an ignorant, gullible, naïve member of the public. Mention how O.J Simpson apparently failed his polygraph, and how shocked you were that he ‘got off’, and how you don’t get why they just didn’t polygraph him in court and spare everyone such a long, silly
trial. Act like you are glad polygraphy exists, as it stops ‘bad’ guys getting jobs in the FBI etc. Act enthusiastic and interested in what is going on. This is a fascinating experience you will want to tell your friends and family about.

Control questions are those you would reasonably expect most people would have done at some point, such as lie, cheat, or steal an item of little value, such as taking a pen home from work. But if it is about having stolen MONEY, or a money value limit is stated, like 250 dollars, this is a relevant question.

Control questions tend to be more ambiguous, whereas relevant questions more specific.

Have you ever committed ‘a crime’? This is general, and hence a control question. You are expected to lie. You are expected to have broken some laws during your life. If the word ‘serious’ is added, this is now a relevant question. You have NEVER committed any SERIOUS crimes!

The polygrapher will give you clues, by leading into control questions you are expected to lie to, by giving you additional motivations to lie. Such as hinting that any sort of cheating or lying would preclude you from employment, then asking you if you have EVER cheated or lied. This is general. It is a control question. Be sure to LIE and say ‘NO’. And employ the counter-measures that will make your response really ‘light up’ the polygraph, giving them such a high benchmark that it is unlikely any lie you tell during the rest of the interview will be able to exceed the readings you are producing right now.

If you ask for clarification, and your polygrapher responds ‘Interpret the question any way you wish’ or ‘what does it mean to YOU?’, it is a control question. You must lie now. You are expected to. They will use your response as a baseline / benchmark to compare later responses to, assuming that you are lying right now. So lie. Deny it.

Your polygrapher will give you the “opportunity” to get anything off your chest that may be “bothering” you. Don’t fall for it. Make no admissions.

Breathing Countermeasures Your polygrapher will attach the polygraph’s electrodes to your ring and index fingers, the inflatable pressure cuff to your arm (or perhaps a transducer set to your thumb instead), and place one pneumograph tube around your chest and the other around your abdomen. From the moment the pneumograph tubes go on, you need to be concerned about your breathing. Many people are falsely accused of attempting to “beat the box” because they (in the polygrapher’s opinion) breathe too deeply or too slowly or both. Your polygrapher will be happy if your breathing rate is between about — and breaths (in and out) per minute, or — seconds each. Pick a breathing rate within this range that is comfortable for you and take relatively shallow—not
deep—breaths. Each breath should be about the same length. Practice until it becomes second nature. You should maintain this baseline breathing pattern until the pneumograph tubes are removed from your chest and abdomen. Don’t relax and change your breathing pattern as soon as the last question has been asked! The polygraph is still recording your breathing, and your polygrapher may let the instrument continue recording your physiological responses for a minute or so after asking his last question in order to see if your breathing pattern changes. He may interpret any change after the last question is asked as an indication that you were employing countermeasures.

Your polygrapher will ask his series of questions, with a pause of about 20-30 seconds between questions. You will have already mentally categorized the questions he reviewed with you as “control,” relevant, or irrelevant during the “pre-test” interview. There will be no surprises. If you cannot decide whether a question is a “control” question, then you should err on the side of caution and assume that it is relevant. As soon as you recognize that the question your polygrapher is asking is a “control” question, or, alternatively, immediately after answering the question, change your baseline breathing pattern to produce one of the five pneumograph reactions that DoDPI considers to be most significant in chart scoring: Note: None of these manipulations call for deep breathing.

Filling your lungs to full or nearly full capacity is likely to be interpreted by your polygrapher as an attempted countermeasure.

holding one’s breath for four or five seconds (anything much longer may make your polygrapher suspicious) after breathing out. The second reaction, a respiration rate decrease, may be produced by simply breathing more slowly for 5-15 seconds, ending before the asking of the next question:

The third scorable reaction, a change in inhalation/exhalation ratio, may be effected by exhaling more slowly than inhaling for 5-15 seconds, ending before the asking of the next question:

The fourth reaction, a decrease in amplitude (also known as suppression), may be produced by taking several shallower breaths and then returning to one’s baseline breathing pattern. This should be done over the course of 5-15 seconds, ending before the asking of the next question. The fifth reaction is similar to the fourth, except that breathing becomes shallower gradually before returning to one’s baseline breathing pattern. Again, this should be done for 5-15 seconds, ending before the asking of the next question. In addition to the breathing countermeasures described above, you can enhance your cardio (heart rate and blood pressure) response to the “control” questions by choosing one of the following two additional countermeasures. Mental countermeasures: Perform mathematical calculations in your head as quickly as you can. For example, divide 45 by 3 or calculate the square root of 169. Other activity that
requires focused concentration is also effective. For example, pick an arbitrary number (say 854) and count backward by 7s as quickly as you can. Alternatively, you may think exciting thoughts, (e.g., falling off a cliff, an encounter with a rattlesnake, being raped at knifepoint—use your imagination). You want to think of something that will make your heart race and cause an increase in blood pressure. Again, begin either as soon as you recognize a “control” question, or right after answering the “control” question, and continue for 8–20 seconds, but no longer than the beginning of the next question. A breathing reaction may naturally accompany such mental activity without your having to think about it. 2. Tongue biting. Bite down slowly on the side of your tongue hard enough to produce moderate pain, but don’t cut your tongue. Again, begin either as soon as you recognize a question as a “control” question, or right after answering the “control” question, and continue for 8-20 seconds, but no longer than the beginning of the next question. If you start biting as soon as you recognize the “control” question, you will of course pause long enough to answer the question, and then resume the tongue bite. Be subtle, your polygrapher mustn’t notice. You can practice this “pain countermeasure” in front of a mirror.

The first three editions of The Lie Behind the Lie Detector included constriction of the anal sphincter muscle as a physical countermeasure to be applied timely with the asking of the “control” questions. However polygraph manufacturers such as Lafayette and Axciton have begun marketing piezoelectric sensor pads that they claim aid in the detection of physical countermeasures. These pads are typically placed on the seat of the polygraph chair, and additional pads may also be placed on the armrests or beneath the subject’s feet. While no polygrapher has ever demonstrated any ability to detect the anal sphincter contraction employed as a countermeasure, even with the aid of such pads, we cannot exclude the possibility that a sphincter contraction might result in a detectable change in weight distribution over the surface of a piezoelectric sensor pad. Given this uncertainty, we believe that mental countermeasures or tongue-biting, which plainly cannot be detected by such means, are preferable.

Countermeasures and the “Stim Test”. By employing the breathing and cardio countermeasures you’ve learned to augment your physiological responses as you answer the question about the number or card you actually picked, you can make your polygrapher think that you really are a “screamer,” and he won’t be surprised when you react strongly to the “control” questions.

You should practice both the breathing and cardio countermeasures until you can employ them at will and with confidence.

Remember to continue your baseline breathing pattern until the pneumograph tubes are removed from your chest and abdomen. If you have correctly identified
the “control” questions and applied the countermeasures described above, you should have produced a strongly “truthful” chart.

At some point in the “in-test” phase, your polygrapher may turn off the polygraph instrument, sit down in front of you, tell you that a question is troubling you, and ask you if there is anything you would like to get off your chest before a repeat polygraph chart is done. This is a commonly-used bluff. Don’t fall for it. If you have agreed against our advice to submit to a polygraph interrogation in a criminal investigation, then under no circumstances should you try to explain why you might have reacted to a question. Remember that any minor admissions you make at this point are likely to be blown out of proportion. Maintain your truthfulness politely, but firmly. “I told you the truth, nothing is bothering me about that question.”

If you have submitted to a pre-employment or postemployment polygraph screening interrogation, then you should have some explanation prepared in advance that cannot be turned into a damaging admission, just in case your polygrapher tells you that one of the relevant questions really seems to bother you. If you refuse to offer any explanation at all as to why you might have reacted to a certain relevant question, then your polygrapher might interpret it as stonewalling and use his discretion to render an adverse opinion. Thus, you should appear concerned and puzzled as you offer a pre-planned explanation. Some examples of explanations that cannot be twisted into damaging admissions include: • “All I can think of is that I’ve always felt guilty when I’m accused of something. Make sure that your “throw-away” explanation does not invite further interrogation. Keep it as simple and direct as possible. Do not add any info, or contradict, in any way or form, anything you answered in any questionnaire, or during the interrogation. If your polygrapher remains unsatisfied after you have offered your explanation as to why you might have reacted to one of the relevant questions, then you should offer no further explanation. “I told you the truth. I can’t think of any other reason why I might have reacted when you asked that question.” They are just fishing. It is all part of the con.

After collecting the polygraph charts, rather than directly accusing you of deception, your polygrapher may begin by asking you to tell him which question troubled you the most. Be sure to name one of the “control” questions as being the one that most troubled you. Have an innocuous explanation prepared e.g I think I felt guilty about not spending more time with X. I told X I had to work, when really I was just overwhelmed with work etc, and needed some ‘time off’ with my friends, away from X’.

After you’ve gone through all the question repetitions, your polygrapher may attempt to subject you to a “post-test” interrogation. He may tell you that your charts show deception (even if, based on polygraph doctrine, they don’t), and that
he can’t help you unless you admit to whatever it is that was bothering you. Again, don’t fall for this bluff. Your polygrapher is not there to “help” you. He is not going to “go to bat” for you against headquarters. The sole purpose of the “post-test” interrogation is to obtain a confession or damaging admission. If your polygrapher attempts a “post-test” interrogation, it is a good sign that you have already “failed.” Under no circumstances should you deviate from what you provided, no matter how hard your polygrapher may lean on you. Remember that even an innocent remark can be twisted into a damaging “admission.” You have nothing to gain by remaining for a “post-test” interrogation. While a “failed” polygraph “test” can be detrimental to your future employment potential (both with the testing agency and others), a polygrapher’s report that you admitted to withholding information can be absolutely devastating. Politely, but firmly, terminate the interrogation, and leave. “I told you the truth, but you say I’m lying. I don’t understand. I have nothing more to say to you. Good day.” In terminating the interrogation, be sure to the following sort of action, which polygrapher’s interpret as a clear behavioral sign of deception: Namely, when after a subject has been accused as guilty during an interrogation and denies his implication, while being dismissed, turns to the examiner, shakes his hand and says, “sorry to have cause you so much trouble”

If your polygraph examination is for employment with the CIA or NSA, do not be surprised if you are told that you are “having problems” at the end of your polygraph session, subjected to a “post-test” interrogation, and scheduled for a “re-test.” It seems to be standard operating procedure for these agencies to subject applicants to more than one polygraph session.

It is a common trick for the Polygraph operator, who has led you to believe that you have just one shot at the polygraph, falsely accuses you of deception, subjected you to a full-blown “post-test” interrogation, and then left the room: He returns. Here it comes I think. To my surprise he announces he has spoken to a supervisor about my case. I am being allowed a chance to retest. I’m ecstatic. “Because we want you to pass your polygraph, we are going to go ahead and schedule another polygraph exam tomorrow to see if we can’t help you clear the test. You have to understand, this is a rare second chance. We don’t do this often. We’re doing this because we want to try to work with you. I want you to think very carefully about what has happened here today and reconsider some of the answers you have given.” I return to the waiting area. Other applicants are there, waiting. I’m surprised to hear from their conversations that nearly all of them have been offered “rare” second chances to retake the polygraph the next day.…. 

No polygrapher has yet demonstrated any ability to reliably detect countermeasures
Silent Answer Test In this technique, which is apparently intended to catch examinees off guard, the examinee is told to remain silent during the “in test” phase and to answer the questions in his/her head. Just as in normal polygraph examinations in which one answers out loud, the way to pass the Silent Answer Test is produce stronger reactions to the “control” questions than to the “relevant” questions. Don’t do anything differently.

Yes Test In this technique (Reid & Inbau, 1984), the subject is instructed to answer all questions “Yes.” (In some cases, the “control” questions may be left out.) The idea is to trick the subject who has been augmenting his/her reactions to the “control” questions into producing reactions to the relevant questions instead. If he/she does so, countermeasure use is inferred. If you encounter the “Yes Test,” be careful not to augment reactions to the relevant questions. If the “control” questions are included, you still want to show reactions to them.

Another counter-countermeasure approach that seems to be in use is the following: during the pre-test phase, the polygrapher will deliberately refer to one or more irrelevant questions as “control” or “comparison” questions in an attempt to mislead the examinee. If the examinee then shows strong reactions to any of these irrelevant questions, the polygrapher infers that countermeasures have been used.

The polygrapher may also apply “time bars” to irrelevant questions in an attempt to make them appear more like “control” questions. Examples of time-barred irrelevant questions include, “Between 1980 and 1985, did you attend Georgetown University?” and, “Before 1990, did people sometimes call you Henry?” If the examinee shows strong reactions to a time-barred irrelevant question, countermeasure use may be inferred.

The polygrapher may casually inform the examinee that his polygraph results are “NDI.” An examinee who has not researched the polygraph should not understand that “NDI” means “No Deception Indicated” (that is, he/she has passed), and should appear confused by the examiner’s statement. On the other hand, if the examinee appears relieved by the news that his charts were “NDI,” it would suggest that the examinee has, in fact, researched polygraphy and has employed countermeasures. Or the polygrapher may tell the examinee that his charts are “DI,” which is shorthand for “Deception Indicated” (or possibly “SR” for “Significant Response”). Again, the subject who has not researched polygraphy should not understand the meaning of either of these terms.

Some polygraph instruments may be equipped with one or more piezoelectric sensor pads, typically placed on the seat of the polygraph chair, and optionally on the armrests and under the subject’s feet as well. The manufacturers claim, without offering any scientific evidence, that these devices may be used to detect physical countermeasures such as the anal sphincter contraction. Some
polygraphers may alternatively employ one or more pneumatic (air-filled) sensor pads or a strain gauge (typically placed under the front legs of the chair).

If the polygrapher (or his boss) was already suspicious of you before the polygraph interrogation, he may remain suspicious even after you produce a “truthful” chart. He may accuse you of having employed countermeasures, even though he can’t prove it.

Your polygrapher might try to bluff in an attempt to get you to admit to employing countermeasures. He’ll turn off the polygraph, disconnect the pneumograph tubes, arm cuff, and electrodes, pull up a chair knee-to-knee with you, look you dead in the eye, and in a calm voice declare, “I know what you’re doing. Alternatively, your polygrapher may appear angry or offended as he delivers his bluff. Don’t fall for it!

Another bluff you may encounter is this: your polygrapher will tell you that it’s “obvious” that you’re manipulating the results. He’ll tell you he thinks you’re honest, and he would like to help you pass, but he can only do so if you admit to having used countermeasures. He might at this point even tell you about a person his agency recently hired who was only able to pass the polygraph after admitting to having foolishly used countermeasures he had read about on the Internet. (Some polygraphers may even mention AntiPolygraph.org by name.) Don’t be fooled: this person who admitted to using countermeasures, passed, and went on to be hired does not exist.

If your polygrapher attempts either of these bluffs with you, you should appear to be confused, “I didn’t do any of the things you said. I told you the truth.” Remember the first rule we discussed at the beginning of this chapter: make no admissions! And the most damaging admission you could possibly make (in your polygrapher’s mind) is that you employed countermeasures.

As soon as your polygraph interrogation is over, take detailed notes for your personal records. You might take a portable tape recorder with you for this purpose and leave it in your car, briefcase, or purse. Often, you will not be told whether you passed or failed before you leave. If you have employed the methods described in this book, you should have handily passed. But you may have made a mistake. Or your polygrapher may have decided even before asking his first question that you are not going to pass. In the event you are later told you failed or that your results were inconclusive, your notes will be of great importance. Start off with the place you took the exam, the examiner’s name, the date, and the questions you were asked. Write down every detail you can remember about the polygraph “test”—no matter how insignificant it may seem at the time. Begin with the questions you were asked, and which ones the polygrapher accused you of being deceptive on. Also, be sure to include any derogatory comments made by the examiner, questionable and/or abusive tactics, etc. Be sure to start this
memo the day of the exam—not the next morning when you may have forgotten
details. Keep this document nearby so that you can add to it during the following
days when you may recall details that slipped your mind. Having an accurate
record will be crucial to almost anything you do in attempting to clear your name.
Post Your Experience on the Internet Exercise your First Amendment right to free
speech by publicly exposing polygraph waste, fraud, and abuse. Write an account
of your experience to be posted on AntiPolygraph.org. Your silence only plays
into the hands of those who have abused you.

The DoDPI Law Enforcement Pre-Employment “Test” is used by federal law
enforcement agencies that require pre-employment polygraph screening, such as
the FBI, U.S. Secret Service, and DEA. The CIA’s pre-employment polygraph
technique is similar. The following three question sequences are from
Appendices E, F, and G of the handbook, respectively:

Law Enforcement Pre-Employment Test Question Sequence/Phase I 1.
Irrelevant: Are the lights on in this room? Yes. 2. Sacrifice Relevant: Regarding
the national security questions, do you intend to answer each question truthfully?
Yes. 3. Comparison: Before -----, did you ever lie about something important?
No. 4. Relevant: Do you know anyone who is engaged in espionage or sabotage
against the United States? No. 5. Comparison: Prior to -----, did you ever lie to
intentionally mishandled any classified information? No. 8. Comparison: Before -
-----, did you ever lie to cover something up? No. 9. Relevant: Have you had any
unauthorized foreign contacts? No. 10. Comparison: Are you a really honest
person? Yes. 11. Relevant: Have you ever been involved in terrorist or subversive
activity? No. 12. Comparison: Are you the kind of person who would betray a
friend? No. Law Enforcement Pre-Employment Test Question Sequence/Phase 2
1. Irrelevant: Are the lights on in this room? Yes. 2. Sacrifice Relevant:
Regarding your past, do you intend to answer each question truthfully? Yes. 3.
Comparison: Prior to -----, did you ever lie to make yourself look better? No. 4.
Relevant: Have you ever committed any serious crime? No. 5. Comparison: Are
you the kind of person who would betray a member of your family? No. 6.
Relevant: Are you intentionally withholding any information about your
involvement with illegal drugs? No. 7. Irrelevant: Is this the month of -----? Yes.
8. Comparison: Are you absolutely trustworthy? Yes. 9. Relevant: Are you
intentionally falsifying or omitting any information on your application forms?
No. 10. Comparison: Before -----, did you ever cheat in school? No.

Breakdown Test Sequence (Drugs) 1. Irrelevant: Is today -----? Yes. 2. Sacrifice
Relevant: Regarding your drug involvement, do you intend to answer each
question truthfully? Yes. 3. Comparison: Before -----, did you ever falsify any
5. Comparison: Before -----, did you ever violate any official rules or regulations?
No. 6. Relevant: Have you ever purchased any illegal drugs? No. 7. Comparison: Prior to this year, did you ever lie about something important? No. 8. Relevant: Are you now withholding any information from me regarding your drug involvement? No. 9. Comparison: Prior to -----, did you ever do anything for which you could be fired? No. 10. Relevant: Is there now any information on your employment form which you know for a fact to be false? No. 11. Comparison: Before -----, did you ever tell a lie about anyone? No.

The Zone Comparison “Test” (ZCT), alternatively known as the Zone of Comparison “Test” (ZOC), is the polygraph technique most commonly used for polygraph interrogations concerning a single issue, and it is used especially in criminal investigations.

Those planning to use countermeasures to protect themselves against a false positive outcome need to be able to recognize the different types of questions (relevant, irrelevant, and “control” on the fly.

Symptomatic. Is there something else you are afraid I will ask you a question about, even though I have told you I would not? Answer NO

Control. Prior to this year, did you ever steal anything from an employer? Answer NO

Irrelevant. Are the lights on in this room? Yes.

Sacrifice Relevant. Regarding that stolen money, do you intend to answer truthfully each question about that? Yes.

Symptomatic. Are you completely convinced that I will not ask you a question on this test that has not already been reviewed? Answer YES

Non-Current Exclusive Control. Prior to 1993, did you ever lie to anyone in a position of authority?

Non-Current Exclusive Control. Prior to 1990, did you ever lie to get out of trouble?

Symptomatic. Is there something else you are afraid I will ask you a question about, even though I have told you I would not?

If you are a suspect in a criminal investigation, you should not submit to a polygraph examination at the request of law enforcement. The “test” is merely an excuse to interrogate you with no lawyer present.
Make no admissions. The primary utility of polygraphy is that it encourages people ignorant of how it works to offer up derogatory information about themselves that they would not otherwise provide. Remember, the damage done by a “failed” polygraph “test” pales in comparison to a “test” (regardless of result) accompanied by a sworn statement from a law enforcement officer alleging that you admitted to withholding information in sworn documents. Nothing good can come of changing your story one iota when you enter a polygraph suite—so make no admissions! Your polygrapher’s job is simple: to get you to make damaging admissions.

Do not deviate whatsoever from what you have already stated. If you previously reported to the agency having smoked marijuana five times, and the polygrapher asks if it could have been six, the answer is “no.” Changing your statement at his suggestion to something like “less than ten times,” while still accurate, is a prescription for disaster.

Understand the “stim test”—the trick played by polygraphers with cards and/or numbers at the outset of most polygraph “tests.” Although the examiner will explain that the function of the “test” is to calibrate the machine, the real purpose is to instill fear in you that the machine will detect any attempt at deception. Apply countermeasures here at the point where you “lie” to the polygrapher.

During the “in-test” phase, employ these countermeasures as soon as you recognize each “control” question and for 8 to 20 seconds thereafter. • Recognize that the only reliable method polygraphers have of detecting deception or countermeasures is to bluff examinees into making an admission. Polygrapher bluffing regarding countermeasures is becoming more common as more and more examinees are learning the truth about polygraphy. Make no admissions! • Be keenly alert for any possible segue into the “post-test” interrogation phase. Don’t stay to repeat your denials to the same question ad nauseam. Politely pull the plug on the session after being taken over the same question two or three times. You are not being paid for your time, and there is nothing to gain by allowing yourself to be subjected psychological abuse. • Regardless of what you may have heard about Aldrich Ames talking his way out of deceptive charts, be extremely careful if you choose to explain a purported response to a relevant question. This brings with it the risk of having an admission/confession falsely attributed to you. There may not have even been a reaction to the question in the first place.
THE MILTON MODEL

MHR Milton Erickson clearly identified his task as that of bringing about a hypnotic state in which he could stimulate her unconscious to use her past learnings in a therapeutic manner.

**Puzzle**: how to plant 10 trees in 5 straight rows with 4 trees in each row? The solution is to plant them in the shape of a pentagram, a five pointed star. The trick is to abandon all prejudgements (prejudices) concerning how ‘rows’ are usually / typically / normally parallel lines … this is what stops most people coming to the solution…a fixed frame of reference…a fixed definition of what ‘rows’ ‘should’ look like…they get ‘stuck’ on the preconceived idea of parallel rows … as if there are no other ways to arrange rows, as the solution requires…the solution requires you approach the problem in a purely ZEN frame of mind…free of any assumptions, preconceptions, definitions … so you can ‘reinvent’ the ‘row’ as if for the first time, escape history, escape your mental limitations, your mental prisons, in which ‘rows’ are ‘always parallel’ to each other…it is all about freeing up our frames of reference, allowing greater flexibility and adaptability…escaping former conditioning and limiting beliefs and assumptions and ideas and prejudices and preconceptions … so we are free to allow the full resources of our minds, especially those outside the usual narrow range of ‘conscious awareness’ and ‘conscious attention’ a.k.a the ‘sub-conscious’ or ‘un-conscious’ resources…that part of our minds that is outside the narrow beam of attention, the 5 to 9 items we are capable of holding in our minds at any moment in time…etc…

Another of his setbreaking problems is to write number 710 and asks client to read it in all possible ways. Most people are not able to break the number set sufficiently to read it as OIL when they turn it upside down. Erickson typically reveals the answer by first asking the patients to make an S near the upside-down 710. If they still don’t get it, he has them make the S right in front of the upside-down 710 so it reads SOIL. At that point most people succeed in shifting from the number to the letter set.

This was a typical example of another of Erickson’s approaches for depotentiating a patient’s habitual mental sets to introduce the possibility of
experiencing more flexible frames of reference. With the trees and 710 problems, he has patients experience the rigidity of their own mental sets and then he gives them a bit of training in developing more flexible frames of reference.

Always have patients experience as much of themselves and their limiting mental sets as possible within therapy. The most important thing in therapy is to break up the patients' rigid and limiting mental sets.

**Indirect Hypnotic Forms Preparing for Trance Induction**

E: All right, how do you think I will induce a trance in you?

F: Well, I know there is a way by counting one to ten, I believe. I know very little about it.

begins with an indirect form of suggestion: how do you think I will induce a trance in you? already implies that you will induce trance; it's now only a question of how.

**Trance Induction via not Knowing and not Doing: The Early Learning Set**

E: Will you sit back in your chair with your feet flat on the floor and your hands on your thighs. The hands not touching each other, and just look at one single spot here. You don't need to talk. You don't need to move. You don't even need to listen to me. Your unconscious mind is close enough to me to hear me. And that's the only important thing.

Now there are various changes that take place in you. Your heart is beating at a different rate. Your breathing has changed. Your reflexes have altered. And you are doing the same thing now that you did when you first went to school. You looked at letters of the alphabet. They seemed impossible to learn. But you did learn them. And you developed a mental image of the letters and the numerals. And you developed a mental image of each of them in various forms that stayed with you for the rest of your life. You have looked at that one spot long enough so you have a mental image, and you do not know where it is in your mind. You can close your eyes N...O...W

E: When she responds initially by sitting back in her chair with feet flat on the floor, she is saying to herself that she will go into trance. These initial adjustments allow her to make that important suggestion to herself rather than my telling her. It’s always much better to have patients make the important suggestions to themselves.
R: You now embark upon your favorite form of trance induction via eye fixation and a number of indirect hypnotic forms that are effective precisely because no one could really argue with anything you say. The patient is lulled into not knowing and not doing (need not talk, move, or even listen) to depotentiate her conscious sets. A dissociation is facilitated by your emphasis on her unconscious functioning as a subtle form of the conscious-unconscious double bind.

E: Not needing to listen to me is an indirect way of emphasizing that it's her own personal experience, not mine.

R: You then ratify the process of trance experience as an altered state by pointing out how physiological changes have taken place (heartbeat, breathing, and reflexes). You conclude this initial stage of trance induction with the early learning set that tends to evoke ideodynamic aspects of early childhood learning, when so much was absorbed on an autonomous or unconscious level. These early learning patterns may now be activated for learning trance experience, which must also proceed on as much of an autonomous level as possible. You then precipitate eye closure with the direct suggestion to close her eyes N . . . O . . . W said in a slow but quietly emphatic and insistent manner. This particular vocal emphasis now acquires the value of an unconscious conditioned stimulus. The next time you use that low tone of voice with similar emphasis and insistence, she will tend to enter trance but not really know why. If you later use the word now to awaken her, you will use a clear, quick, bright, and louder tone of voice that will acquire the value of a conditioned stimulus for awakening.

MHR 'tone of voice etc used as anchor for trance state !

**Trance Deepening via Contingency Suggestion: Pause as an Indirect Suggestion**

E: And with each breath you go deeper and sounder in the deep hypnotic sleep.

[Pause]

Now you know why you want to go into a trance. You do not fully understand why some of that memory escaped you.

[Pause]

R: You are using a contingency suggestion when you now facilitate trance-deepening by associating deeper trance with an inevitable behavior - breathing.

E: I pause after telling her to go deeper and sounder" because that does take time. The pause itself is an indirect suggestion to do that now.
R: You then further motivate her for deepening trance by reminding her of her purpose in seeking hypnosis. You thus utilize her own motivation for deepening trance.

An Associational Network Facilitating an Unconscious Search for Lost Memories

E: But the mental images that you formed in kindergarten are still within your mind. Things long forgotten still have their mental images in your mind. You can lose learnings by the loss of brain cells. But you haven't lost the brain cells concerned with X (the thing client wants to remember).

[Pause]

And those mental images belong to you, and you can enjoy getting them back. And I think the best way of getting them back is doing so by getting one small one and being completely delighted by it. Not asking for more, but just enjoying the pleasure and delight of that one little memory. And the next thing you know you'll get another little memory that will give you a great deal of pleasure and delight. And doing it this way you will build up your pleasure and comfort and ease very rapidly. Not rapidly in time but rapidly in force, in strength. And then some day you'll realize you really do have all of it. And when one uses the unconscious mind, one does it at the rate of speed that belongs to the unconscious. Your unconscious knows how fast it can work, how fast your conscious mind works. And your unconscious will know how to feed that memory back to you.

By pointing out how even earlier mental images are still within your mind. This implies that the escaped memory is still within and available to her. You then leave it to her unconscious

E: I admit to her that there is a way of losing memories by a loss of brain cells, but I affirm that is not the case with her.

R: You thereby pick up some doubts she might have about being able to recover her memories, and depotentiate them.

E: When I affirm that the mental images belong to you and you can enjoy getting them back, I'm referring back to my earlier remark about how they escaped you and the implication that she deserves to get back what belongs to her. I then emphasize the delight one little memory can give her.

R: That can reinforce her so that she will tend to have more and finally a chain of recovered memories.
E: Someday you'll realize you have all of it implies a noncritical acceptance of each small bit of memory as it comes. I'm attempting to rule out self-criticism.

R: That conscious self-criticism can so limit the spontaneous creativity of the unconscious.

E: Yes, I say it belongs to the unconscious and the unconscious knows how fast it works. I then contrast that with how fast your conscious mind works, thereby separating the conscious and unconscious.

R: You emphasize the separation of conscious and unconscious to make sure she leaves it to the unconscious rather than try to work on it with the more limited means of her conscious processes. That is the essence of your hypnotic approach: depotentiating the conscious mind's limited means and reinforcing unconscious processes with their greater potentialities.

E: Yes, and the separation is stated in such a way that it has to be accepted because what I'm saying is true.

R: Hypnosis is not a means of directly programming people to do things in one way. With billions of neurological connections in the mind it is terribly presumptuous to try to program people.

E: It is a very uninformed way.

R: We are allowing the infinite diversity of the unconscious to come forth rather than trying to program one idiotic idea or point of view we may have. There are infinite patterns of learning and ways of doing things. Our approach helps people unlearn their learned limitations.

R: You use surprise as another indirect hypnotic form that will tend to depotenti ate the limitations of her conscious sets and habitual attitudes that may be blocking her memories. You reinforce this by again emphasizing the central role of the unconscious being allowed to work in its own. You continually suggest that pleasure and enjoyment will accompany the unconscious search and processes. This is in part a truism and in part a means of motivating her further. It would be a significant research problem to determine if, in fact, such suggestions for pleasure are ideodynamically mediating further reinforcement by activating the positive reward centers of the limbic system.

Separating Conscious and Unconscious Processes: Trance Awakening and Ratification: Training in Posthypnotic Suggestion

E: I'm going to have you awaken shortly for a lesson in enjoying what your unconscious can do for you. When I awaken you, I want you to have a very
profound feeling of comfort, as if you had been sleeping for eight hours. I want you to enjoy that.

[Pause]

Now you can start thinking about counting backward from twenty to one, waking up one-twentieth of the way at each count. And you can begin counting backward from twenty to one, awakening at one. And begin the counting now!

[Pause as Mrs. F silently counts to herself and opens her eyes and begins body reorientation in twenty seconds]

E: I emphasize that I am going to awaken her because I don't want her unconscious to awaken her. It's the job of her unconscious to turn up those memories. It's my job in association with her conscious mind to awaken her. I carefully separate the conscious and unconscious and keep them separate.

R: You begin the process of awakening her with a subtle posthypnotic suggestion that is very easy to accept. Her trance experience up to now has given every appearance of the deeply comfortable, receptive sort that is sometimes difficult to distinguish from sleep. You therefore utilize this to ratify her trance on awakening. Whatever behavior the patients manifest during trance (concentration, restlessness, emotions, etc.) can be used to ratify trance with a posthypnotic suggestion that allows them to respond with some expression about it upon awakening. This is your initial approach in training her to follow posthypnotic suggestions. You finally awaken her with that now! said in that bright and alert tone that will become an unconsciously conditioned stimulus for awakening.

Posthypnotic Suggestion Ratifying Trance: The Patient's Experience as the Focus of Attention

F: Hi! How was I? Oh, I felt like I went to sleep! You know? Like I went to sleep. That was strange.

E: A beautiful demonstration.

F: Did I go into a trance like I should have?

E: How do you feel?

F: It was sleep yet it wasn't sleep. It was like a borderline to sleep.

E: How do you feel physically now?
F: Much more relaxed. Much more at peace. I feel much more with it. I heard your voice, and it became a little fainter, but it was there in the background.

E: But you ceased to hear individual words and sentences?

F: Yes, just a voice.

E: Did you hear my cassette recorder start and stop?

F: No, I did not hear any other thing.

R: Her first words on awakening are an obvious response to your posthypnotic suggestion to feel as if she's had eight hours of sleep. She is also ratifying trance at the same time. She describes the comfortable, quiet, and receptive type of trance where no conscious effort is being made in any direction. This is in sharp contrast with the deeply searching, concentrated, and furrowed brow that was characteristic of X's trance (sweating case). The dissociation wherein F could hear the therapist's voice in the background but not the individual words and sentences is very characteristic of trance.

E: My voice in the background is where I want it to be. It's in the background of her experience. Her own experience is in the focus of attention.

R: You evoke the patients' own inner experiences as the therapeutic factor so that they don't hear irrelevant things (such as the cassette recorder). This is the opposite of so many therapists who insist that the patients focus on the therapist's words and views.

E: I asked her, How do you feel? because I did not want her thinking.

R: It can be entirely valid to feel as if she had eight hours of sleep, but it would be a falsehood to ask her to really think she had had eight hours of sleep when you both know she has not. You are always careful to avoid anything that would cause disbelief and a loss of faith in the validity of whatever you say.

E: I always distinguish between thinking and feeling: Thinking can be valid but it's limited; a feeling can be anything even though it's an illusion from a rational point of view.

Somnambulistic Training: Indirect Posthypnotic Suggestion for Trance Induction by Catalepsy

E: Would you like a surprise?
F: OK what is it?

[The senior author silently reaches over and touches her right hand with a very slight guiding motion. Her hand lifts and remains cataleptic, suspended in midair.]

E: Close your eyes and go to sleep. And you can really feel pleased, and happy, and rested.

E: In her first trance I mentioned how she'd been taken by surprise many times in the past when her unconscious knew something before she did. That was an unrecognized post-hypnotic suggestion that is now being used to induce this second trance with a surprise.

R: This trance induction by catalepsy (Erickson, Rossi, and Rossi, 1976) is also a way of deepening her hypnotic involvement with a nonverbal approach. You then deepen the trance by utilizing the sleep . . . happy . . . and rested experience, which you now know she is very capable of experiencing. You are beginning somnambulistic training by giving her many experiences of entering and awakening from trance. What other means have you for facilitating the somnambulistic state?

E: It's like learning anything else in life. The first time you read a textbook, you may not understand much; after you've read it two or three times, it begins to make sense. Rehearsal of trance, posthypnotic suggestion, and further hypnotic training are all being given at the same time to develop somnambulistic behavior.

Trance Awakening with Open-Ended Posthypnotic Suggestion

E: And if you wish, you can leave your right arm where it is after you awaken. And you can begin counting backward from twenty to one, awakening at one. And start the counting now!

[Mrs. F awakens with her arm remaining cataleptic in midair.]

R: You now give a very open-ended posthypnotic suggestion to leave her hand there if she wishes. This open-ended approach is fail-safe and tends to evoke an acceptance set by allowing the patient to express her own individuality. It is also a means of further assessing to what degree she is willing and ready to experience further hypnotic phenomena.

Trance Ratification via the Patient's Own Experience
F: Umm. What is my arm doing there? What is this? [She withdraws her arm from its cataleptic pose.] Why was that up in the air?

E: Do you realize you've learned how to go into a trance?

F: I was thinking about that and just wondering if I have grasped enough to do this myself. I'll go home and try it.

**Third Trance: Induction and Posthypnotic Suggestion for Learning**

E: Now do you want to see what you have learned?

[The senior author again induces an arm catalepsy by guiding her arm upward. Mrs. F blinks and closes her eyes and evidently goes into a trance.]

And you can leave your arm there and recognize what you have learned after you awaken. And you can awaken by starting counting now.

[F awakens with her arm still cataleptic.]

F: That is ... oh!

[F puts her arm down.]

**Fourth Trance: Autohypnotic Training via Training and Expectancy**

E: Now suppose you raise your hand.

[F lifts her hand until it remains posed in balanced tonicity (catalepsy). She closes her eyes and evidently enters trance.]

R: In asking her to lift her own hand this time, are you placing trance induction more under her own control as a stage in autohypnotic training?

E: I did not tell her to go into trance. When you tell someone to raise or extend the hand, they are going to expect something. You're using that expectancy learned in everyday life.

R: And what else is there to expect in this situation except trance? You have built an association between hand levitation and trance so that she can expect and does, in fact, go into trance entirely on her own. This may look superficially like a process of conditioning (and it may be in part), but it's the element of expectancy as well as her own motivation for trance that leads her to experience it here.
E: I didn't define it as trance. I let her own experience define it.

MHR This is how conditioning works in religion, education, propaganda...you induce a state once, then re-inforce it by repetition, until any single element of a ritual or propaganda etc stimulates the trance state induced, at first, by careful and deliberate strategies.

**Implied Directive to Ratify Trance: The Careful Study of Communication by the Therapist**

E: And when you have recognized that you are in a good trance, you can tell yourself about awakening.

[After a few moments F awakens and reorients all on her own.]

F: Um! My word! I'm taken sort of by surprise by all of this.

E: A pleasant surprise.

F: The mind is an unbelievable organ, isn't it! This is wonderful.

E: All right. Now you know you can lift your hand and go into trance, and when you have been in a trance sufficiently, your unconscious mind can tell you to awaken. Now you know you can do that. You have just had that experience.

F: Yes.

R: You now use the implied directive as a means of having her recognize, explore, and validate her own trance experience. It is very important in autohypnotic training to give the patients an opportunity to recognize and ratify their own trance experiences.

E: When she says, I'm taken ... by surprise, you know she's following my posthypnotic suggestion for a surprise. The validity of the experience is expressed in her own words, The mind is an unbelievable organ. . . This is wonderful, not mine.

R: Above all, hypnosis is experiential learning rather than intellectual or abstract knowing.

E: I want you to notice how connected everything is even though it's all impromptu. It is a language I've learned, a careful study. I know all the articles of speech and I know the meanings of all the words. Because I learned it carefully, I can speak it easily.
Hypnosis is actually a very selective form of attention.

E: By the way, did you know that you could produce your own caudal anesthesia N . . . O . . . W.

you are using two indirect hypnotic forms to induce trance and initiate an unconscious search and process that may help her reexperience her caudal anesthesia as a hypnotic response: 1) N . . . O . . . W spoken in the slow, low, insistent manner tends to reinduce trance as an unconsciously conditioned response; 2) the question initiates the unconscious search and processes for the ideodynamic memories of her chemical caudal anesthesia. This all happens automatically (hypnotically) even though her mind doubts

**Surprise and Vocal Cues for Reinforcing Anesthesia**

E: Now you listen to me because you are going to be very surprised because you can't stand up.

[Mrs. F looks a bit startled, and her body remains perfectly still for about fifteen seconds as the senior author continues.]

E: You don't know how to stand up, do you?

F: Well I did when I came in here.

E: (slow, low, insistent vocal cues in italics) You've got a caudal!

**Removal and Ratification of Hypnotic Response**

[Pause as Mrs. F remains motionless for another fifteen seconds, then Erickson removes it as follows.]

E: Now you can move!

F: [She looks a bit incredulous and finally shifts her lower body a little.] Is this a joke or is this real? Because with the caudal the only thing I could move was my big toe.

E: That's right. You see, I know what a caudal is, and when I give a hypnotic suggestion that you cannot stand up, you lose the ability to use your leg muscles.

F: Oh, boy! What an education I've gotten today!
R: You let her remain immobile for only eighteen seconds. Is that because you sensed she doubted her hypnotic response and may have broken out of it by testing it too much?

E: You develop a sense for these things. I do know that I wanted to stay away from any dispute about her big toe.

R: Trivial experimentation tends to blur the distinction between the trance and awake state and lessen the dissociation between them, which in turn lessens the effectiveness of trance.

**Protecting and Further Ratifying Hypnotic Responsiveness: Unrecognized Posthypnotic Suggestion Via Generalization**

E: Now don't try to explain your learnings to anybody. They belong to you and they are special, and when your child starts growing up and hurts his arm, you can remember how I told you gently, You can't stand up. And you couldn't. You can tell your child he is going to feel all right now. You say it and you mean it. Your sincerity and your expectancy will cause that child to accept the suggestion, and his arm won't hurt. [The senior author now tells a story about how he taught a physician to use the surprise technique of anesthesia.] A farmer came into the emergency room with a serious wound, shouting over and over in a state of panic, Doctor, you've got to help me! Doctor, you've got to help! The nurse tried to get the farmer seated, but he just kept pacing back and forth and shouting. Finally the doctor said, Shut up! Sit down! Stop hurting! I had told the doctor he could do that, and he tried it out. Ordinarily you don't talk to a patient that way. The farmer was so surprised that he did sit down and stopped hurting. That is the surprise technique.

MHR Suggest, and allow, memories to come back in dribs and drabs, first vague, then more distinct...set up expectation of this, so no pressure for ‘immediate complete vivid recall’ ... allow unconscious to decide how much, when, and what, will be recalled, at what speed etc...so ANY small recollection builds expectation of success of recall of everything, in detail...build up in steps / history of successes / positive expectations / positive self-fulfilling prophecies...that is how memories are re-triggered, by association bridges...one association triggers one element which triggers other elements, which trigger ‘gestalt nodes’ ... gradually and then suddenly...

In example woman wanted to recall birth / delivery of her child...had been given episiotomy (I assume cutting of vagina?) without warning, had had arms tied down, and last thing she had heard was the screams of a mother who had just suffered a still birth...so very negative setting...and expectations, after history of being told of all potential the risks / dangers of child-birth...anxiety built up...changed her personality to more anxious from then after...recalling / therapy
with Erickson reduced her general anxiety, which allowed the memories to return…

The amnesia of the childbirth had also stuck her in that stage of development i.e recollection lead to sudden changes, as if ‘matured intellectually / emotionally’ 2 years in one week…MHR traumatic childhood can ‘stick’ someone in a particular emotional etc age…‘arrested development’…

Clinical examples indicate how the natural process of personality maturation can be blocked by traumatic experiences that result in amnesias, since the life experience has not been integrated. The deeper meaning of her request to recover her lost memories is now evident: These memories are important for her current and future personality growth and maturation.

**Body Language in Trance Resistance**

E: What is your reluctance about going into a trance today? [E noticed that F had her legs crossed]

F: Did I show that to you? I have no reluctance.

E: You have a minor reluctance.

F: Well, boy, you must be extremely perceptive. I don't, What is it that makes you feel this way?

E: I'm not going to prompt your conscious mind. I prefer what your unconscious tells me.

F: I did not notice any reluctance at all. Is it the manner of speech, mannerisms?

E: Don't try to guess it. Your unconscious is doing a beautiful job. It will let you know. **DO YOU WANT TO GO INTO A TRANCE TODAY?**

F: Yes.

E: N...O...W?

F: Okay.

E: [To R] You've seen the answer, haven't you?

R: Yes, I think I do.
E: I didn't say. [To F] Uncross your legs please. [Pause as she uncrosses her legs and adopts the more typical posture for trance induction] N . . . O . . . W.

[Pause as F's eyes flutter and then close]

Go way deep into the trance.

[Pause]

E: At the end of the last session Dr. Moore suggested she would remember something that would be the little flower on the icing of the cake, but she makes no reference to it in this initial account. Since she has not tried to identify it, she may be reluctant to enter trance where she may be faced with it.

R: I notice she also had her legs crossed, which is the opposite of what you advise during trance induction. She keeps them crossed during your initial effort with the conditional N . . . O . . . W and doesn't enter trance until you ask her to uncross them. Then your N ... O ... W is effective. Patient Deepening Trance with Hand Levitation

E: And entirely for yourself in an objective fashion review everything that you told me, told us. Review it slowly, carefully, objectively. And if you notice any minor deficiencies, it's all right to correct them. It's also all right for you to correct them and not to know that you have corrected them.

[Pause as F's right hand begins to levitate upward very slowly in a barely perceptible manner]

E: She now deepens her trance by raising her own hand so that she can verbalize it without knowing it. She takes care of that by making certain that she goes deeper.

R: She is protecting her conscious mind by going deeper into trance. You offered some protection with your suggestion that she could correct minor deficiencies without knowing it. Self-Protective Mechanisms of the Unconscious

E: But I do want you to appreciate the ability of your unconscious mind.

[Pause]

The ability of your unconscious mind to perceive things. And to release them to the conscious mind in whatever detail the unconscious considers best.

[Pause]
And now there is a question I asked you. And I'm going to try for an answer now.

Before the episiotomy, perhaps subsequent to it. But I wonder if before the episiotomy you had some overlooked, forgotten feeling in your breasts. You don't need to tell me.

[Long pause as her hand now levitates to about two inches above her thigh very, very slowly]

Your unconscious seems to be telling me, not letting you know.

[Long pause as hand continues levitating very slowly]

E: As I get closer to anxiety-producing material dealing with the episiotomy her hand levitates more as a protective device by deepening trance.

R: This appears to be a clear example of the self-protective aspect of the unconscious that you frequently talk about. The unconscious is deepening the trance to protect the conscious mind from knowledge it's not yet ready to receive.

E: Yes.

**Patient Deepening Trance with Hand Levitation**

E: And entirely for yourself in an objective fashion review everything that you told me, told us. Review it slowly, carefully, objectively. And if you notice any minor deficiencies, it's all right to correct them. It's also all right for you to correct them and not to know that you have corrected them.

[Pause as F's right hand begins to levitate upward very slowly in a barely perceptible manner]

E: She now deepens her trance by raising her own hand so that she can verbalize it without knowing it. She takes care of that by making certain that she goes deeper.

R: She is protecting her conscious mind by going deeper into trance. You offered some protection with your suggestion that she could correct minor deficiencies without knowing it.

It's perfectly all right not to know …. It's also perfectly all right to recover it later. It's perfectly all right for me to be mistaken.

You're giving her unconscious a series of cautious, open-ended suggestions to permit the memories and understanding of her situation to proceed in their own
way and time. You also protect her from any misconceptions you may have with your remark about its being all right if you are mistaken. You're giving her own system the authority to declare what is valid for her own experience.

**The essence of psychological trauma:** The mind recording something it does not or cannot organize because it's a first experience that is overwhelming in some way.

**A Careful Awakening with Posthypnotic Suggestions of Comfort**

E: Now straighten up still some more. Still more. Still more. Still more. Even more. Even more. Let your head be slowly upright fully. And now, as you slowly awaken, I want you, as you awaken a bit at a time, to increase a bit at a time your sense of comfort and pleasure. Enjoy life.

**A major function of psychotherapy is to let unimportant things fade into the background and only the relevant things come to the foreground.**

You let them be background.

E: I let her render them into the background. She didn't know why it happened, she just knew I said something that really hit the point.

R: There is a recording consciousness that is independent of a knowing and understanding.

Your basic thesis that hypnotherapy can lead to a resynthesis and reorganization of unfortunate life experience.

**The Orgasm in the Birth Process: Individual Patterns of Knowing and the Resolution of Traumatic Experience**

The most beautiful orgasm a woman can have is when she gives birth to a baby.

F: That's what I was thinking! That's what I was thinking! It is really! The similarities, I'm not kidding you. The similarities between the two are quite the same and they go hand in hand. . . . The cry of the baby was like music ... I was dazed, I couldn't believe it.

She has not only gained the complete set of memories she wanted in her original request for therapy, but she has also radically reorganized her perception and understanding of them. She has effectively dealt with a psychological trauma that was at the source of her memory problem, and has even resolved some of the early childhood experiences that gave her, in part, a predisposition to this trauma.
Instead of being bitter at her young doctor, she can now understand him as a victim of his own limited education. She certainly has an enhanced sense of the worth of her own perceptions, feelings, and thoughts and a profound respect for her own unconscious processes.

**MHR While in trance, have client relive phobic situation and then transfer fears / threats associated with phobia onto an object such as the chair they are sitting in/on... dissociating and displacing fears ... reification of the fear**

I let her go through that plane trip with great air turbulence, and then I told her that she would soon feel comfortable and at ease. She would then suddenly find that all her fears had slid off her onto the chair she was sitting on. She was then awakened. She immediately leaped out of that chair! I called in my wife and told her to sit in the chair. As she started to the patient yelled, No, no, don't! and physically prevented my wife from sitting.

R: You were testing the patient?

E: No, I gave her an opportunity to validate that the chair contained the fears.

R: I see! It was actually a way of helping her recognize and ratify her own therapeutic response of concretely displacing her fears onto the chair.

All your fears and anxieties and horror are sitting in that chair where you are sitting. It's up to you to decide how long you want to sit there with those fears. You should have seen how she jumped out of that chair!

R: That's how you awakened her. You displaced all her fears onto the chair.

Posthypnotic suggestion does not necessarily function because an idea is deeply imprinted in the mind during trance. Rather, posthypnotic suggestions are always in dynamic process and as such require outer and inner stimuli and cues to evoke and reinforce them. That's why it's so useful to associate posthypnotic suggestions with some inevitable patterned behavior the patient will experience after trance.

**Resolving an Early-Life Trauma at the Source of a Phobia**

In using regression therapeutically you first recover the emotions in trance to help the patient recognize them. Then put the patient back in a trance; this time leave the emotions buried and let the intellectual content be recognized. Then put them back in a trance a third time and put the cognitive and emotional aspects together and then have them come out of trance with a complete memory.
You have them experience emotions and intellect separately and then put them together to integrate the now totally recovered memory.

Rapport, response attentiveness, an interesting therapeutic frame of reference and high therapeutic expectation contribute to efficacy.

By requesting responses that are already high in a patient's response hierarchy, e.g. observe if client tends to nod head for 'yes' etc, or simply say something they are likely to agree with, and respond with a verbal 'yes'…total body 'yes'…muscle memory momentum MHR… it is more likely that you will be successful in facilitating an initial post-hypnotic response, and most importantly, you thereby initiate an acceptance set for the more difficult posthypnotic suggestions associated with it.

With negative affects dissociated from the memory, can experience childhood traumatic events / confusing events, with an adult person's view, so the fear and anxiety she experienced as a child are replaced by the curiosity and fascination of an adult. MHR initially focused on vague feelings of terror, then next time focus on actual experience in dissociated state, as external observer, with no emotions...so able to 'see' and 'recall' details of what happened...no threat to system...providing insights...cool calm understanding...then later can re-integrate so that can remember entire incident...and process the affects with the facts ... and 'express' the 'blocked' 'threatening' memory...re-integrate it into entire life’s experience...so no longer threatening...make sense of...process the feelings / emotions / affects...’ex-press’ them...

MHR A genuine age regression in which she was actually reliving an early life experience rather than simply remembering it is related to the affective re-enactment, whereas the object, dissociated recollection is from pov of current adult...with adults understanding / resources ...now they can be integrated, so no longer terrifying i.e if experienced same thing as adult, as experienced as child, ‘handle’ and ‘respond’ and ‘process’ it differently i.e greater resources / understanding...so to adult little dog much less threatening, sexual encounter less terrifying, can put things in context / understand / respond to with adult resourcefulness ...this is what Erickson is doing...integrating the child with the adult...for the ‘engram’ was ‘arrested’ / ‘frozen’ in time...arrested development of some part of adult associated with this...expresses self as irrational phobia...neurosis...patterns...habits...mental states and even physical habits e.g sucking on cigarette or over drinking? General anxiety etc...

Use examples, concrete, from own or other or stories, to explain integration desired...of overcoming past bad experiences successfully ... survival and stronger for it...not letting it stop you enjoying living...so one dog bit you...not to let that stop you enjoying all other dogs, or even walking where dogs
are... etc... concrete, imagistic illustrations make better contact with the right hemisphere, where such personality integrations may be taking place.

Integrating the emotional and intellectual aspects of the experience from an adult's perspective now enables her to relive the experience without the child's fear. This is an emotionally corrective approach that helps the patient reassociate and reorganize her inner experience in a therapeutic manner. Once a certain amount of catharsis of the traumatic aspects of the experience takes place (in the first phase of the reexperiencing the emotions without the intellectual component), the entire experience can be integrated and worked through from a new adult perspective in another relatively brief trance. It's interesting that under this third trance condition, where she is to reexperience both the emotional and intellectual aspects of the experience, she recalls much more detail than with either alone. That this is something more than a simple recall of a lost memory is indicated by the fact that she reports it as a newsreel in my mind, wherein it seemed to come to her autonomously as an unconscious process unfolding itself spontaneously, rather than a labored effort of the conscious mind to remember.

You can start the process by having the patient recall one single facet of the emotional experience - then an unrelated intellectual facet, like a jigsaw puzzle. The entire experience can be recovered, the whole meaning can be put together, only when the last piece is put into place.

**The Utilization Approach to good study habits / fear of learning MHR**

E: The alterations I'm going to suggest, the first is this: homework is tedious, tiring, exhausting. I think homework carries with it a sense of something well done, well accomplished, and the feeling it is going to be done, is being done, and has been completed will carry with it a very partial feeling that will enable you to concentrate better, learn more rapidly, and enjoy the entire process.

[Mrs. A nods her head yes in the rapid, abbreviated manner that is characteristic of a conscious intentional process]

You think it over, don't nod or shake your head yet, think it over.

E: You don't want the patient to agree with you too soon. It's nice to think it over before you buy a house.

R: As is highly characteristic of your style, you begin by first accepting her own frame of reference, homework is tedious. This opens an acceptance set. You then add your initial suggestion, homework carries with it a sense of something well done.
Your suggestion is a truism - anyone would have to agree with it - and that further establishes the acceptance set. To this you finally add the easy-to-accept suggestion, a very partial feeling that will enable you to concentrate better, learn more rapidly, and enjoy the entire process. You don't directly command her; you simply state truisms about better learning and associate them with her own inner experience in such a way that she cannot deny them. She accepts them as valid for her own experience and thus she receives and accepts your suggestions. You do not add anything new with these suggestions. Rather you evoke and utilize her own real-life experience; anyone who has ever, at any time, done their homework (or any other kind of learning) usually has had a feeling of accomplishment, and this is invariably associated with a very partial feeling that they can learn even better some time or other. Your suggestions about better concentration and more rapid learning thus reinforce aspects of her own experience which you have evoked. You (1) establish an acceptance set and then (2) evoke aspects of her life experience that you can then (3) utilize to help resolve her current problem. This is a typical example of your utilization approach to therapeutic suggestion. She accepts this so quickly with a nodding of her head that you must tell her to think it over. You want to let her unconscious have enough time for a thorough search of the relevant inner processes that can implement these suggestions.

E: I let her have a little taste of a good thing with a very partial feeling, so she will soon tell herself that she wants the whole thing. It's a common life experience to take a taste and then want the whole thing. A mother says, just take a little bite.

Tell true or fictitious stories analogous to the phobia, situation, crises etc, to change the way of looking at the ‘feared’ thing...‘spin’ it...aim to induce open-mindedness...ability to look at things from different points of view / perspectives e.g the ‘crises’ as a ‘opportunity’, the ‘solution’ being ‘in the problem’, loneliness Vs solitude, the different ‘meanings’ we could and do ascribe to the same things...this allows greater flexibility and adaptability...

Study / practice / work strategy: Every time you shift from one pattern of activity, this change represents NOT doing the previous, and thus is restful in itself, a relief, and novelty. On the farm I learned to pitch hay right-handedly and left-handedly. When my right arm got tired, I rested it by using my left hand. In chopping wood - right- and left-handed. Always resting first one arm and then the other. Alternating in hoeing in the garden, I did the same thing. Studying chemistry is so different than reading a novel. Reading a novel is one kind of an exercise, and a chapter from a psychology book is another kind of exercise, so I was always working at top speed at each of the things that I was doing and resting from all the other things.
MHR this is how I work now, and why I enjoyed having a part-time job while studying at university...work became a ‘break’ from study, and study became a ‘break’ from work...relief...pushing on with something too long leads to lower quality work and results, as you can only really concentrate fully, or physically work, fully, for so long...which is why I say share the ‘menial’ work around among everyone, for the ‘academic’ and ‘white collar worker’, such physical labor is helpful and experienced as a ‘relief’ and ‘break’, whereas forcing one person to do it 8 hours every day makes it a grueling, mind destroying exercise, as doing any mental activity, repetitively, without ‘breaks’, becomes a grinding, mind destroying exercise...

A ‘break’ in activity has been shown to be key to most creative/intellectual/artistic/innovative breakthroughs in all areas of industry, art, science, and philosophy...

Most people sadly use ‘cigarettes’ or ‘food’ to justify/provide/produce ‘breaks’...instead of overeating, smoking, etc, do some physical exercise...do anything, as long as it is different, using different muscles, physical vs mental, or vice versa...this should be accepted as a ‘legitimate’ reason for a ‘break’...and if productive work is done during this ‘break’, it does not represent a loss to anyone...executives of course can take ‘power naps’ or go to the gym...the ‘working lunch’ might be replaced with the ‘working walk’ like the ‘Peripatetics e.g Plato...walk and talk...rather than force people to ‘work on and through’, which usually reduces work quality, increases the likelihood of accidents and short and long term health problems, staff turnover with associated recruitment training etc costs...and loss of the best staff...

So arrange workflows and training so no-one is stuck doing any particular task for more than 50 minutes or so, with the next task planned being as different as possible...stop using people as machines...force people to learn different skill sets so this becomes possible...train them...facilitate the new skill sets...though many people will be more ‘comfortable’ doing what they’ve been doing, they will prove more productive and be healthier if you vary their work...it doesn’t have to be a huge difference...simply using different muscle groups, allowing changes in posture, and employing great attention to detail with more mechanical/easy...same goes with eyesight...need to change from short version to long vision, vary distances at which eyes focused...provide some ‘distance’ they can gaze off into regularly, to stop eye muscles becoming atrophied and stuck, leading to short or long sightedness...e.g reading book vs screen vs listening vs looking at things further away...I’ve literally blinded myself for days on end by writing for weeks on end, on my computer...going outside after several weeks of intense writing/typing, I could barely focus on anything...and most eye exercises deliberately force the person to focus on different sized things at different distances...bringing them into focus...to strengthen and make more
flexible, the eye muscles…and avoid and minimize any sight deficiencies / problems…

Students are notorious for cleaning their rooms etc, doing the housework, when exams or assignments are approaching…work that they have put off as ‘too hard’ or ‘unattractive’ etc for months, suddenly becomes ‘attractive’ and ‘a relief’ and ‘a break’ from something ‘worse’…so therapists will often get clients to force themselves to do some task they don’t like every time they avoid X, so that X becomes attractive in comparison, and even a ‘relief’ from the odious alternative given them by their therapist…most people avoid certain things…make them the most attractive option among alternatives given them, and suddenly they become enthusiastic … imagine if your options are ‘cleaning out porta-potties’ or ‘doing some gardening’ or ‘participating in an exercise program’…just how ‘attractive’ the garden work or exercise program are going to now seem to the client / person you are trying to motivate to exercise or work in the garden…you have, by introducing WORSE options, make the target option very attractive…

If you are a disciplined person, then deliberately break up your study / research / writing routines with physical activities like an exercise break, do a bit of cleaning, fold up the laundry, etc…but always making sure you don’t avoid the thing your most dislike / fear etc by spending TOO much of your time cleaning…that said, if you want to see a clean student dorm, visit them just before exams, or when assignments are due…you will get a totally false impression of their normal standards of hygiene and cleanliness and order…

Even changing ‘subjects’ as I do, keeping several projects ‘online’ at any one time, so when you get bogged down and stuck and bored or over exposed to one project, and are likely to start losing intensity of focus, you can switch to another project, on another subject e.g a video, or a different book, a piece of fiction vs non-fiction, a technical guide, song lyrics, or do some general research on a totally different subject, so that the change brings relief, and increased motivation and intensity of focus…and gives the ‘unconscious’ time to ‘mull over’ the work you have been doing on the other projects…

In fact I doubt I ever would have managed the high quality of my books if I had been ‘paid’ to write them, to a deadline. I simply would have had to push on even when my mind was not on the work. The quality would have suffered. Most ‘master classes’ fail to come anywhere near the quality of my work. It takes so much writing, re-writing, drafting, re-drafting, ‘breaks’ during which sudden insights and ideas come to me, requiring editing, re-writing, total re-writing, total re-structuring…re-reading entire chunks of text to re-write them more clearly, in fewer words, with fewer steps, in the ideal / optimal sequence…you could NOT have paid me to put that level of concentration, effort, total immersion, and to
deal with the level of frustration of finding something NOT perfectly clear, after following my own instructions like a new student, or finding I did NOT totally comprehend what I was writing, and needed to totally re-research something, from scratch, until I really FELT I knew what I was saying, and then finding the best way to say it, to avoid misunderstanding…oh I could write a book here about the process, and one day I hope I will, because so few people ever follow it…it would be a role model…but probably neglected, because I don’t ‘belong’ to the jew world order cliché, and my work challenges their total hegemony…

or simply go for a walk to do your shopping, carry out your routine exercises…do some cleaning, rearrange your closets and set aside clothing to ‘give to charity’…do something you’ve been putting off like repairing your bicycle…don’t try to ‘force’ anything…creativity doesn’t come that way…it is something many cultures are yet to learn…they think cramming their heads with facts and figures and technical knowledge and skills will produce innovations…it will not…cannot…does not…never did…it just produces suicidal students, workers, and management…who keep doing the same old thing expecting a different outcome … one definition of insanity… the least likely way to innovate, generate new ideas, processes, products, and services...

Having ‘brainiacs’ doing cleaning work, simple manual labor, or better still, doing the ‘worst’ part of other people’s usual work, especially ‘manual labor’, will give them a greater appreciation for all the ‘non-financial’ benefits of their job, so that they should be less inclined to complain about their own job, and demand more pay, simply because fewer people could do their job (though many more than they will admit to themselves, and many more than the artificial professional organisations artificial ‘jumping through hoops / useless academic qualifications, unnecessary ‘hoops’ and ‘rubber stamps’ and ‘bureaucracy’ and ‘red tape’, all deliberately designed to artificially reduce the number of people ‘legally qualified’ to do a particular job, and thus artificially reduce the number of ‘potential applicants’..a typical sort of ‘conspiracy’ that Adam Smith warned against, and insisted we needed to ‘regulate’ and ‘prevent’ and ‘detect’ and dismantle…

This works both ways…all types of labor need to have an appropriate respect for the work others do...especially mental Vs manual...trade vs professional...‘unskilled’ vs highly trained, and everything in between…most manual laborers will find it a relief to return to their manual labors after a ‘taste’ of stressful, brain intensive, frustrating, etc ‘mental’ workplaces and conditions…and most doctors would still prefer to be doctors, and find it a relief to be back in their medical practice, after a few days work as a ditch digger or toilet cleaner…they would in fact chose medicine over manual work, even if they
were paid only twice as much as the cleaner, and just a little more than the mine worker, maybe even less than the mine worker...I think you get my point, or will, if you are honest...and actually experience this strategy to increasing social justice and fairness, and ‘truth in pricing’ of labor and goods and services...

There is nothing ‘intrinsic’ to the wage differentials we see today...doctors in general practice earning hundreds of thousands, even millions, a year, for basic medical practice work that a robot or computer program could do better, for almost nothing...or maids in hotels working hard and efficiently, but not earning enough from a 40 hour week to simply pay their own bills...let the doctor work as a maid for a few weeks, then see what a relief working in their own profession would be to them...then they might feel it worth investing 5 years in education to avoid having to be a hotel maid...without any need for excessive financial rewards to lure them back to their medical practices...

We tend to overlook the benefits of what we have, and complain about those we feel we are being deprived of, which others appear to be enjoying...we look to the more fortunate as our benchmarks, and thus experience a sense of deprivation and injustice, when in fact billions of people will be doing the very same, with US as their benchmark...and if we simply became aware of the ABSOLUTE and relative good fortune we experience, compared to those BELOW us in this scale, we can suddenly feel fortunate, lucky, and become happy...very David Hume all this...we don’t appreciate what we have, and complain about what we don’t, while what we have is much more than most others, and what we don’t, is mostly illusory, and so rare, that we should never consider using it as a benchmark...of course advertisers, Hollywood etc all make the ‘unrealistic’ seem like ‘everyone enjoys it, so why not me? It’s so unfair’...almost NO-ONE lives like the people in the t.v commercials or movies or television shows...so stop watching them, and comparing your life to them...compare your life to all the less fortunate people and animals, and suddenly you will feel grateful, lucky, blessed, fortunate, and suddenly happy...and compassionate, and generous, and start wanting to help others, rather then strive for unrealistic lifestyles etc that really don’t exist, and certainly could NEVER be emulated by many people, let alone be used as a role model or benchmark for a large number of people, let alone the ‘typical person’, let alone everyone.

Motivate self by remembering WHY you are doing something i.e the desired outcome, and how good that will feel...and how good it felt in the past...how good it feels to overcome the sub-goals / objectives / steps / modules...that each is bringing you closer to satisfaction, so that each step becomes satisfying...focus on each little success...the short distance...if you focus on the long term
outcome, and how far away it is, it can seem impossible / too hard / too far away, and you can lose motivation, despair at ever getting there…if you focus on each step, the satisfaction of having made the last step, this success, then the journey will become satisfying, so much so that many people often are disappointed to have finally arrived, the journey being so satisfying…’to travel with hope is better than to arrive’ …

Every day someone ‘dies’ from a simple operation because the doctor assumed it was ‘a simple operation’, and makes some error which they would not have made had they treated each operation as ‘difficult’ … consider the mind-set in each case…when you assume something is ‘tricky’ vs easy and simple…over-confidence can be fatal…lack of prudence / care / concentration / preparation…of thousands of people each year are operated on for the wrong condition, or completely without condition, because doctors failed to ask them their name before operating, or checking their records…simple mistakes, because ‘it is too obvious who needs what operation’ right? And before complex ‘checks’ were introduced to aviation, overconfident pilots failed to carry out the simple routine checks, or missed steps, leading to ‘accidents’ and crashes…assumptions don’t just make an ass out of you and me, they can make corpses, or people undergoing surgery on the wrong part of their body, or surgery they never needed. Many die during such surgeries. Many doctors need to be reminded to simply ‘wash their hands’ before surgery.

Understanding that air is a medium, and bird fly in it like fish swim in water, or we walk on land, helps remove fear of flying and turbulence … air is something, not nothing…at high speeds it is as ‘dense’ as water…at very high speeds it is as ‘concrete’ as air…and ‘hitting’ it is like hitting a solid…though talk of ‘hitting anything probably best left out of such therapy with a ‘flying phobia’.

Explain how airframes and wings are designed to flex, like bird wings, and designed to take in much greater stresses than they are likely ever to experience … though 911 original missile in that clip (which one is doctored? The one with the small missile, or the one without it?) flew in a way that the stresses would have broken up the ‘plane’ if it was the plane it was supposed to be / officially defined as …. A missile can manouvre in ways that would totally disintegrate a commercial passenger airliner wings and airframe…

Air turbulence at 30,000 feet is a different thing to air turbulence on the ground, or close to it. Falling a few meters from a window can be very dangerous. Even falling to the ground from your feet. But falling from 30,000 feet, or even 5000 feet, is a totally different experience. One you can ‘enjoy’. So we need to adjust our preconceptions / conditioned reflexes / assumptions / definitions of ‘falling’ when we go from being on the ground, or in a building, or bridge, to being in an
aircraft flying high in the sky. The higher up you are, the safer you are, because
you have all that altitude between you and anything ‘solid’ that might be a threat.
You can afford to fall 29,000 feet before you need have any reason for
concern…in theory…as planes today are so old that no test ever calculated the
cumulative effects of constant repeated ‘flexing’ of the airframe and wing…they
never expected their planes to fly so far, for so long i.e modern cost saving
measures of planes being in constant use, for decades…no test ever continued to
‘flex’ a plane wing, for example, as many times as many commercial passenger
airliners have been exposed to / have already endured…etc…

We need to be more flexible and open minded and situation oriented,
challenging any fixed definitions, assumptions, beliefs we have based on
previous experiences or conditioning / education / training, and become more
ZEN in our daily lives, to be open minded. To be flexible. To look and see and
feel what is here, now. As if for the first time. Without all the historical baggage.
When it is safe to do so. When we have the luxury of being able to step out of our
typical, learned, conditioned, habitual, reflex, stimulus response patterns. The
bell ringing does NOT always indicate food will soon be presented. Pay attention
to the here and now. You hear a bell, but there is no food anywhere, so stop
salivating. There are no tiger here, so no need to be on alert at every moment to
every noise that MIGHT be a tiger. Some dogs bite, so be cautious, but if a dog
appears friendly, and its owner tells you it is harmless / O.K, there is no reason to
be scared, just because a dog once bit you, or your parents warned you about the
dangers of dogs, or … etc..

Phobic behavior comes about from the problem of using an old frame of
reference inappropriately in a new situation. It is experienced as a negative affect
without any appropriate intellectual component: The patient experiences anxiety
and fear without knowing why; they have these phobic reactions. The original
source of the fear has been forgotten, repressed, suppressed. The person is not
responding to the here and now, appropriately i.e proportionate to the real risks
present … they are responding to some previous situation / risks / threats … they
need to open their mind, experience the here and now as it really is, be more
objective and rational about the real current existing threats e.g be wary, cautious,
some dogs bite, so don’t just reach out to any dog you see…people can hurt you,
and some are potential risks…but fearing all people isn’t practical…you need to
adapt to the real and present risks…being cautious, but not so much that you
cannot function…we must take some risks…but evaluate them ongoing, not run
and hide any time we hear a rustling in the grass…avoiding all possible risks and
threats is impossible…we need to be here and now, ZEN aware, calm and
alert…not let past experiences limit our enjoyment and productivity in the here
and now, where, if we look, with an open mind, free of assumptions and self-
limiting beliefs, we can see many opportunities, and very few serious immediate
threats…while being alert to anything that might happen here and now, or in the
near future…based on the sensory input coming from the here and now stimuli…and not the past ‘movies’ and ‘internal voices’ running in our heads…etc…

Sexual, ‘racial’, religious, etc prejudices are the same. They are limits you impose on them. YOUR OWN limiting beliefs, Conditioned / learned assumptions / preconceptions / pre-judgements made BEFORE you give the person a chance to prove these invalid … you need to allow each person to make an individual impression on you, free of any assumptions etc and limiting beliefs etc on your part. THAT is the essence of anti-discrimination training / practices / laws…

We are always growing, and need to adapt and adjust our ‘beliefs’ about our ‘selves’ and our world…like as children, our arms and legs etc always growing, we had to adjust, adapt, make allowances, and while doing so we were often clumsy, bumped into things, fell over, getting used to our new physical dimensions…our new skills, our new powers, our new privilleges and responsibilities…new situations and conditions…‘arrested development’ occurs when our minds don’t keep up with our bodies, and our current states / situation / conditions e.g ugly duckling ‘feels’ ugly even after becoming the beautiful swan…its self-image never catching up with its objective physical reality…so it ‘feels’ ugly, and its subjective reality is that it is ugly (everyone always said or implied this growing up)…so it behaves as if it is ugly, doesn’t take care of its appearance, wears any old clothes, has no confidence, slouches, is shy, and so soon it ‘manifests’ this self-belief, and appears quite slovenly, and people then treat them as if they are ugly…or are confused by them…in any case, the persons own limiting beliefs limit their enjoyment of life…etc…

Awkwardness should be applauded as a sign of growth and new learning.

E: The only things that I say to you that cling are those that touch upon your experience in some way. So Erickson uses a shot-gun hit and miss approach, never knowing in advance which things to say, which examples to give, and relying that some of the ‘shot’ will hit its mark…never assuming he can predict…he tells stories, different stories, anecdotes, interesting facts, … letting the person’s unconscious pick up on the appropriate metaphors, similies, analogies, and work with them, hear them, respond to them creatively…you need a ‘touch-stone’ to reach people…something THEY find relevant…and a resource / lesson / piece of information their sub-conscious can work with / be stimulated by / triggered by, to do its creative work…your story / example / illustration etc must ‘resonate’ with their own experience, to be able to ‘manifest’ the changes required … like hitting an E tuning pitch fork, to get the E string of a guitar or piano to emphatically resonate with it…”Black noise” was developed, according to David Bowie, to do the same with objects…first finding an objects resonant
frequency, matching it, as in ‘mirror and lead’ ‘pace and lead’, and then changing YOUR frequency, so that IT changes its frequency in empathy, to one at which IT cannot maintain its current physical integrity, at which point it literally disintegrates...like the opera singer making crystal glasswear explode, simply by hitting the right note, then varying that note high enough to ‘lead’ the glass to vibrate at frequencies higher than it is capable of maintaining, without dis-integrating / blowing up.

Uncovering Techniques: Dissociating Intellect and Emotions to Uncover Traumatic Memories

E: In this matter of uncovering techniques I think one of the most important things is to recognize that if your patient has something covered up, she's got it covered up for a very good reason, and you'd better respect that fact. You ask the patients to respect the fact that you personally do not think it needs to be covered up but that you are going to abide by their needs, their actual needs. Now you've told them you will abide by their needs, but they don't hear you qualify it to their actual needs.

R: This is an example of indirect suggestion through two-level communication. The first portion of your statement about abiding by their needs is readily accepted by a patient's conscious mind and tends to open a yes or acceptance set for the qualification that follows regarding their actual needs, which may be very different from what they think they are. The unconscious does pick up this qualification (which may be subtly emphasized with a slight vocal intonation or gesture), however, and uses it to initiate an inner process of search for actual needs. This search on an unconscious level may finally result in new insights that will depotentiate the patient's previously limited frames of reference and thus facilitate therapy.

E: Yes. You actually have two issues here: Does it need to be covered up? Can it be uncovered? You then point out to a patient that there are various ways of remembering things. Undoubtedly, when we cover up a memory, we usually cover up a lot more than the memory itself. That is, trauma of a shaved head might be covered up as an uncomfortable memory, but along with that would be covered up the room in which it was done, perhaps the address of that particular place, and other things that happened that year. Does the year need to be covered up? All the other things that happened that year? You thus emphasize that the patient undoubtedly covered up many things that didn't need to be covered up. So why not uncover every one of those things that are not safe to uncover and be sure to keep covered up the things that are not safe to uncover? You then define the situation as one from which the patient can withdraw at any time. You point out, suppose you did accidentally uncover something you didn't want uncovered.
How long do you think it would take you to cover it up again? That is the little bit of assurance that you always give your patient.

You then point out to a patient that it is perfectly possible to remember the intellectual facts of something but not the emotional content, and vice versa. You point out that once, when you felt downhearted and blue, you couldn't for the life of you figure out why, but there must have been a reason in the back of your mind. You experienced the emotions but you didn't have intellectual content. In recovering a traumatic memory you can uncover deep emotions and not intellectual content. If you want to, you can remember the actual intellectual content; you need not remember whether you felt sad, mad, or glad. It will be just a memory, as if it happened to somebody else.

In everyday life we frequently notice people with an attitude of indifference. They may have an intellectual appreciation of their position but an emotional indifference. Well, I think that in hypnotherapy we need to recognize the tremendous importance of indifference, detachment, and the possibility of extracting only one fragment here and another fragment there. It was sufficient that Bob recover something and then develop an amnesia, because when he developed an amnesia for any part of it, that was at my request. That was not his own spontaneous involuntary amnesia under pressure. This was something where he was being responsive to suggestion, and therefore the amnesic behavior was under his control. It was just as effective as a repression, but it allowed that traumatic material to be available for examination - and available in varying degrees, in small portions in relation to emotional healing and the ideational content.

Is it necessary to develop a deep trance state for this particular type of thing?

E: It was with Bob, but it's not necessary if you get that state of indifference and ask the person to think of himself more or less as being in the next room undergoing a certain experience. Of course you can't see it, you can't hear it, but think of yourself as undergoing a certain experience - the experience of recovering a lost traumatic memory, and as you sit here you are not really in a deep trance, you're not really in a medium trance, you are in a light trance. You don't feel like moving, you don't really feel like doing anything, but your mind seems to be rather far away and you are thinking about yourself in the other room - remembering something, and I wonder what part of that memory you're remembering? There you are getting associations, and the patient can start remembering.

R: Your request that the patient simply imagine himself in another room recovering a lost memory is itself an indirect approach to hypnotic induction. You (1) fixate attention with that request, and if the patient takes you seriously, you certainly have temporarily (2) depotentiated his habitual conscious
framework. The patient is thereby engaged in a (3) search on the unconscious level, since the conscious mind certainly doesn't know how to do it. The trance induction is further emphasized with your suggestions. You don't feel like moving, you don't really feel like doing anything, but your mind seems to be rather far away. You are utilizing indirect suggestions in the form of not doing, and a dissociation between the personality sitting with you and the mind thinking about yourself in the other room. The patient's own associations and (4) unconscious processes then take over and mediate the (5) hypnotic response of recovering the lost memory.

**Hypnotherapy in Extreme, Sudden, Acute Emotional Disturbances**

Much has been said and written about the need for intensive searching into the remote past of patients to discover the psychodynamics underlying personality and behavioral disturbances. The adaptability of hypnosis in meeting critical situations, the ease with which it can be used without altering natural physiological and psychological processes (as contrasted with pharmacological assaults and electric shock), suggest the desirability of its more frequent and ready use in sudden emergency situations. A psychological approach should certainly be regarded as a method of first choice, to be attempted before resorting to drastic assaults upon the patient's body.

A cataleptic woman was brought in, both eyes equally dilated and unresponsive to having a bright light shined directly into them. Securing a small blinking light (a child's toy), the senior author placed it at the opposite side of the office so that it would be within her field of vision. Seating himself beside her, he softly repeated a long series of brief, gentle suggestions, synchronizing them with the blinking of the light. (Past experience in research had taught the senior author that conditioned responses can be effectively established even when the subject is not consciously aware of the stimuli.) These suggestions were, Off in the distance, see a light. Now it comes, now it goes. Off in the distance, see a little light. Now it comes, now it goes. With monotonous regularity these suggestions were repeated for about twenty minutes. A slight quivering of her eyelids led to a change in the suggestions to the tripartite suggestion of as it comes - and goes - try harder to see, synchronizing the first and third part to the appearance of the light.

After about five minutes of this triple suggestion, her eyelids began quivering and her pupils started to contract. Further synchronized suggestions were given slightly more urgently: As the light comes, your lids will close; as it goes, they will close more. As it comes, your lids will close; as it goes, they will close more. Within two minutes the suggestions were changed to, As the light comes, so tired; as it comes, so sleepy; as it comes, eyes close, so tired; as it comes, eyes close, so tired; as it comes, soon asleep; as it comes, soon sound asleep; and
sound asleep and sounder asleep, and sound asleep and now sound asleep. There
followed, since she responded well, Staying asleep, resting comfortably, repeated
a number of times. She was then instructed to rest comfortably, to sleep deeply,
to relax so comfortably and completely, to feel so good, so much at rest, so ready
to tell the senior author anything he wished to know about, but too tired to be
worried, too sleepy to be scared, just softly to tell the senior author whatever he
asked, and doing so, just understand everything.

Within forty-five minutes this patient related an informative account of her early
youth, when she had seen a neighbor's wife develop an apparently causeless
screaming episode that had terminated suddenly in a mute, catatonic,
schizophrenic stupor with resulting commitment to a state hospital. She related
this as a past unhappy memory that she had forgotten years ago. When she was
asked to continue, she showed mild emotional distress and somewhat hesitantly
related the circumstances of a quarrel with her husband about a vacation trip.
This had caused increasing anger on her part. The trip, as she wished it, would
have taken her to her childhood home, but her husband wished to go elsewhere.
Realizing that he would have his way, she screamed in futile rage, and then the
memory of that neighbor's wife screaming came to her mind. She wondered if I
could stop screaming, and that scared me terribly and I kept screaming. Then
someone - my husband, I guess - slapped me, and that paralyzed me. I just
couldn't see and I couldn't hear. I was just looking helplessly at nothingness,
getting more scared all the time. Just thinking about it makes my skin crawl. It
won't happen again, will it? She was reassured and asked to continue.

Well, nothing happened forever and ever it seemed, and then I thought I saw a
little bright light and I began hearing a voice. At first I couldn't tell what the
voice said, but it seemed that I began listening better, and soon I could hear
better, and pretty soon I heard you talking to me. I know I didn't know you, but I
was tired and sleepy, and some way I knew you would take care of me. You will,
won't you?

Again she was reassured and she was asked what next she wanted. Tell my
husband. She was asked if she did not think she ought to remember the entire
episode when she awakened. Her reply was the inquiry, Will I get scared again?
She was answered with, Not unless you want to be. I don't, was her earnest
assertion. Accordingly, she was aroused and, with no further instruction,
consciously retold the whole story with embarrassment and some slight distress
about the extremes of her behavior. She was then asked if it would not be well for
her to relate the entire story to her husband. Her reply was, Oh yes, or he will
worry about me. She also agreed that her husband's partner could be present
when she learned that he had participated in the situation.
Her husband asked, Were you thinking about that neighbor when you insisted on the vacation trip, including going to your old home? Oh, no! I haven't thought of her for years. It's just that I got a letter from Ann [a girlhood friend], that girl I used to know

that you didn't like, and I wanted to go back and see her. Further conversation and discussions were not significantly informative. Suffice it to state that the vacation trip did include her desired visit and that her adjustments have improved during the years that have elapsed. Her husband's comment on the correction of his wife's problem was, Well, I suppose it helps people to get things out of their system, but I'm not sure I would recommend starting it that way.

The entire therapeutic process for this patient required not over two hours, and the passage of about a half dozen years indicates that it was adequate.

Hypnosis also offers the opportunity of dealing with the patient at two levels of awareness, so that the patient can safely approach a complete understanding of a traumatic experience that was previously repressed as intolerably painful - that is, at an unconscious level of mentation and then at a level of conscious awareness.

It is impossible to hold a stop watch to time oneself and to avoid thinking about an elephant for one whole minute.

You find an interest area of the person. An area where there are strong programs built into the person, and you just focus on that to induce trance.

E: That's all!

R: But why do your subjects become so absorbed in their interest areas that trance behavior is evident? We all talk about what's intensely interesting to us in normal conversations every day without falling into trance.

E: Because I stick to that one thing!

R: The conversation does not jump to something else. You focus on one thing, you intensify that absorption, and that's what trance is.

E: I don't let the conversation jump to anything else. Yes, trance is a focusing on one thing. Watkins has written a paper describing a trance as dropping all the peripheral foci and narrowing it down to one focus. I agree with that.

When you are surprised, I would speculate that a creative moment is taking place wherein new protein structures are being synthesized in the brain that then serve
as the organic substrate of new phenomenological experience. The experience of surprise is the reaction of consciousness, the old frame of reference or set that has been governing consciousness, reacting with a startle to the new that has just been synthesized and now appears on a phenomenological level for the first time. The surprise implies that the old frame of reference must now be expanded or changed to accommodate the new (Rossi, 1972, a, b c; 1973a b).

Yes, every time you surprise a small child, you widen its range of responses.

R: Every time adults do a double-take, you widen their range of responses. So we are always trying to facilitate surprise as creative moments in therapy.

By telling a child to keep a secret, for example, you are telling that child to put certain defenses under conscious ego control, to develop creative tact, etc.

Therapy is like taking the gems from underneath the surface and throwing them up to consciousness. The gems would be the valid insights.

E: And the stones would be the not-so-good things. In successful living you can always afford to throw away a lot of gems because there are always a lot more available to you. Those gemlike friendships of childhood can be given up because there are other things for the adult. Now the beating a playmate gave you - that is a stone you toss aside.

While she was going through this symbolic experience, a process of healing was taking place. She tells you about this symbolic experience, but her conscious mind still does not know that a healing has taken place.

When she has a hypnotic experience utilizing that language in a positive and constructive fantasy that leaves her feeling good, then an increment of healing or growth has taken place. Whenever something good happens in a fantasy, on whatever symbolic level, then healing has taken place.

The Freudian tends to translate everything into terms understandable by the reality-oriented, ego consciousness of the left hemisphere, while the artists' natural proclivities incline them to the symbolic approaches of the right hemisphere.

To an infant a hand lifting is only a hand that is lifting. There is no arm involved. It takes some time to connect the hand to the forearm, the upper arm, the shoulder, the self. And to discover that the hipbone is connected to the kneebone and so on. Some time to discover it. Adults seldom realize the learning process that is involved.
If you have a target area, X, you want a patient to talk about, you first talk of the associated topics A, B, C, D, etc. that all converge upon X. Gradually the area X is stimulated to the point where it is expressed by the patient. You're beginning this session by giving her associative process many possibilities of response by talking about many thing.

E describes how an infant can repeatedly reach for its own hand and each time not understand what is happening as the hand moves. The adult watching the infant is puzzled that the infant is making this continuous reaching movement.

Now I have talked, trying to give you a general background from which you can start your own self-exploration.

[E gives many clinical examples of the source of psychopathology in the inhibition of self-exploration due to parental and societal structures.]

[E describes how once when he demonstrated hand levitation, all the observers thought the subject failed until he proved that the subject hallucinated his hand levitating.]

That hallucination was just as effective as a real hand movement because it was the inner experience that was important. You can at any time you wish make use of the engrams. I think you know that word. Imprints for various learnings and experiences. But you don't need muscles and bone and flesh.

And you can see colors with your eyes closed.

[Pause]

And you can feel heat and cold while your body remains comfortable.

[E gives further examples of hallucinated feelings and sensations under hypnosis. At one point he has J open her eyes and, finding that she knows nothing about a tapestry hanging on his office wall, E proceeds to give her a little lecture about the pre-Columbian origin of its symbols, etc.]

You first tell stories and give many interesting examples of what you later more directly suggest the patient can now do. Your initial patterns of indirect associative and ideodynamic focusing initiate many autonomous search processes within the patient, so that when the more direct suggestion comes, the unconscious is ready in terms of its own mechanisms and the conscious mind is eager to receive whatever it can.

I know that I can remember what happened at three weeks old. If I can so can others.
You know there is something synthesized, to use your favorite word, because when patients find something new, never again can they function in the old incomplete way. Their world is permanently changed.

R: The most self-evident criterion for genuine creativity or psychosynthesis is that the patient's world view, attitudes, and behavior do change. Anything less than this simply means the patient is only paying lip service to the therapist for whatever insights are purportedly developed.

When do patients have a good time? When something has been cured!

R: So having a good time, positive affect in a patient under these circumstances, means something is being healed.

E: That something desirable is occurring no matter how unpleasant it may be.

R: So positive affect is another important criterion of satisfactory work.

At least three basic types of therapeutically useful trance: (1) The self-absorption type like this, where the patients are so absorbed in self-exploration that they are seemingly oblivious to the therapist; (2) the more popular conception of trance, when the patients are very much in rapport with therapists and responding to suggestions and (3) somnambulism, where the patients' eyes may be open and they may talk and act as if awake, yet respond hypnotically to the therapist's suggestions. In practice you have all kinds of admixtures between them.

During the first few moments after awakening one is still in a light trance state.

Are you willing to learn something totally new? Without much effort?

Notice my pauses in this section. To ask someone to learn something new is a threat, so I pause and then I slowly say without much effort to make it less threatening.

In the first part of this session you let her indulge in the self-absorption type trance. Now your remarks are beginning to convert her over to the type of trance were she is in close rapport with you so she can experience new hypnotic learnings by following your directions closely and exactly.

You introduce the possibility of automatic writing by first establishing a childhood or early learning set. Just as she first learned to write as a child, you hope a more childlike set will help her automatic writing. But she seized too eagerly onto the child role, so you had to correct it. Actually she was responding too literally to your earlier statement that you were going to treat her as a child.
E: Yes. She is responding as a child out of desire. I had to get her away from that
because children can be pretty irresponsible.

R: The awkwardness she experienced in holding the pencil is a revealing cue
about her state of age regression. You then give your first direct suggestion
regarding automatic handwriting: She can write without knowing what she is
writing. This not knowing, of course, facilitates further dissociation from her V
adult consciousness

**Indirect Ideodynamic Focusing to Facilitate Automatic Writing**

A patient who felt troubled about something requested that she be allowed to
write a question and then an answer. Erickson distracted her with conversation as
she spontaneously wrote her question and answer on different parts of a sheet of
paper. He folded up the paper and put it in her purse. Three months later she
reported that she found the answer to her question and requested permission to
look at the paper that was still folded. She now unfolded the paper and saw she
had actually written two questions. The first was, Will I marry Bill? The answer
was, No. The second question was, Am I in love with Howard? The answer was,
Yes. She was now actually engaged to Howard. Thus the automatic writing three
months earlier had reflected her major conflict at the time and indicated feelings
about Bill and Howard that would later become manifest in breaking up with the
former and getting engaged to the latter.

E: Now all of us have such questions. That patient knew from my behavior that I
would not read the question she wrote or the answer she wrote. Let your hand
wander as it takes hold of that pencil.

[Pause. J picks up the pencil.]

Now suppose you talk to me about something other than what your hand will
write.

R: This is very typical of your approach when a subject seems to need help in
trance. When a new hypnotic learning is still in the process of being formulated
or expressed for the first time, you begin quietly and casually to give many
examples of the desired hypnotic behavior. This seems to motivate subjects and
give them unconscious clues as to how to proceed. It also gives time to make the
necessary inner connections that will make the behavior possible; time for the
subjects to realize that you really mean it, and you are willing to wait for them.
It's the basic process of indirect ideodynamic focusing again. Your mentioning
Now all of us have such questions tends to facilitate unconscious processes of
search within her for some meaningful material to express itself in the writing.
You attempt another dissociative approach by asking her to talk to you about
something other than what she is writing.
The fact that the pencil is held differently is a sign of the genuineness of the phenomenon of automatic writing

Notice her language when referring to her own hand: it feels as if it is going to write . . . It is no longer herself.

R: Her dissociation is leading to a depersonalization of the dissociated body part and its activity.

E: She has to actually see the pencil to know it's being held. This again is evidence for a separation of conscious and unconscious.

E: Notice how I accept and reinforce the depersonalization by using it and contrasting it with the part of her that I address as you. She can see what she is writing, but this in itself implies she will not know what she is writing. You can see without knowing. I can just see those books, for example. Her questions and the strange feeling are all characteristic of the dissociative process.

Her remark, I think I must have, but I don't feel I did, indicates a clear dissociation between thinking and feeling. It's interesting to note that her ego consciousness associated with the thinking of her left hemisphere is retained as a part of her identity, while feeling that may be more associated with right-hemispheric experience is dissociated off.

E: All these questions and attempts at logic and rationalizing are highly characteristic of a genuine dissociative state.

R: It is as if her left hemisphere with its logic is trying to rationalize an act that may be outside its range of experience, just as patients with right-hemisphere lesions and deficits use their intact left-hemispheric logic to rationalize their behavior without ever recognizing its incongruities (Luria, 1973).

Her hand begins to write several sentences as she looks at Erickson's face. As usual with automatic writing, the hand picks up speed till it's writing at a furious speed, seemingly much faster than normal. When she has finished, she shuffles the papers without any apparent awareness on her part so a blank sheet is again on top.

Automatic writing is characterized by misspellings. She writes her words with unusual clarity for automatic writing. Usually there is more economy of effort. A yes answer can be condensed into a vertical line and a no into a horizontal line. So a vertical line is actually an abstraction of yes and a horizontal line is an abstraction of no. And an I don't know can be a horizontal with varying degrees of angle to mean it is more like yes (toward the vertical) or more like no (toward the horizontal). A yes line written on the opposite side of the paper could mean a
no. A yes line on top of the paper is yes, but if it is written on the bottom of the paper, that could signify the reverse, a no.

The sun is not too hot to splash in. I love the sun and I am at one with the sun's center. We are the same and I leave the fire whole again, not burnt. And love is like the sun.

Age Regression via Visual Hallucination of Many Self-images Indirect Associative Focusing to Facilitate Certain, Direction in Trance Induction

After hearing an interesting case history for a half an hour about the adoption history of two little girls, their struggle for acceptance, and the many lives they lived in different homes, Jill becomes fixated in her attention and her eyes blink as if she were going into trance. Her eyes finally close. A few minutes later her hand begins to levitate and float about spontaneously. She is evidently in close rapport because she smiles and sobs at appropriate places.

E: And J in your lifetime you really have been many different little girls. And one of the things you can do, Jill, you can do it with your eyes open, you can do it with your eyes closed. Line up a whole line of girls. Have each of them in some significantly meaningful state.

R: You are again using indirect associative focusing when you tell this interesting case about little girls to begin the process of activating her own personal associations and memories of her own childhood. She is entirely absorbed in your story; her attention is focused and fixated so she naturally begins to manifest the initial signs of trance.

Here you make a smooth transition from your case history to your first overt directive to facilitate J's current trance experience.

E: Yes, and if she has any doubt within her about being able to see these little girls, you depotentiate it by giving her the choice of having her eyes open or closed. I then use the words significantly meaningful to help her reach personally meaningful material.

Jill, you can be an objective intelligence off to one side, delighted to look at those little girls, that long line of little girls. And you can describe them as freely as you wish.

R: Here you give her consciousness the task of being an objective observer. Perhaps this is the best place for consciousness in this initial, uncovering stage of therapy. You allow the unconscious to do the uncovering via a series of images of girls that consciousness can simply receive. Consciousness is thus placed in a receptive mode (the ideal mode for trance), where it is not likely to direct or
interfere with images emerging automatically from the unconscious. The phrase freely as you wish then gives a positive and reinforcing orientation to your permissive suggestion to describe her experience.

Catharsis Balanced with Positive Affect and the Objective Observer: Implication

E: You can be pleased, amused. You can empathize with the little girls, but you will be a detached intelligence.

R: Telling her she can be pleased and amused facilitates the experience with a positive affect. Allowing her to empathize permits emotional flow and a possible catharsis while still protecting her with the objective observer. E: Pleased and amused evoke different aspects of the spectrum of her inner life. You can be amused by a bad girl and pleased with a good girl. So she has a tremendous amount of freedom to explore all these possibilities in her past - and all this by implication.

Now being that detached intelligence you need not know that you are Jill. You are something separate. But a knowing something. You need not know that those little girls are a succession of Jills. And I would like to have you enjoy that experience tremendously. Covering Many Possibilities of Response to Depotentiate Doubts

E: You see those girls as if they were tangible hallucinations or you can see them in your mind's eye or you can see them not knowing that they are mental images. You see them and think that they are flesh and blood.

R: You now cover a number of possible ways she can see the images: as hallucinations, as images in the mind's eye, or a total belief in their reality out there as flesh and blood.

E: Yes, you also depotentiate her doubts by giving her many possible modes of response. Not Knowing to Depotentiate Left-Hemispheric Functioning?

E: And you need not know that each is related to the other. But I would like to have you perform this task very completely, and you can do it while in a trance state or you can be fully awake and recall the experience as an extremely vivid dream that you can relate to me and to Dr. Rossi. And you can feel free to discuss that little girl or that slightly bigger girl or that much bigger girl. That is something that you can do in a manner far better than you know. In a manner that will be a pleasure for you to learn that you can do it so well. Now let your hands come to rest on your thighs and just rest comfortably.

R: I wonder if not needing to know the images are related together is a way of dismissing or depotentiating left-hemispheric functioning?
E: That could well be. As I read this transcript I'm amazed how long experience has taught me to cover many possibilities of response whenever I'm exploring a patient's inner life.

R: Yes, you enumerate many possibilities of response, from constructing the images while in trance to recalling them later as a dream. Voice Locus as a Cue for Visual Hallucinations

E: And feel very, very comfortable, and whenever you want to start, you line those girls up [At this point the senior author shifts his body 45 degrees away from J so he is now oriented to an imaginary wall in that direction] against that nice white wall. [J opens her eyes and blinks with a blank look] And you are looking, is there enough wall there for you to see all of them? [J looks up in the new direction Erickson has oriented himself to. She now stares with dilated pupils with her eye focus shifting about. She is apparently hallucinating with her eyes open.]

J: It isn't just a wall.

R: This is an interesting use of voice locus and body reorientation as a cue for the direction where she may experience a visual hallucination. Dangling Phrases to Facilitate Self-Expression

E: I know. I can say it's a wall, but you can say it's a -

J: Porch, it's a gate. But it is white and some of the paint is splintering. There is a little girl standing behind it, but it is like a gate porch fence kind of. And there is a big tree with gray bark that crumbles off when you put your fingernail on it, and she is doing it. She is watching it fall down and the sun feels very warm. She is wearing a dress that is patched from old sheets, or new sheets. It has patches on it. She likes the design of the patches better than her dress because it feels fuzzy under her finger and it has a red flower on it. And she is thinking, she is thinking the tree is her backyard tree. It is a Sunday and her father is coming with ice cream, but she knows it really isn't true.

E: But it is nice to think so.

J: She has a little calico cotton dog, a red background with little white flowers and its nose part is orange. It is like a patch dog made of more patches. She loves it. And she feels that now she is feeling it and she is hugging it.

R: You use an incomplete dangling phrase here for her to finish.

E: Yes, dangling phrases give her an opportunity to express herself.
R: You always let the patient fill in the blanks whenever possible. In this way the therapist is always seeking out the patient's frames of reference and association rather than intruding his ideas on the patient.

E: Yes, therapy should always be designed to fit the patient and not the patient fit the therapy. Her vivid description of how as a child she crumbles the gray bark when you put your fingernail on it is one of those ingenuously personal details that tends to ratify trance.

Body, Head, and Eye Orientation as Cues to Visual Hallucinations

J: And she is watching someone walk up the dirt way. It is not paved. It's got stones, and he kicked one stone and she liked it. And because he kicked the stone she liked him. And she is waving to him now. And she knows that she wants to push the fence, but she is going to have to walk around, more than push it right there, to where there is an opening. And she is going up to him. She wants to hug him.

R: As she spoke these words her body, head, and wide-open eyes oriented in the direction where she was apparently hallucinating someone kicking stones. As she talks about the fence, she looks up as if it's taller than herself. Evoking a Complex

J: She feels she doesn't have a father. She would like the man to be her father. I can feel that she does.

What I called a two-state dissociative regression (Erickson, 1965a). You can see things better in such a dissociative state. Dissociation helps you realize different experiential states. If these different experiential states do not know each other, the observation of them can be all the more objective.

R: The objective observer and such two-state dissociative regressions could thus be means of facilitating the left hemisphere's objective perception of the many dimensions of the total personality. Since Jill falls so easily into right-hemispheric experience, her psychological problems may stem from a relative weakness of her left-hemispheric functioning; her ego identity and stability may be too fluid. The objective perception you are facilitating here may be a means of strengthening her left-hemispheric functioning.

E: I want to make clear to your intelligence that you will become those little girls and that they really are all the same little girl at different times. But you can see any other girl that you wish.

J: There is a little little girl, she looks like someone I know. She is going up to these high school girls. She is very little. She is only about two or three, wearing
a diaper. She lives right near the high school and there are lots of steps because she lives above a store, but she goes, she likes to go out the door and walk down these steps. Sometimes she has to crawl down, and she likes to go over and see what is going on. She has chubby little legs and one curl across the top of her head. She is pulling a little dog. Not a real dog. And she smiles at this big high school girl, really pretty girl who is with her boyfriend. And they seem to be talking about dancing or something like that. She knows what dancing is, though she is little.

R: The objective intelligence can recognize that all the images are of the same person even though each image (or ego state related to a specific age) remains dissociated from all others.

E: The objective observer that sees and describes current realities can also alter and change earlier childhood realities.

R: This is really amazing! The mind is a self-improving system that can change past distortions and traumatic experiences from the more adult point of view. I have described a class of healing dreams wherein this appears to be one of the constructive functions of dream experience. (Rossi 1972a).

MHR THIS IS KEY, … THE FEBRURARY MAN IDEA…OF RELIVING / REWRITING YOUR PERSONAL HISTORY TO INCLUDE ALL THE RESOURCES / EXPERIENCES YOU IDEALLY WOULD HAVE HAD, IN A PERFECT WORLD ETC…

Facilitating the Objective Observer: Language Cues of Interacting Age Levels

E: Find all those girls named Jill and look at little Jill and little bigger Jill and a little bit bigger Jill and a bigger Jill. Because they really don't know each other. Of course there will be other boys and other girls. But little Jill …

[Pause]

And each little Jill has her own tune, and each of them, they won't really see each other. They won't even know that they are all there. Your intelligence can see them and understand them.

[Pause]

J: There is another girl. She is just four. No, she is not even four, she is almost four. She loves the boulevard because there is so much going on. The girl that takes care of her is looking all over for her. She is delighted to get down those stairs and down the street, and there is a big movie show. She is walking by it. Then there is another boy. She turns the corner and there is a huge park, it looks
so big with grass in the middle, and this lady that everyone calls Crazy Mama is picking up papers. She has a white scarf on a huge behind and a big big arm and a white apron and a brown blouse. And she has a stick that she picks up papers with. This little girl is watching her, fascinated, because they say she ate her father and put him in a pot and cooked him. Could it be true? Then there is another girl who lives in that building, but she is older. She is five and a half. And she is very sad because she is moving away and she doesn't know where except that it is far, it is very far.

[J now gives a long and detailed account of moving from one part of the country to another and her perception of a few more age levels. Throughout this period her eyes are alternately opened and closed. When they are open, she is apparently hallucinating visually as she looks about describing the scene as she sees it. She concludes with the following.]

J: She is about ten and she is in the fourth grade and she knows all her work so well that they are skipping her into the next grade. She is very proud. She doesn't have pretty dresses like the other ones. The shoes have patches on them, but she doesn't mind it. She likes the designs on the patch. It doesn't matter. But she is doing very well. She has two spelling books because she is doing the next grade work and her work, and they are skipping her. She is proud when she gets up and knows all the right answers. And they are moving again. [Pause]

R: You're again suggesting that each girl will not recognize the others even though the objective intelligence can relate them as one. Why?

E: There can be a freer recognition and recovery of many self-images if they do not have to recognize each other. The adult does not like to recall the experience of wet diapers of the infant or the running nose of the child.

R: So the objective observer that relates them is detached even from her adult self.

E: In this section we also witness the shifting levels of her vocabulary and perceptions. Words like boulevard, delighted, huge, and fascinated belong to the adult. Yet they are used to describe childhood images in a childlike way, as when she speaks of Crazy Mama's huge behind and her question could it be true? that she put her father in a pot and ate him. The detached, objective observer can recover childhood perceptions with an adult's understanding. This is a valid characteristic of trance. The detached observer is a center pole and fixed reality about which the patient can explore many childhood experiences in adult words. Memory is not all of one piece; it's always fragments of adult and child interacting. Posthypnotic Suggestion for Time Distortion Yielding Long Rest and Recovery
E: Would you like to rest?

J: I am very tired.

E: All right.

Just close your eyes and rest.

Very comfortably.

Rest. And have a long rest. A rest that seems hours long. Hours long with hours of comfort.

[Pause]

And as the comfort builds up in your body that supports that intelligence, and looks at that larger number of little girls each named Jill, but a different Jill each time, feeling different, doing different, thinking different, and really different, yet always Jill. And soon this intelligence will renew its curious, fascinating looking at that long line of girls all Jill. None of which can see the other, all of which have only faint memories, partial memories of smaller Jills, and only partial ideas of what the bigger Jill is like that this intelligence can look in curiosity and interest and enjoy describing each one of those Jills. A feeling so rested now, as if you had eight hours of sound and restful sleep.

[Long pause]

It is going to be a pleasure to open your eyes and start talking about those girls.

E: I use time distortion here to allow her to adjust to the awake state, yet allowing her to retain all the memories of the different Jill states.

R: You are giving her a posthypnotic suggestion for hours of time distortion. We will see after she awakens just how effective the suggestion has been. Confusion of Trance and Dream

[She yawns deeply]

I felt like I fell asleep and had some dreams. Did I really fall asleep? Did I? I don't think - I feel like I fell asleep, really fell asleep. I was dreaming about when I was much younger.
E: It was a nice restful sleep.

J: I know. That was not polite. I didn't come here to fall asleep in a chair. My body feels like it was sleeping. I was dreaming about -

R: She begins by describing a dissociation between feeling and thinking in her evaluation of her trance. She then confuses the trance with dream experience. Trance Reinduction via Suggestion of Dream: Language Cues to Visual Hallucinations

E: But the dream is continuing.

[J closes her eyes momentarily and appears to lapse back into trance. She then opens her eyes and continues.]

J: I was dreaming about when I was much younger. It seems so vivid. It almost seems like I can see myself standing over there.

E: Sitting there and growing.

J: When I was a little girl. Of course exactly this one plaid dress that I wore I can see myself right over there. I wore it until no one could wear it. I really can see myself standing over there and going home. We lived on a street called X Avenue. The best part of the place was my father had put like a gate with a fence and a trellis with flowers all over it. I loved that. The house was OK, but it was small. But that part when you walked into the house through the trellis, you felt like you were entering somewhere.

E: And you can see yourself.

J: That's the strange thing. I can see myself right over there. Standing doing that. I can almost reach over there and touch that trellis.

R: You reinduce trance by simply suggesting the dream continue.

E: Yes, we witness the rapid transition from the more awake state, when she uses the past tense to say I was dreaming, to the trance state, when she next uses the present tense, It seems so vivid.

R: The rapid development of visual hallucinations with her eyes open is also indicated by her linguistic transition from It almost seems like I can see myself standing over there to I can see myself right over there. to I really can see myself standing over there ... She then admits her perplexity when she says it's a strange thing that she can see herself over there and almost reach over and touch the trellis she obviously is hallucinating.
The February Man

Sensitive therapists have long recognized their role as surrogate parents who do, in fact, help their patients experience life patterns and relationships that have been missed. I.E GIVE A CLIENT A POSITIVE CHILDHOOD EXPERIENCE I.E THE NURTURING, LOVE, SUPPORT, ACCEPTANCE, APPROVAL, ETC THEY NEVER GOT...SO THEY CAN ESCAPE ANY ‘ARRESTED DEVELOPMENT’ AND AVOID TREATING THEIR OWN CHILDREN ETC AS THEIR PARENTS MIS/TREATED / NEGLECTED THEM...

She had been a most unwanted child. Her mother never had any time for her… Essentially she and her mother had remained strangers…Because of this history she now wondered what kind of mother she would be. Her psychological reading had convinced her that her rejection by her mother and her emotional starvation as a child would in some way adversely affect the handling of her own baby. She wanted to know if, through hypnosis, her unconscious could be explored and either her anxieties relieved or she could be made aware of her deficiencies and thus make corrections… it would be necessary for her to relate at length all her anxieties, fears, and forebodings. In so doing she was to give as comprehensive a picture of their nature, variety, and development as possible. It was explained that the primary purpose of this report was to make certain that the senior author appreciated as fully as possible her feelings and thoughts before any attempts were made to ascertain causes and remedies. From this additional material, of course, he privately hoped to learn more details of her life history that he could use to facilitate the hypnotherapeutic work.

The patient was exceedingly fearful, anxious, and tearful. She expressed disconnected fears of hurting, neglecting, and resenting her child. She feared feeling tied down by it, of being overly anxious, of giving overcompensatory attention to it, of making it a hideous burden in her life instead of a pleasure, of losing her husband’s love, of never loving the child, and so on.

She elaborated upon these ideas poorly but in relationship to every possible stage of the child’s eventual development.

She wept throughout the interview, and while intellectually she regarded her fears as groundless, she declared that their strong obsessional character was causing insomnia, anorexia, and severe depressive reactions that terrified her.

If she tried to read or to listen to the radio, the printed page or the program would be obscured by vivid, compelling memories of her own childhood unhappiness. She recognized that all her fears were abnormally exaggerated, but she felt helpless to do anything about them.
Except for innumerable anxieties little actual history was obtained.

At the next interview she was assured that an elaborate program had been worked out and that the results would undoubtedly be most satisfying to her. What the plan was could not be disclosed to her yet, but through hypnosis her unconscious would acquire adequate understanding. All that she needed to know consciously was that hypnosis would be employed and that the task could be begun immediately if she wished. She acquiesced eagerly. In this session approximately five hours were spent training her adequately as a hypnotic subject. Particular emphasis was placed upon age regression. Her intelligence and excellence as a subject made possible the elaborate training considered necessary for the planned procedure.

During the training slowly and cautiously she was regressed in time repeatedly to some safe past situation into which, in some fashion, the writer could enter directly or indirectly, without distorting the regression situation. Thus the first regression was to the first interview with her. In having her relive that interview, it became easily possible to introduce a new element not actually belonging to the situation but that could easily fit into it. In accord with her revivification of that interview the writer merely remarked, Do you mind if I interrupt and introduce a thought that just came to my mind? It just occurred to me that you could easily be a good hypnotic subject, and

I wonder if you would mind closing your eyes and sleeping hypnotically for a few moments, and then arousing and continuing from where I interrupted? Thus an interpolated trance was introduced into that reliving of the first interview, in which no hypnosis had occurred.

The first trance has the effect of dissociating the patient away from the surrounding reality into her internal environment. When you then interpolate a second trance into the first, it effects an even deeper regression into herself. The basic purpose of the interpolated trance is to get the patient further removed from outer consensual reality. It's particularly useful for age regression.

E: Yes, I don't have to help her withdraw from the outer environment with the interpolated trance. When she gets back to reality, it will be much more difficult for her to recover that interpolated trance for which she has an amnesia even in the trance state.

R: So an interpolated trance is another way of effecting a deeper hypnotic amnesia.

E: In future trances she's going to have an amnesia for the interpolated trance, but she would have to go through it to get a complete memory of the first trance in which it took place. I gave her many positive supportive suggestions during the interpolated trance. This served to reinforce all the positive values of that initial interview.

R: It's like a feedback loop, where what comes later reinforces the positive values of what occurred earlier.

E: Yes, and it's reinforcing what happens now by virtue of the past that I've transplanted into the initial interview. I work in all directions. In everyday life when strangers meet they may speak casually in a general way until they discover something common in their past: They might have vacationed in the same place or come from the same state or town or gone to the same school. Sometimes they
discover to their delight that they have a few acquaintances in common and can now share more intimate details of their lives. They have now created a strong rapport in the present based entirely on experiences from the past.

R: They have created a shared phenomenal world in common (Rossi, 1972a). They have built associative bridges that now bind them together in friendship. This is a common everyday process of social relating that you are now utilizing to enhance your rapport with this patient. The interpolated trance is a way of rapidly creating a positive history that enhances current relations.

She was then regressed to an intern’s party at which there was a number of the senior author’s former medical students. In the process of regression the suggestion was implanted that she might meet him at that party or that someone would mention his name, and undoubtedly this would happen when someone approached her and attracted her attention by gently squeezing her wrist. Then, when this unexpected thing happened, she could make a full response to the wrist pressure and react in accord with whatever situational need developed. Primarily, this was to introduce a physical cue to permit ready induction of a trance state at any time, even during the reliving of past events that had occurred long before meeting the senior author. Various such regressions were induced, aided by special information that had been privately supplied by the husband. These were utilized to condition her for trance induction in any set of psychological circumstances.

E: I was building rapport protection with this procedure. I once regressed a subject at Clark University to ten years of age. While regressed, he explained that he was on an errand to buy a loaf of bread for his mother. We could all see the abject terror on his face because he did not know anyone in that room (where as an adult he was being hypnotized). I spent a wretched four and a half hours trying to get back into rapport with him because he was afraid of me and afraid of everyone else. That taught me that thereafter I'd have a secondary way of establishing rapport with the subject such as touching a wrist. It’s an attention-attracting but otherwise meaningless cue. The subject cannot easily incorporate it into the age-regressed pattern of behavior.

R: You did not directly tell her that pressure on her wrist was a cue to enter trance or to pay close attention to what you were suggesting.

E: If I had said it that directly, she could reject it. Therefore I put it in an indirect framework of contingent possibilities: She might meet me. Someone would approach her; she could make a full response to the wrist pressure and react in accord with whatever situational need developed. These (the italicized words) are all undefined. There is no demand or threat in all this, and therefore no need for resistance or rejection.
R: We usually don't reject undefined possibilities in everyday life. Rather, possibilities and contingencies usually evoke our sense of wonder, speculation, and expectation. Possibilities actually initiate pressures of unconscious search within us that may trip off useful unconscious processes. Whatever situational need also covers all possibilities, including whatever suggestions you give her. You give her the most general form of an indirect suggestion here.

E: A most general form that can be filled in by the patient's specific understanding. Interpolating New Life Experiences: The February Man

She was trained to develop in good fashion extensive regressions that were made to serve merely as a general background and situation for new, interpolated behavioral responses. She was regressed to past situations, and that frame of reference was employed merely as a background into which new hypnotic behavior could be interpolated. When sufficient training had been completed to ensure good responses, she was regressed to childhood at the age of four. The month of February was selected because it was her birthday. She was oriented to the living room of her childhood in the act of merely walking through it. She had often walked through her living room. Since the state of regression was limited to that act, it would constitute only a frame of reference. The walking through could be arrested and new behavior introduced into that setting without altering or falsifying the situation. Thus the new behavior intruded into that situation could be related temporally to the events of that age-regression period.

As she roused somnambulistically in this regressed state, she was greeted by the senior author: Hello, little girl. Are you your Daddy's girl? I'm a friend of your Daddy's, and I'm waiting for him to come in to talk to me. He told me yesterday that he brought you a present one day and that you liked it very much. I like your Daddy, too. He told me it would soon be your birthday, and I'll bet he brings you an awful nice present. This was followed by silence, and the senior author apparently absentmindedly snapped open and closed his hunting case watch, with no further effort to engage her in conversation or to attract her attention. She first eyed him, then became interested in the watch, whereupon he held it to his ear and stated that it went tick, tick very nicely.

E: Hello, little girl assigns her a hypnotic role.

R: In that first second when she opens her eyes in somnambulistic trance you immediately reinforce the age regression so there could be no doubt about it. Is she going to see you as Dr. Erickson or as someone she does not know in her past? Your opening remark orients her into the past.

E: And there have been people in her past who have said just such a thing.
R: You then attract her attention appropriately by playing with your watch. This is just about right for a four-year-old; you do not introduce yourself in a direct or demanding way. You behave very much as a visitor to her house might when she was a child. Wrist Cue as a Nonverbal Signal for Metasuggestions Orienting the Somnambulistic State

After a few moments the suggestion was offered that she might like to snap the case open or to listen to the watch. She nodded her head shyly and extended her hand. Taking hold of her wrist as if to help her, the senior author handed her the watch. She looked at it and played with it. The suggestion was offered that if she listened to it for a little while, it would make her very sleepy. This was followed by the comment that soon the senior author would have to go home, but that some time he would come back, and, if she wished, he would bring his watch so she could open and close it and listen to it.

She nodded her head, and her hand holding the watch was guided to her ear. Her wrist was slowly squeezed, and trance suggestions were given accompanied by suggestions that maybe next summer the senior author would come again, and maybe she would recognize him.

E: I had to get out of her house. I ended that interpolated life experience with the wrist cue in an appropriate way (guiding her hand with the watch to her ear) and suggesting she would get sleepy as she listened to it.

R: Having her go to sleep is fairly appropriate behavior for a four-year-old listening to a watch, and her sleep allowed you to leave. It also enabled you to give her the posthypnotic suggestion about seeing her again next summer maybe, and may be she would recognize you. These possibilities are appropriate for her age because a four- to five-year old child might not recognize a friend after a year. But why did you give her the rapport cue by squeezing her wrist as you added these suggestions?

E: Although she was in a somnambulistic trance, further hypnosis would be needed to effect an alteration of that state to induce other phenomena.

R: I see. Even during a somnambulistic state special rapport is needed to effect important suggestions. The wrist cue is an orienting signal for the metasuggestions you will use to guide the somnambulistic state; it tells her important suggestions are coming. I have had the difficulty of working with some subjects who were so obstinate during the somnambulistic state that I could hardly get a word in edgewise. Like self-centered children, such subjects would soon take over the situation and simply live out an inner experience without my being able to relate to them. This may be valuable for cathartic purposes, but it does not permit the therapist to interpolate new experience as you are doing here.
E: You need another hypnotic frame of reference to orient her to important suggestions without verbally defining it as such and without altering my role as a stranger, Daddy's friend.

R: Classical age regression has typically been a simple reliving of a past life experience. A catharsis or process of desensitization is relied upon as the therapeutic means of resolving pent-up emotions of life traumas.

E: That does not add anything. Here I'm adding to the past.

R: That's the object of the entire procedure. You regress her to establish a frame of reference into which you can interpolate therapeutic life experiences. You are adding new experiences to her memory bank; you're adding new elements of human relating that she missed in reality.

E: You can add belief to something that does not exist if you repeat it often enough. That's why I had to give her many experiences with me as the February Man. I'm adding reality to a nonexistent thing.

R: It becomes real in terms of internal reality. With this approach you can alter a patient's belief system; you cannot really change her past, but you can change her beliefs about her past.

E: You can change beliefs and values. It's not really that we can believe lies; rather, we discover more things. Patients believe their limited reality until they discover more reality.

R: I wonder if we can equate discover more reality with creating new consciousness? There is still a basic question here, however. Are you (1) really adding something new to the personality, or are you (2) simply helping her discover and experience a natural, inherent pattern of human relating (the archetypal child-parent relationship) that she very much needed and wanted? Utilization theory would emphasize the second alternative; you are structuring circumstances that allow her to evoke and utilize inherent (species-specific) behavior patterns that must be expressed for normal development. But you are certainly adding a new content within the framework of this inherent pattern. Continuing Experiences with the February Man: Ratifying the Historical Reality of Age-Regressed Experience

She was then permitted to experience about fifteen minutes of profound hypnotic sleep. This sleep was a passage of time during which my departure and eventual return (as had already been suggested) could take place. Her wrist was then again gently squeezed, and suggestions were offered that she better be in the yard because the flowers were blooming for the first time since her birthday last
winter, and perhaps her Daddy's friend might come again. At all events she could
really open her eyes very, very wide to see the flowers. She opened her eyes and
was apparently enjoying her visual hallucinations when the writer, from behind,
adressed her, Hello, little girl. Do you remember me? She turned, eyed him
carefully, smiled, and said, You're Daddy's friend. The reply was made, And I
remember your name. It is R. In this way the senior author became established as
an actual figure in her past life without impinging upon realities or distorting
them, but merely by adding to them by a simple process of temporal association.
Thereupon a casual conversation was initiated at a childish level about the red
and pink and yellow flowers (she said they were tulips), whereupon she reminded
the writer about his watch, and essentially the same course of events ensued as
had previously. Many more comparable instances were developed to ensure the
possibility of the writer's intrusion into her past without invalidating the
regression state. She was given extensive experience with the February Man, a
figure that became more and more established in her life history.

E: I had learned from the initial interviews that her childhood home did have
extensive flower gardens with red, pink, and yellow flowers. I would further
ratify the historical aspects of the experience by pretending to have an unclear
memory of my previous visits with her. How clear does anyone remember an
experience of a year ago? Two years ago? Four years ago? I also introduced
changing views. As she gets older, she gets a different perspective on things. I'd
say, That first doll you had was really very nice. Remember your enthusiasm for
that first circus? I might make such remarks to the ten- or twelve-year-old girl
about the six-year-old girl.

R: You built associative bridges between the trance experiences at different age
levels that established the historical reality of your visits with her. Indirect
Posthypnotic Suggestion

Finally she was placed in a profound trance and given extensive posthypnotic
suggestions to ensure a comprehensive amnesia for all trance events and to
ensure continued cooperation. I'd gently squeeze her wrist and say You have now
completed that task. I want you to go into a profound trance at this time. I want
you to enjoy resting, I want you to feel fresh after you've awakened, comfortably
enjoying the feeling of being wide awake, prepared for a new day's activities.

E: That latter suggestion, prepared for a new day's activities, implies that she will
be ready for more work; we are just beginning.

R: That's how you also imply a posthypnotic amnesia without directly telling her
she would not remember. You could then put her back into trance for another
experience with the February Man. Time for Hypnotic Work
In subsequent sessions, usually of several hours' duration, essentially the same procedure was followed.

E: I had to have several hours in order to let her have an experience with the February Man at one age level, rest, and then another experience at another age level. Time is expandable and compressible, but a certain amount of real clock time is still needed for careful work. Initially you really don't know what the patient's capacities are. Time is needed to explore them. Integrating Hypnotic and Real-Life Memories: Creating a SelfConsistent Internal Reality

A number of hypnotherapeutic sessions now took place following this same pattern. She was regressed to many different periods of her life, usually in a chronologically progressive fashion, taking care not to let the created situation impinge contradictorily upon the actual realities of the past. For example, on one occasion, regressed to a nine-year-old level, she manifested intense astonishment upon opening her eyes and seeing the senior author. Cautious inquiry disclosed that she was visiting a distant relative for the first time and had just arrived the previous night. A few questions elicited enough information to orient the senior author so that he could claim a business friendship with her relative. This laid a foundation very necessary for the subsequent ubiquity of him in her life experience. Aiding in the acceptance of his ubiquity was the fact that both of her parents traveled extensively and often unexpectedly, and that they had innumerable acquaintances and friends. Hence it was easily assumed that the same was true of the senior author as Daddy's friend. Also of importance was the February Man's knowledge of various cities she had visited and the fact that he, as well as she, had studied psychology, all of which provided a wide background permitting her to accept him unquestioningly. As the procedure continued, the technicalities of securing responsive behavior became minimal, and a dozen regressed states could be developed in an hour's time. These were all utilized to secure a report by her of things and attitudes current to the regression period, as well as an account of expected or anticipated events. Anticipated events served admirably in enabling the senior author to direct regression states to safe periods. However, care had to be exercised, since anticipations were not always fulfilled. Frequently, however, the visit was devoted to an account of what had happened since the last visit that is, the preceding regressed state. She learned to look upon the senior author as a recurrent visitor and as a trusted confidant to whom she could tell all her secrets, woes, and joys and with whom she could share her hopes, fears, doubts, wishes, and plans.

From time to time it became necessary to induce comprehensive amnesias, obliterating various of the senior author's visits, and to regress her to an earlier age and to go over an already partially covered period of her life more adequately. Thus, some sudden change in her life, not anticipated at an earlier age regression, might
have become established before the period of the next age regression, thereby creating a situation at variance with established understandings. On such occasions the last age regression would be abolished by amnesia suggestions, and a new regression to an earlier time would be induced to permit the securing of pertinent data.

R: You made a very careful and extensive effort to integrate hypnotic and real memories so they were molded into a self-consistent inner reality. This would ensure the permanence of the new attitudes you were facilitating in her. If there were contradictions and a lack of consistency between the hypnotic and real memories, self-corrective processes within the unconscious would have tended to gradually eliminate the hypnotic suggestions as foreign intrusions. This may be why so much hypnotic work in the past has had only temporary or partial effect. Direct suggestions made even while a patient is in a deep somnambulistic state are not programmed within the mind forever in a rigid way. The human mind is a dynamic process that is continually correcting, modifying, and reformulating itself. Inconsistencies are either worked out in a satisfactory manner or are expressed as problems (complexes, neuroses, psychosomatic symptoms, etc.). There is thus nothing magical or mysterious about the effectiveness of your approach: It is based on very careful, thorough work integrating real memories with hypnotic experience. Facilitating Therapeutic Attitudes: A Therapy of Life Perspectives: Dreams and Hypnosis

The consistent and continual rejection she experienced from her mother presented many opportunities to reorganize her emotions and understanding. By this procedure the senior author's role became one of friendship, sympathy, interest, and objectivity, thereby giving him the opportunity to raise questions concerning how she might later evaluate a given experience. Thus, in expressing her grief over breaking a cheap little china doll her father had given her and which she treasured, she could declare that, when she grew up and became a mother and had a little girl who broke her doll, she would know that it wasn't something awful but that she would know just how her little girl would feel. Similarly, a fall on the dance floor in her teens was regarded by her as an utterly and completely devastating experience. Yet she manifested a readiness to understand the senior author's comment that she should rightly appreciate it as such in the present but that at the same time she could also understand how, in the future, it could really be regarded as a minor and completely unimportant event, perhaps even amusing. Her first adolescent infatuation, her jilting by the boy, and her tremendous need to understand herself in relation to that event were dealt with. Her resolution to leave the finishing school, to enter the university, her choice of studies, her scholastic struggles, and her limited social life were all covered. The meeting with the man who became her husband, her doubts and uncertainties about him, the eventual engagement, and the mother's attitude toward him, toward the marriage, and toward the subsequent pregnancy were all detailed to the senior
author in current accounts of what was happening to her. Numerous other instances of rejection, neglect, and disappointment by her mother and father were relived and discussed with the February Man. Real happy memories were also relived and integrated with the hypnotic memories to ensure a comprehensive integration of them.

R: Whenever she had a traumatic life situation, she could now discuss them with her father's friend, the February Man. In effect you became a therapist at such times. This is a curious state of affairs, you as her current therapist became a therapist in her past, helping her deal with her difficult life situations as they occurred. I've noticed something similar in dreams. Some patients seem to relive their past in dreams but correct the traumatic aspects of their past with their current adult perspectives (Rossi, 1972a; 1973c). This again points out the self-corrective aspect of the psyche; it is in a continual process of reformulating or resynthesizing itself to achieve a more integrated pattern of functioning. You utilize and facilitate this resynthesizing aspect of psychic functioning with your role as the February Man. You are doing hypnotically what frequently happens naturally during dreams.

E: Yes. [The senior author now recalls such a dream of his own, when the adult Dr. Erickson observed himself as a child (Erickson, 1965a).] Dreams give us the opportunity to relive past events and appraise them critically from an adult perspective.

R: Dreams are autotherapeutic processes that help the mind correct and integrate itself. I also believe we are synthesizing new phenomenological realities in our dreams that become the basis of new patterns of identity and behavior (Rossi, 1971; 1972 a, b; 1973 a, b, c.). A Reversal of Realities: Deepening the Therapeutic Frame of Reference

Toward the end of this extensive reorganization of her attitudes about her past, a new memory was recalled: Her secret resolve years ago to have hypnotic anesthesia should she ever marry and become pregnant. As she now again considered this possibility, she received a letter of foreboding from her mother requesting that the term grandmother never be used - in essence, rejecting the unborn baby. This letter intensified the patient's anxieties and fears anew.

To deal with these renewed anxieties a variation in our hypnotic procedure was developed. In this variation a blanket amnesia was first induced for all her previous hypnotic work, and she was asked to again relate all her fears and anxieties. In this state, as expected, her account was comparable to her original expression of her problems before hypnotherapy.
A new trance state was then induced in which the blanket amnesia was removed. She was then regressed to a week before the arrival of her mother's letter. In this state of hypnosis she was asked to recall fully all the many visits, talks, and discussions over the years she had had with the senior author as Daddy's friend. As she recalled his many visits and their conversations on so many subjects, the suggestion was offered that she ought to consider the present minor worries against that total background. As she began this correlation of her unhappy ideas in the past as she conceived it at the moment, she began to develop amazing insights, understandings, and emotional comfort.

Having reestablished the new attitudes developed in the hypnotic work, the senior author next led her into an age-regression state covering the period just after the receipt of the mother's letter. After expressing some sensible views about her mother's problem, she was asked to give the reactions she could develop if she did not include in her thinking all she knew about her past. She was told that she ought to speculate aloud on how she could really enlarge her reactions into exaggerated fears and anxieties by just not being comprehensive in her thinking. She was urged to offer speculative statements expressing such anxieties. She then proceeded to verbalize them as she thought would be possible if she did not think intelligently. This speculative account was identical with that which she had originally given just before therapy began and the previous account with the blanket amnesia for all the hypnotherapeutic work. But it was given as a speculative account which was decidedly different from the new reality of her emotional life that now included the new frames of reference she had developed with the February Man.

Subsequent regression states were similarly utilized. Her speculations about how she could exaggerate her fears always gave accounts similar to the one she gave originally before hypnotherapy. These speculations were always in sharp contrast to her real attitudes developed with the help of Daddy's friend, the February Man. She now drew extensively upon her actual past history, with all its interpolated experiences with Daddy's friend. During this period a tremendous amount of her past history came out in clear relevance to her entire current problem. As this type of activity continued, she developed insights that were remarkably corrective.

R: This is an ingenious twist: what was originally a painful reality now becomes the speculative account, while the new attitudes introduced by hypnosis become the abiding reality. That is, she is now accepting her expanded frame of understanding developed with the February Man as her real views, while her previous behavior is now seen merely as a speculative account of how badly things could be if she did not think intelligently. This procedure may be helping her integrate the February Man frame of reference at an even deeper level. This is
particularly the case because she is already in a deep hypnotic state as she experiences this reversal of realities. Termination: A Final Conscious Integration of All Trance Work

Finally, as she progressed in this regard, the topic of hypnotic anesthesia for the delivery of her child was mentioned increasingly by her while she was in trance. She was reassuringly told that as the months of pregnancy passed, it was absolutely certain that all of her anxieties would be comprehensively and comfortably understood and thus become a resolved experience of the past. In their place would be a realization that in some way she would meet someone who would teach her to understand herself happily. Since she was in an age-regressed state, this was naturally a reference by implication to the senior author as someone she would meet in the future. In so doing she would be trained to become an excellent hypnotic subject and thereby her college resolve for a hypnotic delivery would be fulfilled.

The termination of therapy was accomplished rather simply. She was regressed to the time of preparation for her first visit to the senior author’s office. She was assured by him - still in the role of Daddy’s friend - that her trip would be fully successful in many more ways than she really expected. The scene was then shifted to the office, and she was much astonished to see the February Man. The senior author was also astonished! She was puzzled at his presence, explained that she had come to see Dr. Erickson. She was assured that she would see Dr. Erickson and that he would meet her wishes fully, but that, for a few minutes, she should sleep most profoundly. During this trance approximately one half-hour was spent instructing her so that after

she awakened she would recall from the beginning, in chronological order, every trance experience she had had, together with all insights and understandings that she had developed up to the date shown by the day’s newspaper on the desk. At the close of the interview she was told to spend a few delightful days reviewing her memories, making certain that she understood, remembered, and accepted all her past in an adjusted fashion. As for the hypnotic anesthesia, she would be certain of it, but the minor details would be arranged in the next interview.

R: This was a final summation for a final conscious integration of all her therapy. She now finally learns how you played the role of the February Man, how you reversed her realities, and so on. Yet this does not undo the effectiveness of the new attitudes and frames of reference you helped her develop. Why doesn't it? After all your incredibly complex efforts to develop a new frame of reference, integrate it, and deepen it, why do you end the therapy with this complete denouement?

E: Because I may have made some errors. She may have made some errors. Let's make sure we get the whole set of errors corrected.
R: You are not afraid of undoing your therapeutic work because you actually, have helped her develop new frames of reference and understandings that have therapeutically altered her emotional life. This case contrasts sharply with those cases in which you like to maintain an amnesia for all hypnotherapeutic work. What is the difference?

E: Some personalities need amnesia, some do not. It's a matter of clinical experience to distinguish them.

R: Those patients whom you judge to have destructive conscious attitudes toward the therapy might do better with an amnesia.

E: This patient was actually left with some amnesia for the negative emotions she experienced in relation to her mother. My final posthypnotic suggestion to her was to spend a few delightful days reviewing her memories, making certain that she understood, remembered, and accepted all her past in an adjusted fashion. This precluded any regression into the catastrophically negative affects and anxieties she was experiencing before therapy. Training for Obstetrical Analgesia: A Two-Year Followup

At the next session some days later she stated that she had been interested primarily in thinking about her hypnotic delivery. After much discussion with her husband, during which he was primarily the listener, she had decided on an analgesia if it were possible. She explained that she wished to experience childbirth in the same fashion as she had, as a child, sensed the swallowing of a whole cherry or a lump of ice, feeling it pass comfortably and interestingly down the esophagus. In a similar manner she would like to feel labor contractions, to sense the passage of the baby down the birth canal, and to experience a sense of distension of the birth canal. All this she wished to experience without any sense of pain. When questioned about the possibility of an episiotomy, she explained that she wanted the sensation of the cutting without pain and that she wanted to feel in addition the suturing that would be done.

When asked if she wished at any time to experience any feeling of pain merely as a measure of sampling it, she explained: Pain shouldn't have any part in having a baby. It's a wonderful thing, but everybody is taught to believe in pain. I want to have my baby the way I should. I don't want my attention distracted even a single minute by thoughts of pain. Accordingly, as a measure of meeting her wishes, she was taught to develop complete hypnotic anesthesia. (Usually the procedure is to proceed from numbness to analgesia to anesthesia.) Since in this instance an analgesia was the primary goal, anesthesia was induced extensively and then systematically transformed into an analgesia. (That a complete transformation of anesthesia to analgesia could be effected is doubtful, but the patient's wishes could be met in this manner, and whatever anesthesia remained would only supplement the effectiveness of the analgesia.)
When she had been trained sufficiently to meet various clinical tests for analgesia, extensive training was given to her to effect the development of a profound somnambulistic posthypnotic trance with that degree and type of analgesia you have just learned, so that she could enter into labor without any further contact with the senior author.

Additional instructions were that she would awaken at the completion of labor with a full and immediate memory of the entire experience. Then, when she returned to her room, she would fall into a restful, comfortable sleep of about two hours' duration, and thereafter she would have a most pleasant hospital stay, planning happily for the future.

About seven weeks after the delivery she and her husband and baby daughter visited the senior author. They reported that, as she entered the hospital, she had developed a somnambulistic trance. During the labor and delivery her husband was present. She had talked freely with her husband and the obstetrician and had described to them her labor contractions with interest. She had recognized the performance of the episiotomy, the emergence of the head from the birth canal, the complete delivery of the baby, and the suturing of her episiotomy - all without pain. The expulsion of the placenta caused her to ask if there was a twin because she felt another one moving down. She was able to laugh at her error when informed it was the placenta. She counted the stitches in the repair of her episiotomy and inquired if the doctor had cheated by giving her a local anesthetic because, while she could feel the needle, it was in a numb, painless way that she associated with the numb feeling of her cheek after a local dental anesthetic. She was relieved when informed that there had been no local anesthetic.

She was shown the baby, looked over it carefully, and asked permission to awaken. She had been instructed to be in full rapport with her husband and the obstetrician and to do things as needed to meet the situation. Hence, inexperienced in the situation, she carefully met the need of abiding by the situation by making sure it was in order to awaken. She again looked the baby over. Then, upon telling her husband that she had full memory of the entire experience and that everything had occurred exactly as she desired, she suddenly declared that she was sleepy. Before she left the delivery room, she was sound asleep, and slept for one and a half hours. Her stay in the hospital was most happy.

Two years later she announced to the senior author she was having another baby, and asked that she be given a refresher course, just to make certain. One session of about three hours in the deep trance sufficed to meet her needs. Much of this time was used to secure an adequate account of her adjustments. They were found to be excellent in all regards.
**Trance Induction: The Early Learning Set**

E: Now sit with your hands on your thighs like this. And just look at one spot there. And just look at it continuously. You do not need to talk. You do not need to move. You actually do not need to move. Just look at that one spot. And many years ago you went to kindergarten, first grade. And you were confronted with what seemed then an insurmountable task of learning the letters of the alphabet in all their many forms. And it seemed an insurmountable task. But you did form mental images for every letter of the alphabet. And you formed mental images of the numbers. And you formed those mental images to remain with you for the rest of your life.

This early learning set induction tends to facilitate age regression by indirect ideodynamic focusing that evokes early learning experiences. MHR you overcame apparently insurmountable challenges from birth, you just need to recall these past successes, to gain confidence to approach ANY ‘new’ task ... just like back then, you will manage...we don’t know HOW...YOU don’t know HOW, you managed / we manage to learn to speak, write, walk, but we DID / DO manage ... it is our UNCONSCIOUS resources that are activated ... we must confidently expect them to kick in again, now, as they did then...

**Ratifying Trance: Body Language in Trance**

While I have been talking to you your respiration has changed, your pulse has changed. Close your eyes N ... O ... W.

[Pause as the patient's eyes close and his head bows down very slowly, bit by bit, until it almost touches his chest]

You go deeply into a trance and enjoy the feeling of comfort and satisfaction all over.

[Pause as patient's body tips forward a bit precariously]
You can lean back in the chair.

[Pause as patient's body reorients back comfortably in the chair]

R: You begin your process of vocal conditioning with your slow drawn-out N . . . O . . . W and then emphasize that in a deep trance one can enjoy feeling comfort and satisfaction all over. This is a form of indirect suggestion because we know that such comfort is a characteristic of trance.

E: My emphasis on satisfaction all over includes his scalp, nose, buttocks, and penis.

R: The patient does not recognize this as an indirect suggestion by generalization: Since his penis is the problem his unconscious will tend to automatically focus some of that suggested satisfaction there.

E: The fact that his body tips forward may be an indication that he is leaning toward the light of love; he had been leaning away from it after his wife died.

R: Leaning forward may be an indication of a positive rapport. Does that mean that a leaning backward or pulling in a direction away from the therapist is an indication of a negative transference reaction or a problem between therapist and patient?

E: It can indicate a difficulty with the ideas being presented.

**Posthypnotic Suggestions Initiating Somnambulistic Training: Being in Trance without Knowing It**

And now I want you to realize something. Shortly after you awaken I'm going to say something to you.

R: This posthypnotic suggestion is a way of initiating somnambulistic training. It is a very easy suggestion to accept because after a patient awakens he naturally expects you will say something. He doesn't realize, however, that when you do say something, you're actually giving a posthypnotic cue that will initiate another trance. Your earlier research (Erickson and Erickson, 1941) indicated that subjects reenter trance when receiving posthypnotic cues and carrying out posthypnotic suggestions. When you begin to say something after trance, they will tend to reenter trance even though their eyes may be open and they may act as if they are awake. This is your definition of the somnambulistic state: A person acting as if he is awake but capable of following the therapist's hypnotic suggestions.
E: Yes, with hypnotic training you want them to be content with the thought that they are awake.

R: Even though they are really not. Do you define that as the somnambulistic state? The patient thinks he is awake, but he is following you so closely and is thereby capable of carrying out so many hypnotic responses that we say he's actually in an altered state called trance. He is not critical and initiating his own behavioral directions; he is waiting for your suggestions. He is in trance without being aware of it.

E: I once told a subject to act as if he was awake with all of us who were in the room. But when a totally unexpected person came in the room, the subject could not respond to his presence. He never heard the newcomer speaking to him.

R: Indicating that there was a special rapport with those already present in the room that excluded any strangers. Such an intense state of rapport is characteristic of somnambulistic trance. I'm beginning to believe that patients are frequently in somnambulistic trance without the hypnotherapist recognizing it or knowing how to use it.

E: I certainly agree! Most have such fixed and rigid ideas of what somnambulistic behavior is. [The senior author goes on to point out how subtle changes in behavior that indicate the presence of therapeutic trance are frequently missed by many therapists.

**Utilizing Patients' Motivation to Reinforce Suggestions**

And you can be surprised that you ever really have doubted yourself.

[Pause]

R: You throw in a therapeutic suggestion here?

E: To reinforce the preceding posthypnotic suggestion.

R: You utilize the patients' own motivation for therapy to reinforce your suggestions.

E: All your suggestions in therapy should be a connected whole. Hypnotic Amnesia Facilitating Somnambulistic State

Now it isn't necessary for you to remember what I say to you in the trance state. But your unconscious mind will remember. But all of us know very little about what the unconscious mind knows.
This is a permissive suggestion for amnesia. You don't command amnesia—that might only arouse conscious resistance. You are apparently letting the patient do something easy: it isn't necessary for you to remember. This implies that it's too hard to remember (as we all well know from many experiences in everyday life.)

If you tell anyone they have to do something, they invariably come back with they don't.

You then admit Your unconscious mind will remember. But all of us know very little about what the unconscious mind knows. This tends to reinforce amnesia and the role of the unconscious while depotententiating the importance of his more limited conscious mental sets. This emphasis on conscious amnesia and the significance of unconscious functioning is another way of facilitating the somnambulistic state.

Deepening Trance by Rehearsal

I'm going to arouse you and put you back into trance.

Awakening and putting a patient back into trance repeatedly is a way of deepening trance (Erickson, 1952).

Is it also a way of further depotententiating his conscious orientation, a sort of confusion approach to somnambulistic training?

Yes, you're training the patient to respond in a therapeutic way.

You're training him to respond to you.

And you base your therapeutic suggestions on his own patterns of behaving.

By deep trance you mean that the patient is following you very closely in accord with his needs. Questions as Direct Suggestion in a Permissive Manner

And you are going to do everything I ask you to do. Can you be surprised at your ability to make true whatever I say?

[Pause]

Your first sentence here seems to be a shocking authoritarian demand for obedience.

Everything I ask you to do. I did not say, Do what I tell you to do.
R: When you ask, you are actually making a permissive request that the patient could refuse. Then you follow it up with a very innocuous-sounding but strongly reinforcing question about being surprised at your ability to make true whatever I say?

E: Even infants like surprises.

R: A surprise also implies that the unconscious will be active and surprise the conscious mind.

E: Too many therapists tell their patients to do this or that rather than ask. That's an iron hand covered with a lot of velvet.

**Discharging and Displacing Resistance: Use of the Negative**

And you will make true whatever I say, will you not?

E: You will, will you not? If anybody is going to use the negative, it had better be me.

R: If the patient has a resistance in the form of a no within, then your use of will you not? tends to displace and discharge the no.

You therefore use negatives in this rather curiously concrete way to pick up the patient's negative and convert it into a constructive direction.

**Hypnotic Poetry Bypassing Conscious Resistance**

In spite of any thinking you do, what I say will be true.

R: This poetic couplet is another way of dealing with resistance. Many patients fear that if they have contrary thoughts during trance, the therapeutic suggestions cannot be effective. Your couplet reassures them on this point. The smooth pattern of sound and stress in this couplet suggests it may be an example of Snyder's Hypnotic Poetry (1930), which bypasses the critical, intellectualistic left-hemisphere so it can be accepted by the right.

E: I'm bonding my therapeutic suggestion to whatever resistance he may have within.

R: In this case you don't necessarily eliminate resistance but rather add your therapeutic suggestions to it. It's a way of utilizing the patients' resistance so that whenever they express it to themselves, they find themselves also expressing the therapeutic suggestion. This is especially important for this type of patient, who seems so cooperative in his manifest behavior. Since he is so cooperative on the
outside, his resistances must be hidden within. You therefore utilize this inner resistance by adding a constructive suggestion to it without even having to bring it up with the patient.

**Apparent Trance Awakening and Spontaneous Reinduction: Individual Characteristics of Somnambulism**

Take your time and mentally, silently, count backward from twenty to one. Awakening one-twentieth of the way at each count. And begin the count now.

[Pause as P appears to awaken in about one minute]

Pretty hard to awaken wasn't it?

P: Um-hum.

[E answers the phone, and as he does so P closes his eyes and evidently goes back into trance.]

E: And it's hard to awaken, but you can awaken again.

[Pause as P opens his eyes slowly. He does not reorient much to his body, however, so we may presume he is still in trance.]

And awaken with a very comfortable feeling.

P: I feel comfortable.

E: Why did you go back into trance the second time?

[Pause as P looks perplexed]

Your unconscious mind understands a lot more than you do.

R: It's an indication of his intense somnambulistic rapport with you that he closes his eyes and goes back into trance when you remove your attention from him by answering the phone. He is now following your earlier posthypnotic suggestions that he would go back into trance after awakening. If he were really awake, he might have moved about a bit or related to me since I was right next to him. But he completely ignores me and all the recording equipment. Deep trance does not mean a patient is stuporous or unconscious; it does mean that a patient's attention is intensely focused on what is relevant, so that everything else is ignored. You ask him to awaken again, but he only opens his eyes. When you tell him to awaken with a very comfortable feeling, he responds in an almost exact paraphrase, I am comfortable. This exact following of your words is another
indication of the somnambulistic state. Why is he perplexed when you ask him why he went into trance the second time?

E: There is a retardation of intellectual processes that easily leads to perplexity in the somnambulistic state.

R: So here we have three characteristics of somnambulism: (1) the intense rapport; (2) the exact following of the therapist's remarks that are in accord with the patient's own needs; and (3) the lack of mental initiative. The somnambulistic state does not mean the patient is an automaton but that he is extraordinarily well related to the therapist.

E: It's his conscious mind that is perplexed. I verify that by adding that his unconscious understands a lot more than he does. I keep out of the situation; don't say, I know what's going on. I say, Your unconscious knows.

R: Are there any general characteristics of somnambulism, or do we have to pick them out as highly individualized manifestations in each person?

E: You have to pick them out for each individual; they will vary depending upon the purposes of the patient.

R: This patient showed little initiative in his somnambulistic state, but other persons might show a lot - expressing their fantasies, etc. Is there a general difference between an active and passive somnambulism?

E: This patient did not like what he was receiving from himself, therefore he remained passive in order to get what he could from me. That's why I worked for amnesia and perplexity to depotentiate his conscious sets.

R: Those were ways of depotentiating his habitual conscious attitudes so that an unconscious search and process could be initiated to facilitate a therapeutic response. Thus, even when the patient is in a very passive and receptive state, you do not resort to directly programming him with what he is to do. Rather you make an effort to help him sidestep his own conscious limitations so his unconscious potentials can become manifest.

E: The patient had better believe in his own unconscious.

Hypnotic Phenomena as Early Patterns of Behavior: Implication Evoking Early Psychomotor Patterns? Two-Level Communication for Therapeutic Suggestion via Metaphor

E: And all of your life since the age of one you have known you could stand up. Right?
P: Um-hum.

E: And now you know you can't. Try it. You can't. [Said very quickly and softly]

[Pause as the patient makes a few slight abortive movements with the upper part of his body and looks about, a bit distressed]

E: Since the age of one you have known you could stand up implies that before the age of one you could not. At the same time this is a two-level communication dealing with his problem in a metaphorical way: Not being able to stand up is like not being able to get an erection.

R: You choose a hypnotic phenomenon that has an unconscious connection with his psychological problem, so that when you later resolve the hypnotic phenomenon (allow him to stand up) you may also be resolving his sexual impotence to some degree. This is an unusually clear example of indirect therapy being done on an unconscious level. This also appears to be an unusually clear example of your utilization approach to hypnotic phenomena. Do you believe that you are actually evoking an early psychomotor level of not being able to walk and then utilizing it as the basis of this hypnotic phenomenon? Hypnosis is not just imagination; it is based on the activation of the relevant neurological circuits—very often those from infancy and early childhood.

E: Yes. Those infantile and early childhood patterns have a long history.

R: Because of their long history they have a certain prepotency within us; they have never been really extinguished, and when properly activated they can be expressed in behavior. It is usually more effective to activate such early psychomotor patterns by indirect means such as implication, because a direct command could evoke the doubting attitudes of consciousness that in turn block the hypnotic response.

E: You deal with the patient as a total historical being. You can rely on those neurological tracks and memories of long duration much more than you can on the very recent ones.

R: It would be well for the hypnotherapist to study early childhood development to gain a more adequate understanding of the type of phenomena he can evoke as well as hints about how they may be evoked. Most if not all hypnotic phenomena are actually early patterns of functioning. This is a distinctive aspect of your work: you believe you are evoking real mental mechanisms and unconscious processes in hypnotic phenomena. It is the utilization of an individual's early experiential learning rather than hypersuggestibility or imagination per se that is the basis of hypnotic phenomena.
E: Patients can only respond out of their own life experiences.

**The Creative Process of Therapeutic Analogy**

E: And now you truly know how an idea can take possession of you.

[P closes his eyes and appears to lapse deeper into trance]

E: In mentioning that he now truly knows how an idea can take possession of one, you are by analogy referring, of course, to his problem: Just as an idea can prevent him from standing up, so can an idea prevent his penis from standing up.

R: He probably closed his eyes again because of a sudden realization of standing up having those different meanings?

E: Closing his eyes probably corresponded to the inner search and unconscious processes that actually create that meaning. To grasp such an analogy requires a creative effort on his part. Because it is his own creative effort, he is less likely to reject it than if it was simply thrust upon him as a direct statement.

**Two-Level Communication: Further Somnambulistic Training**

E: And rouse again and feel very comfortable all over.

[Pause as P opens his eyes again]

How do you feel about not being able to stand up?

P: Well, it didn't bother me. I didn't want to stand up.

E: And now you can't remain seated.

[P looks around and stands up, seemingly a bit embarrassed for a moment or two]

Now you can sit down

[P sits].

E: When he said he didn't want to stand up, that implied he had a choice. On an unconscious level it also means he has choice about his penis not standing up.

R: I see - he may want to make that choice at times. He may be using two-level communication here without quite realizing it. The further suggestion that he can't remain seated in this context now has the symbolic meaning of not being able to keep his penis down and may account for his apparent embarrassment at
this point. It is also a means of further training in somnambulistic behavior wherein he follows your hypnotic suggestions even while acting as if he's awake.

E: To say that he can't remain seated is therapeutic on an unconscious level. Notice that I carefully avoided saying You have to stand up. I wanted to avoid the stand up issue because he had such difficulty with his penis standing up that it could have defeated the hypnotic suggestion on an unconscious level.

Levitation: Hemispheric Interaction in Trance Induction and Suggestion

E: I want you to enjoy this experience. One or the other or both of your hands will lift up toward your face. And no matter how hard you try to press down, it's going to lift up toward your face.

[Fingers of the patient's right hand lift tentatively, and then the whole hand lifts with a gentle, bobbing motion]

And you can't stop it.

[Pause as P's right hand slowly approaches his face]

And there is nothing you can do to stop it.

[Pause as the hand bobs up toward P's hairline]

A little bit higher. There is nothing you can do to stop your hand from feeling hair.

[P's hand approaches and finally touches the hair on his head]

The feeling of hair, and you can't stop your hand from doing that. And now you know that whenever you wish your penis can stand up and feel hair.

[Pause]

R: You now undertake a classical hand levitation, but your words have another level of meaning where hand levitation becomes equivalent to penis levitation. Several times you mention You can't stop it. Are you thereby attempting to symbolically depotentiate his conscious mind's ability to stop a penis erection?

His left hemisphere may be so preoccupied with levitating his right hand that it leaves his right hemisphere more available to accept and act upon your therapeutic suggestions given in the symbolic language of the right hemisphere.

Posthypnotic Suggestion Contingent on Inevitabilities
E: And you can enjoy it. It won't be your hair. It won't be your hair. It will be the feeling of hers. And you can't lower your hand until you've enjoyed sensing the feeling of hair sensing a warm body.

[Pause]

And nothing can tell you that your penis won't stand up. Nothing can tell you that.

[Pause]

And nothing can prevent it from feeling hair and a vagina for as long as you want.

[Pause]

And I want you to notice your hand doesn't feel as if it's touching your hair, it feels as if it's touching that lady's hair.

[Pause]

E: I initiated the process of lifting toward his face and hair. Once that was well under way and could not be stopped, then I could shift it to the issue of vagina and pubic hair.

R: Having accepted the initial condition, he is carried on by its momentum to accepting the therapeutic suggestion.

E: Now he can't avoid sensing a warm body when he is with her; that's inevitable and I've symbolically tied an erect penis to her warm body when I say You can't lower your hand until you've enjoyed... warm body.

R: This is a basic principle of posthypnotic suggestion wherein you always make a suggested behavior contingent on an inevitability.

Further Posthypnotic Suggestion

And I want you to have the surprise of your life because sometime today or tomorrow your hand will touch the hair on her head, and you'll find what your penis will insist on doing. And you're going to let that be a surprise are you not?

[P nods his head yes]

[Pause]
And you're going to be so delighted with the forcefulness of your desire. But you will not offend the lady. But you will be pleased with the very forcefulness of the desire.

[Pause]

And philosophers of old have said, As a man thinketh, he is. And you'll never forget that, will you? And now think this question over well, are you willing to tell us something about the lady?

[P nods head yes]

E: Sometime today or tomorrow actually means anytime. It could be next month and still fall within the generalized time range of this suggestion.

R: Here you again make a posthypnotic suggestion about penis erection contingent on another inevitability (touching her hair).

E: How do you offend the lady? By either being too forceful or not forceful enough. I've covered both possibilities there forcefulness of your desire. When I then ask him if he wants to tell us something about the lady, it implies he has choice, and if he tells us something he also has the right to hold back other things. The right to hold things back gives him potency and power.

**Preparation for Awakening**

All right, take your time and awaken and just spontaneously tell us something about her.

[Pause as P opens his eyes and focuses as if he is awake. His hand remains at his head, however, and he does not reorient any other part of his body]

P: Well, she is beautiful. She is the same age as I am. And I never loved anyone like this before in my life.

E: I've just given him the implied posthypnotic suggestion to hold back and he responds with the generalization Well, she is beautiful. He is actually holding back. He's following a posthypnotic suggestion without even realizing it.

R: In having him hold back you're returning him to his normally awake ego controls and are thereby preparing him for a full awakening.

E: Yes, when he admits loving her more than anyone else in his life, he is volunteering that on a more conscious awake level.
Symbolically Displacing and Discharging a Lack of Confidence

E: What did you just learn about yourself?

P: More confidence, for one thing.

E: There is something lacking in your confidence?

P: Yes, there was doubt.

E: There is something now lacking in your confidence. I'll tell you what it is. You can't put your hand down.

P: Hum!?

E: When he talks about confidence here, he's implying a lack of confidence, so I displace it onto the hand. Put the lack of confidence in a harmless place.

R: This is a way of displacing and discharging a lack of confidence in a symbolic manner.

Two-level Communication with True Trance Awakening

E: And you can't push it down until you have a feeling of intense satisfaction.

[Long pause as P closes his eyes. He finally opens them again, puts his hand down, and adjusts his whole body slightly, as is characteristic of patients awakening from trance.]

P: Yeah, I feel pretty good now!

E: And what are you going to need?

P: Uh?

E: You don't have to tell us.

P: No.

E: But you think it over. She's got two beautiful twins, and both deserve a name.

[Pause]

P: Yeah.
E: After a pleasant sexual intercourse what happens?

R: You relax and your penis goes down. So your suggestion that he can't put his hand down until he has a feeling of intense satisfaction is another bit of two-level communication that he receives just as he is waking up. This tends to build a bridge between the therapeutic suggestion on the unconscious and conscious levels.

E: He then responds with, Yeah, I feel pretty good now! A two-level response without his quite realizing it. I now continue with remarks about her two beautiful twins, which he recognizes as a reference to her breasts. If he is to make love to her, he had better appreciate her breasts.

**Indirect Ideodynamic Focusing**

E: Someone who liked mountain climbing was asked on a social occasion, Do you intend to do any mountain climbing this weekend? And he said, Oh, yes, but he didn't name the mountain. That was a secret between him and his wife. And every couple should have a language of love.

[Pause]

P: I feel better now.

**Therapeutic Restructuring of a Former Symptom**

E: Now, I always tell young men, Sometime in your lifetime you're going to lose your erection. And what you don't know is that your unconscious mind is telling you that the beauty of your wife's body is overwhelming. And to enjoy that fact. Because that's the greatest possible compliment you both can receive. If on some occasion unexpectedly you lose your erection, it's a very profound compliment, because as soon as you realize you have complimented her in the most ultimate fashion, then your erection comes back.

[Pause]

R: Do you actually believe that a loss of erection could really be a compliment, or is this just a rationalization you're offering him?

E: He's placed a bad interpretation on a loss of erection. Why should he keep that forever and ever? Life is much better if sometimes it rains and sometimes it doesn't. I've seen many cases where it really was a compliment.
E: [To R] Do you know the Ginkgo tree?

R: Oh yes, very well! They have live motile sperm!

**Anorexia Nervosa Paradox and Double Bind**

I told her most emphatically that her parents sent her to me to have me tell her to eat, but I had no intention of doing so; eating was her own problem, and she could do as she pleased.

R: In this initial approach you immediately establish rapport with the patient by telling her mother to shut up. You then facilitate the developing of a yes set by adapting yourself to the patient’s own frame of reference, as you tell her you have no intention of telling her to eat. You then place the locus of therapeutic control within the patient by saying that eating was her own problem and she could do as she pleased. You apparently allow the patient to keep her resistances and you see to it that she has no need to defend herself against you. She is now more available for whatever you suggest.
We all have a repertoire, have experienced, have produced in ourself, every phenomena that trance / hypnotic therapy seeks to employ therapeutically, to provide relief from a particular ‘problem’ or ‘symptom’. E.g we have all experienced trance states, forgetting of pain during great book or other distraction, ‘referred’ pain i.e feel pain in one area when stimuli really in another, amnesia for memories i.e forgetting, positive and negative hallucination e.g not seeing keys on table, and seeing things that aren’t there e.g curtain ‘seen’ as a girl sitting in the window, pot plant ‘seen’ as menacing face i.e Gestalts interpreted according to our expectations / current thoughts…waking to see spiders that aren’t there, as eyes adapt to being open, being certain of a ‘fact’ that turns out to be untrue, even concerning something we ‘saw’ or ‘heard’ or ‘confidently recall’ or ‘are sure of’. The therapist can use these typical capacities for time distortion, amnesia, anesthesia (where you forget pain, or don’t notice it e.g focused / intently concentrating-attending to something else e.g running from vicious dog) or watching engaging scene / film/ reading / lost in reverie / thought / daydream, which we DO have experience of but have forgotten or don’t think about…telling stories helps us remember our own latent potentials, what we’ve already done / experienced / managed, and thus can employ for our own benefit again, as the means to relieving / solving some particular challenge / symptom / problem…

MHR this also means, like Buddha suggested, never to attempt to contradict something people ‘know’ e.g that they can’t be hypnotized, that pain killers don’t work on their level of pain, that they are going to suffer, that dentistry is going to be painful…instead E utilizes these very symptoms / beliefs to induce trance states, bypassing the inevitable resistance which like any resistance training, tends to strengthen the muscles / beliefs, and like a clever martial artist, uses the momentum / force of the belief by pacing / mirroring it, then leading it in a different direction from its original trajectory, employing its momentum, utilizing the vector of the symptom, to lead the person somewhere better than it was heading, producing outcomes superior to those it was producing…

N.B An example of clever manipulation is controlled opposition / Cultural Marxist / weaponised trust / confidence man / con man Michael Moore, in his Trump film. Even though they are both World Wrestling Federation style ‘opponents’, secretly working for the same ‘Team Zion’, Jew World Order, in this film he wants to appear to want to ‘warn’ you about Trump, and sow seeds of doubt. Simply to produce chaos. To build ‘straw men’ of ‘pre-selected candidate democracy as if it is truly representative democracy, and thus destroy out belief in true democracy, and of ‘crony conspiracy oligarchic capitalism’, and thus destroy our faith in authentic ‘Adam Smith’, Conspiracy FREE, capitalism, and to manipulate economic systems via financing and the central banks, to produce what appears to be the Marx predicted ‘crises of capitalism’, as a straw man, when in fact these ‘crises’ are completely manufactured and have NOTHING to do with Adam Smith style authentic economics, and to carry out false flags to be
blamed on Islam and Arabs, to build up a ‘straw man’ terror threat, to be used to scare you into giving up your freedoms, and fighting the Jew World Order’s wars…

So keeping in mind that Michael Moore and Trump are on the same team, working to discredit democracy, capitalism, and Islam / Arabs, lets look at how Moore begins his film by gaining your ‘agreement’ with a Yes set that appears to be supporting your belief in Trump as the freedom fighting, opposing the Jew World Order. He appears to agree with Trump. So he gets your attention. Otherwise you’d just turn him off, if he just began by contradicting everything you felt and believed about Trump. He makes it sound like he understands you and Trump, and why you believe in Trump. But this is all to gain your confident, trust, attention, and ‘hook you’ so that he can then lead you down the garden path with his propaganda. It is like the old ‘bait and switch’, where a store advertised some desirable product you want, just to get you to run down to the shop, only to find that they have ‘run out of’ that product, but can offer you a great deal on an ‘alternative’, the actual product they always intended trying to get you to buy, but which you otherwise never would have come to the store to even look at.

If Moore had begun by challenging everything you believed about Trump, and being antagonistic to him, by ridiculing your ‘faith’ in Trump, you would have switched off. You would have resisted. You would not have watched his film, or if you did, you would have done so with a very negative, resistant, hostile attitude, looking for flaws in his argument to use against him, and you would have left his film feeling that your convictions / beliefs had been strengthened…you would be even more convinced that Trump was the candidate for you…and you’d never pay attention to anything Mr Moore had to say ever again. He’d have lost you as a potential audience. And the first rule of manipulation is to get your attention. And hold it long enough to work your ‘magic’, your ‘languaging’, your ‘Ab Ra Ca Dab Ra’, your ABraCadabra. Yes folks, abusing the power of language, of your old ABC.

Speak to the wall so the door may hear - Sufi saying.

**five-stage paradigm of the dynamics of trance induction and suggestion**

1. Fixation of Attention via Utilizing the patient’s beliefs and behavior for focusing attention on inner realities.

2. Depotentiating Habitual Frameworks and Belief Systems via Distraction, shock, surprise, doubt, confusion, dissociation, or any other process that interrupts the patient’s habitual frameworks.

3. Unconscious Search via Implications, questions, puns, and other indirect forms of hypnotic suggestion.
4. Unconscious Process via Activation of personal associations and mental mechanisms by all the above.

5. Hypnotic Response via An expression of behavioral potentials that are experienced as taking place autonomously.

Establish a sound rapport - that is, a positive feeling of understanding and mutual regard, the means by which therapist and patient secure each others’ attention. Both develop a yes set, or acceptance of each other. The patient is learning to observe and achieve a state of response attentiveness to their own responses, including to the therapists suggestions.

Patients have problems because of learned limitations. They are caught in mental sets, frames of reference, and belief systems that do not permit them to explore and utilize their own abilities to best advantage. Human beings are still in the process of learning to use their potentials.

Therapeutic trance is a period during which patients are able to break out of their limited frameworks and belief systems so they can experience other patterns of functioning within themselves. These other patterns are usually response potentials that have been learned from previous life experience but, for one reason or another, remain unavailable to the patient. We help them re-discover their competencies, talents, resourcefulness, positive experiences of success they have forgotten / repressed / don’t attend to. In this process new frames of reference and belief systems are created.

In the preparatory phase of hypnotherapeutic work mental frameworks are facilitated in a manner that will enable the patient to respond to the suggestions that will be received later during trance. We help patients create an optimal attitude and belief system for therapeutic responses. Suggestions made during trance frequently function like keys turning the tumblers of a patient's associative processes within the locks of certain mental frameworks that have already been established.

Therapeutic Trance

Therapeutic trance is a period during which the limitations of one's usual frames of reference and beliefs are temporarily altered so one can be receptive to other patterns of association and modes of mental functioning that are conducive to problem solving. We view the dynamics of trance induction and utilization as a very personal experience wherein the therapist helps patients to find their own individual ways. Trance induction is not a standardized process that can be applied in the same way to everyone. There is no method or technique that always works with everyone or even with the same person on different occasions. Because of this we speak of approaches to trance experience. We thereby
emphasize that we have many means of facilitating, guiding, or teaching how one might be led to experience the state of receptivity that we call therapeutic trance. However, we have no universal method for effecting the same uniform trance state in everyone. Most people with problems can be guided to experience their own unique variety of therapeutic trance when they understand that it may be useful. The art of the hypnotherapist is in helping patients reach an understanding that will help them give up some of the limitations of their common everyday world view so that they can achieve a state of receptivity to the new and creative within themselves.

**Fixation of Attention**

The fixation of attention has been the classical approach for initiating therapeutic trance, or hypnosis. The therapist would ask the patient to gaze at a spot or candle flame, a bright light, a revolving mirror, the therapist's eyes, gestures, or whatever. As experience accumulated it became evident that the point of fixation could be anything that held the patient's attention. Further, the point of fixation need not be external; it is even more effective to focus attention on the patient's own body and inner experience. Thus approaches such as hand levitation and body relaxation were developed. Encouraging the patient to focus on sensations or internal imagery led attention inward even more effectively.

An interesting story or a fascinating fact or fantasy can fixate attention just as effectively as a formal induction. Anything that fascinates and holds or absorbs a person's attention could be described as hypnotic. We have the concept of the common everyday trance for those periods in everyday life when we are so absorbed or preoccupied with one matter or another that we momentarily lose track of our outer environment.

The most effective means of focusing and fixing attention in clinical practice is to recognize and acknowledge the patient's current experience. When the therapist correctly labels the patient's ongoing hereand-now experience, the patient is usually immediately grateful and open to whatever else the therapist may have to say. Acknowledging the patient's current reality thus opens a yes set for whatever suggestions the therapist may wish to introduce. This is the basis of the utilization approach to trance induction, wherein therapists gain their patients' attention by focusing on their current behavior and experiences.

**Depotentiating Habitual Frameworks and Belief Systems**

In our view one of the most useful psychological effects of fixating attention is that it tends to depotentiate patients' habitual mental sets and common everyday frames of reference. Their belief systems are more or less interrupted and suspended for a moment or two. Consciousness has been distracted. During that momentary suspension latent patterns of association and sensory-perceptual
experience have an opportunity to assert themselves in a manner that can initiate the altered state of consciousness that has been described as trance or hypnosis.

There are many means of depotentiating habitual frames of reference. Any experience of shock or surprise momentarily fixates attention and interrupts the previous pattern of association. Any experience of the unrealistic, the unusual, or the fantastic provides an opportunity for altered modes of apprehension. The authors have described how confusion, doubt, dissociation, and disequilibrium are all means of depotentiating patients' learned limitations so that they may become open and available for new means of experiencing and learning, which are the essence of therapeutic trance.

A creative moment occurs when a habitual pattern of association is interrupted; there may be a spontaneous lapse or relaxation of one's habitual associative process; there may be a psychic shock, an overwhelming sensory or emotional experience; a psychedelic drug, a toxic condition or sensory deprivation may serve as the catalyst; yoga, Zen, spiritual and meditative exercises may likewise interrupt our habitual associations and introduce a momentary void in awareness. In that fraction of a second when the habitual contents of awareness are knocked out there is a chance for pure awareness, the pure light of the void (Evans-Wentz, 1960) to shine through. This fraction of a second may be experienced as a mystic state, satori, a peak experience or an altered state of consciousness.

MHR BARDOT … the uncarved block is left uncarved…can express the nothing from which all-things emerge…lets reality speak to us…allowing it the silence to be heard…like Moses parting the dead sea…which is probably a metaphor for exactly this process…stopping the flow…just for a moment…long enough to allow the mind to 'pass over' 'to the other side'…the discovery, insight, eureka moment…escape from history, and slavery, the slavery of definitions, past conditioning, limiting beliefs…FAITH….and freedom…

Erickson (1948) has also described hypnotic trance itself as a special psychological state which effects a similar break in the patient's conscious and habitual associations so that creative learning can take place.

In everyday life one is continually confronted with difficult and puzzling situations that mildly shock and interrupt one's usual way of thinking. Ideally these problem situations will initiate a creative moment of reflection that may provide an opportunity for something new to emerge. Psychological problems develop when people do not permit the naturally changing circumstances of life to interrupt their old and no longer useful patterns of association and experience so that new solutions and attitudes may emerge.

Unconscious Search and Unconscious Process
In everyday life there are many approaches to fixing attention, depotentiating habitual associations, and thereby initiating an unconscious search for a new experience or solution to a problem. In a difficult situation, for example, one may make a joke or use a pun to interrupt and reorganize the situation from a different point of view. One may use allusions or implications to intrude another way of understanding the same situation. Like metaphor and analogy (Jaynes, 1976) these are all means of momentarily arresting attention and requesting a search - essentially a search on an unconscious level - to come up with a new association or frame of reference. These are all opportunities for creative moments in everyday life wherein a necessary reorganization of one's experience takes place.

An indirect suggestion initiates an unconscious search and facilitates unconscious processes within patients so that they are usually somewhat surprised by their own responses. The indirect forms of suggestion help patients bypass their learned limitations so they are able to accomplish a lot more than they are usually able to. The indirect forms of suggestion are facilitators of mental associations and unconscious processes.

The Hypnotic Response

The hypnotic response is the natural outcome of the unconscious search and processes initiated by the therapist. Because it is mediated primarily by unconscious processes within the patient, the hypnotic response appears to occur automatically or autonomously; it appears to take place all by itself in a manner that may seem alien or dissociated from the person's usual mode of responding on a voluntary level. Most patients typically experience a mild sense of pleasant surprise when they find themselves responding in this automatic and involuntary manner. That sense of surprise, in fact, can generally be taken as an indication of the genuinely autonomous nature of their response.

Hypnotic responses need not be initiated by the therapist, however. Most of the classical hypnotic phenomena, in fact, were discovered quite by accident as natural manifestations of human behavior that occurred spontaneously in trance without any suggestion whatsoever. Classical hypnotic phenomena such as catalepsy, anesthesia, amnesia, hallucinations, age regression, and time distortion are all spontaneous trance phenomena that were a source of amazement and bewilderment to early investigators. It was when they later attempted to induce trance and study trance phenomena systematically that these investigators found that they could suggest the various hypnotic phenomena. Once they found it possible to do this, they began to use suggestibility itself as a criterion of the validity and depth of trance experience.

When the next step was taken to utilize trance experience as a form of therapy, hypnotic suggestibility was emphasized even more as the essential factor for successful work. An unfortunate side effect of this emphasis on suggestibility
was in the purported power of hypnotists to control behavior with suggestion. By this time our conception of hypnotic phenomena had moved very far indeed from their original discovery as natural and spontaneous manifestations of the mind. Hypnosis acquired the connotations of manipulation and control. The exploitation of naturally occurring trance phenomena as a demonstration of power, prestige, influence, and control (as it has been used in stage hypnosis) was a most unfortunate turn in the history of hypnosis.

While a trance state is induced and maintained by suggestion, and hypnotic manifestations can be elicited by suggestion, the hypnotized person remains the same person, their altered behavior derives from the life experience of the patient and not from the therapist. The induction and maintenance of a trance serve to provide a special psychological state in which the patient can reassociate and reorganize his inner psychological complexities and utilize his own capacities in a manner concordant with his own experiential life, to release the 1000 flowers of the soul i.e their massive potential, once freed from limiting beliefs.

The seemingly miraculous power of effecting therapeutic changes in the patient, results from an inner resynthesis of the patient's behavior achieved by the patient themself, not from any 'magical power' on the part of the therapist.

Freud gave up on hypnosis as he was using direct suggestion, the results of which are always only a temporary relief from the symptoms. It is simply a response to the suggestion and does not entail that reassociation and reorganization of ideas, understandings and memories so essential for an actual cure. It is this experience of reassociating and reorganizing his own experiential life that eventuates in an actual cure.

For example, anesthesia of the hand may be suggested directly and a seemingly adequate response may be elicited. However, if the patient has not spontaneously interpreted the command to include a realization of the need for inner reorganization, that anesthesia will fail to meet clinical tests and will be a pseudo-anesthesia.

An effective anesthesia is better induced, for example, by initiating a train of mental activity within the patient himself by suggesting that he recall the feeling of numbness experienced after a local anesthetic, or after a leg or arm went to sleep, and then suggesting that he can now experience a similar feeling in his hand. By such an indirect suggestion the patient is enabled to go through those difficult inner processes of disorganizing, reorganizing, reassociating and projecting inner real experience to meet the requirements of the suggestion. Thus, the induced anesthesia becomes a part of his experiential life, instead of a simple, superficial response. The chronic alcoholic can be induced by direct suggestion to correct his habits temporarily, but not until he goes through the inner process of reassociating and reorganizing his experiential life can effective results occur.
The therapist merely stimulates the patient into activity, often not knowing what that activity may be, and then he guides the patient and exercises clinical judgment in determining the amount of work to be done to achieve the desired results. How to guide and to judge constitute the therapist's problem while the patient's task is that of learning through his own efforts to understand his experiential life in a new way. Such reeducation is, of course, necessarily in terms of the patient's life experiences, his understandings, memories, attitudes and ideas.

Therapeutic trance helps people sidestep their own learned limitations so that they can more fully explore and utilize their potentials. The hypnotherapist makes many approaches to altered states of functioning available to the patient. Most patients really cannot direct themselves consciously in trance experience because such direction can come only from their previously learned habits of functioning which are inhibiting the full utilization of their potentials. Patients must therefore learn to allow their own unconscious response potentials to become manifest during trance. The therapist, too, must depend upon the patient's unconscious as a source of creativity for problem-solving. The therapist helps the patient find access to this creativity via that altered state we call therapeutic trance. Therapeutic trance can thus be understood as a free period of psychological exploration wherein therapist and patient cooperate in the search for those hypnotic responses that will lead to therapeutic change.

Consciousness does not always recognize its own altered states. How often do we not recognize that we are actually dreaming? It is usually only after the fact that we recognize we were in a state of reverie or daydreaming. The inexperienced user of alcohol and psychedelic drugs must also learn to recognize and then go with the altered state in order to enhance and fully experience its effects. Since therapeutic trance is actually only a variation of the common everyday trance or reverie that everyone is familiar with but does not necessarily recognize as an altered state, some patients will not believe they have been affected in any way. For these patients, in particular, it is important to ratify trance as an altered state. Without this proof the patient's negative attitudes and beliefs can frequently undo the value of the hypnotic suggestion and abort the therapeutic process that has been initiated.

Trance experience is highly individualized, patients will manifest these indicators in varying combinations as well as in different degrees.

**COMMON INDICATORS OF TRANCE EXPERIENCE**

- Autonomous Ideation and Inner Respiration
- Experience Swallowing
- Startle reflex
- Balanced Tonicity (Catalepsy)
- Body Immobility
- Objective and Impersonal Ideation
- Body Reorientation
- After Trance Psychosomatic Responses
- Changed Voice Quality
- Pupillary Changes
- Comfort, Relaxation
Spontaneous development of hypnotic phenomena such as age regression, anesthesia, catalepsy, and so on as more genuine indicators of trance than when these same phenomena are suggested. When they are directly suggested, we run into the difficulties imposed by the patient's conscious attitudes and belief system. When they come about spontaneously, they are the natural result of the dissociation or reorganization of the patient's usual frames of reference and general reality orientation which is characteristic of trance.

Regression is not a fundamental characteristic of trance, although it is often present as an epiphenomenon of the early stage of trance development, when patients are learning to give up their usual frames of reference and modes of functioning. In this first stage of learning to experience an altered state, many uncontrolled things happen, including spontaneous age regression, paresthesias, anesthesias, illusions of body distortion, psychosomatic responses, time distortion, and so on. Once patients learn to stabilize these unwanted side reactions, they can then allow their unconscious minds to function freely in interacting with the therapist's suggestions without some of the limitations of their usual frames of reference.

Hypnotherapeutic work does not require a dramatic experience of classical hypnotic phenomena, it is even more important that the therapist learn to recognize the minimal manifestations of trance as alterations in a patient's sensory-perceptual, emotional, and cognitive functioning. A valuable means of evaluating these changes is in the use of ideomotor and ideosensory signaling (Erickson, 1961; Cheek and Le Cron, 1968). An experience of trance as an altered state can be ratified by requesting any one of a variety of ideomotor responses as follows:

If you have experienced some moments of trance in our work today, your right hand (or one of your fingers) can lift all by itself.

If you have been in trance today without even realizing it, your head will nod yes (or your eyes will close) all by itself.

The existence of a therapeutic change can be signaled in a similar manner.
If your unconscious no longer needs to have you experience (whatever symptom), your head will nod.

Your unconscious can review the reasons for that problem, and when it has given your conscious mind its source in a manner that is comfortable for you to discuss, your right index finger can lift all by itself.

Some subjects experience ideosensory responses more easily than other subjects. They may thus experience a feeling of lightness, heaviness, coolness, or prickliness in the designated part of the body.

In requesting such responses we are presumably allowing the patient's unconscious to respond in a manner that is experienced as involuntary by the patient. This involuntary or autonomous aspect of the movement or feeling is an indication that it comes from a response system that is somewhat dissociated from the patient's habitual pattern of voluntary or intentional response. The patient and therapist thus have indication that something has happened independently of the patient's conscious will. That something may be trance or whatever therapeutic response was desired.

An uncritical view of ideomotor and ideosensory signaling takes such responses to be the true voice of the unconscious. At this stage of our understanding we prefer to view them as only another response system that must be checked and cross-validated just as any other verbal or nonverbal response system. We prefer to evoke ideomotor responses in such a manner that the patient's conscious mind may not witness them (for example, having eyes closed or averted when a finger or hand signal is given). It is very difficult, however, to establish that the conscious mind is unaware of what response is given and that the response is in fact given independently of conscious intention. Some patients feel that the ideomotor or ideosensory response is entirely on an involuntary level. Others feel they must help it or at least know ahead of time what it is to be.

A second major use of ideomotor and ideosensory signaling is to help patients restructure their belief system. Doubts about therapeutic change may persist even after an extended period of exploring and dealing with a problem in trance. These doubts can often be relieved when the patient believes in ideomotor or ideosensory responses as an independent index of the validity of therapeutic work. The therapist may proceed, for example, with suggestions as follows:

If your unconscious acknowledges that a process of therapeutic change has been initiated, your head can nod.

When you know you need no longer be bothered by that problem, your index finger can lift, or get warm [or whatever].
In such usage there is value, of course, in having the patient's conscious mind recognize the positive response. The more autonomous or involuntary the ideomotor or ideosensory response, the more convincing it is to the patient.

At the present time we have no way of distinguishing when an ideomotor or ideosensory response is (1) a reliable and valid index of something happening in the unconscious (out of the patient's immediate range of awareness), or (2) simply a means of restructuring a conscious belief system.

Therapeutic trance is a means by which we help patients learn to use their mental skills and potentials to achieve their own therapeutic goals. Note how Erickson would ‘cure’ some symptom, or provide relief, but then Erickson would pursue deeper structural changes in the person, i.e. the symptom brings them to therapy, where they have the chance to resolve much deeper, systemic issues, of which the symptom was an expression, i.e. symptomatic of.

Rapport

Response Attentiveness

Assessing Abilities to Be Utilized

Facilitating Therapeutic Frames of Reference

Creating Expectancy

Therapeutic trance is a period during which the limitations of one's habitual frames of reference are temporarily altered so that one can be receptive to more adequate modes of functioning. While the experience of trance is highly variable, the overall dynamics of therapeutic trance and suggestion could be outlined as a five-stage process: (1) Fixation of attention; (2) depotentiation of habitual frameworks; (3) unconscious search; (4) unconscious processes; (5) therapeutic response.

The utilization approach and the indirect forms of suggestion are the two major means of facilitating these overall dynamics of therapeutic trance and suggestion. The utilization approach emphasizes the continual involvement of each patient's unique repertory of abilities and potentials, while the indirect forms of suggestion are the means by which the therapist facilitates these involvements.

We believe that the induction and maintenance of therapeutic trance provides a special psychological state in which patients can reassociate and reorganize their inner experience so that therapy results from an inner resynthesis of their own behavior.
Ratifying the process of therapeutic change is an integral part of our approach to hypnotherapy. This frequently involves a special effort to help patients recognize and validate their altered state. The therapist must develop special skills in learning to recognize minimal manifestations of altered functioning in sensory-perceptual, emotional, and cognitive processes. Ideomotor and ideosensory signaling are of special use as an index of therapeutic change as well as a means of facilitating an alteration of the patient's belief system.

New observational skills are the first stage in the training of the hypnotherapist. One needs to learn to recognize the momentary variations in another's mentation. These skills can be developed by training oneself to carefully observe the mental states of people in everyday life as well as in the consulting room. There are at least four levels, ranging from the most obvious to the more subtle.

1. Role relations

2. Frames of reference

3. Common everyday trance behaviors

4. Response attentiveness

1. Role relations: Carefully note the degree to which individuals in all walks of life are caught within roles, and the degrees of flexibility they have in breaking out of their roles to relate to you as a unique person. For example, to what degree are the clerks at the supermarket identified with their roles? Notice the nuances of voice and body posture that indicate their role behavior. Does their tone and manner imply that they think of themselves as an authority to manipulate you, or are they seeking to find out something about you and what you really need? Explore the same questions with police, officials of all sorts, nurses, bus drivers, teachers, etc.

Frames of reference: To the above study of role relations add an inquiry into the dominant frames of reference that are guiding your subject's behavior. Is the bus or taxicab driver more dominated by a safety frame of reference? Which of the store clerks is more concerned with securing his present job and which is obviously bucking for a promotion? Is the doctor more obviously operating within a financial or therapeutic frame of reference?

Common everyday trance behavior: Table 1 can be a guide as to what to look for in evaluating a person's everyday trance behavior. Even in ordinary conversation one can take careful note of those momentary pauses when the other person is quietly looking off into the distance or staring at something, as he or she apparently reflects inward. One can ignore and actually ruin these precious moments when the other is engaged in inner search and unconscious processes by
talking too much and thereby distracting the person. How much better simply to remain quiet oneself and carefully observe the individual manifestations of the other's everyday trance behavior. Notice especially whether the person's eye blink slows down or stops altogether. Do the eyes actually close for a moment? Does the body not remain perfectly immobile, perhaps even with limbs apparently cataleptic, fixed in mid-gesture?

Watching for these moments and pauses is especially important in psychotherapy. The authors will themselves sometimes freeze in mid-sentence when they observe the patient going off into such inward focus. We feel what we are saying is probably less important than allowing the patient to have that inward moment. Sometimes we can facilitate the inner search by simply saying things such as:

That's right, continue just as you are.

Follow that now.

Interesting isn't it?

Perhaps you can tell me some of that later.

After a while patients become accustomed to this unusual tolerance and reinforcement of their inner moments; the pauses grow longer and become what we would call therapeutic trance. The patients then experience increasing relaxation and comfort and may prefer to respond with ideomotor signals as they give increasing recognition to their trance state.

**Response Attentiveness:** This is the most interesting and useful of the trance indicators. The junior author can recall that lucky day when a series of three patients seen individually on successive hours just happened to manifest a similar wide-eyed look of expectancy, staring fixedly into his eyes. They also had a similar funny little smile (or giggle) of wistfulness and mild confusion. That was it! Suddenly he recognized what the senior author had been trying to teach him for the past five years: Response attentiveness! The patients may not have realized themselves just how much they were looking to the junior author for direction at that moment. That was the moment to introduce a therapeutic suggestion or frame of reference! That was the moment to introduce trance either directly or indirectly! The junior author can recall the same slight feeling of discomfort with each patient at that moment. The patient's naked look of expectancy bespoke a kind of openness and vulnerability that is surprising and a bit disconcerting when it is suddenly encountered. In everyday situations we tend to look away and distract ourselves from such delicate moments. At most we allow ourselves to enjoy them briefly with children or during loving encounters. In therapy such creative moments are the precious openers of the yes set and
positive transference. Hypnotherapists allow themselves to be open to these moments and perhaps to be equally vulnerable as they offer some tentative therapeutic suggestions. More detailed exercises on the recognition and utilization of response attentiveness will be presented at the end of Chapter Three.

**Direct and Indirect Suggestion**

A direct suggestion makes an appeal to the conscious mind and succeeds in initiating behavior when we are in agreement with the suggestion and have the capacity actually to carry it out in a voluntary manner.

Many famous people have described how their conscious search for a solution, idea, or memory ends up being completed by an unconscious process after they have ‘given up’, consciously, and began working on other problems, or doing something entirely unconnected to the problem they were working on a.k.a ‘eureka moments’ … often after months or years…like suddenly ‘remembering’ that name that was ‘on the tip of your tongue’ but which you could not pull into conscious recollection.

Experimental data indicates that an unconscious search (for the solution, memory, idea, etc consciously sought, then abandoned) continues at the rate of approximately thirty items per second even after the conscious mind has gone on to other matters.

If consciousness is unable to carry out a direct suggestion, e.g we explain how irrational it is to fear flying more than showering, but the ‘logic’ doesn’t change the symptoms, a therapeutic effort to initiate an unconscious search for a solution by indirect suggestion can be initiated.

Where the person acts on the suggestion, their behavior a subjective response synthesized within the patient that utilizes the patient’s unique repertory of life experiences and learning. It is not what the therapist says but what the patient does with what is said that produces the therapeutic benefits. The words of the therapist evoke a complex series of complex UNCONSCIOUS internal responses within the patient. They become aware of the product of these subconscious processes when their symptoms improve / disappear etc.

Traditional forms of direct suggestion involved repeating the same suggestion over and over, and were directed to programming or deeply imprinting the mind with one fixed idea, prove useful in advertising, propaganda, COUÉISM?

Whereas Erickson’s INTERSPERSAL approach avoids repetition of terms, instead repeating the IDEA in different forms, many times in a single sentence, to
trigger associations in the patient i.e that their own subconscious will generate / connect / relate.

For Example, by interspersing variables of the word ‘free’, such as ‘Feel free to freely express yourself’, can trigger associations that allow the person to overcome inhibitions, suppressed and repressed desires, etc…so that they feel free to express things they really want to, but felt unable to… interspersing words and concepts suggestive of comfort can produce pain relief is achieved without the formal induction of trance…

**Indirect Associative Focusing**

The easiest way to help patients talk about their mothers is to talk about your own mother or mothers in general. A natural indirect associative process is thereby set in motion within patients that brings up apparently spontaneous associations about their mothers. Since we do not directly ask about their mother, the usual limitations of conscious sets and habitual mental frameworks (including psychological defenses) that such a direct question might evoke are bypassed. NLP uses the term transderivational process, to describe this i.e the person identifies with the character in the story as their own mother, their own relationship etc.

Erickson would frequently intersperse remarks or tell a number of stories and anecdotes in seemingly casual conversation. Even when his stories appear unrelated, however, they all have a common denominator or common focused association which he hypothesizes to be a relevant aspect of the patient's problem. Patients may wonder why the therapist is making such interesting but apparently nonrelevant conversation during the therapy hour. If the common, focused association is in fact a relevant aspect of their problem, however, patients will frequently find themselves talking about it in a surprisingly revelatory manner. If the therapist guessed wrong, nothing is lost. The patient will simply not talk about the focused association because there is no particular recognition and contribution within the patient's own associative processes to raise it to the verbal level.

This avoids therapists projecting / ascribing / imposing their own definitions, assumptions, beliefs about what the person’s problem/s is/are. They can speculate, and test out these notions on the client, without any fear of transferal occurring. If the focused association is of value to patients, their own unconscious processes of search and evaluation will permit them to recognize it as an aspect of their problem and utilize it in their own way to find their own solutions.

**Ideodynamic responsiveness** is the view that ideas can be transformed into movements, sensations, perceptions, emotions, and so on, independent of conscious intentionality.
When Erickson addressed professional groups about hypnotic phenomena he frequently interspersed interesting case histories and told stories about hand levitation or hallucinatory sensations. These vivid illustrations initiated a natural process of ideomotor and ideosensory responsiveness within the listeners without their being aware of it. When he then asked for volunteers from the audience for a demonstration of hypnotic behavior, they were primed for responsiveness by ideodynamic processes that were already taking place within them in an involuntary manner on an unconscious level.

When confronted with a resistant subject we can surround him with one or more good hypnotic subjects to whom we direct our hypnotic suggestions. A process of indirect ideodynamic responsiveness takes place automatically within the resistant subject as he listens to the suggestions and observes the responses of others. He is soon surprised at how the hypnotic atmosphere effects him so that he becomes much more responsive than before.

In the context of a number of anecdotes and stories about how others have learned to experience phantom pleasure instead of pain, interspersed indirect ideodynamic suggestions such as the above begin automatically to initiate unconscious searches and processes that will lead to the amelioration of phantom pain even without the formal induction of trance.

The basic unit of ideodynamic focusing is the truism: a simple statement of fact about behavior that the patient has experienced so often that it cannot be denied. In most of our case illustrations it will be found that the senior author frequently talks about certain psychophysiological processes or mental mechanisms as if he were simply describing objective facts to the patient. Actually these verbal descriptions can function as indirect suggestions when they trip off ideodynamic responses from associations and learned patterns that already exist within patients as a repository of their life experience.

When attention is fixed and focused in trance so that some of the limitations of the patient's habitual mental sets are depotentiated, however, the following truisms may actually trip off a literal and concrete experience of the suggested behavior, which is printed in italics.

**Ideomotor Processes**

Most people can experience *one hand as being lighter than another*.

Everyone has had the experience of *nodding their head yes or shaking it no even without realizing it*.

When we are tired, *our eyes begin to blink slowly and sometimes close without our quite realizing it*.
Sometimes as we relax or go to sleep, a muscle will twitch so that our arm or leg makes a slight involuntary movement.

**Ideosensory Processes**

You already know how to experience pleasant sensations like the warmth of the sun on your skin.

Most people enjoy the refreshing coolness of a light breeze.

Some people can imagine their favorite food so well they can actually taste it.

The salt and smell of a light ocean breeze is pleasant to most people.

**Ideoaffective Processes**

Some people blush easily when they recognize certain feelings about themselves.

It’s easy to feel anger and resentment when we are made to feel foolish. We usually frown when we have memories that are all too painful to remember.

Most of us try to avoid thoughts and memories that bring tears, yet they frequently deal with the most important things.

We have all enjoyed noticing someone smile at a private thought and we frequently find ourselves smiling at their smile.

In formulating such ideoaffective suggestions it is helpful to include a behavioral marker (blush, frown, tears, smile) whenever possible, to provide some possible feedback to the therapist about what the patient is receiving and acting upon.

**Ideocognitive Processes**

We know that when you are asleep your unconscious can dream. You can easily forget that dream when you awaken.

You can sometimes remember one important part of that dream that interests you.

We can sometimes know a name and have it on the tip of our tongue and yet not be able to say the name.

**Truisms Utilizing Time**

In hypnotherapeutic work truisms utilizing time are very important because there is frequently a time lag in the execution of hypnotic responses. The stages of
unconscious search and processes leading to hypnotic responses require varying lengths of time in different patients. It is usually best to permit the patient's own unconscious to determine the appropriate amount of time required for any response.

Sooner or later your hand is going to lift (eyes close, or whatever).

Your headache (or whatever) can now leave as soon as your system is ready for it to leave.

Your symptom can now disappear as soon as your unconscious knows you can handle (such and such) problem in a more constructive manner.

**Not Knowing, Not Doing**

Valid hypnotic experience involves the utilization of unconscious processes. A basic aspect of therapeutic trance is to arrange circumstances so that constructive mental processes are experienced in taking place by themselves without the patient making any effort to drive or direct them. When one is relaxed, as is typical of most trance experiences, the parasympathetic system physiologically predisposes one not to do rather than to make any active effort of doing. Similarly when we are relaxed and the unconscious takes over, we usually feel comfortable and do not know how the unconscious carries out its activities. Not knowing and not doing are synonymous with the unconscious or autonomous responsiveness that is the essence of trance experience. An attitude of not knowing and not doing is therefore of great value in facilitating hypnotic responsiveness. This is particularly true during the initial stages of trance induction, where the following suggestions may be appropriate.

You don't have to talk or move or make any sort of effort. You don't even have to hold your eyes open.

You don't have to bother trying to listen to me because your unconscious can do that and respond all by itself.

People can sleep and not know they are asleep.

They can dream and not remember that dream.

You don't know just when those eyelids will close all by themselves.

You may not know just which hand will lift first.
You don't really know just how your unconscious will help you resolve that problem. But your conscious mind can be receptive to the answer when it does come.

Your conscious mind surely has many questions, but it does not really know just when the unconscious will let you give up that undesirable habit. You don't know if it will be sooner or later. You don't know if it will be all at once or slowly, by degrees. Yet you can learn to respect your own natural way of doing things.

**Open-Ended Suggestions**

Human predispositions and potentialities are too complex to assume that anyone could possibly know ahead of time just what is the most creative approach to the new that continually overtakes us. One view of maladjustment is that we attempt to impose old views and solutions into changed life circumstances where they are no longer appropriate.

The open-ended suggestion permits self-determination. When patients are in trance, the open-ended suggestion permits the unconscious to select the most appropriate means of carrying out a therapeutic response.

We all have potentials we are unaware of, and we usually don't know how they will be expressed.

Your mind can review more feelings, memories, and thoughts related to that problem, but you don't know yet which will be most useful for solving the problem you are coping with.

You can find yourself ranging into the past, the present, or the future as your unconscious selects the most appropriate means of dealing with that.

He doesn't know what he is learning, but he is learning. And it isn't right for me to tell him, you learn this or you learn that! Let him learn whatever he wishes, in whatever order he wishes.

Open-ended suggestions carry a strong implication that a therapeutic response will be forthcoming.

**Covering All Possibilities of a Class of Responses**

Vagueness, suggestions covering all possibilities of a class of responses, will ensure you get some response that can validate the process, and start a cycle of self-fulfilling expectations re: efficacy of trance induction and power of unconscious to realise desired outcomes.
Soon you will find a finger or a thumb moving a bit, perhaps by itself. It can move up or down, to the side or press down. It can be slow or quick or perhaps not move at all. The really important thing is to sense fully whatever feelings develop.

All possibilities of finger movement have been covered, including the possibility of not moving at all. The suggestion is thus fail-safe. The patient is successful no matter what response develops.

The same approach can be used when the patient has experienced therapeutic trance and is ready to deal with a problem.

Soon you will find the weight problem being dealt with by eating more or less of the right foods you can enjoy. You may first gain weight or lose it or remain the same for a while as you learn the really important things about yourself.

This gives the unconscious the opportunity to determine which of the response possibilities (not in italics) will be expressed. It suggests / evokes a deeper search, in italics, to find the source of the overeating symptom.

Research suggests that the human brain, when questioned, continues an exhaustive search throughout its entire memory system on an unconscious level even after it has found an answer that is apparently satisfying on a conscious level.

It is traditional to ‘sleep on problem’, and wake up with fresh insights or solutions.

The Socratic method of education, asking a student a series of questions intended to direct their thoughts to a particular conclusion, is a classical illustration of using questions as initiators of mental processes.

Which question you ask can determine the answer you get, by getting your interlocutor to focus on something in particular, to the exclusion of other things, thus biasing their attention and their answer in a particular direction. If you ask for what is similar between X and Y, they will ‘search for’ similarities. Ask them for differences between X and Y, and they will focus on differences.

Apparently different responses / symptoms / behaviors can share common denominators, etiologies etc.

MHR By asking a question they normally do NOT ask themselves, or no-one else asks them, we direct / focus their attention to things always there, but which they have glossed over. They suddenly ‘see’ things always there. But the way in
which they thought, placed it outside of their awareness / consciousness. ‘A-ha’, surprise moments, eureka moments…simply by reframing the context…

Questions in Trance Induction

Questions act as indirect forms of suggestion when they cannot be answered by the conscious mind. They activate unconscious processes and initiate autonomous responses, the essence of trance behavior. A series of questions are commonly used to initiate and deepen trance eye fixation or hand levitation.

Questions go from ones that could be consciously answered, and progress until the final questions in a series can only be answered unconsciously or autonomously. The questions MUST incorporate and utilize the patient's ongoing behavior during the sessions.

The aim is to move towards the situation where they are focused intensely within themselves wondering about how they will respond, rather than verbally answering. This implies that a dissociation is taking place between their conscious thinking (with its sense of control) and their apparently autonomous responses to the therapist's questions.

MHR this validates the idea of hypnotism i.e that the person can respond to suggestions without their conscious involvement. This transfers power of suggestion to the therapist, and self-fulfilling placebo effects etc, and establishes the belief / idea that the therapist can initiate unconscious problem solving processes that will eliminate the symptoms / solve the underlying problems etc…

Eye Fixation

1. Would you like to find a spot you can look at comfortably? 2. As you continue looking at that spot for a while, do your eyelids want to blink? 3. Will those lids begin to blink together or separately? 4. Slowly or quickly? 5. Will they close all at once or flutter all by themselves first? 6. Will those eyes close more and more as you get more and more comfortable? 7. That's fine. Can those eyes now remain closed as your comfort deepens like when you go to sleep? 8. Can that comfort continue more and more so that you'd rather not even try to open your eyes? 9. Or would you rather try and find you cannot? 10. And how soon will you forget about them altogether because your unconscious wants to dream? (Therapist can observe slight eyeball movements as the patient’s closed eyes follow changes on the inner dream scene.)

This series begins with a question that requires conscious choice and volition on the part of the patient and ends with a question that can only be carried out by unconscious processes. An important feature of this approach is that it is fail-safe
in the sense that any failure to respond can be accepted as a valid and meaningful response to a question. Another important feature is that each question suggests an observable response that gives the therapist important information about how well the patient is following suggestions. These observable responses are also associated with important internal aspects of trance experience and can be used as indicators of them.

If there is a failure to respond adequately, the therapist can go on with a few other questions at the same level until responsive behavior is again manifest, or the therapist can question patients about their inner experience to explore any unusual response patterns or difficulties they may have. It is not uncommon for some patients, for example, to open their eyes occasionally even after it is suggested that they will remain closed. This seems to be an automatic checking device that some patients use without even being aware of it. It does not interfere with therapeutic trance work. The question format thus gives each patient's own individuality an opportunity to respond in a therapeutically constructive manner. These features are also found in the handlevitation approach.

**Hand Levitation**

1. 1. Can you feel comfortable resting your hands gently on your thighs? [As therapist demonstrates] That's right, without letting them touch each other. 2. 2. Can you let those hands rest ever so lightly so that the fingertips just barely touch your thighs? 3. 3. That's right. As they rest ever so light, do you notice how they tend to lift up a bit all by themselves with each breath you take? 4. 4. Do they begin to lift even more lightly and easily by themselves as the rest of your body relaxes more and more? 5. 5. As that goes on, does one hand or the other or maybe both continue lifting even more? 6. 6. And does that hand stay up and continue lifting higher and higher, bit by bit, all by itself? Does the other hand want to catch up with it, or will the other hand relax in your lap? 7. 7. That's right. And does that hand continue lifting with these slight little jerking movements, or does the lifting get smoother and smoother as the hand continues upward toward your face? 8. 8. Does it move more quickly or slowly as it approaches your face with deepening comfort? Does it need to pause a bit before it finally touches your face so you'll know you are going into a trance? And it won't touch until your unconscious is really ready to let you go deeper, will it? 9. 9. And will your body automatically take a deeper breath when that hand touches your face as you really relax and experience yourself going deeper? 10. 10. That's right. And will you even bother to notice the deepening comfortable feeling when that hand slowly returns to your lap all by itself? And will your unconscious be in a dream by the time that hand comes to rest?

**Questions Facilitating Therapeutic Responsiveness**
Questions can be combined with not knowing and with open-ended suggestions.

And what will be the effective means of losing weight? Will it be because you simply forget to eat and have little patience with heavy meals because they prevent you from doing more interesting things? Will certain foods that put on weight no longer appeal to you for whatever reasons? Will you discover the enjoyment of new foods and new ways of preparing them and eating so that you'll be surprised that you did lose weight because you really didn't miss anything?

The last question in this series is an illustration of how compound questions can be built up with and and so to facilitate whatever tendency is most natural for the patient.

Ambiguity can depotentiate the patient's learned limitations so new possibilities may be experienced. Lawyers like to befuddle, confuse, and trick witnesses into agreeing with the lawyer etc, using ambiguity to suggest responses favorable to the lawyer’s argument. ‘Leading the witness’ is a common ‘objection’ made by opponents to judges, to have a line of questioning removed from the record and ‘not allowed’, the jury told to ‘ignore the previous comments’.

A compound suggestion is made up of two statements joined together with a grammatical conjunction or with a slight pause that places them in close association. The implication is that they are related, the one supporting the other.

Five classes of compound suggestion have been of particular use in hypnotherapy: (a) the yes set and reinforcement, (b) contingency, (c) apposition of opposites, (d) the negative, and (e) shock, surprise, and creative moments.

Other more complicated strategies include indirect suggestion such as implication, binds, and double binds.

Linguistic joining and separating expressions can be used to suggest an association, or a dissociation, in the listener's mind / consciousness / awareness.

While there is no deterministic means of manipulating mental processes and controlling behavior with indirect forms of suggestion, we can use languaging to explore and facilitate response potentials in our interlocutors.

The Yes Set and Reinforcement

MHR associate something clearly true with the suggestion you want to make, in a way that the suggestion seems a logical / necessary / easily accepted, corollary or conclusion or outcome of the truism / self-evidently true / correct / desirable first statement. Use words like ‘so’ and ‘therefore’, and ‘and’, as if the second follows naturally from the first. ‘We are young and on holiday, with no
responsibilities, and the weather is so beautiful, (so) lets have sex’. The ‘yes’ / desirableness/ agreeableness / mental ‘yes’ given in response to the first, gives MHR momentum to accepting the suggestion that follows. People want to retain the pleasant sensation of agreeableness, so are more likely to agree to the second, rather than if the suggestion itself was made alone.

Truisms are a means of opening a yes set to facilitate suggestion.

When the truism or positive and motivating association follows the suggestion, we have a means of reinforcing it.

**Contingent Suggestions and Associational Networks**

A useful form of compound statement occurs when we tie a suggestion to an ongoing or inevitable pattern of behavior. A hypnotic suggestion that may be difficult for a patient is easier when it is associated with behavior that is familiar. The hypnotic suggestion hitchhikes onto the natural and spontaneous responses that are well within the patient’s normal repertory. The contingent suggestion is italicized in the following examples.

With each breath you **take you can become aware of the natural rhythms of your body and feelings of comfort that develop**.

As you continue sitting **there, you will find yourself becoming more relaxed and comfortable**.

As your hand **lowers, you'll find yourself going comfortably back in time to the source of that problem**.

As you mentally review the source of that **problem your unconscious can develop some tentative ways of dealing with it**.

And when your conscious mind recognizes a plausible and worthwhile **solution, your finger can lift automatically**.

When you feel ready to talk about **it, you'll find yourself awakening feeling refreshed and alert, with an appreciation of the good work you've been able to do**.

**Apposition of Opposites**
There is always a competing impulse / desire / objective / goal / motive e.g. tension and relaxation, motivation and inhibition, conscious and unconscious, eros and logos, thesis and antithesis, in all we feel and do. The balance of these is the final outcome / decision / action / belief that is expressed. MHR. Any movement of one muscle group requires another muscle group to oppose it / resist it, e.g. muscles literally have to tighten and relax, to maintain our balance. Same goes with all our motives / desires.

As that fist gets tighter and tense, the rest of your body relaxes. As your right hand lifts, your left hand lowers.

As that arm feels lighter and lifts, your eyelids can feel heavier and lower until they are closed.

Similar suggestions can be formulated for virtually any of the opponent processes in the sensory, perceptual, affective, and cognitive realms.

As your forehead gets cooler, your hands can get warmer.

As your jaw becomes more and more numb and insensitive, notice how your left hand becomes more and more sensitive.

You can experience all your feelings about something that occurred at age X without being able to remember just what caused those feelings.

When you next open your eyes you will have an unusually clear memory of all that, but without the feelings you had then.

As you review that, you can now experience an appropriate balance of thinking and feeling about the whole thing.

Dissociation can be utilized to first help the patient very thoroughly experience both sides of an opponent system before they are brought together at a more adequate level of integration.

MHR Every belief is, at some level, opposed by a corresponding doubt…that is the nature of cybernetic feedback systems…science looks for doubt, faith avoids it…models and belief systems seek confirmation rather than contradiction, as this is more comforting…but if we can step out of the ‘system’ for a moment, the model, there is a chance of noticing / attending to / observing / seeing these contradictions…HUME showed how opposing emotions etc compete, and the stronger one takes the power / energy etc of the weaker…so we tend to go to extremes of either / or, love or hate, rather than put up with the discomfort of ambiguity…but ambiguity is the basis of confusion, and learning…we just need to break the habitual re-production of beliefs to allow a re-consideration…even re-
observation...to ALLOW our eyes to see, our ears to hear etc what is actually there, rather than what our models and maps tell us SHOULD be there...

Erickson was big on discharging the negativity or resistance (reactive inhibition) that builds up whenever a patient is following a series of suggestions. In everyday life we can recognize how people who are negative or resistant usually have a history of feeling they were imposed upon too much. Because of this they now want to have it their way! They resist being overdirected and very often do the opposite of what they believe others want them to do. This oppositional tendency, of course, is actually a healthy compensation for their early histories. Nature apparently wants us to be individuals, and many believe that the history of man's cultural and psychological development has been an effort to achieve ever-more-encompassing degrees of free, unfettered, and genuine self-expression.

After repeating some task (running a maze, solving certain problems of a similar nature) the subject, whether rat or man, appears less and less willing to repeat the task, and more easily accepts alternative pathways and other patterns of behavior. This favors the expression of new responses that can lead to new possibilities.

MHR evolution works on such 'hit and miss' 'binge and purge'...those species whose members express this are more 'creative' and 'adaptive'...and when the DNA plays the same game, spontaneously mutating, it is likely to produce more 'one in a billion' hits we know of as 'evolution' ... or if the cosmic rays 'damage' DNA in the same way, we get the same result, even if DNA itself is by nature totally stable.

Erickson believed that the simple expression of a negative by the therapist can often serve as a lightning rod to automatically discharge any minor inhibition and resistance that has been building up within the patient. Thus he will use such phrases as the following:

And you can, can you not? You can try, can't you? You can't stop it, can you? You will, won't you? You do, don't you? Why not let that happen?

Studies indicate that it is up to 30 percent more difficult to comprehend a negative than a positive. Thus the use of negatives can introduce confusion that tends to depotentiate a patient's limited conscious set so that inner work can be done.

The use of the negative is also related to another indirect form - not knowing and not doing. This use of the negative can be very usefully and casually introduced in contingent suggestions, such as the following that utilize the connective until.

You don't have to go into trance until you are really ready.
You won't take a really deep breath until that hand touches your face.

You won't really know just how comfortable you can be in trance until that arm slowly lowers all the way down to rest on your lap.

And you really don't have to do [therapeutic response] until [Inevitable behavior in patient's near future].

You won't do it until your unconscious is ready.

MHR thus you ‘agree’ with the resistance, not to do something, but then use the momentum of agreeableness, to ‘sleight of mouth’ the suggestion in at the same time, like sneaking in behind someone who has just entered a door with their key / password etc. You have them agree with ‘can’t’, ‘won’t’, ‘don’t’, and then they find themselves agreeing with ‘UNTIL’ something else that is bound to happen soon. So you satisfy both the resistance, and the naturally latent opposite, acceptance, also employing a conscious-unconscious double bind, so that accepting the first i.e rejecting / resisting, means you have unaccountably also accepted the second, that you in fact WILL do what you just agreed to resist / not do.

Shock, Surprise, and Creative Moments MHR ZEN

A shock surprises patients' habitual mental frameworks so their usual conscious sets are depotentiated and there is a momentary gap in the habitual re-production of patterned behaviors, responses, ‘beliefs’ i.e a BARDOT…where the person is HER NOW…and the unconscious is free to search for alternative beliefs / responses / habits / solutions to the ‘problems’ and ‘stimuli’ and ‘triggers’ currently anchored / fixed / idolized / dogmatized in the dysfunctional / limited responses / beliefs / habits of thought and behavior.

Shock and surprise can sometimes precipitate autonomic reactions that are normally not under voluntary control. At a delicate moment in a conversation one sometimes blushes in an uncontrolled manner when unconscious emotional processes are touched upon. If a person is not blushing during such an unguarded moment, one can frequently precipitate a blushing response by simply asking, Why are you blushing? This question - as an indirect form of suggestion administered during the delicate (potentially creative) moment when the listener's habitual mental frameworks are in nascent flux - evokes the suggested autonomic processes easily.

In everyday life a loud noise may startle us so that we freeze, momentarily inhibiting all body movement; we are thrown into a momentary trance as the unconscious races for a means of comprehending what is happening. The answer may flash that it was only a car backfiring, and we relax. But if in that precise
moment someone yells the suggestion, bomb! we almost certainly will flinch, look around in panic, or fall to the ground to protect ourselves. Daily life is filled with less dramatic examples of unexpected shocks that startle and surprise and perhaps lead to a double-take, where we have to look back or go over that again to comprehend what is really going on. We could theorize that foul language is actually a form of shock that has developed in most cultures to startle the listeners so they will be more available to what is being said and be more readily influenced by it.

If nothing satisfactory comes forth during such a BARDOT, the therapist can make suggestions as further stimuli during the ‘break’, to try to catalyze a therapeutic response.

**Momentary shock can be generated in therapeutic dialogue by interspersing shock words, taboo concepts, and emotions.** Words like sex, secrets, and whispering momentarily fix attention, and the listener is more receptive. A momentary pause after the shock allows an inner search to take place. It can be followed by reassurance or an appropriate suggestion.

Your *sex* life

[Pause]

just what you need to know and understand about it.

*Secretly* what you want

[Pause]

is most important to you.

You may get *divorced*

[Pause]

unless you both really learn to get what you need in the relationship.

In each of these examples the shock in italics initiates an inner search that can lead to the expression of an important response during the pause. The therapist learns to recognize and evaluate the nonverbal body reactions to such psychological shock. If there are indications that the patient has become preoccupied with the inner search, the therapist simply remains quiet until the patient comes forth with whatever material has been stimulated. If there are no indications of material coming from the patient, the therapist ends the pause with a reassurance or suggestion, as illustrated above. The most effective initiators of
shock utilize the patient's own frames of reference, taboos, and needs for a break out of the old so that a creative reorganization can take place.

**Implication and the Implied Directive**

It is not what the therapist says that is important but what the patient hears. That is, the words of the therapist only function as stimuli that set off many personal trains of association within the patient. It is these personal trains of association within the patient that actually function as a major vehicle for the therapeutic process.

Implication is formed verbally by the If... then phrase.

*If you sit down then you can go into trance.*

Now *if* you uncross your legs and place your hands comfortably on your lap, *then* you will be ready to enter trance.

When a person then sits down, uncrosses their legs, places their hands in their laps, they have intrinsically also agreed to go into trance. By association. By the logic. Like MHR you help / harm people you love / hate, so if you have just harmed / helped someone, you MUST love them…that only makes sense…

MHR N.B entire process of trance requires these props / conditions / situations because we cannot automatically put ourselves into trance by force of conscious will...otherwise we would just say to ourselves...I will now enter a deep trance...but muscle memory etc means that if we practice, starting with help, at achieving trance, after many successful experiences, we CAN more or less consciously enter deep trance, like those Buddhis monks on fire…

We cannot even consciously will sleep. In fact doing so often keeps us awake. What we CAN do is prepare ourselves to go to sleep, and trust in our unconscious to do the rest. If we set up routines, as in children, then our internal clocks etc will be calibrated to different activities at different times. We can learn to associate sleep with brushing our teeth, a bedtime story, lights out, laying in bed. And then we can go through these actions, which have become ‘anchored’ with ‘time to get sleepy and fall asleep’, and thus will be triggered by these routine actions…and so we can ‘program’ ourselves for sleep and ‘initiate sleep cycles’ by carrying out the behaviors associated with / anchored to ‘going to sleep’. If we only ‘sleep’ in bed, then just laying down in bed can ‘trigger’ the sleep induction.

The words of interlocutors evoke all sorts of associations in their interlocutors/listeners. The *implications* of what is said / heard are more potent as suggestions than what is being said directly. In a public conversation the participants are frequently inhibited, and respond with associations that are nothing more than
cliches. In a more personal interaction, such as hypnotherapy, the participants have license to respond with their more intimate or idiosyncratic associations. In such personal interactions we are sometimes surprised at what associations and feelings we experience. Freud employed such ‘word associations’ and these have become synonymous with psychotherapy. When our conscious mind is surprised in this manner, the therapy has been successful in facilitating an expression of our individuality that we were not previously aware of. Such as an infantile desire to kill father and sexually possess mother! And the repressed guilt / fear that goes with such impulses, and how it has become manifest in the person’s current symptoms / problems.

Your own memories, images, and feelings are now more important to you in this state…is an invitation to shut out external impressions, as you are not in this special state called trance.

We are usually not aware of the moment when we fall asleep and sometimes are not even aware that we slept.

MHR This is a truism we can all agree to, and logically it follows that as this is true, the falling into a trance state may be similar. This acts to depotentiate the limiting sets of consciousness, which might normally resist the very idea that trance is real, and assert ‘nothing is happening, I am NOT falling into a trance state’. But now ANY odd feeling can be interpreted / defined as part of a process of falling into trance…any such impression is invited / suggested by the therapist to be so interpreted, producing a self-fulfilling chain of reinforced expectations that ‘I will fall into trance’ as ‘I am currently entering a trance state’. The person is thus willing to define any actions as ‘automatic’ and ‘unconscious’ indications of trance being entered. And to define anything experienced as ‘beyond conscious control’ i.e a product of the unconscious…the POWER of the unconscious mind…and thus the THERAPEUTIC power of the unconscious / trance state.

Now you know you do many things all day long without being aware of them. Your heart just beats along without any help or conscious direction from you. Just as you usually breathe without being aware of it. And even when you walk, your legs seem to move by themselves and take you wherever you want to go. And your hands do most of the things you want them to do without your saying Now hands do this, now hands do that. Your hands work automatically for you, and you usually don't have to pay attention to them. Even when you speak, you do it automatically, you don't have to be consciously aware of how to pronounce each word. You can speak without even knowing it. You know how to do it automatically without even thinking about it. Also, when you see or hear things or when you touch or feel things, they work automatically without you having to be conscious of
them. They work by themselves and you don't have to pay attention. They just take care of themselves without your having to be bothered about them.

The Implied Directive

The implied directive has three recognizable parts:

1. 1. a time-binding introduction; 2. 2. the implied suggestion that takes place within the patient; 3. 3. behavioral response that signals when the implied suggestion has been accomplished.

Thus, as soon as

1. 1. the time-binding introduction

your unconscious has reached the source of that problem,

2. 2. the implied suggestion initiating an unconscious search taking place within the patient

your finger can lift.

3. 3. the behavioral response that signals when the implied suggestion has been accomplished.

As can be seen from this illustration, the implied directive is an indirect form of suggestion that initiates inner search and unconscious processes and then lets us know when a therapeutic response has been accomplished. MHR gives us feedback / so we know they have done what we asked.

Implied directives

When you have found a feeling of relaxation and comfort, your eyes close all by themselves.

So when their eyes close, we know they have accessed this state.

As that comfort deepens, your conscious mind can relax while your unconscious reviews the nature of the problem. And when a relevant and interesting thought reaches your conscious mind, your eyes will open as you carefully consider it.

So when they open their yes, we will know that their UNCONSCIOUS has done its therapeutic work, and communicated / shared the results with the conscious mind.
Binds and Double Binds

Precisely what these are, and thus how to formulate them, is unknown. But we can still use them heuristically.

A bind offers a patient a free, conscious choice between two or more alternatives, BOTH of which, leads the person in the same direction, in our case, a therapeutic one. In sales it would be one that increases sales. Damned if you do, damned if you don’t, expresses the eternal conundrum that leads to ‘the lesser of two evils’ being the most desirable, while both outcomes are Undesirable.

Double binds relate to behaviors that are NOT part of a person’s usual range of conscious, voluntary choice and control. There is no ‘formula’ for producing double binds as what is a bind or double bind for one person may not be for another.

We can utter ‘O.K’, but do so in ways that ‘mean’ very different things. By the verbal intonation, tone, pitch, delivery, and non-verbal indicators, it could mean we reluctantly agree, we enthusiastically agree, we feel obliged to agree, we feel we have no choice, we can express anger, impatience, joy, fear. We can use this facility for ambiguity / multiple meanings, to suggest something the conscious mind would normally reject as ‘outside its realm of possibilities’ i.e due to limiting beliefs / models / maps / fears etc.

MHR we are often tricked consciously by others, or unwittingly by our own beliefs / models / maps / internalized-identified limits, into doing something we do NOT consider a good choice, by it being the lesser of two evils, and these two evils being presented as the ONLY options…when in fact there are many others. We may even feel relief at having the second option offered to us, e.g fates worse than death Vs death, and happily march to our death, feeling we have escaped something worse. When in reality the double bind offered has simply narrowed our search for solutions…it has blinkered us…thinking we may ONLY go left or right, we fail to realise we could turn around, or go straight ahead, up, or down. By pretending that the ‘only alternative’ is worse than what you want someone to agree to, you can trick them into agreeing to something they otherwise would never imagine agreeing to. Such as war. Such as giving up all their freedoms and rights, to avoid certain death from terrorists…when in fact there are millions of alternative options that would all meet the necessary and sufficient criteria / conditions for ‘homeland security’. Etc

The above is a typical ‘avoidance-avoidance’ double bind. You rush into one option offered to avoid one you think worse. You would normally avoid BOTH, e.g war, but are told you can either bomb women and children in Germany, or face a Nazi invasion of the U.S. Absurd as that fear is in reality, it is offered in a context where it is the only other alternative, and unless you realise how absurd
the threat is, e.g. death by terrorist much less likely than death by falling in the shower, you fall for the trick.

The other double bind is the ‘approach-approach’ where ‘you can’t have your cake and eat it to’...you are tricked into believing that you cannot have BOTH freedom AND security. As if it is impossible to protect you from ‘terrorists’ by any other means than you submitting to the loss of ALL your privacy and freedoms.

The clinical art of utilizing these models of conflict is to recognize which tendency is dominant within a particular patient and then structure binds that offer only therapeutic alternatives of response. When we do not know which tendency is more predominant, we can offer general binds that are applicable to anyone, such as the following.

Would you like to enter trance now or later? Would you like to enter trance sitting or lying down? Would you like to go into a light, medium, or deep trance?

This is of course our model of politics called ‘democracy’, where you are offered two Jew World Order representatives to choose from. Would you like your Jew World Order puppet to be male or female? Apparently right or left wing? Apparently for or against immigration? Apparently for or against war? You are so invested in these ‘issues’ that you fail to notice that in EVERY election that has EVER occurred, especially in the Jew.S.A, it made ZERO difference what the candidates said. They ALL did the work of the Jew World Order. They ALL brought you war, even if they promised Peace. They all raised taxes on the middle classes, directly or indirectly, even if they promised tax reductions. They all increased the size of the government, directly or indirectly, and increased government debts, less in some cases, but usually MASSIVELY.

MHR The behavior change resulting from a double bind works on the person’s own associations, rather than any ‘one size fits all approach’ or ‘protocol’. Part of its power in the therapeutic setting is that it is experienced as taking place on an autonomous (unconscious, hypnotic) level, and increases/reinforces the belief in the process, and power of the unconscious, setting up further expectations of future efficacy from this form of therapy, and belief in the power of the unconscious etc…

The Conscious-Unconscious Double Bind

The conscious-unconscious double bind is designed to bypass the limited beliefs of the conscious mind, giving the unconscious a chance to use its resources, offer new solutions / responses. It uses consciously accepted messages to initiate unconscious searches / processes / activate / mobilise it’s resources.
If your unconscious wants you to enter trance, your right hand will lift all by itself. Otherwise your left hand will lift.

Whether one gets a yes (right hand) or no (left hand) response to this suggestion, one has begun to induce trance, since any truly autonomous response (lifting either hand) implies that a trance exists. If the patient simply sits quietly, and no hand response is evident after a few minutes, the therapist can introduce a further double bind with the following addition.

Since you've been sitting quietly and there is yet no hand response, you can wonder if your unconscious would prefer not to make any effort at all as you go into trance. It may be more comfortable not to have to move or talk or even bother trying to keep your eyes open.

At this point the patient's eyes may close and trance become manifest. The eyes may remain open with a passive stare, and there will be continuing body immobility suggestive of the development of trance. If the patient is experiencing difficulty, on the other hand, there will be an uneasy shifting of the body, facial movements, and finally some talk about the problem.

The use of the negative as described earlier is very useful.

You don't have to listen to me because your unconscious is here and can hear what it needs to, to respond in just the right way.

And it really doesn't matter what your conscious mind does because your unconscious can find the right means of coping with that pain [or whatever].

You've said you don't know how to solve that problem. You are uncertain and confused. Your conscious mind really doesn't know what to do. And yet we know that the unconscious does have access to many memories and images and experiences that it can make available to you in ways that can be most surprising for solving that problem. You don't know what all your possibilities are yet. Your unconscious can work on them all by itself. And how will you know when it has been solved? Will the solution come in a dream you will remember, or will you forget the dream but find that the problem is gradually resolving itself in a way that your conscious mind cannot understand? Will the resolution come quickly while wide-awake or in a quiet moment of reflection or daydreaming? Will you be at work or at play, shopping or driving your car, when you finally realize it? You really don't know, but you certainly can be happy when the solution does come.
We are depotentiating the patient's conscious, habitual, and presumably more limited patterns in favor of unconscious processes and potentials we do not even have to understand at all. We set no limits with open ended alternatives. It is left to the unconscious to deliver in its own way, in its own time.

If you like to think in terms of left and right brain activity, we are allowing the non-dominant hemisphere an opportunity to contribute, by bypassing the limits usually imposed by the dominant hemisphere, e.g. the ‘rational’ and ‘fixed’ belief system/heuristics system/modeling brain, so the more intuitive, creative, mysterious hemisphere is free to contribute.

Hypnotic or autonomous behavior takes place outside the patient's immediate range of consciousness and is therefore dissociated from the conscious mind. MHR it has no ‘emotional investment’ in ‘refuting/refusing/filtering/blocking/distorting the suggestion made to the non-dominant, creative hemisphere. However it will ‘post-rationalise’ any behavior resulting, and ‘own’ it, and make up a narrative/story to justify that behavior, when in fact it was initiated by the other hemisphere, all proven in actual clinical experiments, detailed in T vol. I and II.

You can as a person awaken, but you do not need to awaken as a body.

[Pause]

You can awaken when your body awakens but without a recognition of your body.

The double dissociation double blind tends to confuse a patient's conscious mind and thus depotentiate his habitual sets, biases, and learned limitations. This sets the stage for unconscious searches and processes that may mediate creative behavior. The following examples suggest the range of its application.

You can dream you're awake even though you're in trance.

[Pause]

Or you can act as if you're in trance even while awake.

You can find your hand lifting without knowing where it is going.

[Pause]

Or you may sense where it is going even though you're not really directing it.

You can make an abstract drawing without knowing what it is.
You can later find some meaning in it even though it does not seem related to you personally.

You can speak in trance even though you don't always recognize the meaning of your words.

Or you can remain silent as your head very slowly nods yes or shakes no all by itself in response to my questions.

Indirect forms of suggestion such as implications, contingencies, negatives, open-ended suggestions, apparently covering all possibilities of a class of responses, not knowing, not doing, and so on all facilitate dissociations that tend to depotentiate a patient's habitual conscious sets.

Now, in a moment your eyes will open but you don't need to awaken. [Pause]

Or you can awaken when your eyes open, but without remembering what happened when they were closed.

This double dissociation double bind has a definite marker indicating that the suggestion has been received and is being acted upon: the eyes opening. When the eyes open, the therapist notes whether (1) there is a simultaneous movement of the body, indicating that the patient is awakening or (2) the patient remains immobile, indicating that trance is continuing. If the patient's body remains immobile when the eyes open, the patient will have a complete memory of all trance events, since that trance continues. The therapist can assess this condition by questioning and then requesting an ideomotor response so the patient's unconscious can firmly validate that a trance is still present (e.g., If you are still in trance your yes finger can lift, your head can slowly nod yes, and so on). An affirmative ideomotor response, indicating that the patient continues to experience trance even with eyes open, is a strong indication that the patient has entered the first stages of somnambulistic training: Patients in this state can in general act as if they are awake, yet they continue to follow suggestions as if they were in a deep trance. The therapist then simply continues this somnambulistic training by proffering further suggestions to deepen their involvement and extend their range of hypnotic responsiveness (automatic talking and writing, visual and auditory hallucinations, and so on).

If, on the other hand, such patients move and speak as if they were perfectly awake when their eyes open, they are apparently acting on the second alternative, and we would assess the validity of the trance by determining the presence of an
amnesia for trance events. But what if a patient awakes and there is no amnesia? Does this mean that trance was not experienced? Possibly. More likely, however, such patients will recall only one or two things of such particular significance for them during trance that they attracted conscious attention and so are recalled easily after trance. There will tend to be an amnesia for many other trance events; however, another possibility is that amnesia may be a particularly difficult response for such patients. They may have experienced a genuine trance but for some reason cannot experience the response of amnesia. To assess this possibility the therapist reintroduces trance and then, after another double dissociation double bind, uses another modality as an indication of trance. In the following, for example, body movement (or an inhibiting verbal response) is used as a trance indication instead of amnesia.

Now, in a moment your eyes will open, but you don't need to awaken.

Or you can awaken when your eyes open, but you won't feel like moving your arms for a few minutes [or won't feel like speaking for a few minutes].

Patients who accept the second alternative and awaken can validate the trance by not moving their arms (or speaking) for a few minutes. It is wise to offer trance indicators in this permissive manner. (You won't feel like moving your arms) rather than as a challenge (You won't be able to move your arms), because the challenge is often taken as an affront by our modern consciousness that takes such hubris in its apparent independence and power.

**Multiple Levels of Meaning and Communication: The Evolution of Consciousness in Jokes, Puns, Metaphor, and Symbol.**

Jung see the symbol not as the best representation of something that is still in the process of becoming conscious, rather than a simple sign of one thing for another. MHR this is much nicer than Plato’s ideas of some ideal form everything else is a poor copy of. In our Jew World Order context, symbols may thus be used to provoke that becoming, to direct it according to the wishes of the Jew World Order leaders / actors…

MHR The word metaphor (meta, beyond, over ; pherin, to bring, bear ) refers to an utterance that literally denotes one thing but by analogy suggests / connotes another . Used as a literary device, as metaphor, analogy, and simile are used to bypass conscious resistance to ideas / potential new beliefs / contradictions of existing beliefs / models / maps, which if attempted directly, in the form of explicit formal argument, would be too ‘disconcerting’ / antipathetic to it, and thus simply blocked / rejected out of hand. In my words you have to ‘trick’ the reader into considering an idea…the story being an accepted format during which the listener has implicitly agreed to ‘suspend judgement’ to enjoy the tall tale /
romance/adventure. As compared to the formal argument where defensiveness of existing beliefs is the sad norm.

Metaphor (To carry you above, over, and beyond)

Metaphor and analogy are thus the means to facilitate a bypass of conscious resistance to new, challenging, current-model/map/belief system/noetic structure contradicting ideas. Normally the conscious mind ‘doesn’t want to know about these’ as they would require a total re-organisation of their belief systems, assumptions, etc, which can be very emotionally challenging / discomforting / disturbing. If X is NOT true, then maybe Z and Y and T are also not true, and what have I been doing with my life? What did I send my sons and daughters to commit heinous crimes, and be killed, for? If there is no proof of X, what does it mean for the rest of my beliefs? If Hitler and the nazis’ were good people, not evil, then this means WE were the war criminals…if there was no ‘holocaust’, then what could justify our war crimes?

So these ‘tricks’ have what Jung called a ‘Transcendent function’, namely: the integration of conscious and unconscious contents in a manner that facilitates the evolution of new patterns of awareness (Jung, 1960).

All these approaches lead to the maintaining an attitude of expectancy about what can be experienced, opening up the conscious and unconscious to the possibility that change can take place, consciously or unconsciously, to produce this very self-fulfilling prophecy. They open a BARDOT of opportunity in a normally ‘continuous’ defense shield a.k.a ‘I know what I know dogma and I am not even going to consider ideas that do not support what I already ‘know’ to be true’. The continuity is from constant re-production of the belief, from moment to moment…just stop this, like Moses parting the flow of the red sea or River Jordan, just for long enough to allow a new idea to ‘pass over’ from the unconscious side to the conscious side, with potentially huge impacts on the entire belief system there, which MUST now take this new data / insight into consideration, to maintain some sense of integrity.

The formalized ritualistic procedures of trance induction, where the same method is applied mechanically to everyone, can be contrasted to the naturalistic approach, wherein the patient's unique personality and behavior are utilized to facilitate trance. In this utilization approach the patient's attention is fixed on some important aspect of his own personality and behavior in a manner that leads to the inner focus that we define as therapeutic trance. The patient's habitual conscious sets are more or less depotentiated, and unconscious searches and processes are initiated to facilitate a therapeutic response.

The process starts with preparing patients for trance experience, followed by an induction, and then ratification of the trance. Erickson proved that the utilization
approach using indirect forms of suggestion can facilitate a therapeutic outcome in virtually any situation.

**Accepting and Utilizing the Patients' Manifest Behavior**

Openness towards, and acceptance of, the patients' definitions of reality / current experience / world view / belief system / model / map can produce rapport, and therapeutic EXPERIENCE of trance, whatever THAT is.

The activity of the hypnotist merely facilitates what is a purely intrapsychic phenomenon, dependent upon internal processes, and NOT directly on what the therapist says or does. Consider the client’s own unconscious resources the ‘egg’, and the therapy environment like an incubator.

The therapist should NOT seek to force the person to demonstrate phenomena THEY think indicate trance, and should seek to attend to, and employ, the behaviors the client DOES demonstrate, towards approaching, inducing, and deepening, the trance state.

Remarks can be timed to coincide with the client’s behavior. So that soon the words inhale, exhale, lift, and lower acquired a conditioning value of which they are unaware because of the seemingly conversational nature of the suggestions. Similarly, casual suggestions are offered in which the words sleep, sleepy, and sleeping are timed to their eyelid behavior. By becoming attentive to the person, you can formulate indirect suggestions that build a yes set which the person finds agreeable to continue to build, so that your suggestions receive a momentum / force.

An example may be cited of a volunteer subject, used later to teach hypnosis to medical students. After a general discussion of hypnosis, she expressed a willingness to go into a trance immediately. The suggestion was offered that she select the chair and position she felt would be most comfortable. When she had settled herself to her satisfaction, she remarked that she would like to smoke a cigarette. She was immediately given one, and she proceeded to smoke lazily, meditatively watching the smoke drifting upward. Casual conversational remarks were offered about the pleasure of smoking, of watching the curling smoke, the feeling of ease in lifting the cigarette to her mouth, the inner sense of satisfaction of becoming entirely absorbed just in smoking comfortably and without need to attend to any external things. Shortly, casual remarks were made about inhaling and exhaling, these words timed to fit in with her actual breathing. Others were made about the ease with which she could almost automatically lift her cigarette to her mouth and then lower her hand to the arm of the chair. These remarks were also timed to coincide with her actual behavior. Soon, the words inhale, exhale, lift, and lower acquired a conditioning value of which she was unaware because
of the seemingly conversational nature of the suggestions. Similarly, casual suggestions were offered in which the words sleep, sleepy, and sleeping were timed to her eyelid behavior.

Before she had finished the cigarette, she had developed a light trance. Then the suggestion was made that she might continue to enjoy smoking as she slept more and more soundly; that the cigarette would be looked after by the hypnotist while she absorbed herself more and more completely in deep sleep; that, as she slept, she would continue to experience the satisfying feelings and sensations of smoking. A satisfactory profound trance resulted and she was given extensive training to teach her to respond in accord with her own unconscious pattern of behavior.

MHR this example also supports my contention that people are addicted to many aspects of smoking, independent of the actual nicotine addiction.

When this same subject was later used by students, who did not accept her wish to smoke, they were not able to induce trance as it was the fixing of her attention on her smoking, something she was already semi-entranced by / focused on intently, that induced the trance state. So use whatever resources are offered, rather than trying to force the issue with some pre-formulated notions of what ‘should’ work etc.

Erickson recognized and utilized her meditative mood to facilitate trance by fixing her attention even more on her smoking with casual conversational remarks. This casual conversation, of course, provides the senior author with a general context into which he can intersperse suggestions about pleasure, ease, inner sense of satisfaction, and becoming entirely absorbed in smoking 'comfortably without need to attend to any external things. These interspersed suggestions tended to depotentiate her habitual waking orientation even further. The process of not knowing and not doing that takes place when we do not have to attend to external things led her to an unconscious search for some new form of direction and orientation.

This new direction was provided by the senior author with his obvious interest in her smoking behavior. He then utilized her smoking behavior for a process of unconscious conditioning; her inhaling, exhaling, lifting and lowering of her hand became conditioned to following his voice and suggestions. This unconscious conditioning was a way of assessing and reinforcing her response attentiveness. Finally the ideodynamic associative value of words like sleep were then associated with her actual eyelid behavior suggestive of sleep (eyelids closing, fluttering, etc.). Even though both therapist and patient fully recognize that therapeutic trance is not sleep, words evoking the idea of sleep tend to evoke associated behaviors (like comfort and not doing) that tend to facilitate trance.
The process of rapport was further enhanced as he took her cigarette and suggested she might continue to enjoy smoking as she slept more and more soundly. A hallucinatory wish fulfillment of something she obviously enjoyed, such as smoking, was made contingent on sleeping more and more soundly. She was given an expectancy of continued satisfying feelings as she went deeper into trance. This sound utilization of her smoking behavior, together with many indirect forms of suggestion that evoked her own associative processes, then led to more extensive trance training.

A highly intellectualized frame of reference attending primarily to external things can be gradually shifted to an internal focus that is more suitable for therapeutic trance.

For example one such client pointed out that he was obviously tense, anxious, and concerned about the tension tremors of his hands, which were resting on the arms of the chair, and that he was also highly distractable, noticing everything about him.

Erickson immediately seized upon this last comment as the basis for the initial cooperation with him. He was told, Please proceed with an account of your ideas and understanding, permitting me only enough interruptions to insure that I understand fully and that I follow along with you. For example, you mentioned the chair but obviously you have seen my desk and have been distracted by the objects on it. Please explain fully.

He responded verbosely with a wealth of more or less connected comments about everything in sight. At every slight pause, the writer interjected a word or phrase to direct his attention anew. These interruptions, made with increasing frequency, were as follows: And that paperweight; the filing cabinet; your foot on the rug; the ceiling light; the draperies; your right hand on the arm of the chair; the pictures on the wall; the changing focus of your eyes as you glance about; the interest of the book titles; the tension in your shoulders; the feeling of the chair; the disturbing noises and thoughts; weight of hands and feet; weight of problems, weight of desk; the stationery stand; the records of many patients; the phenomena of life, of illness, of emotion, of physical and mental behavior; the restfulness of relaxation; the need to attend to one's needs; the need to attend to one's tension while looking at the desk or the paperweight or the filing cabinet; the comfort of withdrawal from the environment; fatigue and its development; the unchanging character of the desk; the monotony of the filing cabinet; the need to take a rest; the comfort of closing one's eyes; the relaxing sensation of a deep breath; the delight of learning passively; the capacity for intellectual learning by the unconscious. Various other similar brief interjections were offered, slowly at first and then with increasing frequency.
Initially, these interjections were merely supplementary to the patient's own train of thought and utterances. At first, the effect was simply to stimulate him to further effort. As this response was made, it became possible to utilize his acceptance of stimulation of his behavior by a procedure of pausing and hesitating in the completion of an interjection. This served to effect in him an expectant dependency upon the writer for further and more complete stimulation.

As this procedure was continued, gradually and unnoticeably to the patient his attention was progressively directed to inner subjective experiential matters. It then became possible to use almost directly a simple, progressive relaxation technique of trance induction and to secure a light medium trance.

Throughout therapy, further trance inductions were basically comparable, although the procedure became progressively abbreviated.

MHR utilize whatever the person brings to the interaction for focusing and fixing the patient’s attention, into THAT, as a means of fixing / focusing and HOLDING his attention, which is WHAT trance induction IS, whatever the means UTILISED, whether a light, pendulum, or their own symptoms / racing thoughts / pain…then gradually interject leading suggestions in direction of relaxation, trance.

This represents a double bind for this patient: His distractibility is used to undistract, to focus his attention.

Encourage person to go into details ‘to ensure that I understand fully and that I follow along with you’. This is an unrecognized interspersed suggestion to understand and follow the therapist.

Not knowing and not doing are actually an important condition for trance experience, and he had stated he was not sure if he could be hypnotized etc, so this offered opportunity FOR trance.

Erickson gingerly interacts with the patient by redirecting his attention anew at every pause as a means of cooperating with him, and at the same time, enhancing his response attentiveness. By very gradual steps the senior author builds an associative network that leads the patient from the paperweight and filing cabinet to the delight of learning passively and the capacity for intellectual learning by the unconscious. The shift in focus is from the outer to the inner, which is in keeping with trance work. The shift is facilitated by a continuing utilization of the patient’s intellectual approach, with the emphasis on learning passively and the unconscious learning. The passivity and unconscious aspects of trance experience are thus associated with the learning that the patient already accepts and knows how to do; it is thus much easier for the patient to accept passivity and the unconscious when it is associated with learning. In this shift from an outer to an
inner focus the senior author has a great opportunity to intersperse many forms of indirect associative focusing (e.g., the phenomena of life, of illness, of emotion, of physical and mental behavior) and indirect ideodynamic focusing (e.g., the restfulness of relaxation . . . the comfort of withdrawal from the environment, fatigue and its development ). This can facilitate trance induction by initiating unconscious searches and processes that could evoke partial aspects of trance experience as well as a review of the patient's problems.

As the therapist continued to utilize the patient's own train of thought and utterances, his response attentiveness was further enhanced and a greater degree of expectant dependency was experienced by the patient as he now began to look to the therapist for further direction into inner subjective experiential matters, where his psychological problems were.

A client presented, stating that he could only participate if he was allowed to pace back and forth, and idea other therapists had rejected. Erickson utilized his symptoms.

‘Are you willing to cooperate with me by continuing to pace the floor, even as you are doing now’? His reply was a startled, Willing? Good God, man! I've got to do it if I stay in the office.

(As a question, it immediately fixes the patient's attention and sends him on an inner search for an appropriate response. It is an excellent compound suggestion that associates an important suggestion about cooperation with his ongoing behavior of pacing the floor. Pacing the floor constantly was the patient's own ability that was rapidly assessed, accepted, and utilized to facilitate a yes set. The question came as a bit of a shock and surprise that depotentiated his dominant mental set about his own resistance and startled him into a strong exclamation of his need to cooperate. Rapport was thus strongly established, and therapy structured as a joint endeavor. With such a strong immediate rapport, a high expectation was set in motion, heightening the patient's response attentiveness to his own internal states as well as to the therapist's further suggestions. By a gradual process of association and unconscious conditioning this response attentiveness was heightened even further, so the patient was finally able to accept suggestions to sit down and go even deeper into himself so that he could relate his history in a state of deep absorption that is described as profound trance.)

Thereupon, he was asked to permit the writer to participate in his pacing by the measure of directing it in part. To this he agreed rather bewilderedly. He was asked to pace back and forth, to turn to the right, to the left, to walk away from the chair, and to walk toward it. At first these instructions were given in a tempo matching his step. Gradually, the tempo of the instructions was slowed and the wording changed to Now turn to the right away from the chair in which you can
sit; turn left toward the chair in which you can sit; walk away from the chair in which you can sit; walk toward the chair in which you can sit. etc. With this wording, a foundation was laid for more cooperative behavior.

The tempo was slowed still more and the instructions again varied to include the phrase, the chair which you will soon approach as if to seat yourself comfortably. This in turn was altered to the chair in which you will shortly find yourself sitting comfortably.

His pacing became progressively slower and more and more dependent upon the writer's verbal instructions until direct suggestions could be given that he seat himself in the chair and go deeper and deeper into a profound trance as he related his history.

Approximately 45 minutes were spent in this manner inducing a medium trance that so lessened the patient's tension and anxiety that he could cooperate readily with therapy thereafter.

The value of this type of Utilization Technique lies in its effective demonstration to the patient that he is completely acceptable and that the therapist can deal effectively with him regardless of his behavior. It meets both the patient's presenting needs and it employs as the significant part of the induction procedure the very behavior that dominates the patient.

Deep hypnosis is a joint endeavor in which the subject does the work and the hypnotist tries to stimulate the subject to make the necessary effort. So if the person believes they know what YOU should do, do what they say. It works. It will also dispel misconceptions of the mystical powers of the hypnotist. It is team work. This acceptance and utilization of the patient's help is the cardinal feature of our approach.

**Utilizing Emergency Situations**

Emergency situations are invariably trance-inducing. Iatrogenic problems (new problems introduced by the attempt to relieve the existing problem e.g side effects of treatments / surgery etc) and neurotic symptoms can be learned by overhearing unfortunate remarks during emergency and stress situations when the patient had lapsed into a spontaneous trance (as a primitive protective response to danger) and was consequently in an unusually heightened state of suggestibility.

MHR thus ‘terrorist threat alerts’ to induce this state of terror and suggestibility…‘we must attack Iran NOW’…yes, of course, murder a few more million women and children…

**Utilizing the Patient's Inner Realities**
The statements in italics are those of the therapist, the others those of the client, who has stated that she fears (doubts / doesn’t know if) she could never go into trance / be hypnotized.

You really can’t conceive of what a trance is - no, I can’t, what is it? - yes, what is it! - a psychological state, I suppose - A psychological state you suppose, what else! - I don’t know - you really don’t know - no, I don’t - you don’t, you wonder, you think - think what - yes, what do you think, feel, sense? - (pause) - I don’t know - but you can wonder - do you go to sleep? - no, tired, relaxed, sleepy - really tired - so very tired and relaxed, what else? - I’m puzzled - puzzles you, you wonder, you think, you feel, what do you feel? - my eyes - yes, your eyes, how? - they seem blurred - blurred, closing - (pause) - they are closing-closing, breathing deeper - (pause) - tired and relaxed, what else? - (pause) - sleep, tired, relaxed, sleep, breathing deeper - (pause) - what else - I feel funny - funny, so comfortable, really learning - (pause) - learning, yes, learning more and more - (pause) - eyes closed, breathing deeply, relaxed, comfortable, so very comfortable, what else? - (pause) - I don't know - you really don't know, but really learning to go deeper and deeper - (pause) - too tired to talk, just sleep - maybe a word or two - I don't know (spoken laboriously) - breathing deeper and you really don't know, just going deeper, sleeping soundly, more and more soundly, not caring, just learning, continuing ever deeper and deeper and learning more and more with your unconscious mind.

From this point on it was possible to deal with her simply and directly without any special elaborations of suggestions. Subsequent trances were secured through the use of posthypnotic suggestions.

The above is simply a condensation of the type of utterances utilized to induce trance. In general, there is much more repetition, usually only of certain ideas, and these vary from patient to patient. Sometimes this technique proves to be decidedly rapid. Frequently with anxious, fearful patients, it serves to comfort them with a conviction that they are secure, that nothing is being done to them or being imposed upon them, and they feel that they can comfortably be aware of every step of the procedure. Consequently, they are able to give full cooperation which would be difficult to secure if they were to feel that a pattern of behavior was being forcibly imposed upon them.

As can be seen from the above, the patient's experience of not knowing, I don't know what trance is, can be an ideal starting point for initiating trance and the exploration of inner realities.

The patient's experience of not knowing, I don't know what trance is, can be an ideal starting point for initiating trance.
A volunteer subject at a lecture before a university group declared, I was hypnotized once several years ago. It was a light trance, not very satisfactory, and while I would like to cooperate with you, I'm quite certain that I can't be hypnotized. Do you recall the physical setting of that trance? Oh yes, it was in the psychology laboratory of the university I was then attending. Could you, as you sit here, recall and describe to me the physical setting of that trance situation?

He agreeably proceeded to describe in detail the laboratory room in which he had been lightly hypnotized, including a description of the chair in which he had sat, and a description of the professor who had induced the trance. This was followed by a comparable response to the writer's request that he describe in as orderly and as comprehensive a fashion as possible his recollection of the actual suggestions given him at that time and the responses he made to them.

Slowly, thoughtfully, the subject described an eye closure technique with suggestions of relaxation, fatigue, and sleep. As he progressed in verbalizing his recollections, his eyes slowly closed, his body relaxed, his speech became slower and more hesitant; he required increasingly more prompting until it became evident that he was in a trance state. Thereupon, he was asked to state where he was and who was present: He named the previous university and the former professor. Immediately, he was asked to listen carefully to what the writer had to say also, and he was then employed to demonstrate the phenomena of the deep trance.

Questions focusing on memories can be a reliable means of assessing the patient's availability for trance and frequently a fine means of facilitating the actual induction of trance e.g. ask about earliest memory. Inner search for an earlier memory can lead to spontaneously falling into a trance and experiencing age regression to infancy.

**Utilizing the Patient's Resistances** recognizes and accepts the patient's manifest behavior as a foundation for establishing rapport, and then gradually focuses the patient inward.

Resistance is usually an expression of the patient's individuality! The therapist's task is to understand, accept, and utilize that individuality to help patients bypass their learned limitations to achieve their own goals. This example is a particularly clear illustration of how a patient is really in control, while the therapist is simply a provider of useful stimuli and frames of reference that help a patient experience and express new potentialities. We see how it can be perfectly appropriate for the patient to reject or modify the therapist's suggestions in order to more adequately meet the patient's needs.

Erickson used a blend of both leading and following the patient.
Wording suggestions in such a fashion that a positive or a negative response, or an absence of response, are all defined as responsive behavior. For example, a resistive subject who is not receptive to suggestions for hand levitation can be told, shortly your right hand, or it may be your left hand, will begin to lift up, or it may press down, or it may not move at all, but we will wait to see just what happens. Maybe the thumb will be first, or you may feel something happening in your little finger, but the really important thing is not whether your hand lifts up or presses down or just remains still; rather, it is your ability to sense fully whatever feelings may develop in your hand. Thus any of the possibilities constitutes responsive behavior.

The subject whose resistance is manifested by failure to levitate his hand can be given suggestions that his right hand will levitate, his left hand will not. To resist successfully, contrary behavior must be manifested. The result is that the subject finds himself responding to suggestion, but to his own satisfaction.

The very fact that a subject volunteers to be hypnotized and then offers resistance indicates that they have not totally rejected the possibility of being hypnotized. Otherwise why would they submit / appear at all?

Erickson always demonstrates full respect for the subject as a uniquely functioning personality.

**A method of initial trance induction, and as a trance reinduction procedure**

A suitable casual explanation is given relating general concepts of the conscious and of the unconscious or subconscious minds. Similarly, a casual though carefully instructive explanation is given of ideomotor activity with a citing of familiar examples, including hand levitation.

Then, with utter simplicity, the subject is told to sit quietly, to rest his hands palm down on his thighs, and to listen carefully to a question that will be asked. This question, it is explained, can be answered only by his unconscious mind, not by his conscious mind. He can, it is added, offer a conscious reply, but such a reply will be only a conscious statement and not an actual reply to the question. As for the question itself, it can be any of several pertinent questions, and it is of no particular significance to the person. Its only purpose is to give the unconscious mind an opportunity to manifest itself in the answer given. The further explanation is offered that the answer to the question asked the unconscious mind will be an ideomotor response of one or the other hand lifting upward, that of the left signifying no, and that of the right signifying yes.

The question is then presented: Does your unconscious mind think that you can go into a trance? Further collaboration is offered: Consciously you cannot know what your unconscious mind thinks or knows. But your unconscious mind can let
your conscious mind discover what it thinks or understands by the simple process of causing a levitation of either the right or the left hand. Thus your unconscious mind can communicate in a visibly recognizable way with your conscious mind. Now just watch your hands and see what the answer is. Neither you nor I know what your unconscious mind thinks, but as you see one or the other of your hands lifting, you will know.

It is necessary for the subject to go into a trance in order to discover the answer to the question. No matter which answer you give, you have to go into a trance first.

If there is much delay, additional suggestions can be given: One of your hands is lifting. Try to notice the slightest movement, try to feel and to see it, to enjoy the sensation of its lifting and be pleased to learn what your unconscious thinks.

Regardless of which hand levitates, a trance state frequently of the somnambulistic type supervenes simultaneously. Usually, it is advisable to utilize, rather than to test, the trance immediately since the subject tends to arouse promptly. This is often best done by remarking simply and casually. It is very pleasing to discover that your unconscious can communicate with your conscious mind in this way. There are many other things that your unconscious can learn to do. For example, now that it has learned that it can develop a trance state and to do so remarkably well, it can learn various trance phenomena. For instance, you might be interested in -. The needs of the situation can then be met.

Resistant subjects manifest their attitudes by difficulty in understanding the preliminary explanations, by asking repeatedly for instructions, and then by an anticipation of hand levitation by lifting the left hand voluntarily. Those subjects who object to trance induction in this manner tend to awaken at the first effort to test or to utilize the trance. Most of them, however, will readily go back into the trance when told, And you can go into a trance just as easily and quickly as your unconscious answered that question just by continuing to watch as your unconscious mind continues to move your hand up toward your face. As your hand moves up, your eyes will close, and you will go into a deep trance. In nearly all instances, the subject then develops a trance state.

An essential component of this technique is an attitude of utter expectancy, casualness, and simplicity on the part of the operator, which places the responsibility for any developments entirely upon the subjects.

During a talk there is ample opportunity to intersperse many ideodynamic suggestions that cannot help but activate the described ideodynamic process at least partially within most members of the audience. After giving a demonstration of hand levitation, he describes the following occurrence:
One of the subjects felt very, very strongly that she was not a good subject. As I observed that intensely rapt attention (response attentiveness) she was giving me, however, I could feel very strongly that she was a good subject. So I asked her to 'Give your unconscious mind the privilege of manifesting in some way that you are a good hypnotic subject but that you will not consciously recognize it. At the same time you can continue to function well at the conscious level. I might add that the manifestation might be obvious to the audience but not to you.' Even as she continued to focus closely on me and not the audience or anything else, she said, Tm not a good subject, and I don't believe you can convince me.

At this point I was utilizing her resistance to let her think she was awake and not in a somnambulistic trance. But the very intensity of her absorption in watching my every move and following everything I said was a clue to her somnambulistic condition.

I asked her again if I could put her into a trance, but she shook her head 'no,' she wouldn't cooperate. At that moment her left hand began levitating, but she did not see it because she was looking over toward me on the right.

She laughed and joked with the doctors in the audience and said she did not like to feel she was being uncooperative, but she did feel she couldn't go into a trance. Remember, I told her to function very well at the conscious level and very well at the unconscious level. And there she was talking to me and talking to the audience in this fashion. I indicated to one of the doctors in the audience that he should come up and pinch her levitated left hand. He found that she had a total anesthesia in that left hand, that she was willing to swear to the group that she was wide awake and that she couldn't possibly be in a trance. The doctor then came around and pinched her right hand, and she said, 'Ouch, that hurts! Naturally I would feel a pinch.' She was pinched again on the left hand but did not feel it.

What I wanted to demonstrate to the doctors there, and what I want to stress to you, is the separation of functioning that goes on all the time in the human body, separation at an intellectual level, separation at an emotional level, separation at a sensory level, just as you have forgotten the shoes on your feet at this moment and the glasses on your face.

This dramatic example illustrates the importance of the hypnotherapist's learning to recognize that state of rapt response attentiveness when the patient is, for all practical purposes, already in a trance state fixated on the therapist, no matter what may be said to the contrary. When the senior author observes this state of intense absorption on himself, he offers patients one or more forms of indirect suggestion that provides them with an opportunity for a hypnotic response. In this case he used a form of the conscious-unconscious double bind that enabled her unconscious to select a hypnotic manifestation (hand levitating that she had
already been primed for by watching others), while allowing her conscious mind to keep its usual patterns of functioning. She was thus able to keep her resistance while manifesting good hypnotic responsiveness.

Unknown to the senior author, at a lecture demonstration before a medical group, one of the subjects was a trained actor. He watched the other subjects carefully and then, in accord with previous secret arrangements with several people in the audience, he simulated hypnosis and demonstrated anesthesia, negative and positive auditory and visual hallucinations, and developed uncontrollable sneezing upon hallucinating goldenrod in bloom, at the request of one of the conspirators, relayed through the senior author. However, the senior author noted that the actor's manifestation of catalepsy was faulty, and his time relationships were wrong. Minor startle reflexes were noted, too, and the subject was observed to be controlling the involuntary tendency to turn his head toward the author when addressed from the side. Accordingly, he was asked to demonstrate hand levitation in response to carefully given suggestions. The actor did not show the usual time lag in response to suggestions of a sudden little jerk or quiver. This served to convince the senior author that he was being hoaxed.

Accordingly, the subject was furnished with pencil and paper and instructed to do automatic writing and to do this automatic writing in the correct style of true automatic writing. The actor had never witnessed automatic writing; however, as he began writing, suggestions were offered of writing slowly and better and better, writing automatically the sentence, 'This is a beautiful day in June.' The word this" was repeated four times with strong intonations to fixate consciousness on it, while the rest of the sentence was said more softly and swiftly, so that it would tend to be missed by consciousness and fall into the unconscious. The word this was written in his ordinary script, but the rest of the sentence was written in the characteristic script of automatic writing. The actor subject was now beginning to experience some genuine trance behavior without realizing it. As he finished writing, the paper and pencil were removed from his sight and he was asked to awaken with an amnesia for trance events. He roused immediately and was asked to discuss hypnosis for the audience. With great satisfaction he proceeded to expose the hoax perpetrated upon the senior author to the amazement of the audience in general and the glee of the conspirators. The subject talked freely of what he had done and demonstrated his ability to sneeze at will.

After he had recounted everything except the automatic writing, this was shown to him and he was asked what he thought of it. He read the sentence aloud, stated that it was just a simple statement with no particular relevancy. Asked about the script, he observed that it appeared to be somewhat labored and juvenile. It soon became apparent to everyone that he had a total amnesia for the writing, that he was genuinely curious about the writing and why he was being questioned about
it. When his amnesia had been adequately demonstrated, he was asked to duplicate that writing exactly. He agreed readily, but as he took the pencil and set it to the paper, it was at once obvious that he had developed a trance state again (repeating trance behavior tends by association to induce trance) MHR this is the power of religious etc ritual...all forms of institutionalized responses e.g military, school, bureaucracy, even views of mass media, readers, students at lectures.... After he had written the sentence this second time, he was aroused with instructions for an amnesia for trance events. As he aroused, he resumed his mockery of the author for being so easily deceived. Again he was shown the writing. He recognized that he had seen the one sentence a few moments ago, but there was a second sentence that he had not seen before.

Negative affects can be utilized to induce trance and to facilitate therapeutic change.

A patient's misunderstandings, doubts, and uncertainties may also be utilized as the technique of induction. Exemplifying this approach are the instances of two patients, both college-trained women, one in her late 30's, the other in her early 40's. One patient expressed extreme doubt and uncertainty about the validity of hypnotic phenomena as applied to herself, but explained that her desperate need for help compelled her to try hypnosis as a remotely possible means of therapy.

The other declared her conviction that hypnosis and physiological sleep were identical and that she could not possibly go into a trance without first developing physiological sleep. This, she explained, would preclude therapy; yet she felt that hypnosis offered the only possible, however questionable, means of psychotherapy for her, provided that the hypnotherapy was so conducted as to preclude physiological sleep. That this was possible, she disbelieved completely.

Efforts at explanation were futile and served only to increase the anxiety and tension of both patients. Therefore an approach utilizing their misapprehensions was used. The technique, except for the emphasis employed, was essentially the same for both patients. Each patient was instructed that deep hypnosis would be induced. They were to cooperate in going into a deep trance by assessing, appraising, evaluating, and examining the validity and genuineness of each item of reality and each item of subjective experience that was mentioned. In so doing, the women were to feel under obligation to discredit and reject anything that seemed at all uncertain or questionable. For the one, emphasis was placed primarily upon subjective sensations and reactions with an interspersed commentary upon reality objects. For the other, attentiveness to reality objects as proof of wakefulness was emphasized with an interspersing of suggestions for subjective responses. In this manner, there was effected for each a progressive narrowing of the field of awareness and a corresponding increase in a dependence
upon and a responsiveness to the writer. It became possible to induce in each a somnambulistic trance by employing a simple eye closure progressive relaxation technique slightly paraphrased to meet the special needs of each of the two patients.

The following sample of utterances, in which the emphasis is approximately evenly divided between subjective aspects and reality objects, is offered to illustrate the actual verbalization employed.

As you sit comfortably in that chair, you can feel the weight of your arms resting on the arms of the chair. And your eyes are open and you can see the desk and there is only the ordinary blinking of the eyelids, which you may or may not notice, just as one may notice the feeling of the shoes on one's feet and then again forget about it. And you really know that you can see the bookcase and you can wonder if your unconscious has noted any particular book title. But now again you can note the feeling of the shoes on your feet as they rest on the floor, and at the same time you can become aware of the lowering of your eyelids as you direct your gaze upon the floor. And your arms are still resting their weight on the arms of the chair, and all these things are real and you can be attentive to them and sense them. And if you look at your wrist and then look at the corner of the room, perhaps you can feel or sense the change in your visual focus. Perhaps you can remember when, as a child, you may have played with the experience of looking at an object as if it were far off and then close by. And as associated memories of your childhood pass through your mind, they can range from simple memories to tired feelings because memories are real. They are things, even though abstract, as real as the chair and the desk, and the tired feeling that comes from sitting without moving, and for which one can compensate by relaxing the muscles and sensing the weight of the body, just as one can feel so vividly the weariness of the eyelids as fatigue and relaxation develop more and more. And all that has been said is real and your attention to it is real and you can feel and sense more and more as you give your attention to your hand or to your foot or the desk or your breathing or to the memory of the feeling of comfort some time when you closed your eyes to rest your gaze. And you know that dreams are real, that one sees chairs and trees and people and hears and feels various things in dreams and that visual and auditory images are as real as chairs and desks and bookcases that become visual images. In this way, with increasing frequency, the writer's utterances became simple, direct suggestions for subjective responses.

Aim for hand levitation as the ‘proof’ i.e validation of trance efficacy, as final object of induction, as this is visual, easily observed by person.

Anxiety, confusion, doubt, uncertainty, and depression is characteristic of most patients involved in a process of growth. MHR represents a BARDOT of opportunity...rejection/doubt of current ‘reality’ i.e ‘this can’t be
real’…offer / define as hope of transformation…as signs of potential change for better…takes crisis to force out attention onto a ‘problem’, error etc. e.g. pain attracts attention to problem e.g. sharp object threat…cut hurts, so attend to…blister stops you wearing those shoes and destroying feet…overeating constipation and haemorrhoids, migraines and over-thinking/planning/worrying/stressing etc…

The typical states of depression and uncertainty with which most people enter therapy are actually spontaneous manifestations of the second and third stages (depotentiating habitual conscious sets and unconscious search) of our general paradigm of trance induction and suggestion.

Depression and uncertainty only take pathological forms when a problem is so overwhelming that one cannot work through these uncomfortable affects on one’s own. In helping patients cope with these states we can again recognize how hypnotherapy can be understood as a facilitator of natural processes inherent in psychological growth.

Since the patient's symptom is usually a major focus of attention, we can sometimes utilize it to facilitate trance induction and rapidly resolve the problem.

Where E couldn’t get anaesthesia of the mouth, instead induced/suggested hyper-sensitivity in hand, which became focus on client…so could have dental surgery with numb/no pain in, mouth…as focused on pain in hand, which was gently cushioned etc…

The patient's fixed understanding was that the dental work must absolutely be associated with hyper-sensitivity. When this rigid understanding was met, but transferring the sensitivity to the hand, which is much easier to manage, oral surgery without anaesthetic was possible. Utilizing the fixed belief that ‘dental surgery MUST be painful’…but making the hand the ‘victim’, rather than the mouth.

He encourages the patients to do what they already know they can do and then displaces, transforms, or adds to it something they need to do. He uses questions, contingent suggestions, and associational networks to carry the patients from their well-rehearsed but maladaptive behaviors to the desired therapeutic responses.

Study video recordings of your therapy sessions to discover those moments of rapt response attentiveness when your patient was most focused on you. How well did you utilize these moments to introduce therapeutic remarks?
Plan how you could use these moments of response attentiveness to introduce indirect forms of suggestions that could facilitate free association related to therapeutic issues. Some simple examples are as follows.

**Do your eyes feel like resting and closing for a moment while your unconscious mind explores that [whatever]?**

I want you to be quiet for a moment, and as you think that over we will see what else your unconscious mind brings up about it. And you don't have to talk until you really feel comfortable about it.

Therapists must find the combination of words that is natural to them and their patients in order to facilitate the inner search and unconscious processes in a casual and comfortable manner.

indirect forms of trance induction. During those moments of common everyday trance when the patients may be apparently absorbed within themselves, looking out a window, staring at their hands, the floor, the ceiling, or whatever, therapists can introduce options for trance via indirect forms, such as the following:

You are absorbed in something now, and if your unconscious agrees that this is a comfortable moment for you to enter trance, you will find that your eyes will seem to close all by themselves.

Does your unconscious want those eyes to close so you can just continue as you are even more comfortably?

Just let yourself continue as you are and your body won't even have to move until your unconscious has a surprising solution to that, even though your conscious mind may not yet know what it is, exactly.

During a moment of rapt response attentiveness, when the patient's attention is focused on the therapist, trance could be introduced as follows:

I know you are not entirely aware of it, but I'm noticing something about you that indicates you may be ready to enter trance. And if your unconscious really wants to, you'll find those eyelids closing [handlifting, or whatever].

Study the patient's manifest behavior and symptoms to determine how they can be channeled into therapeutic responses. Practice building associative bridges between the known and possible to the unknown and desired.

Try giving an unusually clear and direct suggestion or posthypnotic suggestion after lulling the listener into an agreeable state using literary devices to induce a hypnotic effect, such as (1) a perfect pattern of sound and stress, with heavy
vocal stress falling at half-second intervals; (2) absence of abrupt changes or intellectual challenges; (3) vagueness of imagery, permitting each individual's personal unconscious to fill in the details; (4) fatigue for what we would call depotentiating habitual mental frameworks; (5) the use of repetition or refrain.

MHR this is basically the power of ritual in religion, secret societies, public assemblies with a structure etc

Receptivity to suggestions can occur during a formally induced trance or during the common everyday trance in which attention is fixed and absorbed in a matter of great interest. MHR It is not possible to completely erase and rewrite the program of an adult or even child...but we can work with the existing imprinted/conditioned beliefs/strategies/habits, and then lead the person towards more productive ones...more valid/ justified/correspondent ones...

A statement, ‘It’s going to be really hard, to overcome X’ etc, is agreeable to the conscious mind that expects trouble/difficulty, so has rapport built-in, a yes set, while the end of the statement is directed to the non-conscious mind, suggesting/implying/tacitly confirming that they WILL overcome X’...

Fixing attention and opening a yes set by recognizing and acknowledging current experience. 2. Associating a suggestion with this current experience by way of an indirect hypnotic form (compound suggestion). 3. Utilizing the person's own interests, desires, frames of reference etc as a vehicle for the suggestion. 4. Associating the suggestion with a reasonable future contingency i.e something bound to happen in the future.

The suggestion proper is in italics: Shortly after you awaken, I'm going to say something to you. I'm going to arouse you and put you back into trance. In spite of any thinking you do, what I say will be true.

Serial Posthypnotic Suggestions are harder to resist than those given alone. E.g a young girl placed in a chair and repeatedly told to go to sleep, and to sleep very soundly," while holding her favorite doll. A series of subtle posthypnotic suggestions suitable for facilitating the trance training and the reinduction of trance for adults might run somewhat as follows.

When you awaken, you will open your eyes... Move and perhaps stretch a bit... You can talk a bit about what interests you in your experience... And forget all the rest... Until I ask you to go back into trance... So you can experience and remember something more.

The first three lines of the above are a series of truisms that together form an associational network of behaviors that are inevitabilities. Since they are inevitable, they tend to initiate a yes set within the patient, who probably won't
even recognize line 4 as a subtle suggestion for hypnotic amnesia. Line 5 is a fairly direct posthypnotic suggestion to reenter trance that contains an important contingency with the word until. Until means that on reentering trance the patient will remember something forgotten due to a hypnotic amnesia when he was awake. Line 6 continues the associational network binding a future trance with the current experience, and it also contains a subtle ambiguity: Will the patient merely experience and recall what was lost in the amnesia, or will there be a new experience that will then be recalled? Will it be recalled only during trance or after trance as well?

Most therapists automatically alter the tone and cadence of their voice during trance work. The patients, in turn, become automatically and usually unconsciously conditioned to experience trance in response to these vocal alterations. If the therapist adopts these vocal changes during an ordinary conversation, the patient will frequently begin to experience partial aspects of trance without quite knowing why. Since these minimal cues bypass the patient's conscious frames of reference, they are often surprisingly effective. When therapists notice these beginning manifestations of trance (e.g., eye blinking, minimal movements, blocking, some confusion, and so on), they can reinforce them with other nonverbal or verbal cues they typically use during the initial stages of trance induction. For example, when the patient is looking directly at the senior author during trance induction, he will frequently look directly at the patient's face but focus his eyes at a distance beyond. When he later does this during an ordinary conversation, the patient initially feels a bit disconcerted, then begins to experience a disorientation that can only be resolved by going into trance.

At such moments the senior author may reinforce the process with a look of happy expectation and double bind questions such as the following:

I wonder just how awake you are now?

Just how much trance are you beginning to experience?

Is that a trance you're beginning to experience?

It's comfortable to just let that happen, isn't it?

You don't have to talk, do you? It's nice just to let yourself be.

Many patients become conditioned unconsciously and automatically to begin the process of trance experience as soon as they enter the therapist's waiting room. The observant therapist need not engineer such patterns of unconscious conditioning or set them up intentionally. It is far more effective simply to observe them as they occur naturally and then to utilize them as important
indicators of unconscious processes. Some patients, for example, position their bodies in certain characteristic ways during trance. Later, during an ordinary therapeutic session, the therapist may notice aspects of that trance position developing. Perhaps a head, arm, leg, hand, or finger falls into trance position. This may be a nonverbal and unconscious body signal that the patient is reexperiencing an association to trance on some level and now needs to do trance work. When therapists recognize these body cues, they can facilitate the process with an expectant look and questions somewhat like the following:

Are you aware of what's happening to you now?

Pause for a moment. Can you sense what's taking place within you?

Do you feel you are really completely awake?

How much trance are you beginning to experience?

Posthypnotic suggestion via the initiation of expectations, tensions, or patterns of behavior that can only be completed or resolved after trance is formally terminated

Unconscious conditioning can initiate partial aspects of trance that can only be resolved by the patient actually going into trance, or that could only be resolved after trance by some therapeutic behavioral change on the person’s part, by their unconscious.

During their first trance he will casually remark how interesting and therapeutic it can be to experience a pleasant surprise. He then obtains their willingness to experience a pleasant surprise after they awaken. A pleasant expectation is thus set up within the patients that can be resolved by a therapeutic shock or surprise after they awaken. This expectation is an unresolved tension that heightens their sensitivity to the therapeutic surprise that the therapist has planned.

The expectation of a pleasant surprise tends to suspend patients' habitual sets and attitudes and to initiate unconscious searches and processes for the promised pleasant surprise.

After the patient has been awake for a while, after coming 'back' from the trance state just induced, Erickson would guide the patient's hand and arm upward with a look of bemused expectation. The patient's arm usually remains suspended in midair because it has been given subtle but directive tactile cues to remain so (Erickson, Rossi, and Rossi, 1976). Patients usually do not recognize these tactile cues on a conscious level, however, so they are indeed surprised at the apparently peculiar behavior of their arms. The senior author will reinforce this surprise and
imply that it means the patients are entering trance in fulfillment of the posthypnotic suggestion he gave previously with remarks such as the following:

Surprising, isn't it?

Does your hand always remain up when someone touches it?

And it can be a pleasant surprise to find yourself going back into trance without any effort.

Are your eyes beginning to close?

And that hand won't go down until the other hand goes up.

The patient's surprise and puzzlement about what is happening is essentially a confusion approach to depotentiating habitual conscious sets and frameworks so that an altered state is facilitated.

MHR the person 'forgets' the 'priming' for this they were given under trance, and thus is surprised by this, at a conscious level. This opens a 'Bardot of opportunity'.

MHR during trance you lead person to expect a pleasant surprise (that will validate the power of the unconscious / trance state for therapeutic benefit i.e change / resolution of their symptoms / problems). So after they 'return', when the therapist initiates some ideomotor / cataleptic response, it is readily acquiesced to as the ‘pleasant surprise’, and experienced as such i.e self-fulfilling suggestion / prophecy made during trance is ‘realised’...it is defined as the fulfillment of that ‘prophecy’ / suggestion implanted during trance ... MHR so a messiah is ‘seeded’ in everyone’s minds, and when someone is trumpeted as being that messiah, it is readily accepted as the logical fulfillment of that long awaited / expected savior etc...also predictive programming similar...prime people to ‘understand’ the ‘meaning’ of something in advance...e.g set up ‘buzz’ for ‘Intel’ or other new product or political clown in jew world order political circus...

**Surprise in a posthypnotic suggestion** heightens expectancy while providing a failsafe channel for the expression of the patient's individuality after awakening. Consider the following posthypnotic suggestion, which is most appropriately offered at the end of a period of successful trance work during which the patient is in a positive mood and experiencing a yes set.

Would you like to experience a pleasant surprise after you awaken?
A patient who responds in the affirmative to this question (by head nodding, finger signaling, verbal response, smiling, and so on) is in the following situation:

The positive yes set of the trance work is carried over into the posthypnotic period. Awakening is accompanied by a sense of heightened expectation and positive motivation to experience something new. The patient's usual conscious sets do not know what the surprise, the new, will be. The patient's habitual conscious and limiting sets are therefore depotentiated in favor of something new that can only come from the patient's own unconscious. The suggestion for a pleasant surprise has been given in the form of a question which in itself initiates an unconscious search that may uncover and permit a new potential or another aspect of the patient's individuality to become manifest. The suggestion tends to be fail-safe because whatever patients experience or report after a period of successful trance work can be accepted as a pleasant surprise. If patients are happily excited, that can be a pleasant surprise. If patients are more thoughtful and appear to lapse back into body immobility as they reflect on their trance experiences, the therapist can facilitate a surprise with a suggestion such as, As you notice how quiet your body is, it may be surprising how easily your eyes can close as you go back into trance to reach a complete understanding of that. The therapist may not know what that is, but whatever it is can be facilitated. When the patient experiences a surprise in some form after trance, a therapist's final comment such as And that was a pleasant surprise, wasn't it? Tends to ratify the therapeutic work that has just taken place as well as the value of trance as a valid approach to solving problems.

The therapist employs the same ‘spin doctoring’ techniques of the Jew World Order, of their lawyers, advertising account executives, propagandists, priests, agitators, and what ‘mind readers’, ‘cold readers’, ‘clairvoyants’, ‘palm readers’, ‘tea leaf readers’, ‘rune throwers’, ‘stick throwers’, employ as their main tool…ambiguity, vagueness, looseness, etc…so that it is INEVITABLE that something their dupe experiences can and will be interpreted by them as a confirmation of the ‘prediction’ offered by the ‘supernaturally gifted’ or ‘god-connected’ con artist / priest / sales executive / propagandist. You get ‘a-ha’ moments the person themselves construct on the flimsiest of grounds…by association, analog, metaphor, simile…so many roads to the same ‘confirmation of prediction’ or ‘suggested experience’ e.g people will see the sign of the cross in cloud formations, if primed in advance, and this is then suggested by an ‘authority’…’look, the clouds, they’ve formed the sign of the cross, this is a sign, who can deny it’ and who would deny it, and risk disapproval, rejection, abandonment by their tribe / group?

There are so many ‘inevitable’ behaviors people perform, usually non-consciously, that by directing their conscious mind to seek out something, they are sure to find something…that they would normally pay no attention
to...something routine and habitual...can now become a ‘verification’ or ‘confirmation’ of trance, or that some god exists, and is on their side in the field off battle, or that someone is a witch, or a terrorist, or a nazi ... I wouldn’t use the Jew world order suppled ‘communist’ example, as evidence shows that McCarthy was totally justified in his paranoia, and that the number of communists who had infiltrated U.S society was much larger than even HE imagined.

But of course the Jew World Order managed to associate McCarthyism with ‘witch trials’, such is their full spectrum hegemony.

Serial posthypnotic suggestions require much thought and planning. Together with contingency suggestions, associational networks, and double binds they can constitute an almost impenetrable thicket for snagging practically any random association or behavioral potential the patient may have and holding it fast to the therapeutic endeavor (MHR desired belief imprinting). A serial pattern of suggestions will mutually reinforce each other and, it is hoped, displace the patient's symptom.

Close observation of patients on the next visit after a successful trance induction can reveal automatic re-inductions on returning to the situation / condition /state / place / chair they were induced in...the therapy session context can induce trance by association i.e become conditioned to develop some level of trance merely by returning to the ‘scene of the crime’. Can utilise these to increase speed and depth of current trance induction. MHR like any institutionalized setting i.e formalized interactions e.g respect for authority, state of mind on entering a church / ceremony...any ritualized encounter has qualities of conditioning ... propaganda will re-trigger entire ‘education’ re: Nazism, holocaust etc...

Expressing the simple expectation of feeling rested and comfortable upon awakening from trance is generally a fail-safe, since such responses almost inevitable. To these inevitabilities one can gradually add suggestions particularly suited to the patient's needs.

Hypnotic alteration of sensory-perceptual functioning for coping with pain and facilitating comfort

Reducing pain from obvious somatic sources (such as accidental physical trauma, surgery, dentistry, obstetrics, cancer, and so on) as well as psychosomatic problems. Anxiety reduction.

Trance / hypnosis about inducing a more receptive state i.e to therapeutic (MHR and malicious manipulative) suggestions / directions, than normally possible in typical lucid / conscious state.
Aim to get patient in touch with own potentials for the control of his psychological and physiological responses and behavior.

Abolition of pain occurs in daily life situations where pain is taken out of awareness by more compelling stimuli that distract our attention away from it.

Everyone has had experiences of this nature, to prove the power of the mind in reducing pain. We simply draw our patients’ awareness to these, as proof of the power of the mind.

Pain that is ‘felt’ is conscious. But the same stimuli can be experienced without any consciousness of pain. In sleep, preoccupation, narcotics, and hypnosis, the same signals representing the stimuli to the brain do NOT result in any subjective feelings of pain.

Immediate pain is intensified by memories of past pain and the future expectation of pain, so that it can go from being a nuisance, to being an all encompassing source of despair. Expecting it will soon disappear, makes pain less threatening, intense, pre-occupying, and threatening. The ‘meaning’ of the pain has a huge impact on its impact. A pain that has continued from past to present, and looms large in the future, is a different animal altogether to a brief, new, temporary affliction. MHR The ‘experience’ of the actual here/now pain is thus modified by these factors. The herer/now experience occurs in this context of past and future. Expectations of future pain make the future a threatening thing. It is much easier to bear temporary pain you expect to have relief from.

MHR anxiety contributes much to stress / frustration, which intensify / amplify / augment the actual here/now pain by adding to it fear of future pain.

MHR facing pain, emotional and physical, one moment at a time is thus bound to reduce the ‘suffering’ involved…adding nothing to what is here/now… and then question of whether pain is at all possible in a moment…i.e does it have a minimum duration? A ‘cycle’? A wavelength? It takes time for most things to ‘develop’ i.e for a woofer cone to displace the required air to transmit the audio wave…if you lived in the moment, here and now, you could NOT have ANY context for anything…no ‘music’, not even a wave form, so not even a note would be possible…

MHR Hypnosis allows us to change the way a person RELATES to the impression being represented as ‘pain’. We can offer expectations that relief will come soon, and remove a preoccupation with the pain, with its past, and its future, removing it from these contexts, so that all we have to deal with is the actual stimuli here and now. We have, so to speak, already reduced the pain by two thirds, when we focus strictly on the here and now.
BUT MHR pain is feedback…if we ignore it, minimize it, we may be doing ourselves an injustice.

Secondary meanings resulting in varying interpretations of the pain can alleviate or intensify the subjective experience of pain. MHR no pain no gain, pain that is a means to a positive end e.g having a baby, winning a prize, glory, is clearly of a different nature to the pain of torture, or due to some stupid error such as pride or greed i.e self-inflicted pain maybe the worst subjectively.

Chronic long-term pain in an area of the body may result in a habit of interpreting all sensations in that area as automatically painful, long after the original stimulus is gone.

Iatrogenic disorders (mhr side effects of the treatment) and disease MHR can result when a doctor expresses negative expectations which the patient overhears or ‘reads’ in the doctors body language etc, and so the opposite, positive, self-fulfilling effects can be utilized to improve patient health, success of treatment, recovery times etc.

Pain motivates the patient to protect the painful areas, to avoid noxious stimuli and to seek aid, which is positive. It can however become a negative when it becomes ‘learned’ by association etc.

Pain can be described as dull, heavy, dragging, sharp, cutting, twisting, burning, nagging, stabbing, lancinating, biting, cold, hard, grinding, throbbing, gnawing etc

We can get patients to focus on these subjective qualities, to gain a history of success in dealing with the more minor properties, to build up self-fulfilling expectations when we come to tackle the more dramatic properties of the situation / condition / total pain profile and associated distressing experiences.

Any hypnotic alteration of any single interpretive quality of the pain sensation serves to effect an alteration of the total pain complex.

Remembered pain, past pain, immediate pain, enduring pain, transient pain, recurrent pain, enduring persistent pain, intractable pain, unbearable pain, threatening pain. There is a whole spectrum of meanings attached to the ‘objective’ stimulus, which make up our ‘response’ to it, our ‘representation OF it.

Direct hypnotic suggestion for total abolition of pain sometimes work, but usually is of limited duration, and as it does not work in the majority of cases, you risk sabotaging future attempts i.e failure, lack of confidence in efficacy, lack of faith, in any future attempts.
The permissive indirect hypnotic abolition of pain, worded and offered in a fashion much more conducive to patient receptiveness and responsiveness, is more often effective.

In everyday life we see the forgetting of pain whenever more compelling stimuli attract their full attention away from their pain, producing an amnesia for it.

We can use a combination of partial, selective, and complete amnesias in relationship to selected subjective qualities and attributes of sensation in the pain complex as described by the patient, as well as to the total pain experience.

A fourth hypnotic procedure is the employment of hypnotic analgesia, which may be partial, complete, or selective. Thus, one may add to the patient’s pain experience a certain feeling of numbness without a loss of tactile or pressure sensations. The entire pain experience then becomes modified and different and gives the patient a sense of relief and satisfaction, even if the analgesia is not complete. The sensory modifications introduced into the patient’s subjective experience by such sensations as numbness, an increase of warmth and heaviness, relaxation, etc. serve to intensify the hypnotic analgesia to an increasingly complete degree.

Hypnotic anesthesia is more often accomplished indirectly by the building of psychological and emotional situations that are contradictory to the experience of the pain and which serve to establish an anesthetic reaction to be continued by post-hypnotic suggestion.

Hypnotic replacement or substitution of sensations. E.G the suggestion of an incredibly annoying, though tolerable itch on the sole of the foot to fully absorb the person’s total attention, and thus distract and engage a their attention away from other chronic, intolerable, unbearable pain of a more threatening nature e.g associated with cancer or other potentially fatal condition. The itching is enough to distract, but it has a different meaning, offering no threat, and offering the expectation of relief from scratching in the near future. MHR.

Then hypnotically, feelings of warmth, of coolness, of heaviness and of numbness were systematically induced for various parts of her body where she suffered pain. And the final measure was the suggestion of an endurable but highly unpleasant and annoying minor burning-itching sensation at the site of her mastectomy. This procedure of replacement substitution sufficed for the patient’s last six months of her life. The itch of the sole of her foot gradually disappeared but the annoying burning-itching sensation at the site of her mastectomy persisted.

The patient is convinced pain MUST be associated with their condition, so you replace one unbearable threatening pain with a bearable, non-threatening one, to
change the entire character of the experience of pain. MHR like the old joke of stepping on someone's toes to make them forget their toothache, at least for a time.

**Hypnotic displacement of pain** is the employment of a suggested displacement of the pain from one area of the body to another, a.k.a referred pain. Pain in the hand, for example, is much more manageable, less inconvenient and frustrating, gets in the way of normal life activities, and is less threatening, than, pain in the head or stomach.

**Hypnotic dissociation** usually employing time and body disorientation to hypnotically reoriented a person in time to the earlier stages of his illness when the pain was much less, if often effective when drugs and other methods fail to provide relief. Ideally you would want to project a person back to a time before there was ANY pain, but this rarely works MHR the person expects SOME pain after the diagnosis, and will resist this all too obvious break with current reality.

**Body disorientation** is where the patient is hypnotically dissociated and induced to experience themselves as apart from their body. One woman would develop a trance state and experience herself as being in another room while her suffering body remained in her sickbed. I went into a trance, got into my wheel chair, came out into the living room to watch a television program, and I left my suffering body in the bedroom. She pleasantly and happily told about the fantasized television program she was watching. Another such patient remarked to her surgeon, You know very well, Doctor, that I always faint when you start changing my dressings because I can't endure the pain, so if you don't mind I will go into a hypnotic trance and take my head and feet and go into the solarium and leave my body here for you to work on. The patient further explained, I took a position in the solarium where I could see him (the surgeon) bending over my body but I could not see what he was doing. Then I looked out the window and when I looked back he was gone, so I took my head and feet and went back and joined my body and felt very comfortable. This particular patient had been trained in hypnosis by the author many years previously, had subsequently learned autohypnosis, and thereafter induced her own autohypnotic trance by the phrase, You know very well, Doctor. This was a phrase that she could employ verbally or mentally at any time and immediately go into a trance for the psychological-emotional experience of being elsewhere, away from her painful body, there to enjoy herself and remain until it was safe to return to her body. In this trance state which she protected very well from the awareness of others, she would visit with her relatives, but experience them as with her in this new setting while not betraying that personal orientation.

**Hypnotic reinterpretation of pain experience.** The reinterpretting for the patient in hypnosis of a dragging, gnawing, heavy pain into a feeling of weakness, of profound inertia, and then as relaxation with the warmth and comfort that
accompanied deep muscular relaxation. Stabbing, lancinating and biting pains may sometimes be reinterpreted as a sudden startle reaction, disturbing in character, but momentary in duration and not painful. Throbbing, nagging, grinding pain has been successfully reinterpreted as the unpleasant but not distressing experience of the rolling sensations of a boat during a storm, or even as the throbbing that one so often experiences from a minor cut on the fingertip with no greater distressing characteristics. Full awareness of how the patient experiences his pain is required for an adequate hypnotic reinterpretation of the pain sensation.

In the trance state, the patient was taught to develop an amnesia for all past attacks of pain. He was then taught time distortion so that he could experience the five to ten minute pain episodes in ten to twenty seconds. He was given posthypnotic suggestions to the effect that each attack would come as a complete surprise to him, that when the attack occurred he would develop a trance state often to twenty seconds.

**Hypnotic time distortion** is useful where a person experiences regular attacks of pain, and where the gaps between these attacks are ruined by the fear of the coming, expected, anticipated, painful attacks. In the trance state, a patient is taught to develop an amnesia for all past attacks of pain. They are then taught time distortion so that they can experience the five to ten minute pain episodes in ten to twenty seconds. They are given posthypnotic suggestions to the effect that each attack would come as a complete surprise to them, that when the attack occurred they would develop a trance state often to twenty seconds duration, experience all of the pain attack, and then come out of the trance with no awareness that they had been in a trance or that he had experienced pain. Thus the patient, in talking to their family, would suddenly and obviously go into the trance state with a scream of pain, and perhaps ten seconds later come out of the trance state, look confused for a moment, and then continue their interrupted sentence. MHR this is an extreme case of where ‘being here, now, and taking a Zen approach to life, becomes clear.

**Hypnotic suggestions effecting a diminution of pain**, - not a complete removal of the pain, are less likely to be resisted and rejected by the conscious mind. By suggesting that the diminution occur *imperceptibly*, the suggestion is made even more effective. It is impossible to deny / challenge such a suggestion. And so any slight diminution, real or merely possible, can be taken as proof that the therapy is working / effective i.e gives credence to the idea of trance / suggestion / hypnosis / the power of the unconscious to provide relief / solutions. The efficacy will more likely thus be validated, and produce self-fulfilling prophecies and placebo effects via faith in the process.
This diminution is usually best brought about by suggesting to the hypnotized patient that his pain is going to diminish imperceptibly hour after hour without his awareness that it is diminishing until perhaps several days have passed. He will then become aware of all pain or of special pain qualities. By suggesting that the diminution occur imperceptibly, the patient cannot refuse the suggestion. His state of emotional hopefulness, despite his emotional despair, leads him to anticipate that in a few days there may be some diminution; particularly that there may be even a marked diminution of certain attributes of his pain experience. This, in itself, serves as an autosuggestion to the patient. In certain instances, however, the patient is told that the diminution will be to a very minor degree. One can emphasize this by Utilizing the ploy that a one percent diminution of his pain would not be noticeable, nor would a 2 percent, nor a 3 percent, nor a 4 percent, nor a 5 percent diminution, but that such an amount would nevertheless be a diminution. One can continue the ploy by stating that a 5 percent diminution the first day and an additional 2 percent the next day still would not be perceptible. And if on the third day there occurred a 3 percent diminution, this, too, would be imperceptible. But it would total a 10 percent diminution of the original pain. This same series of suggestions can be continued to a reduction of pain to 80 percent of its original intensity, then to 70 percent, 50 percent, 40 percent, and sometimes even down to 10 percent. In this way the patient may be led progressively into an even greater control of his pain.

Always keep in mind that pain often serves useful purposes to the individual. It constitutes a warning, a persistent warning of the need for help. It brings about physical restriction of activity, thus frequently benefiting the sufferer. It instigates physiological changes of a healing nature in the body. Hence, pain is not just an undesirable sensation to be abolished, but rather an experience to be so handled that the sufferer benefits. MHR, but once we have acknowledged the pain, and thanked it for its warnings, and have taken all the reasonable measures to avoid / remove etc the ‘stimulus’ that is being interpreted and ‘represented’ as ‘pain’, we can offer the body alternative ways to represent that stimulus, to maintain the original message / feedback / warning, in a representation e.g ‘color gradient’, like a ‘fire hazard chart’ that provides the same information, without resort to any suffering. So we will calm down, breathe deeply, massage our neck and head etc, and stop whatever it was that was frustrating / irritating / stressing us out, but not need to resort to pain killers for the pain, which has served its purpose now, and is no longer required. MHR but society wants us to pretend there is no REAL problem, and to simply mask the screaming feedback that is yelling ‘this is no good, this is a problem, stop this etc, with a dulling pain killer, so that the person can ignore the feedback, the information, and continue serving as the mere means to someone else’s ends. Consider the emotional pain of an abattoir worker, abortionist, soldier, prison warden, or even unhappy housewife. The fire is hot, or the life is dull and unrewarding, but the ‘employer’ wants you to keep your hand in the fire, or stuck in that condition, as it suits THEM.
Conversational Approach to Altering Sensory-Perceptual Functioning: Structuring a Therapeutic Frame of Reference

W: Well this phantom pain—if we could lick that, it would be wonderful.

E: All right. Now I am going to give you a story so that you can understand better. We learn things in a very unusual way, a way that we don't know about. In my first year of college I happened to come across that summer a boiler factory. The crews were working on twelve boilers at the same time, and it was three shifts of workmen. And those pneumatic hammers were pounding away, driving rivets into the boilers. I heard that noise and I wanted to find out what it was. On learning that it was a boiler factory, I went in and I couldn't hear anybody talking. I could see the various employees were conversing. I could see the foreman's lips moving, but I couldn't hear what he said to me. He heard what I said. I had him come outside so I could talk to him. And I asked him for permission to roll up in my blanket and sleep on the floor for one night. He thought there was something wrong with me. I explained that I was a premedic student and that I was interested in learning processes. And he agreed that I could roll up in my blanket and sleep on the floor. He explained to all the men and left an explanation for the succeeding shift of men. The next morning I awakened. I could hear the workmen talking about that damn fool kid. What in hell was he sleeping on the floor there for? What did he think he could learn? During my sleep that night I blotted out all that horrible noise of the twelve or more pneumatic hammers and I could hear voices. I knew that it was possible to learn to hear only certain sounds if you tune your ears properly. You have ringing in your ears, but you haven't thought of tuning them so that you don't hear the ringing.

Since rapport and response attentiveness were already established with this couple, the senior author was able to immediately structure a therapeutic frame of reference with this story about how the unconscious automatically learns to adjust our sensory-perceptual functioning in an adaptive manner even when we are asleep. He does not tell them in a direct and intellectual manner that they will have to learn to alter their sensory-perceptual functioning. If he did, they might find some issue to argue about or, as so commonly happens with patients who have experienced a great deal of failure, they might immediately plead that they could not alter their functioning; they would not know how to do it, or would not be able to believe that it could happen to them. His stories about himself and the illustrations he continues to present are all established facts that together structure the basic frame of reference which the couple will need for their therapeutic work. He continues now in a rather humorous vein.

It is so hard to convince someone who doesn't wash often enough that he has to wash more often. He doesn't smell himself!
What people don't know, that they can lose that pain and they don't know they can lose that ringing in the ears.

All of us grow up believing that when you have pain, you must pay attention to it. And believing when you have ringing of the ears that you must keep on hearing it.

Erickson tells his anecdotes and then once he ‘has’ his listener, he gradually begins to intersperse therapeutic suggestion (in italics) about how they can learn to tune out their ringing in the ears (MHR I use it as biofeedback i.e audio feedback when I am not attending to my stress levels i.e start deliberate calming measures e.g deeper breathing, relaxation) and he can lose their pain. Because these suggestions are interspersed within a network of stories they are interested in hearing, the patients tend to accept the suggestions (without even realizing that therapy is taking place) particularly since the senior author moves quickly on to another interesting anecdote before they can protest or reject or even think about the interspersed therapeutic suggestions.

Erickson has not made any effort to induce a trance in a formal manner, but his stories are so absorbing the couple's attention that they are actually a bit entranced.

They simply sit quietly with their eyes fixed upon him. They are obviously relaxed and oblivious to anything else that might be going on around them. They are exhibiting a state of response attentiveness that is ideal, for the receptivity will enhance their experience of therapeutic trance.

Once listener has entered ‘yes set’, agreeing with all the anecdotes that applied to other people, it is agreeable to accept any suggestions that he might learn to do the same as those other people in the stories. MHR we have ‘yes’ ‘agreement’ ‘acceptance’ momentum! A high degree of expectancy for a therapeutic response has been created.

Erickson frequently trains people to go into trance by counting from 1 to 20 and to awaken by counting backward.

It is usually quite easy for patients to experience relief from their symptoms during autohypnosis. The problem is when they come out of it. The challenge is to extend this comfort for longer periods - second by second, by geometric progression. The senior author then asks them if they can extend their symptom-free condition for one second after trance today. Then double it to two seconds tomorrow. And double it again to four seconds the day after. If they continue doubling the amount of symptom-free time in this geometric progression every day, in eighteen days they will be extending it for more than twenty-four hours.
And your next problem is learning to keep that good feeling a second longer. And two seconds longer. Then four seconds longer. And six! And eight!

Blood pressure changes according to where the blood is. When you go to sleep at night, your blood drains out of your brain and into a plexus, a collection of blood vessels in the abdomen. You wake up and blood pressure is increased and shoves blood back into your brain.

You can think about increasing your heart rate and you can speed it up. And you can do it comfortably and easily. So long as you know that you can do it.

Erickson always casually mentions how a momentary or temporary return of a symptom can be a normal signal about the body's functioning rather than the persistent return of the symptom or illness per se. This forestalls many lapses back into illness.

One of Erickson’s favorite approaches to trance training is to have a new subject watch another more experienced subject go into trance.

Therapists can train themselves to be able to measure someone’s pulse visually, by observing a vein on the temple, throat, or arm.

It is possible to learn to dissociate one's attention, or put one part of a body in trance, to increase trance depth or cope with symptoms.

Symptoms may seem constant and unchanging. Yet invariably there are moments when we are so distracted that they are outside the central focus of our awareness. This little-recognized fact is usually received with a sense of surprise by patients - a surprise that further depotentiates their old symptomladen frame of reference and initiates a search on an unconscious level for those unconscious processes that may now be utilized for symptom relief.

Our main, very difficult learnings we achieve without knowing that we are achieving those learnings. You can learn easily things about yourself and learn them without needing to know that you have learned them. That you can use those learnings without needing to know that you know those learnings. I am going to ask both of you to awaken gently and comfortably.

You can use those learnings without, needing to know that you know those learnings, contains some subtle implications. The patients can learn to use paintransforming mechanisms on an unconscious level to such an automatic degree that they need not even know they are successfully dealing with pain. Since consciousness is not even aware of the automatic operation of these newly learned pain-control processes, consciousness need not know about the presence of current and future pain. The senior author has emphasized that pain has three
components: (1) memories of past pain, (2) current pain, and (3) anticipation of future pain. His last suggestion can be understood as a means of coping with the latter two without giving consciousness an opportunity to dwell on the process and possibly interfere with it.

This approach is to be used with appropriate clinical caution. Where the pain does not serve any useful function as a signal about body malfunction that their physician needed to know. Thus their pain could be eliminated completely for optimal relief. When pain is an important signal about a body process that the physician needs to know about, then the presence of pain should certainly not be eliminated from consciousness entirely. In such cases the pain can be transformed into a warmth, coolness, itch, numbness, and other symptoms. The aversive quality of pain is thereby eliminated, but its signal value is maintained.

Because of the relative lack of associative bridges, trance events tend to remain dissociated from the patient's habitual frameworks and may thus become amnesic. MHR the trance events are non-sequitur from what came before or follows, so it has no ‘meaning’, no ‘traction’, no ‘significance’, no ‘context’. Erickson deliberately rambles on before the trance, induces the trance and makes the suggestions, then continues his previous ramble, as if there had been no intermission, and no suggestion. This is to encourage non-recollection of the suggestion. This prevents the patient's limited and maladaptive belief systems from later working and possibly undoing the suggestions accepted during trance. The amnesia also tends to vividly ratify trance as an altered state for the patient.

Have person gradually convert e.g. a ringing in the ears, first into a melodic ringing, then ringing in time, tune, pitch with their favorite music, until gradually they have replaced the ringing with their favorite music, so it is not nuisance any more, and then can chose to hear it or not.

Erickson used a very dramatic approach to establish rapport, response attentiveness, and trance induction, where clients showed extreme doubt, resistance, negativity, hostility about efficacy of process. Often the doctors who had previously treated them had conditioned them to reject trance, hypnosis as a waste of time and money.

Trance is most effective on psychogenic origin, like that of phantom limb pain (MHR though nerve ENDINGS intact, so possibly really being triggered by severed ends of nerves?)

An unusual trance induction.

A case where Erickson worked simultaneously with husband and wife. This couple was in their early twenties, however, and they came to therapy in a very negativistic and doubting mood. Because of their extreme doubts Erickson used a
very dramatic approach to establish rapport, response attentiveness, and trance induction.

Archie and Annie were high school sweethearts. They were idealists who went ahead with their plans to be married even after Archie's back was broken and his spine severed in the Viet Nam war. Archie had returned to civilian life permanently in a wheelchair with intractable back pain. His physicians said he would have to learn to live with it. They had warned him against any sort of black magic with hypnosis, which was certainly not worth his time. Archie and Annie nevertheless wanted to try, although by the time they came to their first interview they were in a hostile, negative, and doubting mood regarding their prospects.

E: Annie, you are not to move off that carpet. And you are not going to like what I am doing. It will be offensive to you. It will be offensive to Archie. Now here is a strong oak cane, Archie. You can hold it and you can clobber me at any moment that you think I am doing wrong. You won't like what I'm going to do, Archie, but watch me carefully and clobber me just as soon as you think it is necessary.

Now I'm going to take this other cane and you watch what I'm doing. You will feel what I'm doing Annie. Archie will see what I'm doing. I will stop as soon as you close your eyes and go into a deep trance.

The senior author gently and tentatively touched about her upper chest area with the tip of his cane and then began to gingerly push the upper part of her dress apart, as if to expose her breasts. She closed her eyes, remained rigidly immobile, and apparently went into a deep trance. She had to escape the unpleasant reality of that cane. As soon as she closed her eyes and manifested a trance state, Archie was so surprised he almost dropped his cane.

Erickson was channeling their very evident hostility and vague doubts about hypnosis in general into a very specific rejection of Erickson's behavior.

The poking cane certainly fixated her attention, and the shock of it all certainly depotentiated whatever conventional mental framework she had about how doctors behave and what hypnosis was about. As she stood there, desperately uncertain about what was happening, she was sent on an unconscious search for the trance-inducing processes within her own mind that would release her from her embarrassment. The senior author said he would stop only when she went into trance. She could only escape the unpleasant poking by going into trance. She need not reject the whole situation outright, because, after all, her husband was right there with a stout cane supposedly protecting her. By giving Archie the cane, the senior author was very carefully giving him a channel through which he could focus his hostility. He was also fixing Archie's attention so intently that the
young man was in that state of intense response; attentiveness characteristic of therapeutic trance as he watched the unorthodox proceedings with disbelief. Thus his general doubt and disbelief about hypnosis could now be channeled, displaced, and discharged onto the apparently ridiculous behavior he was witnessing. Without quite realizing it, he also became convinced that Erickson could perform the unspeakable, the unorthodox, and, by implication, an unusual cure.

E: Annie, when you awaken, you can sit in your chair, and no matter what you think, whatever I say is true. Do you agree to that?

[Annie nods her head yes repetitiously in the slight and slow manner characteristic of the perseverative behavior of trance.]

Whatever I say is true, no matter what you think.

This was a carefully formulated two-level suggestion: (1) No matter what you think is a phrase recognizing her conscious doubts that enables Erickson to focus her attention by utilizing her own mental framework of doubt and resistance. She could think whatever she liked within this doubtful frame. At the same time (2) on an unconscious level she was to make true or real whatever Erickson was to later suggest. We could also say that two realities or belief systems were permitted to coexist side by side in a more or less dissociated manner: (1) The conscious belief system of doubt and resistance to hypnosis that she brought to the therapy situation, and (2) the new reality of hypnosis Erickson was introducing in such a suddenly shocking manner that neither she nor her husband could properly evaluate and understand it. She was permitted to indulge in her previous belief system even while Erickson's reality was being introduced in a manner that she could not avoid or resist. Whatever the doubts or resistances of her previous beliefs, she was certainly not prepared to cope with a cane probing her dress while her husband stood poised with another heavy cane ready to clobber the crippled doctor. Since her conscious mental framework could not cope with the situation, her unconscious had to intervene with the appropriate responses of going into trance and accepting Erickson's suggestions.

The senior author assessed and deepened her trance by obtaining her positive response to his two-level posthypnotic suggestion. He then asked her to awaken and sit down. She sat down with a look of expectation, doubt, and hostility. He then addressed her as follows.

E: Now you are awake, Annie. You don't know what has happened. You can think that you wish you knew, but you don't know.

With this the senior author was stating the obvious. Certainly Annie did have questions on her mind about what, if anything, had happened. Thus the truth of
the first part of the statement, You can think that you wish you knew opened a
yes or acceptance set for the critical suggestion that follows, but you don't know.
This suggestion is critical because it implies that something important did
happen, but she does not know what. The implication that something happened
means she may no longer be what she has always experienced herself as being.
The something that happened may be hypnosis; it may mean she now will be able
to experience whatever reality Erickson is going to suggest. The not knowing
thus opens a gap in her belief system that initiates an unconscious search for the
internal resources (unconscious processes) that will be needed to carry out
Erickson's further suggestions. Not knowing thus facilitates the utilization of
inner resources that she had never been able to contact previously in a voluntary
manner.

E: Aren't you surprised you can't stand up?

With this suggestion in the form of a question, Annie did indeed experience
amazement at not being able to stand up. The senior author said she would be
surprised, and she certainly was. His question quickly filled the gap and
expectation that had been opened in her belief system by setting into operation
mental processes that somehow prevented her from standing up. Annie probably
did not know why she did not stand up. Neither was she aware that the senior
author had also prescribed her reaction of "surprise at not being able to stand up.
Certainly it was true that she would be surprised at not being able to stand up. His
question was thus another obvious truism that anyone would have to accept. Even
without the previous gap having been opened in her belief system, this question
of surprise could stand as beguilingly effective suggestion that anyone would
have to accept as true. And most would also experience its implication of the
involuntary behavior of not being able to stand.

E: No matter how hard I struck you with this cane, you would not feel it. And
suppose you take your hand and hit yourself hard on the thigh. It's difficult for me
to come over and do it myself, so go ahead. Hit yourself as hard as you can on
your thigh. It won't hurt!

With this Annie did indeed strike a numb thigh and was startled at the effect. She
replied, I felt it in my hand but I didn't feel anything in my leg. Having
successfully experienced one fairly easy hypnotic phenomenon in not being able
to stand, Erickson judged that she was now ready to experience the really
important phenomenon of anesthesia. He made a veiled threat with the thought of
striking her with his fearsome cane, so that she cannot help but feel some relief at
being permitted to test the anesthesia by herself. Erickson then offers further
relief with the fact that he really cannot come over to her (since he is crippled)
and thus reinforces her further for a successful self-test of anesthesia. Erickson
(Erickson, Rossi, and Rossi, 1976) has stated, the unconscious always protects
the conscious. Certainly Annie did feel a need for protection at this moment. The protection came from her unconscious, which effectively mediated the neuropsychological mechanisms that permitted her to say she had indeed experienced an anesthesia in her leg. Pressing on, the senior author now extends the anesthesia further.

E: Now Annie, you can hit your thigh again but won't feel it in either your thigh or your hand.

The senior author now generalizes her successful anesthesia of the thigh to her hand by associating them together in this strong direct suggestion. Annie then slapped her thigh again and exclaimed, I heard that slap, but I didn't feel it in my hand or my thigh. Thus Annie spontaneously confirmed the reality of the anesthesia to her husband. He could doubt Erickson's explanations, but he could not doubt his wife's reactions. Hence the negative attitude induced by his physician was not disputed by his witnessing Annie's experience - it was depotentiated. That is, he was now experiencing a suspension of his previously doubtful and disbelieving frame of reference. Before he could reassert his doubt, Erickson quickly introduced him to a formally labeled trance.

E: You heard that, Archie, you can go into trance now.

Annie's experience was an effective use of modeling hypnotic behavior for her more resistant husband. The senior author then formally induced trance with a compound statement. You heard that was an undeniable truth that opened an acceptance set for the suggestion, Archie, you can go into trance now. Archie could not deny the reality of his senses regarding his wife's experience, and thus had to accept Erickson's suggested reality of trance.

E: Now, Archie, you've had many long years of happy feelings. Why not get those happy feelings back? You've had all the pain you need.

With such suggestions the senior author began to evoke Archie's sense memories of previous years of good body feelings before his back injury. These memories of good body feelings will be utilized to replace his current pain. Notice the therapeutic pun contained in the phrase happy feelings back. Without realizing it Archie was receiving associations of happy feelings with his injured back.

E: I cannot guarantee you against all future pain, but I can tell you to use pain as a warning.

With such suggestions Archie was able to experience considerable relief from pain. A few months later he caught the flu and telephoned Erickson for a booster shot, since with the flu there was a recurrence of back pain.
Hypnosis and therapeutic trance refer to focused concentration, focused attention, directed in the best manner possible to achieve the patient's goals. You can facilitate that with anyone whose motivations and needs you understand.

E: When I want a patient to develop an analgesia, I'm very likely not to mention this question of analgesia. I'm very willing to let the patient tell me all about that pain until I can see from the expression on his face that he thinks I understand. I'm not averse to saying a few things, little things that makes the patient think I do understand. And then I'm very likely to ask him some simple question that takes him far away from this question of the pain: Where did you spend last summer? The patient can be rather surprised at that question about last summer. Last summer he didn't have that pain. We can go into the question of the pleasures and joys and satisfaction of last summer. Emphasize comfort, physical ease, joys, and satisfactions, and point out to the patient how nice it is to continue to remember the joys and satisfactions of last summer, the physical ease of last summer. When the patient seems to be getting just a little bit edgy, I remind him of when he was rowing the boat and got that blister on his hand. It hurt quite a bit but fortunately healed up.

I haven't been afraid to mention hurt or pain or distress, but it is far away from that backache the patient started telling me about. I've mentioned pain from a blister due to rowing a boat last summer and I haven't been shocked by that uneasy expression on his face.

In hypnosis your task is to guide the thinking and the association of ideas that the patient has along therapeutic channels. You know very well that you can have a painful spot on your body and go to a suspenseful movie and lose yourself in the action on the screen and forget all about that pain in your leg or the pain in your arm, aching tooth or wherever. You know that, so why not do exactly the same sort of thing with your patient? If you are operating on a patient in your office and you are aware of the fact that it can cause pain, you can direct your patient's thinking to an area far removed from the pain situation.

I'm thinking of a patient of mine who said, I'm afraid to go to the dentist, I agonize so much, I perspire so frightfully, I'm in absolute misery. I asked the patient immediately, Did you do that as a child? I was listening to her complaint about pain, anxiety, distress, and I asked her what she did in her childhood. I made good contact with her by talking of the distress she was interested in, but I shifted to another frame of reference - childhood. She now talked about her childhood distress, but that was so far away that it was less disturbing and she felt a bit more comfortable. My next step was to ask her what her favorite pleasure was as a child. Now, how do you get from
pain, anxiety, distress, to pleasure as a child? In this case it took only two associative steps. It was so delightful to switch and discuss with me a favorite activity of her childhood. Now she discussed this pleasure in immediate connection with my first question of her experience of distress in childhood. By that immediate succession of questions I tied the two together—distress and favorite activity.

After she told me all about her favorite pleasures as a child, one in particular, I suggested that when she went to the dentist's office, she should really settle in the dental chair. As she really squirmed around in the chair and really felt her seat on the chair seat, her back on the back of the chair, her arms on the arms of the chair, and her head on the headrest, she would have an overwhelming recollection of her favorite childhood activity that would absolutely dominate the entire situation. Now, what had I done? I had taken the painful realities of the dental chair, squirming around trying to get a nice comfortable seat (and I wiggled around in my seat to role-play the way I wanted her to find herself in that dental chair), and associated it with one of her favorite childhood activities. The thing that she remembered was playing in the leaves on the lawn. In the autumn you can build great big houses out of the leaves, nice pathways through piles of leaves, you could bury yourself in the leaves. You could squirm around and get nice and comfortable in those leaves and the rest of the real world would seem far away.

With that she simply went into a very nice anesthetic trance in the dentist's office without any direct suggestions for anesthesia. Now and then the dentist would ask her some stupid question when she really wanted to think about the leaves. The dentist thought that she was an awfully cooperative patient. Mentally she would notice that here was some stupid person trying to talk to her when she was burying herself in the leaves, probably some grownup yelling at her, but she was more interested in the leaves. She could have dental surgery done and not be bothered by it.

You can achieve anesthesia indirectly by shifting the person's frames of reference. In this case the critical shift was to, What was your favorite activity as a child? And then I could really elaborate on that. In other words, you very carefully raise a question.

You raise it in such a way that you can slide past the difficulty and start up another train of mental activity, of emotional activity, that precludes the possibility of feeling pain. Some of my sophisticated subjects with training in clinical psychology and psychiatry, that I have used as subjects, will pick apart the technique that I have used on them. They then recognize the validity of it from their own experiences. They will have me employ precisely the same
techniques on them again because they know that they are human and that you can do the same thing with pleasure, over and over again.

I think it is an error to always strive to get an anesthesia or an analgesia directly. I think you should be willing to accomplish them indirectly because every time you ask somebody, forget that this is a watch, you're asking them to do a specific thing - to forget - to forget what? A watch. Now, remember, forget that watch. That's what you're saying when you say, "Forget the watch. But you can ask them.

MHR Buddha taught this too, to replace / displace a negative thought / idea / feeling with a positive one, rather than trying to resist / challenge / NOT think the bad / negative / painful one.

Now the next thing that you should bear in mind is that when you take away the sense of feeling, anesthesia or analgesia, you've asked your patient to make a different kind of a reality orientation. In some of my earliest experimental work I asked students to discover what the mental processes were in picking up an imaginary apple and putting it on a concrete reality table in front of them (Erickson, 1964). What are the mental processes? A goodly number of the students complained of feeling funny all over and gave up the task; they left without completing the experimental situation. They were losing their contact with reality. Therefore, they felt funny. Now when you induce an analgesia, you are asking your patients to lose a certain amount of their reality contact. You are asking them to alter it. Then they begin to feel funny - they may recognize it or they may not. But they can react to that by getting out of the situation because it is strange and uncomfortable. Therefore, whenever you induce an analgesia or an anesthesia, you must see to it that your patients don't get frightened in one way or the other by the loss of their usual reality relationship. I let those students feel funny all over and let them run out on me because it was an important experimental finding that I wanted to study.

MHR the huge challenge facing anyone trying to 'update' their own or other person's 'definitions of reality i.e maps / models / belief systems / beliefs / faith is this discomfort / fear of the BARDOT i.e the absence of 'what I know' of 'the known and comforting / reassuring'.

In working with patients in the office, when they get a funny feeling, whether they recognize it as a funny feeling or they just experience it as discomfort, they want to run out, too. But they can't afford it, and neither can you. Therefore, it is
your obligation to tell them that one of the astonishing things is that as they begin to feel more comfortable or they get more and more interested in this or that, perhaps they will notice the light in the office is of a softer hue. Quite often I have told patients in my office, I hope you don’t mind here as we continue our work if the light automatically dims and becomes softer or lighter.” Whenever their reality orientations are altered, I know patients are going to tell me the office is getting lighter or darker, or getting warmer or colder, or they feel afraid, or that they feel the office is getting bigger or smaller, that they are feeling taller or shorter. They get all manner of changes in their sense of reality whenever we explore anesthesia or analgesia. These spontaneous sensory-perceptual alterations are all indications that the patients’ reality orientations are altered; trance is developing whether a formal hypnotic induction has been carried out or not. As patients learn to be more comfortable with these spontaneous alterations, they can allow themselves to go deeper into trance. They learn to give up more and more of their generalized reality orientation (Shor, 1959), and they become more capable of experiencing all the classical hypnotic phenomena as well as achieving their own therapeutic goals.

MHR Milton Erickson clearly identified his task as that of bringing about a hypnotic state in which he could stimulate her unconscious to use her past learnings in a therapeutic manner. We all have a repertoire, have experienced, have produced in ourself, every phenomena that trance / hypnotic therapy seeks to employ therapeutically, to provide relief from a particular ‘problem’ or ‘symptom’. E.g we have all experienced trance states, forgetting of pain during great book or other distraction, ‘referred’ pain i.e feel pain in one area when stimuli really in another, amnesia for memories i.e forgetting, positive and negative hallucination e.g not seeing keys on table, and seeing things that aren’t there e.g curtain ‘seen’ as a girl sitting in the window, pot plant ‘seen’ as menacing face i.e Gestalts interpreted according to our expectations / current thoughts…waking to see spiders that aren’t there, as eyes adapt to being open, being certain of a ‘fact’ that turns out to be untrue, even concerning something we ‘saw’ or ‘heard’ or ‘confidently recall’ or ‘are sure of’. The therapist can use these typical capacities for time distortion, amnesia, anesthesia (where you forget pain, or don’t notice it e.g focused / intently concentrating-attending to something else e.g running from vicious dog) or watching engaging scene / film/ reading / lost in reverie / thought / daydream, which we DO have experience of but have forgotten or don’t think about…telling stories helps us remember our own latent potentials, what we’ve already done / experienced / managed, and thus can employ for our own benefit again, as the means to relieving / solving some particular challenge / symptom / problem.(copied to intro)
I didn't want to try to struggle in a futile way when the woman had already learned morphine had no effect on her, when Demerol, no matter how large the dose, seemed to have no effect on her. I didn't want to try to struggle with her and tell her she should go into a trance, because that would be a rather futile thing. Therefore, I asked her to do something that she could understand in her own reality orientations. I asked her to stay wide awake from the neck up. That was something she could understand. I told her to let her body go to sleep. In her past understandings as a child, as a youth, as a young woman she had had the experience of a leg going to sleep, of an arm going to sleep. She had had the feeling of her body being asleep in that hypnagogic state of arousing in the morning when you are half awake, half asleep. I was very very certain the woman had some understanding of her body being asleep. Thus the woman could use her own past learnings. Just what that meant to her, I don't know. All I wanted to do was to start a train of thinking and understanding that would allow the woman to call upon the past experiential learnings of her body.

The next thing I asked her to do after her body was asleep was to develop an itch on the soles of her feet. How many people have had itches on various parts of their bodies? Miserable itches, uncontrollable itches, distressing itches. We all have had that sort of experience, therefore I was again suggesting something to her that was well within her experience, within her physiological, psychological, neurological experience; within her total body of learnings. I was asking her to do something for which she had memories, understandings, and past experience. I was very, very urgent about this development of an itch. The woman shortly reported to me that she was awfully sorry she could not develop an itch. All that she could do was to develop a numb feeling on the dorsum of the foot. In other words the woman was unable in her state of pain to add to her state of pain. She did the exact opposite. She developed a feeling of numbness, not on the sole of the foot, but on the dorsum of the foot.

Now, what was my purpose in seeing her? That is the thing that all of you should keep in mind in dealing with patients. You are seeking to alter their body experiences; their body awareness; their body understandings; their body responses. Every change that develops should be grist for your mill, because it means that the patient is responding. When Cathy told me she had the numbness on the dorsum of the foot, I accepted that as a most desirable thing and I expressed regret, politely, that she had not been able to develop an itch. Why did I express a polite, courteous regret that she had not developed an itch? Why should I criticize or find fault with my patient's responses? I should be gracious about it, because Cathy had a lifelong history of experience with people who had been courteous, who had expressed regret, and who thereby put her at ease since earliest childhood in various situations. Cathy had a background of experience into which my courteous regret could fit.
Now the point I am trying to establish is this: When you talk to patients, talk to them to convey ideas and understandings in such a way that your remarks fit into the total situation with which you are dealing. You try to elicit an ever-widening response on the patients' part so that they respond more and more with their experiential learnings, with their past memories and understanding. Cathy could accept my apology and feel obligated. Since she failed me in one regard, she could feel obligated to put forth more and more effort on the thing that I accepted. While accepting Cathy's numbness on the dorsum of her foot, I also utilized her own background and personality to intensify her efforts to please me. Since I had been so gracious in accepting her failure to produce the itch, I intensified her motivation to cooperate with me in any further tasks.

The next thing I did was to suggest that the numbness extend not only over the dorsum of the foot but perhaps to the sole of the foot and the ankle. Well, of course, in suggesting the sole of the foot where Cathy had failed to put an itch, she would be all the more eager to produce the numbness. As surely as she did that, she would be obligated to develop a numbness of the ankle. Of course Cathy had had plenty of experience being unaware of the sole of her foot, unaware of her ankle. Cathy knew what numbness was, and she had body learnings of those things. Therefore, when I asked her to do those things, she could make a response. Now Cathy was not paying any attention to her bed, to the pictures on the wall, to the presence of the other physician with me, to the tape recorder that was in full view. Cathy was directing her mental attention to her body learnings. In the use of hypnosis you need to be aware of the total unimportance of external reality. Now as Cathy developed the numbness in the sole of her foot and the numbness in her ankle, she withdrew more and more completely from the reality of the room. She was giving her reality orientation to her body, not in terms of cancer pain but in terms of body learnings of numbness. Cathy became very greatly interested in letting the numbness progress from her ankles to the calf, to the knee, to the lower third of the thigh, the middle third, the upper third, having it cross over to the other side of her pelvis and go down the other leg so that

she had a numbness from the umbilicus down. Now that interested Cathy. At that moment, of what interest was the ceiling, the bed, the doctor, the walls, or anything else? Cathy's interest was directed to that state of numbness just as dental patients should be so fascinated by the thought of the control of capillary circulation, by the thought of dental anesthesia, by the thought of learning how to chew their food with a different kind of bite so that they won't have temporal mandibular pain. The thing that interests the patients, the reason they are in your office, should be the point of orientation.

With Cathy oriented to the numbness of her leg and pelvis it was a simple matter to extend the numbness up to her neck. Cathy had metastases throughout her torso, she had lungmetastases, metastases in the bones in the spine as well as the
bones of the pelvis. When you consider that sort of thing, you make every effort to extend the numbness. Here is a patient who knows that she is going to die within a few months. She has been assured of that by physicians whom she trusts and believes, so death is an absolute reality, while the walls of the room, the bed itself might not be an important part of reality. This matter of impending death, this matter of her family, was an unforgettable reality, and so in dealing with her experience of pain it was necessary to include some of the ordinary reality of her daily existence. Cathy had had that cancer for about a year. If I want to help Cathy, I have to organize any hypnotic suggestions that I give her in such a fashion that they incorporate some of Cathy's own thinking, some of Cathy's own understanding. The first thing I did for Cathy in the matter of numbness of the chest was to mention that her cancer first started in her right breast and then to mention that there was still an area of ulceration at the site of the surgery and that that ulcerated area was painful. That is a bit of external reality but it is also a bit of body reality, because Cathy could look down at that ulcerated area, which made it external to her because it was something she was looking at. The pain was a personal experience within her body. The visual thing was external and unpleasant and disagreeable, and that external vision could threaten her life. The pain and distress was an internal experience so far as Cathy was concerned. Therefore, I made Cathy aware of some of the external environment. She was already aware of the internal environment, so I merely made certain to include external environment, but an important part of external environment. The walls in her bedroom, the pillows on her bed, weren't important parts of external reality, but her visual impression of that ulcerated area was a most important part of her external orientation, and so I directed her attention to that.

Cathy had expressed regret because she had not been able to develop an itch on the sole of her foot. What should I do? Now, too many operators, too many people who use hypnosis try to be perfectionists, they try to accomplish too much. That is one of the reasons for failure in many instances - the effect to try to accomplish too much. Any student in high school or college will tell you: certainly I can't make 100, I might make 95, or I might make 90, I can't do better than an 85, I am lucky to get an 80. We have that sort of an orientation. Even the expert marksman says: I hope to get 10 out of 10, but I am not at all certain of that. Expert bowlers would like to make a certain score, but they never really honestly expect in every game to have a perfect score; they expect a certain amount of failure. Those who use hypnosis had better bear in mind that the patients they are working on have a lifetime of experience in expecting a certain amount of failure. You, as the therapist, ought to utilize, you ought to go along with, the patients, and you ought to be the one that picks out the area of failure.

Therefore, in suggesting relief I was very very careful to ensure a certain percentage of failure. What had failed Cathy in the first place? Her first failure was in that right breast, that is where the cancer started, that is where she had her
first sense of personal failure. Her right breast had let her down. Her right breast had doomed her. There is no way of getting around that understanding on Cathy's part. That right breast had doomed her. So now I express my sorrow, my regret that I couldn't take away the pain at the site of that awful ulcerated area on her chest. I recognized aloud to Cathy that that was a minor pain, a minor distress, and I was awfully sorry that I failed. Now Cathy could agree with me, and she could agree with me when I wished that I could produce the same numbness there that I had produced elsewhere in her body. In other words I made use of the double bind: As long as she had distress at the breast area, she had to have numbness elsewhere in her body. Thus I had all of Cathy's general experience substantiating the numbness of most of her body.

Now, there is nothing magical about what I did - it was a recognition of the thinking that Cathy would do . . . the thinking and the understanding that would derive out of Cathy's ordinary life. A woman who grew up in this culture, in this age, would have certain learnings as a result of just being alive. Now, when I left that minor pain, that minor distress, it proved that I was not God. It just gave Cathy another goal to strive for, even though she had the feeling that she would fail as far as this minor pain was concerned. Cathy lived from February, when I saw her, until August. She lapsed into coma and died rather suddenly. But during that length of time, Cathy was free of pain except in this one particular area, but as Cathy said, she didn't hold my failure against me. Why should she? By letting her keep that minor pain, I ensured the success of the rest.

When I first approached Cathy, I had no understanding at all about how I could produce a relief of pain for her, because I didn't know her. I knew nothing really about the uniqueness of her own individual learning. My initial task was to say something that would get Cathy's attention and allow her to make her own personal responses. I then utilized those responses. In the use of hypnosis in medicine, dentistry, and psychology there is a need to explore the kind of thinking and responding that is characteristic of the individual patient. We need to recognize the actual unimportance of what we say as being the goal to be achieved. The importance of what we say lies in its being a stimulus for the elicitation of responses peculiar to the patient. We then help the patients utilize these responses in new ways to achieve their therapeutic goals.

A Tiger Under the Bed

A woman dying of terminal cancer was brought to Erickson's office in an ambulance. She was in desperate pain, and drugs no longer diminished it. She was frankly skeptical of hypnosis and immediately told Erickson of her doubts upon entering his office. He proceeded impressively as follows: Madam, I think I can convince you. And you know how much pain you are suffering, how uncontrollable it is. If you saw a hungry tiger walking through that doorway,
licking its chops and looking at you, how much pain would you feel? She was apparently stunned by this unexpected question and said, Not a bit. In fact, I'm not feeling any pain now either. Erickson then replied, Is it agreeable to you to keep that hungry tiger around? She said, It certainly is! All the associations to hungry tiger had so focused her attention that she was in a walking trance, from which she need not be awakened. She presented the entire appearance of being awake in all other respects. Yet she could see and experience the presence of that tiger at any time, day or night. The hypnotherapist simply evokes surprising sets of emotional, cognitive, or behavioral responses to interfere with the symptoms he needs to alter.

The senior author then told her that her doctors and nurses might not believe it, but she now experienced the truth of pain relief. And, indeed, her physicians and nurses did not understand. Whenever they came to offer her an injection for pain relief, the woman responded with a warm smile, No, thank you, I don't need any. I have a hungry tiger under my bed. They suspected she was hallucinating and perhaps losing contact with reality, but in those last months of her life she lived in apparent comfort without the use of narcotics or tranquillizing medication. Her family thought she was just fine, however.

Shock; Surprise; Fixation of attention; Common everyday trance; Distracting associations; Altered frames of reference; Posthypnotic suggestion to protect the therapeutic work

**Head and Shoulder to the Solarium**

In a case of terminal-illness pain in a woman with a young daughter the senior author addressed the young daughter as follows: Now your mother wants to be convinced that she can be free from pain. That is what you are going to do—convince your mother. Now just sit in this chair here, and while you're sitting in that chair, go into a trance and go over to the other side of the room. And I want you to lose all sense of feeling everywhere. You will be without feeling in a deep trance. You are sitting here, but you're over there on the other side of the room and you are watching yourself there. . . . Now you watch, mother. Your daughter is in a deep trance. She thinks she's on the other side of the room. Now keep your eye on me because I'm going to do something that no mother would ever want done. I rolled the girl's skirt up to expose her bare thighs. The mother looked on in horror as I did that. I raised my hand and I brought it down on her thigh with a terrific slap. The girl was watching herself on the other side of the room. Now I can't slap a girl on the other side of the room, can I? The mother was aghast that there was not a single wince out of the girl. Then I slapped the other thigh. The girl was still comfortable.
This mother was highly addicted to television so I eventually taught her that whenever she had a pain she could not tolerate, she was to leave her body there in bed and take her head and shoulders out into the living room and watch T.V.

This dissociative approach to pain relief was one of the senior author's favorites. In hospital practice he would frequently have patients take their head and shoulders out to the solarium while their surgeon did the necessary work on their bodies in the operating room.

Shock; Surprise; Modeling hypnotic behavior; Dissociation

**Numb with Conversation**

The conversational approach to fixating and holding the patient's attention can be very useful in traumatic situations. There was an automobile accident in Portland, Oregon, and a man skidded on his face on a gravel road for about thirty feet. A gravel dirt road. He was brought into the hospital as an emergency case. One of the members of the American Society of Clinical Hypnosis - we will call him Dan - who does a great deal of plastic surgery and oral surgery was on emergency call that night. He went in and found that the man was conscious and suffering a great deal of pain. Those of you who know Dan know what a marvelous talker he is. He has a steady stream of words, of humor, of interest, of information, a tremendous wealth of knowledge and humor. Dan said, You really filled your face full of gravel and you know what kind of a job that makes for me. I've got to take tweezers and pick out every confounded little granule of sand and dirt and I am really going to have a job and I've really got to mop up that face and get half the hide off it and you have been suffering pain and you want some help out of it and you really ought to get some kind of pain relief and the sooner you start feeling less pain the better and I don't know what you ought to do while you're waiting for the nurse to bring something to inject in your arm but you really ought to listen to me while I am talking to you and explaining to you that I have to do certain things about your face. You know there is a gash here, that must have been a pretty sharp stone that cut that one, but here is a short one and here is a bad bruise and I really ought to mop it off with alcohol. It will hurt at first a little, but after it is done a few times the sting will deaden the tip of the nerves that are exposed and you stop feeling the sting of the alcohol, and did you ever try to make a violin? You know you can make violins out of myrtle wood, you can make them out of spruce wood. Did you ever try making one out of oak? Dan had won a national award for the best tone violin that he himself built out of myrtle wood, and Dan kept up his steady stream. Now and then he discussed the tremendous difficulty of really mopping up that face and putting in the stitches and wondering when the nurse would get around to the hypodermic. All the while, behind him, the nurse was passing Dan the right sort of instrument, the right sort of suture, the right sort of swab, and so on. Dan just kept up that steady
stream and the patient said, You are awfully gabby, aren't you? Dan said, 'You haven't heard me at my best I can talk with a still greater rate of speed just give me a chance and I'll really get into high. Then Dan started getting into high, You know I think fast too and did you ever hear anybody sing the Bumble Bee? I'd better hum it to you. So Dan hummed the Bumble Bee and finally he said, You know that is about all. The patient said, What do you mean about all? Dan said, Here's a mirror, take a look. The patient looked and he said, When did you put in those sutures? When did you clean my face? When did I get an injection? I thought you were just talking to me, just getting ready. Dan said, I've been working hard for over a couple of hours, about two and a half hours. The patient said, You didn't. You've been talking about five or ten minutes. Dan said, No, take a look, count those stitches if you want to, and how does your face feel? The patient said, My face is numb.

Conversational approach; Fixation of attention; Distraction; Inter-spersal of suggestions; Time distortion

**Calloused Nerves**

Recently I had a patient sent to me with chronic hip pain. Very serious pain. I knew better than to try to induce a direct trance in the patient. What did I need to do? Everything I said to that patient, I think, was horribly unscientific, but the patient wanted certain understandings that she could accept, that could justify that chronic uncontrollable hip pain. I accepted the patient's absolute statements of uncontrollable pain. I accepted every one of her statements, so she knew that I believed and thought the way she did. Then I began an entirely specious explanation of how that pain came about, so that the patient could understand it in terms of her own frames of reference. I explained how that hypodermic shot of penicillin or whatever it was, probably had a needle with a ragged point and in being stuck in the hip, hit the sciatic nerve. I explained how the tip of the needle could tear nerve fibers, and I gave a long dissertation on the structure of a nerve. It is not just one single fiber; it is made up of many many fibers. I gave a dissertation on the different kinds of sensations that travel over the fibers. You get heat traveling on one fiber and cold on another, and a touch on another, and pressure on another, until that patient thought that I was rather erudite. Finally, when she was rather bored with this increasing hodgepodge of information, I threw in a suggestion here and there about pain wearing out, of the body becoming accommodated. A laborer with tender hands such as mine would have blisters very promptly using the pick and shovel. But with the pick and shovel wielded a half minute one day, a minute the next day, a minute and a half the third day, and a gradual progression in the length of time, there would be a callous formation until the pick and shovel could be handled all day long. I threw in all sorts of apparently sensible analogies. I pointed out that callous formations can be the skin of your hand and that one can also become used to emotional
deprivation. In other words one can form emotional callouses, one can form intellectual callouses, dermal callouses, nerve callouses - all that sort of thing, until the patient listening to me began accepting all of those suggestions and began on her own to seek a way to use them to help herself lose pain. Every one of those things that I said about callous formation had the effect of the patient's thinking: Yes, I know what callous is. I wish I could have a callous at the nerve in my hip where all that pain is. How nice it would be. How would my leg feel if I had a callous there? It would feel this comfortable, as comfortable as my other leg does. I presented ideas that the patient could find acceptable, but I wasn't asking her to accept those ideas. I was merely explaining possibilities, explaining them in such a way that the patient had to reach out and pull in whatever ideas she needed to facilitate her comfort. Now what is this suggestion? I think that this woman with hip pain was in the kind of trance that was effective for her. I did not dare attempt to induce a formal trance that she could recognize, because I knew she would then think the calloused nerves was just my idea that I was trying to force on her.

Yes set; Specious suggestion fitting the patient's frame of reference; Boredom depotentiating conscious sets; Interspersed suggestions initiating unconscious searches and processes; Indirect associative focusing: Indirect ideodynamic focusing; Open-ended suggestions

MHR E used a fictitious ‘real’ ‘cause’ for the pain, the needle tip, to give her something concrete to focus on, and work with…something easy to vividly visualize and add a callous to…to make the problem clear, and manageable…as a metaphor allowing the non-conscious mind to do its work…concrete enough to satisfy the conscious mind…but fluid enough for the non-conscious mind to work with…it ‘understands’ that it is a metaphor, and that’s fine, as that is what the non-conscious mind works with 24/7, ‘impressions’, ‘constructs’, ‘ideas’, ‘beliefs’, ‘vivid imaginings’.

Symptoms as forms of communication, MHR which disappear once you find an alternative means of expressing what they are communicating

What patients cannot yet clearly express in the form of a cognitive or emotional insight will find somatic expression as a body symptom. It is sometimes found that when patients can talk about their problems with emotional insight, they no longer need to experience their body symptoms. This is the basis of psychoanalysis’ occasional success.

Two-level communication is our basic approach to working directly with the unconscious. We use words with many connotations and implications, analogy, metaphor, puns, riddles, jokes, and all sorts of verbal and imagistic play to communicate in ways that bypass the conscious mind, speaking directly to the non-conscious, so that while the patients' conscious frames of reference are
receiving communication on one level, their unconscious is processing other patterns of meaning contained in the words.

A pun or a joke can bypass an erroneous and limiting conscious framework and effectively mobilize unconscious processes in ways that the patient's conscious intentionality could not.

While the left, or dominant, hemisphere is proficient in processing verbal communications of an intellectual or abstract nature, the right hemisphere is more adept in processing data of a visuospatial, kinesthetic, imagistic, or mythopoetic nature. Since the right hemisphere is also more closely associated with emotional processes and the body image (Luria, 1973; Galin, 1974), the view has developed that it is also responsible for the formation of psychosomatic symptoms. These symptoms are expressions in the language of the right hemisphere. Our use of mythopoetic language may thus be a means of communicating directly with the right hemisphere in its own language. This is in contrast to the conventional psychoanalytic approach of first translating the right hemisphere's body language into the abstract patterns of cognition of the left hemisphere, which must then somehow operate back upon the right hemisphere to change the symptom. That approach sometimes works, but it is obviously cumbersome and time-consuming. All too often the patient develops marvelous patterns of intellectual insight, yet the body symptom remains. Even if the intellectual insight to the left hemisphere is correct, it may remain isolated from the right hemisphere's sources of symptom formation and maintenance. Thus, while the senior author developed the two-level communication approach long before our current understanding of left and right hemispheric patterns of specializations, we now believe that this working directly with the unconscious may be a means of communicating directly with the right, or nondominant, hemisphere, which is probably responsible for psychosomatic symptoms.

MHR unconscious / subconscious simply that part of our calculating / thinking / processing that we are not attending to at that time...habitual patterns we have 'mastered' and which no longer require our attention...we let these routines and programs run automatically, freeing up our 'attention' to focus on 'new' and 'novel' things...so surprise / shock / confusion / novelty all attract our attention, making something previously 'unattended to' now 'conscious'...and so we become 'overly self-conscious of our ears, nose, but, how we walk, talk etc, when someone makes a remark about any of these...maybe we even overhear something we ASSUME refers to our ears / nose / butt / walk / expression...drawing our attention to something we’d otherwise not attend to...Zen koan / surprising behavior of Erickson or Bandler, all ‘snap us to attention’, like officers epaullettes or an authoritative command...idea of ‘background’ and ‘foreground’ useful here...what people refer to as ‘unconscious’ or ‘automatic’ or ‘subconscious’ is the background noise we don’t
attend to, and thus do not ‘hear’…we don’t verbalise these thoughts…when we first learn a task it helps to make a running commentary ourselves, or internalize that of a ‘trainer’ or ‘coach’ or ‘teacher’…but once we have mastered the task we cease this internal commentary, and ‘just do it’…much better than using words like UN conscious, which make no sense…even ‘UN aware’ makes no sense…se are ALWAYS aware of EVERYTHING, possibly, but only ATTEND TO a few things of the infinite possible things to attend to…e.g each muscle employed in walking, balancing, talking…while singer or dancer or athlete attends to these much more carefully… same as ‘repression’ and ‘sublimination’…we simply direct our narrow beam of attention elsewhere…this is why Don Juan’s exercise is to ‘look’ at ‘everything’ in front of you at once…very opposite of our typical narrow fixed focus…Zen and therapy all about looking at things differently…including more things in our attention…ironically trance condition best suited to this is induced by narrowing our focus initially…onto anything…anything that therapist sees tends to be ta natural fixation / natural inclination e.g symptom, pain, object that has ‘caught’ client’s attention / interest…even surprising action / sexually explicit / swear word can do this…momentarily…Zen whacking stick or confusing / surprising koan…a joke leading to laughter is noteworthy…usually double meanings, or ‘truths’ people normally ‘dare’ not speak publicly, or taboo thoughts they dare not express loud, even to selves…

MHR Calling it ‘autonomous’ may be misleading i.e it is program that is running and you are conscious at some level, otherwise you couldn’t suddenly ‘realise’ you’ve been standing /sitting in an awkward position / the tension in your neck and shoulder and jaw and tongue…the ‘feedback’ was always present, but your ‘attention’ was elsewhere…pain demands your attention…it demands you DO something / CHANGE something, to secure RELIEF from it…we call it ‘muscle memory’ but it is probably more apt to refer to a developed set of neuron firing patterns / neural connections…THAT is where the ‘memory’ to perform a complex series of co-ordinated movements / muscle firings, is located ? Or is it distributed around the entire nervous system, and literally ‘in the muscles’?

Music can be playing in the ‘background’ of our awareness / attention, as we attend closely to something someone is saying…Erickson could ‘filter out’ the high decibel sounds of a steel mill to be able to ‘hear’ people talking, by making the noise the ‘background’ and the voices the ‘foreground’… which steel mill workers tend to ‘learn’ over time to do…without realising they are doing it…or have even done it …

A beautiful person attracts our attention, like the magician’s assistant, so that we do not ‘see’ what he does right in front of us.
Trance is fixation of attention…which describes many typical occurrences, and for some people, their entire life…fixed on a narrow spectrum of all the possible impression ‘materials’ around them…e.g. forget about how sitting in chair or standing, so develop poor posture and headaches, forget about the sunshine on their skin, the gentle breeze, the smiling children, lots of good things…see only the bad…or walk about in a daydream / haze / fugue, tripping over things right before their eyes, missing so many details…in the country you will attend to every person as you meet them, in the city you must avoid this, and ignore the overwhelming stimulus…or get migraines from the attempt to ‘attend’ to too much, for too long…

Religious and secular rituals like church services and political rallies, all fixate the attention of the participants, placing them in more suggestive, trance states.

To call these states trance LIKE states is misleading. It is a form of dualism. As if there are trance states and ‘lucid’ states, when in reality we exist on a continuum of trance-lucid states…ask 12 people to describe something and you will get 12 different descriptions, of the same ‘occurrence’. Because each will tend to attend to different possible impressions…e.g. some focus on sights, sounds, smells, positive, negative, sexual, architectural, weather, people, nature…

So are we to say that one is ‘right’ and the others were all ‘in trance-like states’? Not unless one is a Zen practitioner. Perhaps THEY will see ‘everything’, not filtering or selecting or distorting, on a very good day, and assuming the thing being observed was relatively simple.

Trances occur casually, as a person invites you to sit comfortably, relax, and describes something, offers something to look at or listen to, or fixates your attention on one thing by talking about it. Such as your favorite piece of music playing in your mind. Or a recollection of a peaceful, calm, pleasant experience. And very dangerously, while driving your car, your attention tends to drift to the music, or some radio program announcer’s comments, or a recollection, or angry thoughts, or fearful thoughts, or regrets, or the pain in your neck…so that your attention becomes fixed / localized on that particular thing, when it should be Zen awake to everything going on around you, your car, other cars, pedestrians, animals, road conditions etc…speaking on the phone is not just about your hands being otherwise engaged, than where they should be, on the wheel, and ready to change gears, indicate etc…it is about your MIND, your ATTENTION being ELSEWHERE at a time you cannot afford to let it ‘stray’…given you are in charge of a projectile with a potential impact force over a 100 tonnes…

During a battle, having been conditioned to concentrate all your attention on the commands you are given, on carrying out your allotted tasks, allows the ‘battle’ to disappear…and so if you want to know what happened, you’d best ask someone who was not actually participating…the people involved were focused
on a very narrow range of the action…usually what they were personally involved in…battle narrows their field of attention as well as any formal trance induction process…danger…fear…threat…not just of ‘the enemy’, but of your own officers, failing your own comrades who are relying on you, etc…even worrying about ‘looking like a coward’…often the fear of THAT outweighs the fear of the bullets, either the bullets of your own officers, or those of the ‘enemy’…

E: Soon is the undefined future. R: So you are always safe when you give a suggestion introduced with soon.

MHR all ‘images’ and ‘sounds’ are produced in the brain / mind. So a ‘hallucination’ positive or negative simply means you are creating, or not creating, something that is or is not, ‘out there’. You can fail to create an image other people ‘see’ ‘out there’ in your own mind. Or you can add images that others do not ‘see’ ‘out there’.

Seeing and hearing are active constructions of our own brains. We do not ‘see’ or ‘hear’ what is ‘out there’. We take incoming particle-wave-energy patterns and construct what we ‘call’ ‘images’ and ‘sounds’ from these. ‘Out there’ is only electro-magnetic soup arranged in patterns that are more or less stable, as ‘humean uniformities’, which we ‘perceive’ / ‘construct’ / form impressions of, in our brains…or minds?

Confusion as well as assigning an absorbing task are both ways of getting consciousness out of the way. e.g directing conscious mind to attend to real or imagined music while sending the unconscious mind on a search. To so occupy one cerebral hemisphere with music that the activity of the other is facilitated.

Your unconscious mind knows that your conscious mind is not aware of its actions, such as hand levitation, so it merely observes your hand levitating, with no idea why. MHR it will post retrospectively ascribe some ‘logical’ reason e.g I want to scratch my nose, I am thirsty, and may continue the action along this line, appropriating ‘ownership’ and ‘intention’ and ‘conscious design’ of the original action initiated by the unconscious, and ‘following through’ with additional movements which ‘incorporate’ and thus ‘make sense of’ the initial movements of the arm.

Therapist develops relationship with the person’s unconscious that the person themselves does not have. MHR very interesting concept!

And your unconscious mind is free to limit itself to things that I say. [Pause] As I teach your unconscious something I very much desire. Your hands are resting on your thighs, and your conscious mind is going to leave them down there. Sexual connotations speak to unconscious sexual etiology
while conscious mind free to listen to its inner music. The sexual meanings are consciously heard but are understood on an unconscious level only. But the unconscious can keep those sexual connotations to itself. You don't allow the [conscious] self to become aware of it.

E: Unconscious muscle movement is different from that of the conscious mind. And you are not going to know which hand is going to lift. You will have to wait and see, but you'll be uncertain. The mere tendency, first one hand and then the other, perhaps both, then one, then the other, perhaps both. Sooner or later an elbow is going to bend a bit, a wrist is going to lift up, a hand is coming up. [Pause]

E: And it is going to be very pleasant to wait. And you've got a lot to learn about your hands. It is well worth the time, too. And your unconscious mind is already beginning to explore. That's right. It's lifting. A bit more. And sooner or later begins a minor jerk. [X's hands begin minor jerking movement up off her thigh. Much facial frowning is evident.] Lifting all by itself as well as jerk also have sexual connotations.

E: That's right [X's right hand begins momentarily to lift higher.] It doesn't necessarily mean it is that hand. It may be the other. It is still too soon for you to know. Up it comes. That's right. That's a beautiful unconscious movement. [X's hands are lifting with the slow, very slight, and apparently spontaneous bobbing and upward jerking movement that enables an experienced observer to distinguish it from the smooth lifting that is more characteristic of conscious voluntary movements.] That's another and another. You're really learning. That's right. And the wrist, and the elbow. That's beautiful. And now the right hand, indicating that it wants to join the left hand. I don't know if it will. That's right. Up toward your face. Elbows bending. And there is a bit of accommodation between the hands.

Your suggestions do not permit either hand to achieve a clear dominance in lifting. This tends to maintain her conscious mind in a state of confusion and creative flux. She is being maintained in a state of exploration and expectation rather than being prematurely fixated in the simple conviction that one hand is lifting. You are preventing her from forming a final and closed frame of reference around which hand is lifting. She does not realize it, but you are giving her an experience in maintaining a state of open, creative flux. This open state tends to facilitate the possibility of creative moments wherein she may break out of her old symptom-bound frame of reference to achieve a more adequate and therapeutic means of experiencing herself.

E: A common phrase in language is "not to let your right hand know what your left hand is doing."
E: Which one will reach your face first? Left hand began first. Is moving faster.

E: Here I'm introducing competition between the hands. You work at a thing just so long, then you take a break. She has been working hard, so she can now take a break by doing something else.

R: She has been working hard at hand levitation, so now you give her a break by changing the task slightly to one of competition. The same goal of levitation is being achieved, but with a new attitude and source of motivation.

E: Yes, you are transforming one task into another. You alter the tension. [The senior author gives clinical examples illustrating how he utilizes patients' competitiveness to facilitate hypnotic experiences rather than have the patients' using their competitiveness to oppose the therapist. It is a basic principle of utilization theory to use a patient's personality characteristics to facilitate hypnotic experience.]

E: But will the right hand suddenly increase its speed and lift up? That's it. [Pause] And you can take pride in that. Your unconscious is really taking over some control. And you are really beginning to learn that the unconscious can control. And it should be a pleasing thing to note how your hand moves, and you are a harpist, and finger movements are very important, and your unconscious is letting you know that. And even if the left hand gets halfway to your face first, that doesn't mean that the right hand can't catch up to it. [Pause] It may be the right elbow needs to be reminded that it can bend. Of course, the right hand can always have the unconscious change its mind about the right hand movement.

The sexual connotations are ‘lift up’ as in ‘lift up her dress / skirt’ and ‘finger’-ing.

People often blush when you use such sexual connotative words / phrases, even as they are consciously unaware of any sexual meaning.

E: Now your left hand is approaching your face, but the nice thing about it is that your unconscious mind won't let your left hand touch your face until you are really ready to go very deeply in trance and to do everything that needs to be done. Everything, even though you don't know what everything is.

You are relying on the patient's own unconscious to determine the moment for entering deep trance. You have also made the suggestion to enter deep trance contingent on an inevitability: Her hand is going to touch her face from the way it is moving. The phrase and do everything that needs to be done is a very
important all-inclusive suggestion that is hitchhiked onto the above in the form of a compound suggestion.

E: And yet your left hand is moving up toward your face irresistibly, but it won't touch your face until your unconscious mind is really ready. And irresistibly it moves closer and closer. [Pause] And even though your left hand is very close to your face, that doesn't mean the right hand cannot beat it to your face. [Pause] A mere two inches to go, and I still don't know if your unconscious is going to lift your right hand to touch your face first. And that left hand less than two inches away. And now your unconscious mind is showing a desire that you don't know you have. That's right.

R: The use of the negative but it won't touch your face until your unconscious mind is really ready is very interesting. If she has any resistance your use of won't may pick up hers and redirect it in a constructive manner. Your use of the negative tends to displace and discharge the patient's resistance.

E: And now I know that your left hand is going to touch your face soon, and that will signify that you will be in a sufficiently deep trance. That you will hear and understand every word unconsciously that I want you to. [Pause] That's delightful to see those doubts. [Pause] As in the irresistible force that is moving your hand, and that's a relief. [Her left hand touches her face.]

Using her hand touching her face as an ideomotor signal that she is in a sufficiently deep trance

E: And I am going to give you a special reward after you awaken from the trance, and you can wonder what that is. But you can go into a trance any time there is a good reason for it. You can go in by counting from one to twenty, or if I count from one to twenty, going one twentieth of the way each time. You can come out of the trance at the count of twenty to one, coming out one twentieth at a time. And you can all ways go into a deep trance. And you don't need to know any more than that you can all ways go into a trance when it's purposeful and meaningful.

Here you are facilitating a posthypnotic suggestion by arousing expectancy and motivation by mentioning a reward. Wonder is also a special word that tends to initiate an unconscious search and unconscious processes that may be useful. You then give your typical instructions for entering and awakening from trance by counting from one to twenty. You give an interlocking posthypnotic suggestion in a very casual manner that tends to depotentiate consciousness [you don't need to know.] Your suggestions are made highly acceptable to her since they are so protective and respectful, permitting her to go into trance when it is purposeful and meaningful.
E: All ways go into a deep trance is a two-level suggestion: On one level she hears you can always go into a trance; on a secondary level it means you can go into a trance all ways, that is, in many different ways. This is a posthypnotic suggestion that she will go into trance with whatever approach to induction you use. The secondary-level suggestion depends upon the literalism of the unconscious.

And now, after you awaken, I want a bit of music that you haven't thought about or remembered for a long time to come suddenly in your mind when you see me plainly. And you can begin counting, mentally, silently backward from twenty to one beginning the count now. [Long pause as X reorients to her body and awakens.]

R: This is a posthypnotic suggestion that utilizes her own well-developed internal programs about music. Since you are requesting music that has not been thought of or remembered for some time, you are also attempting to lift an amnesia. In this simple way you are testing her capacity for hyperamnesia as well as posthypnotic suggestion. You tie the posthypnotic suggestion to an inevitable behavior, when you see me plainly, so she will have a clear cue to execute the posthypnotic behavior.

E: Yes, and I'm also tying in the first part of trance [where music is also mentioned].

R: With one sentence you are doing a number of things: You are probing for the possibility of a hyperamnesia in recalling a bit of music from childhood; at the same time you are structuring an amnesia for the actual content of her trance experience by tying the end to the beginning, so all in between tends to fall into a lacuna — an amnesic gap. When you administer posthypnotic suggestions, you typically use a buckshot approach, testing for many possibilities in order to assess what hypnotic talents a patient may have. But you usually administer these suggestions in an indirect, fail-safe manner.

E: And it is all so disguised that even the intelligent onlooker does not realize what I am doing.

Questions Evoking Posthypnotic Responses; Shifting Tenses to Facilitate Age Regression

E: Is it pretty? Can you tell us about it?

X: The music?

E: Yes. [Pause]
X: It changed.

E: Tell us what the change was.

X: From harp to an orchestra. [Pause]

E: When was that? [Pause]

X: When I was seven.

E: Where were you?

X: At home.

E: Who is in the room?

E: To your right or left?

X: To my right or left? To my left.

R: Your question uttered a moment after she focuses her gaze on you immediately reinforces the posthypnotic suggestion about music she has not heard for a long time.

E: The word pretty is childhood language to evoke childhood associations. When she asks, The music? it implies there were other things in her mind.

E: From harp, which is a solitary activity, to an orchestra, which includes others. So she is saying [on another level] that the change includes others.

R: The music changing to something she knew at the age of seven indicates the success of your posthypnotic suggestion. You then carefully question her about the circumstances surrounding the music to further extend the hypermnesia?

E: Yes. But also to talk about safe things. We are not going to risk talking about the others. There are two meanings to right and two meanings to left. They are loaded words. I'm using purposely double-barreled words.

R: Her conscious mind hears you questioning about the details of placement to the right or left. But on another level you are still on the track of Is something right or wrong?
E: Yes, and I'm directing it all to her. Notice how at a critical point I shift tense from the past (When was that? Where were you?) to the present (Who is in the room?). This shift in tense is an important approach to facilitating an actual age regression. Notice how her responses after that shift tend to imply she is reexperiencing the past.

With the process of hand levitation she is able to experience the difference between the voluntary lifting of the hand and the involuntary movements of the unconscious. While she is open to unconscious experience, he initiates a process of two-level communication: On one level he talks about hand levitation, while on another level he is using associations with sexual connotations. If her problem has a sexual etiology, these connotations will tend to activate her own sexual associations and lead her to the source of her problem.

It is possible that hypnotherapy can take place entirely at an unconscious level without the patient (and sometimes even the therapist) knowing the why of the cure. The patient only knows a problem has been resolved. No insight in the conventional psychoanalytic sense is involved. This is probably the means by which the miracles of faith healing take place. Somehow or other something in the faith frame of reference touches off the relevant unconscious associations to effect an autonomous inner resolution of a problem. Of the many who apply themselves for such faith cures, however, relatively few experience these happy accidents. They are, indeed, so rare that they are called miracles.

Therapeutic trance is a relatively free period wherein patients can sometimes bypass these limitations so their own therapeutic potentials can operate without interference. So their own unconscious resources can resolve the problem. If the therapist has some understanding of the etiology and dynamics of the problem, then he may help focus the patient's unconscious resources by two-level communication. If the therapist is wrong in his assumptions, two-level communication is a subtle process that simply will not be picked up or acted upon by the patient's unconscious.

[The senior author reaches over and gently touches the underside of her left hand. She takes this cue, and her left hand lifts slowly. It remains suspended cataleptically in midair.]

Demonstrating to her conscious mind that the unconscious can control her behavior. This tends to depotentiate her habitual, everyday frames of reference. Your questions are directed to helping her realize that her ego is limited in its control, but her unconscious has potential for control and eventually cure. Emphasize the importance of the unconscious and heighten her expectancy of her unconscious resources resolving her problems / symptoms.
E: Do you know that you will be in a deep trance when I touch your face? [The senior author touches his hand to her face. She closes her eyes and remains immobile.] Now rest very quietly. And enjoyably.

You reinduce trance by suggesting a cue [touching her face] in the form of a question. Such question inductions are particularly effective because questions are a marvelous means of fixing and focusing attention inward. In this case the question obviously initiated an unconscious search and the requisite unconscious process to lead to the desired hypnotic response of trance. One of your most effective forms of hypnotic suggestion is to ask questions that cannot be answered by the patient's ordinary conscious frames of reference. Questions that ask for an autonomous response [such as ideomotor signaling] on an unconscious level usually depotentiate consciousness and lead to trance experience.

Assigning the Locus of Therapeutic Change as Taking Place in the Unconscious

E: And you're beginning to understand that your unconscious mind can develop control and take charge of so many things. Now in awakening I want you to do it easily and comfortably in your own way.

R: You are again emphasizing and demonstrating unconscious control over behavior and making direct statements about it, so she will have a clear understanding of it as the means of your therapeutic approach.

E: I say so many things to emphasize the plural.

R: That implies the unconscious can also take control over her symptom, too.

Two-Level Communication

E: In a way that meets your needs. But I want your unconscious mind to continue to listen to me and to understand what I say even though your conscious mind may hear something different. Now take it easily and awaken. [Two-minute pause] Now. [Long pause for at least five minutes during which X does not awaken. The fingers of her left hand move as if playing the harp, she grimaces and frowns and has the appearance of being in a state of intense inner concentration.]

E: The plural here again with meets your needs. I'm actually talking about two-level communication without really explaining it.

R: That opens the way for two-level communication? E: That tells her I am talking on two levels.
R: That the conscious mind can understand one thing while the unconscious can elaborate many other associations. The unconscious can elaborate whatever associations are necessary and pertinent to her particular problem. You are again using general words that can be interpreted in as many different specific and personal ways as possible relevant to particular problems. The success of this approach is suggested by the fact that her inner absorption was so deep at this point that it took her at least seven minutes to awaken. The activity of her face indicates that inner work was certainly being done. She was not asleep!

E: Go right ahead [Pause] and share that with your conscious mind. [Another long pause as X remains in intense concentration] Share it with your conscious mind. [Another long pause] This struggle is helping you. Even though you don't know consciously all of the struggle, that is all right.

E: Her unconscious mind understood something different from the word awaken. What does awaken mean? Wake up to your opportunities!

R: Wake up to your opportunity to do inner work?

E: When the hell are you going to wake up? is common folk language.

R: That is folk language for: When are you going to realize what is happening to you?

E: I told her to look for the double meaning, and her unconscious is doing that.

R: That is a double bind: You are forcing her to work on an unconscious level even though she cannot recognize it on a conscious level.

E: Yes. I set her up to place unconscious understandings on whatever I say. They will be her unconscious understandings.

R: This is beautiful! No matter what the problem is, no matter what the therapist's hypotheses are, you are encouraging the patient to do her own work, inner work that is valid for her unconscious.

E: She is not limited or biased by my ideas.

E: I don't need to know what your problem is for you to correct it.

R: Valid hypnotherapy can be done without either the patient or therapist knowing what the problem was.

E: That's right. Note the strategy here of the pause after Go right ahead," and then the longer pauses. That means there is no hurry, it can take place today,
tomorrow, sometime. Do it at your leisure, in other words. Only you haven't said, Do it at your leisure. But that is the understanding the patient gets.

E: It allows the patient to relax so inner work can be done.

E: I'm telling her it is a struggle. Then I give reassurance with that's all right about something about which she knows nothing.

E: [Another long pause as the intense inner concentration with wrinkled brow, frowning, and taut face continues.]

Now you can leave the struggle at this point. But you can return to this point. And there can be an interlude of conscious awareness. You can come right back to this point any time.

Ask person what time they think it is, to check or amnesia / time distortion i.e time during real trance not experienced as time, or at least not real time. Can be longer or shorter i.e time dilation or extension. In trance may feel have been doing something for long time, when only a few minutes, or forget all the time that has passed since going into trance i.e forgetting everything during trance / conscious NOT aware of what happened during trance.

Ask for ideomotor signals from the unconscious to determine if it was receiving things the conscious mind could not recall.

**Variations in trance depth from deep ocean to conscious island.**

I said, And there, can be an interlude of conscious awareness.

R: That suggestion brought up an island of conscious awareness?

E: Yes, something that can be seized upon.

R: How does that help them follow a posthypnotic suggestion? It raises them momentarily to consciousness where they can receive the suggestion?

E: It leads into consciousness.

R: Are you building an associative bridge from the unconscious to the conscious?

E: Yes, it builds a bridge between the struggle taking place on both conscious and unconscious levels.
R: In deep trance it is possible to place suggestions so deeply that there is no bridge to consciousness where they can be expressed. Those suggestions cannot be therapeutically effective.

E: That is why I build bridges.

You are always working with the patient's associative process - putting it here and there. You appear to be making casual conversation, but you are actually doing something with the patient all the time. Questions invariably evoke important early memories and associations.

 Anything that causes the patient to follow the therapist, or any approach that enables the therapist to change the patient's mental status, is the skill with which the therapist changes the patient's associative processes.

E: Now I am going to say something to you. You are not going to understand it consciously. Doesn't it surprise you that you can't stand up? [Pause as X looks surprised]

X: Can I try?

E: Oh, you could try.

[Pause as X makes a slight forward movement in her chair with the upper part of her body only and then stops] It does surprise you, doesn't it? Some day when you get married and are having a baby, you can use the same measure.

X: Oh, really?

E: Um hum. I just gave you a caudal anesthesia or a spinal anesthesia.

X: [Nervous laughter]

E: I don't lay on hands, I lay on ideas. That is kind of a surprise to know that you can't stand up.

X: Let me know when I can.

E: I will always let you know when you can't. I'll always let you know when you can. [To audience] Now when a caudal anesthesia like that can be induced, you know you've got a perfectly good subject.

R: It is a beautiful double bind when you say you are going to say something to her that she is not going to understand consciously: She is bound to listen, but
since she cannot understand consciously, she must respond on an unconscious level.

E: Yes.

R: You initiate a hypnotic phenomenon with a question. It is usually better to evoke a hypnotic phenomenon with a question than a direct suggestion? It is a fail-safe approach.

E: Yes.

R: What cues do you use to know when to attempt such a question to initiate a hypnotic phenomenon?

E: You always give praise to the unconscious.

R: Just previous to this question you did give her unconscious praise when you remarked, And you did that so nicely, and I didn't tell her to do that. The way you say the word try with a subtle, dubious tone in your voice implies she can try but will fail.

E: Yes.

With a minimum of words I induced a spinal anesthesia. If I was right in all my double-talk, she is going to develop caudal anesthesia. Since she has studied [a medical specialty], she knows what a caudal anesthesia is.

Hypnotic technique is giving the stimuli that can be resolved by the subject into the hypnotic experience you wish her to have.

There is a natural ninety-minute biorhythm of rest and activity, fantasy, intensity, and appetite that we all experience continuously (Kripke, 1974). It sometimes seems as if Erickson recognizes that natural variation in the patient's biological clock and adjusts his rhythm of alternating trance and conscious work to coincide with it.]

E: I said, try it, implying she is to make an effort and at the same time to negate it.

R: You had her in a double bind, didn't you?

E: Yes.

R: The word try evokes a double bind situation when it is said with the appropriate inflection and dubious tone of voice. The word try means make an
effort. The dubious tone of voice says, Do not succeed in that effort. She is thus placed in a bind where nothing happens. Even the symptom is turned off. I sometimes wonder if such double binds that function in two modalities are related to the differences in cerebral hemispheric functioning (Diamond and Beaumont, 1974; Rossi, 1977). The cognitive meaning of try would be processed by the left hemisphere, while the emotionally laden tone in which it is said would certainly be processed by the right hemisphere. Since psychosomatic symptoms are now thought to be mediated primarily by the right hemisphere (Galín, 1974), your negative tone of voice would be able to block the symptom at its right hemispheric source.

When you next say try it with emphasis, you immediately double bind it with the negation, You are beginning to have some doubts. When you say try it the third time, you immediately double bind it with the joking tone with which you say just a little puddling stream and your poorest performance on the record. Her final response of not understanding why she does not experience the symptom indicates that her conscious mind is puzzled and rather depotentiated. It has been caught in the double bind that made her symptomatic behavior impossible, but she does not know why. It is important that consciousness be depotentiated when you challenge the symptom, since that allows it to drop into the unconscious which you have prepared as the locus of therapeutic change.

**Ideomotor Signaling to Ratify Symptom Cure**

E: Lifting your right hand means yes, lifting your left hand means no. Does your unconscious mind think that you can X (display the problematic symptom)? Which one will lift? Wait and see.

[Pause]

You can even watch to see which one is going to lift.

X: I can watch?

E: Yes.

[Pause as her right hand lifts a bit, then her left hand lifts a bit too. She has been looking at her right hand.]

E: [To R] The fixation of her gaze shows her conscious action. She only shows one slight look at the other hand. We know what her conscious answer is. She doesn't know what her unconscious answer is. [To X] But your unconscious will suddenly give you a correct answer. [Her right hand lifts more strongly.]
R: You are now using ideomotor signaling as a further demonstration of symptom cure? You are trying to eliminate any further doubts about her symptom cure?

E: Yes, and I create a state of uncertainty by asking, Which one will lift?

R: That uncertainty tends to depotentiate her conscious (and problematic) frames of reference so her unconscious has an opportunity to respond.

E: Where a person looks in finger or hand signaling indicates their conscious expectation.

R: If you have no concrete way of demonstrating symptom cure in the therapy situation itself, then this sort of ideomotor signaling is a good substitut

R: By lifting both hands she is saying that you haven't taken anything (her symptom) away from her; the capacity for the symptom is still there.

**Depotentiating Conscious Doubts About Symptom Cure: The Double Bind**

It is perfectly all right to think one thing consciously and to know exactly the opposite unconsciously.

R: It is hard for a patient to really believe a long-term symptom can disappear so quickly. By giving voice to this inner doubt you are depotentiating it.

E: Yes. It is difficult to believe these changes have been made.

R: She is afraid to know the change has really been made, lest she be disappointed.

E: That's right.

R: Here you are allowing room for conscious doubts, but reinforcing the fact that the unconscious recognizes there has been symptom change. This is another use of the conscious-unconscious double bind. Then, even though the ideomotor signal of the right hand lifting means she still has the capacity for sweating, you point out that at present there is no sweating in spite of the strain. You then give strong ego support for the courage to believe, but you don't actually say believe, since that would imply doubt.

**Posthypnotic Suggestion**

E: I am going to ask you to awaken, and I'm going to tell you an apparently meaningless story. But your unconscious mind will understand. Now awaken
now. one, two, etc. to twenty, nineteen, eighteen, seventeen, sixteen, fifteen, thirteen, nine, eight, seven, six, five, four, three, two, one. Awaken.

R: This is an interesting form of posthypnotic suggestion whereby you are able to later give her unconscious a message that will not be meaningful to her conscious mind. In this way you may be able to bypass the limitations or doubts the conscious mind may have.

Changing the subject quickly after making suggestions is strategy for distracting her from the posthypnotic suggestions you have just given, lest her conscious mind starts to argue or interfere with them. This is highly characteristic of your approach - you make a suggestion and then immediately distract before consciousness can take issue with it.

How soon will you forget me?, suggests an amnesia for all that took place between the suggestions.

Before you met me, you believed that you could always stand up, and you found out that there are times when you can't stand up. Just try it.

[Pause as X again tries unsuccessfully to stand up]

You can do anything I tell you to do, can't you?

X: It seems like it.

E: Then you can stand up.

X: Can I?

E: Yes.

[She does stand up]

X: Yep.

E: Stand up again.

[While she is standing, the senior author continues as follows]

Try to sit down.

[She stands with knees slightly bent but immobilized, and she cannot sit down]
[Pause]

X: I think my legs are made out of steel.

E: Now you can sit down.

[She sits down.]

Now do you know that you can do anything that I tell you to do?

Do you suppose that comes to having dry hands?

X: Could you make me have dry hands?

E: Um hum.

X: Maybe you can.

E: *Maybe?*

What is your relationship with this fellow that came in with you?

X: I'm not sure.

I depotentiate her ‘maybe’ (doubts) by repeating *maybe?* with a doubting tone and then immediately distract her from any remaining doubts by reference to her boyfriend.

Transforming the symptom to the situation of talking about her hands i.e asking her to start producing the symptom e.g wet hands, independent of the usual context i.e performing the harp publicly. I am shifting the cause of the symptom: before, harp playing caused the symptom; now, talking causes it. MHR this is taking control of the symptom...you can produce it at will...taking it out of its trigger-response stimulus-response conditioned, beyond conscious control, context. The associative connection is thus broken...the automatic connection...the muscle memory...habitual action-reaction...

MHR ask person to consciously consider contexts in which the currently undesirable manifestation / symptom / problem would in fact prove very valuable ... even fear valuable...pain valuable in context of avoidance of stimulus...to give appropriate credit to the non-conscious motives which initiated the response / symptom originally...i.e intended to serve positive purpose...e.g fear of all dangerous situations reduces risks / threats / dangers ... appropriate in many cases...just not for ‘all’ dogs or ‘all’ public encounters...or ‘all’ men or ‘all’ X’s...
For the unconscious, symptoms have an important value. You are letting the unconscious retain the value of the symptom by displacing that value to another concrete function.

MHR fear of cancer logical, vs fear of ‘not fitting in with the other smokers’ is stupid. So take fear of second, and amp it up in association with first, to give new motive / strength to defy ‘peer group pressure’ etc.

You are giving a positive value to something that was all negative before. You are helping her recognize the positive value of the physiological function that was formerly only a negative symptom.

The word try uttered in that soft and doubting way you have is a cue that she could not. You had conditioned her to immobility when you use the word try in that way.

Demonstrations of the effectiveness of the unconscious to control behavior are to convince her conscious mind that her unconscious can also control her symptom? This is your basic approach to dealing with symptoms by hypnotherapy. You don't directly suggest symptoms out of existence. You arrange a series of experiences that demonstrate the potency of the patients' unconscious. You give them an opportunity to witness the therapeutic control their unconscious minds have over their symptom and then leave it to their unconscious to continue its therapeutic regulation.

Open-Ended Suggestion to Cope with Problems

E: Now think of a few more of the things that you would like to have your unconscious take charge of.

X: Short of my hands?

E: Other than your hands.

[A comfortable chat now takes place about family matters and apparently unrelated topics for about ten minutes. He is giving her another rest.]

E: Here I’m getting at any other problems she may have.

R: This is an open-ended suggestion to let her unconscious resolve other problems the therapist may not even know about.

Ideomotor Signaling to Evaluate and Ratify Symptom Cure: The Second Round
E: Now, before I asked you what your unconscious answer was about sweating, I told you about your hands. Your right means yes, your left means no. Yes" you would have sweating, no that you would not have sweating. Watch your hands and see if they will signal yes or no. Rest them on your thighs. Which is going to lift?

[After a minute or two of waiting, X's left hand begins to lift ever so slightly and very, very slowly with minor jerks.]

Your confidence is growing. Growing more powerful.

[The right hand also begins to lift, but the left hand remains higher.]

You can close your eyes now. Your unconscious can know the answer, but you don't have to know the answer. All right. Now drop your hands in your lap. The question has been answered. Now you can feel very rested and very comfortable. Now what is that smile for?

[Pause]

E: E illustrates with a story indicating that the conscious mind interferes with therapeutic work, reminding his client that the conscious mind may not know the answer, or what the unconscious is doing…it is enough to 'accept' i.e have faith in the power of the unconscious.

You now acknowledge her conscious doubts and bring them out into the open. You openly acknowledge the truth about her inner situation. She responds with an affirmative yes. You have thus also opened up a yes set. She is in an affirmative mood. You then immediately follow up with, It is nice to watch growth, which is a direct reinforcement of the fact that her left hand did go up, that she is changing and in the process of giving up the symptom.

R: Your story of the bed-wetter (that change can come about gradually, or suddenly) was particularly appropriate because the symptom of wetness and a number of details were similar. You are again bringing in sexual connotations.

E: Yes, wet genitals and wet hands.

**Ideomotor Questioning to Ratify Symptom Cure: The Third Round**

E: Drop your hands. Now let's see, which hand is going to move up. [The left hand lifts only. She frowns while it lifts.] The wrist, too. And the elbow will bend. Come toward your face. Higher, higher, up, well, that is really hard to believe, isn't it? That your unconscious says: Sweating is not for your future. And your unconscious knows that. Your unconscious knows that you
will have a gradual growing conscious realization of that, that only at the speed that your conscious mind can tolerate. Close your eyes.

R: You test a third time, and finally only the left hand lifts, indicating that the sweating has been effectively dealt with. This is a clear case illustrating how you return again and again to deal with her doubts and internal resistance until you get a clear ideomotor response of symptom cure.

E: Yes.

R: You now extend the ideomotor response and, by implication, the cure by having her whole hand levitate higher and higher.

E: A gradual growing conscious realization means that she can learn as rapidly or as slowly as he wants to.

Trance Rest to Reinforce Therapeutic Change

E: Go deeply in trance. And now awaken at your convenience. (X closes her eyes, visibly relaxes for a few moments, and then awakens.)

R: After the successful ideomotor indication of symptom change you give her a period of trance rest. She had been under an evident strain (frowning) during the ideomotor signaling, so you now let her have a few moments of therapeutic trance as a way of rewarding her inner work with relaxation and inner freedom.

Humor to Facilitate Unconscious Psychodynamics

E: Now for a bit of flippancy.

X: Yes.

E: I embarrassed Dr. Bertha Rodger in New York. I was lecturing there at a banquet in my honor. Someone asked me where I was going to sleep that night. I said with Bertha. And I think you are very much surprised to find out how often you sleep with me. You are constantly going to sleep with me, aren't you? Rather shameless, aren't you?

X: No, I don't think I'm shameless.

E: It only seems as if I'm relating a personal narrative.

R: But in fact you are indirectly bringing sex in again. But what is the purpose of this direct sexual confrontation here?
E: I tell her she is going to sleep with me. Consciously she knows she is not.

R: She knows the absurdity of that.

E: But I have said it so convincingly. I have been very convincing to her unconscious so her unconscious says, He's not really talking about sleeping with him, he's talking about sleeping with someone else! I'm nakedly hammering on the sexual aspects.

R: You are using flippancy and humor to facilitate the inner resolution of the sexual psychodynamics of her problem. Humor depends for its effect on engaging unconscious processes. You use humor here to initiate an unconscious search and facilitate the unconscious processes intimately related to the psychodynamic source of her symptom reaction.

I want you to get some good physiological rest. You have done a lot of work. Far more than you know. You have altered a lot of your brain pathways. You have set up new ones. You need to sleep. You are going to think about your hands in a different way.

R: You now directly help her acknowledge that a lot of therapeutic work has been done. You end this session with these marvelous waking suggestions that will facilitate conscious rest and further therapeutic work on an unconscious level throughout her sleep.

Confusion is characteristic of the patient's mental state during the initial and middle stages of therapy with Erickson. Confusion is an indication that the patient's habitual frames of reference and generalized reality orientation have been loosened so that their psychodynamics are now in an unstable equilibrium. A process of deautomatization is taking place wherein many of the patient's erroneous sets that have been responsible for symptoms and maladaptive behavior are loosened to the point where new associations and mental frameworks can be formulated to achieve therapeutic goals.

Recognizing that a great deal of insight therapy needs to be done in this session, Erickson begins by giving her some mental warm-up exercises: He requests that she recall in exact detail the furniture of the place she slept the night before and then all the things she saw on a shopping tour yesterday. All of this may seem irrelevant to the patient, but Erickson is thereby warming up search operations in her mind with nonthreatening material. These search operations will be used later in the session, when she will need to seek and express insights.

The senior author then induces trance with an ideosensory approach (How soon will you warm up your hands?) that is uniquely suited to X because the sensation of warmth" is tied to the theme of sexuality that touches one of her basic
unconscious complexes. He then embarks on the work of undoing repressions in a variety of ways. His object, as always, is to help the patient loosen the rigid mental frameworks that are responsible for symptom formation, so that the unconscious can restructure a better reality. He utilizes ideomotor signaling, analogies, stories, and other devices to move her associative processes continually toward introspection in critical areas. Here we witness Erickson at his best as a therapist facilitating the process of insight. He continually offers one approach after another, like a locksmith trying different keys until the patient finally unlocks her own repressions. After a great deal of initial resistance, X experiences a flood of insights about her family dynamics and the reasons for her symptoms.

Recognizing that a great deal of insight therapy needs to be done in this session, Erickson begins by giving her some mental warm-up exercises: He requests that she recall in exact detail the furniture of the place she slept the night before and then all the things she saw on a shopping tour yesterday. All of this may seem irrelevant to the patient, but Erickson is thereby warming up search operations in her mind with nonthreatening material. These search operations will be used later in the session, when she will need to seek and express insights.

**Training in Thorough Mental Examination**

E: Name the items of furniture in the house.

X: Well, in the living room there are giant pillows instead of furniture, but there is a rocking chair there, too. There is a couch in the kitchen. There are tall bar stools in the kitchen. There are three bedrooms, so there are three beds. Two regular and one water bed. There are three dressers. I think that's all.

E: No other objects? You haven't named a table yet.

X: OK, there is a table and four chairs in the kitchen, etcetera.

E: Now, any special thing you did yesterday?

X: I went shopping by myself for about an hour and was sort of wandering around in a daze, just taking my time. Other than that, no.

E: Where did you shop?

X: A little place, well not little. It is a giant conglomerate department store.

E: What objects did you look at?

X: Food, cheese, meats, flour tortillas, wine, tomatoes, beans, pants.
E: Any other things?

X: No.

X: The pants that I bought were men's pants, but I looked at a pants suit that would be for a woman.

R: What's the purpose of this seemingly irrelevant question about house furniture?

E: When you think about a thing you think inclusively; don't exclude anything.

R: Oh, that's the implication! By having her think in extreme detail about her friend's house furniture, you are training her unconscious to go into something very thoroughly without telling her conscious mind what you are doing. You don't directly say, I want you to thoroughly explore your problems. Instead you put her through another task in a thorough manner. You then expect that process of thorough examination to automatically generalize to her own self-examination of her personal problems.

E: She came to me with a problem, and I tell her she is going to have to do some thinking. And then I demonstrate to her exactly the kind of thinking.

R: You then do the same thing by requesting she make a detailed examination of her shopping.

E: She makes a remarkable listing: she ends up with pants.

R: Oh, the sexual implication of pants?!

E: Yes! It is put in so beautifully. Why would she buy men's pants? It is like choosing a man.

Ideosensory Induction Utilizing a Psychodynamic Complex

E: How are your hands?

X: Misty.

E: Must be you have a warm heart. How soon will you warm up your hands? [Pause]

X: They are getting warmer. [Pause]
E: Close your eyes.  [Pause]  Lean back in your chair.  [Pause]  And just keep sleeping deeper and deeper.

R: Here you deliberately associate her sweating with warm heart and, by implication, sex. Then, before she can respond or interfere in any way with this association, you immediately begin an ideosensory induction to trance by asking how soon will her hands warm up. That question is trance-inducing because to feel an adequate response of warmth, she must first go into trance. Since you have already associated warmth with heart, sex, and sweating, this choice of induction reinforces and extends these associations. Your initial association of misty and warm heart put her on an inner search for your meaning. That inner search is characteristic of the everyday trance when people pause for a moment's reflection over a puzzling question or task. You then immediately make use of this momentary inner focus to initiate a trance induction that also utilizes the inner associations (warmth) that are occupying her at that precise second. We could summarize the whole process as follows. You gave her two trance-inducing tasks simultaneously: (1) The association between symptom (misty) and warmth (sex) puts her on an inner search, and (2) the question about warming up her hands requires trance for an adequate response. These two approaches are interlocking and mutually reinforcing because they have the common theme of warmth. This common theme is itself trance-inducing because you tied it to a central psychodynamic complex (warmth, sex, sweating) that is present in her unconscious. Whenever we touch upon a person's complexes, of course, there is a spontaneous abaissement du niveau mentale (a lowering of consciousness) that also facilitates trance. No wonder, then, that she immediately responds with the ideosensory response of warmth and enters trance.

**Autonomous Trance Training**

E: While you are sleeping more and more deeply, I am going to make some calls. [E dials and makes some telephone calls of a professional nature, discusses setting up future appointments with R, etc. After about five minutes he returns to X].

R: In the initial stages of trance training you sometimes give the patient a free period to learn to go deeper into trance in an autonomous manner, by whatever means they have at their disposal.
E: Breathe very deeply, X. And either nod or shake your head gently in answer to my question.

After five minutes of autonomous trance-deepening you judge her ready to respond to some exploratory ideomotor signaling. You usually like to use head nodding or shaking because that utilizes well-learned and automatic movements that people frequently carry out without realizing it in everyday life.

E: In training a rifle team for the international shoot, I told them to let the sight wander back and forth, up and down, all over the target. You don't know just when you'll squeeze the trigger.

R: The conscious mind will not know just when, so the unconscious will have an opportunity to intrude and squeeze the trigger at just the right moment. You are taking pressure off the conscious mind and giving responsibility to the unconscious. Did you explain that to the riflemen?

E: I did not explain it to them. I said to them they might not even know when their finger squeezed the trigger. It takes all the pressure off because it is not necessary for them to know. The only necessary thing is for the bullet to hit the target.

R: The conscious mind need not know the precise moment. You are allowing the unconscious to play a bigger part in the response.

E: And the conscious mind can be more comfortable because it isn't pressured to do it at an exact moment. A small child always asks, Can I do it when I want to? The feeling of comfort and freedom is very important. You don't have to know the exact time.

R: You allow this freedom for the unconscious to make its own response in its own way in its own time. You depotentiate the erroneous sets of the patient's conscious mind that presumes to control everything and thereby open freedom for the individual's creative unconscious.

**Serial Posthypnotic Suggestion for a Negative Hallucination Training**

E: Shortly you will awaken, wondering where the others have gone. [Pause] It will rather surprise you. Why did they leave? Was there any purpose? Now slowly awaken. [Pause as she opens her eyes and reorients to her body a bit.]
You don't directly suggest she won't see the others when she awakens. You give a more subtle form of suggestion of surprise, and questions about why they left, etc.

Trance Induction by Depotentiating Conscious Sets: Evaluating Posthypnotic Capacity

[X is immobile with a trancelike stare.]

E: Is there anybody else here?

X: In this room? [Long pause] I can't give you a simple answer.

E: Then give me a complex one.

X: Well there are three or four other people here, but they are not.

E: They are not what?

X: Not impinging or something.

E: Not impinging.

You ask a question about the presence of others to evaluate her capacity to follow your subtle posthypnotic suggestion about wondering where the others have gone.

The basic problem of many patients: They are usually afraid to give up conscious control, they do not trust their own unconscious to find solutions and new ways of coping.

A tendency for the hypnotherapist to err in the direction of uncovering unconscious material too quickly. You carefully avoid this danger by emphasizing that patients need not tell until they are ready to do so with a feeling of comfort and safety.

E: I point out that contradiction. Now when does a girl want to have a lack of control?

R: During orgasm.

X: I never did want to be a harpist. [Pause]
E: What do you want to do in relationship to the harp?

X: Play just for myself.

E: And whose idea was it that you be a concert harpist?

X: I always blamed my Dad, but it might have been mine. I think originally it must have been Dad's.

E: Now why did you have wet hands?

X: I know why. So I wouldn't have to play.

E: As an excuse.

R: When her self-revelation does come, it is surprisingly free of emotional trauma. Not wanting to be a concert harpist seems to be such a simple pragmatic fact, yet for her it is giving up an identity built up over a lifetime. One of her major mental frameworks about herself has been altered.

[A fifteen-minute conversation takes place wherein X now experiences a flood of insights about her family's psychodynamics and her symptom of sweating.]

R: Now begins a flood of insight and conviction about the source and nature of her problems in her family. You are here utilizing the classical means of insight therapy to support the reorganization of her psychic economy so that symptom formation is no longer necessary.

All I have done is say words and in so doing I have stimulated memories, ideas that you already had, and then you acted on those memories. You have memories of the time when you didn't even know your hand was your own. And you don't even know when you first knew where your ears were. And you don't know how you finally located your ears. Parents like to have a child point to the hair, forehead, eyes, nose, mouth, chin, and ears. But when did you really know where your ears were?

X: I don't know.

[Erckson demonstrates knowledge of ear location by touching the right ear by reaching with the left hand behind the head.]

E: One time you didn't know those were your hands, so you tried to pick up your right hand with your right hand. It took you a long time to learn to pick up your left hand with your right hand and your right hand with your left hand. So you have a whole bank full of memories and understandings, and
all I do is say something that touches upon those memories. Yesterday when I said, 'Try to stand up,' I tapped into your memory bank to a time when you couldn't stand up. And there was a time when you couldn't sit down because you didn't know what sit down meant. There was even a time when you didn't know you were a people. All I needed to do was tap into your memory bank and you couldn't talk.

R: That is our theory of hypnotic phenomena

R: In these closing remarks you are actually giving a clear outline of our utilization theory of hypnotic suggestion. Suggestion is not putting something into the subject; suggestion is the process of stimulating memories and ideas that you already had that can be acted on by the subject. Suggestion is simply the process of evoking the subjects' own internal associations and helping them utilize these associations for new purposes. All so-called hypnotic phenomena are actually dissociated bits and pieces of behavior that were once normal in earlier stages of development and the initial stages of learning.

E: Knowing things and not knowing them at the same time. [Erickson tells another of his favorite stories about his daughter Christie, who screamed and carried on for seven days until she finally stood up and took 142 consecutive steps the first time she walked. She just knew she was a people and thus had to prove it.

At the end of a therapy process you give full disclosure to your patients about the nature of hypnosis. In particular, you emphasize that they actually have control over the process and they can use it for any constructive purpose.

Behavior, whether in the ordinary waking state or in hypnototherapeutic trance, is not necessarily logical, well-ordered, properly pertinent, or even reasonably appropriate to the situation or conditions evoking it. It may be logical, illogical, meaningless, irrelevant, random, misdirected, nonsensical, metaphorical, humorous or whatever. It is usually impossible to predict with precision just what an individual's response will be in any therapeutic encounter because the simplicities and complexities of behavior and its reasonableness and idiosyncracy derive from many permutations of unknown experiential factors in the person's lifetime of learnings.

Hence, when the problems of distressed, disturbed, and abnormal behavior are encountered, any treatment approach must integrate the individuality of both the therapist and patient. There is no rigidly controlled or scientific method of eliciting the same behavior from one or more patients under the same conditions at different times. Even when the range of responses seems to be greatly limited, totally unpredictable behaviors may occur.
Psychotherapists cannot depend upon general routines or standardized procedures to be applied indiscriminately to all their patients. Psychotherapy is not the mere application of truths and principles supposedly discovered by academicians in controlled laboratory experiments. Each psychotherapeutic encounter is unique and requires fresh creative effort on the part of both therapist and patient to discover the principles and means of achieving a therapeutic outcome.

The most common reason the senior author gave for both his successes and failures was the degree to which he was able to evoke and utilize the particular patient's motivation and repertory of experiential learning. The most remarkable hypnotic effects could be evoked because of the nature of the transference relationship and the importance of these hypnotic responses for the patient's much desired therapeutic outcome. The failures, particularly those involving the hypnotic effects that the senior author was most experienced in evoking in experimental settings, were likewise accounted for by their apparent irrelevance to the patient's real needs.

A basic hypnotherapeutic approach to psychosomatic symptoms is to demonstrate clearly and unequivocably how they are controlled and maintained by psychological processes. Such a demonstration breaks through limiting preconceptions about the organic nature of the problem and usually puts the patient in touch with the psychodynamics of the problem. If it is correct that psychosomatic symptoms are more closely associated with right hemispheric functioning (Galin, 1974), an hypnotic demonstration of the psychogenic control of the problem may be making contact with the actual hemispheric sources of the symptom, since trance itself is considered to be a right hemispheric activity (Bakan, 1969; Hilgard and Hilgard, 1975). This helps us understand why it is that spontaneous insight into the sources and psychodynamics of the problem frequently follows closely upon a demonstration of the psychological control of the symptom. The trance experience opens up common pathways between the psychodynamics and the sources of control of the symptom. The following case, written by the senior author, is a typical example of how this approach can be used.

X was sure her asthma was organic since it had begun with a cold, had been aggravated by the atmospheric impurities of the mining town, and only occurred during cold weather. Furthermore it always disappeared with the advent of warm weather. Also, it had to be organic, since in ten years she had never had a single attack in the summer, and she was the same person psychologically in both cold and warm weather.

She proved to be an excellent subject, developing a deep trance easily. She was given rapid training in posthypnotic suggestions. She was then instructed during trance that at a specified cue (when the writer tapped his pencil three times) she
would be given a memory task, a most important memory task, which would be defined at the proper time. She agreed to follow all instruction and, also, to go to sleep whenever another specific cue was given (when his cigarette lighter was dropped into his ashtray). She was awakened with a comprehensive amnesia for the trance experience. After a few casual remarks, further inquiry was made about the possibility of summer attacks of asthma. She was most positive in her denials.

During trance she was asked if she thought she could develop a severe attack of asthma exactly at 2:37 P.M. She declared the idea to be most ridiculous. She was assured that if her asthma were psychogenic, it was both possible and probable. However, if it were organic, she need have no fears. Somewhat puzzled, she waited for further elaboration, but the writer merely directed her attention silently to the clock.

At 2:25 P.M. she was asked if she felt comfortable. She replied that she was merely puzzled, because watching a clock certainly could do nothing to her. At 2:34 the comment was offered that only three minutes remained before she would or would not develop an asthmatic attack. She only smiled in reply. At 2:37 she turned expectantly to the writer. Immediately the writer tapped his pencil on the table three times (this was a previously directed cue for a posthypnotic suggestion to remember) and said, Remember fully, completely, just as if you were reading it, the content of any letter your father has written to you. A violent asthmatic attack ensued.

During it she was told, The day is hot. It's the 8th of July. It is summertime. There are no fumes or dust or cold. You have not a recent lung infection. You are having a severe asthmatic attack. It began at 2:37, twenty minutes after I said it would, if it were psychogenic. It will stop when I say so. It is psychogenic! Shall I remove it at 2:45 or 2:47, because I can. Do you see this cigarette lighter? That's all it is. It is neither medicine nor magic. But when I do a certain thing with it, your asthma will disappear. Watch it carefully. Be sure you know, really know, that your asthma is psychogenic. Now watch. Immediately the lighter was dropped into an ashtray. A deep trance state ensued, and she was told to sleep deeply, comfortably, and to awaken free of her asthma and with a full recollection of everything. This she was then to relate to the writer.

She responded fully, and upon awakening she began to verbalize freely and comprehendingly. Her recollections may be summarized as follows: Her mother had long been bedridden because of paralysis, cardiac disease, and accompanying respiratory distress. Her father had never treated her mother or her very kindly, and he was tremendously guilt-ridden. Shortly before her first attack of asthma, she had received a letter from a friend, hinting strongly about her father's undue interest in a woman known to be promiscuous. Her asthmatic attack followed her
father's first letter. Thereafter she dreaded from week to week his next letter, but felt duty-bound to answer each letter. His return to the farm each spring gave her a sense of relief because she knew he would be too busy to engage in undesirable activities or to write to her.

When she had completed her summation, she was asked what she intended to do. Her reply was that she would think matters over thoroughly and decide on a course of action. Subsequent reports disclosed that she had visited her father, discussed the situation with him, engaged a lawyer, and intimidated her father into executing legal instruments ensuring her control over and eventual ownership of her share of the farm, and giving him his freedom to do as he wished with his share. Since then the father has handled her property well, but he has been slowly dissipating his share.

He still writes regularly each winter, but the patient has had no further asthmatic attacks since the one induced in the office on July 8, 1949.

As is typical of his general approach to symptom problems he demonstrates with her own experience how her unconscious can control her behavior and thereby indicates that the locus of therapeutic change will be within her unconscious.

During trance she is given careful suggestions to respond with an important memory when given a specific cue. She is not told what the memory is to be about, since that might only arouse further conscious resistance. Her unconscious, however, will probably respond to the obvious implication that it will have something to do with her asthma by activating its relevant unconscious search programs in that area. Implication is a most effective means of evoking searches and processes on an unconscious level that can be precipitated into consciousness when given a specific cue.

Before proceeding the senior author added a safety measure. After giving her training in following posthypnotic suggestions, he instructs her to go to sleep - that is, to enter trance - whenever a specific cue is given. Thus any behavior or symptomatic processes that threaten to get out of hand could be immediately attenuated by having her enter trance.

He then gives her unconscious time, from 2:17 P.M. to 2:37, to align itself to produce an asthmatic attack on cue if the asthma is in fact psychogenic. The unconscious does not work by magic. Time is required for it to do its own work. The senior author judged it would take at least twenty minutes to work through the inhibiting limitations of the patient's conscious sets, which declared the idea to be most ridiculous. An expectation was given for an asthmatic attack at 2:37.
The senior author then allows expectancy and tension to build for twenty minutes. At the appointed time, 2:37, she turns (1) expectantly to him; her readiness is apparent. He then gives the expected posthypnotic cue (tapping his pencil three times) and gives her the critical memory task of recalling the content of any letter your father has written to you. A violent psychogenic asthmatic attack ensues. She is thus precipitated into a (2) state of shock during which her habitual mental frameworks and patterns of defense are momentarily depotentiated.

During this critical period the senior author simply states all the obvious facts regarding the psychogenic nature of her asthma. **When one's habitual mental frameworks (the generalized reality orientation) are so shaken by (3) shock and surprise, one tends to grasp onto any suggestions or belief system that will reestablish security and comfort.** The facts about the psychogenic nature of her asthma are then reinforced through the security and comfort that follow from the posthypnotic cue (lighter-ashtray) to enter a deep and comfortable trance state from which she can awaken free from her asthma with a full recognition of everything. The senior author thereby (4) demonstrates her release from symptomatic behavior while opening the possibility of (5) her gaining insight into the sources and psychodynamics of her problem. She gains these insights and makes her own plans about how to settle her problems.

Hypnosis can be used effectively even when the patient is a difficult and unresponsive hypnotic subject with whom only a light trance state is possible. Three two-hour sessions were required to achieve even that light trance, but it was enough to present the basic suggestion: Your unconscious will know what to do and how to do it. You will absolutely yield to that need and give full expression to me. When finally that has been done completely, you can then recover from your present problem. Although the senior author could not evoke any of the classical hypnotic phenomena with this patient, the above suggestion was enough to assign the locus of therapeutic change to his unconscious. The patient's unconscious was given time to incubate until the next session, when his usual conscious frameworks were suddenly depotentiated with the shockingly authoritarian demand to, Shut up with your conscious mind and its foolish requests for medicine, and let your unconscious mind attend to its task!

That was enough to precipitate an unusually violent and prolonged catharsis that proved to be the vehicle for the resolution of the patient's psychosomatic symptom and a striking change and maturation of the total personality. The periods of the patient's intense catharsis could be looked upon as altered states in which personality reorganization could take place.

It was the case of the trombone player whose upper lip swelled greatly. No form of treatment managed to offer relief, as it was psycho-somatic. He had never been
allowed to contradict his father’s strict rules...’Don’t give me no lip’.... He literally ‘gave’ everyone his lip, with the swelling ... He had to confront his father, and ‘give him some lip’ figuratively, to resolve the problem.

Two-level communication and a continual discharging and displacement of resistance are of primary importance to much of Erickson’s approach.

A classical hand levitation approach to trance induction can be used as a rich context for introducing many therapeutic suggestions in a symbolic as well as a direct form. Therapeutic suggestions are introduced during those first moments of initiating trance experience when patients' attention and expectancy are frequently at their highest pitch. In this unusually rapid approach the patients receive therapeutic suggestions before they realize what is happening. Their consciousness can be so fixated on the novel experience of hand levitation that they do not notice the therapeutic suggestions. The therapeutic suggestions are, therefore, received by the unconscious in a way that bypass some of the patients' conscious, habitual attitudes and learned limitations.

E: You know that seeds found with Egyptian mummies have sprouted after 5,000 years.

He does not have to worry about penis erection because that's also an automatic function. You're thereby introducing another therapeutic frame of reference: Unconscious processes within the body will regulate penis erections just as they do other functions once he gives up the limiting and inhibiting effects of his conscious worry about it. The patient objects by saying a personal relationship is involved. You then utilize this to confirm that from the physiological point of view you really shouldn't have a worry. This resolves the physiological aspect of the problem and enables you to define the problems as psychological or emotional in a manner that he can easily accept. Then with your hypothetical question about any doubt when she is nude you help him acknowledge that even this psychological aspect of the problem is resolvable. Thus in the first few minutes of the interview you have facilitated series of acknowledgments from the patient that structure a very strong therapeutic frame of reference for the hypnotic work that will follow. In his last remark the patient is already placing the problem into the past. He approaches trance with a very high expectation that his now very limited problem can be resolved with ease.

**Suggestions for Recovering Memories: Truisms Covering Many Possibilities of Response**

E: To uncover that memory and return it to you is not likely to occur all at once. What is likely to happen is that you'll remember a little bit here and next week a little bit there. The following week some more of the first part. The following
week it slowly builds up in a regular fashion. And then some day the whole thing will straighten out.

R: You begin with a series of psychological truisms about how we do in fact tend to recover memories piece by piece over time. These suggestions, cover many possibilities of response. her unconscious the freedom to work in its own optimal manner,

You can't know and I can't know - nobody can know - just how you are going to remember He illustrates this further by asking her to recall what she had for dinner last night, validating the fact that her recall comes out in a piecemeal, out-of-sequence order.

When I say she can't know and I can't know. Notice the interspersed suggestion, *you are going to remember.*" Consciously she does not hear that direct suggestion because her conscious mind is focused on the how that precedes the direct suggestion, *you are going to remember.*
Milton H Erickson, Hypnotherapy, an exploratory casebook

Embedded commands: You can begin to relax

Add a non-verbal gesture to set this verbal directive apart from the rest of the utterance with ‘analog marking’

‘I’m wondering if you will …’ is an embedded question, meaning the question forms only part of the utterance, i.e. is embedded in a sentence, rather than forming the entire sentence e.g. ‘Will you…?’

I don’t know if you are aware / know / realize / notice…

Deeply, easily, curious about…

Milton uses phonological ambiguity i.e. many words have different spelling, and meanings, but sound the same…so you can bypass the conscious mind and speak to the subconscious directly…the conscious mind attends to one meaning, the subconscious to the other, e.g. sexual meaning…

He often deliberately makes it unclear what, and to which extent, the adjective, adverb, or verb applies to, in the sentence…used to bypass conscious filters…and Zen tactic of surprise / shock / break internal dialog

He often puts two sentences together, where the end of the first is the start of the second…’I’m speaking clearly to make sure that you can hear you are, in the process of…

Uses transferred epithets e.g. ‘the rock is sad’

He often pretends he is quoting someone else, when making statements. E.g. ‘Last year in Vegas, the Hotel owner …

‘Meta Model’ simply means you interrogate the utterance, to make explicit any assumptions, make explicit anything else that is implicit, note any generalisations
made or implicit, make sure ever utterance has a reference e.g who, what, where in particular Vs ‘people, it, there, she, they, and forces the utterer to be more specific where they are being vague… in order to highlight these, and challenge them... where they remain vague, general, implicit, they cannot be challenged and replaced with more concrete, specific, valid expressions... and these are needed to move forward... Of course NLP makes up its own language for marketing purposes, to trick people into paying huge amounts of money for ‘Master NLP courses’ which basically teach what Bandler and co. have modelled off other people. To their credit they have made some things explicit, and drawn out ‘intuitive’ talent to explain what they do, or observe them doing it and noting it... but this ‘modelling’ behavior goes way back to Maxwell Maltz’s days of ‘psycho-cybernetics’... what gets me is that they made it so hard for even me, who already understood most of what NLP is, to comprehend what NLP was, so that it seemed much more mystical and elusive than it is... they did this consciously to monetize their work as well as possible, or subconsciously, from a desire to appear more original and innovative than they really are... much in the same way Einstein built up on the work of others, much of it directly gifted to him, but then repackaged it, and was pushed to the foreground as a ‘genius’... that both men are Jewish may not be irrelevant!!

In other words you should ask for missing information, where it is not offered e.g what, who, when, where. If comparisons are made, you need to ask what they are comparing themselves, something, to. Who, what, when where? Basically what I call ‘interrogation’. To interrogate simple utterances to reveal all the implicit and explicit assumptions that have been made by the utterer. To seek more concrete levels of abstraction that can be identified, worked with, explicitly.

‘I fell, like, you know, everyone, over there, well, they all, you know, look at me and, like, you know, they’re thinking they’re much better than me an all. And they, like, do this all the time, and like, never, ever, do they think about, hey, you know, the good things I do, and like, I can never get them to admit ….’

There are often mistakes in reasoning, logic, assumptions, mistakes, invalid ascriptions... assuming you can ‘read’ others thoughts about you i.e mind reading, or that others should be able to read your mind, attributing cause-effect relationships that do not exist, or doing so erroneously... i.e she makes me mad, even attributes magical powers to her... who? How? When? Examples? ...

Nominalisation is a neat concept though... all is flux... all is process... all is becoming... leaves everything open to being changed... nothing is ‘done’... ‘finished’... there are NO fait accomplis... just processes that can be influenced...

‘complex equivalence’ is David Humes ‘Humean uniformity’ i.e that supposed cause-effect relationship observed in past / experienced as such, will remain
uniform, and reliable, in the future i.e X+Y will always give / result in / produce / cause, the outcome, condition, state, Z…

Using terms like ‘Lost Performatives’ however is absurd, unforgivable..what is the point of such terms? Simply refers to failure to make explicit WHO said what, where, when, in what context… ‘She always…’ etc…Who? ‘They say…’ Who says?...often ‘hearsay’ and totally unreliable source e.g mass media / government / teachers…

The terms ‘must’ and ‘have to’ are called Modal operators of necessity, which we can forgive Banler for using, given his computing background…they are key though, as people assume they have no choice…this often implicit assumption has to be challenged…a major limiting belief…the idea that ‘I have to’, or ‘I may not’ or ‘I must’…often are totally invalid…just something someone told you and you accepted…conditioning…usually You CAN, and have a choice whether to or not, that you have been tricked into not realising…like feeling obliged to fight wars for Israel because your occupied government was bribed to order you to…just because a thing called ‘conscription’ was introduced…in fact you can UN-introduce it…it’s called democracy…and either you have it or you don’t…but you are told you do NOT have a choice, when you DO…you are told ‘WE MUST…’ when in fact we have lots of different options…

Maybe I got ‘presupposition’ wrong…says here is it something implicitly required to understand a sentence i.e something not said, that we add, to complete the sentence, even though it was never uttered…

I understand Richard monopolizing the training of NLP trainers, but doubt he oversees every course, and that most of his trainers and trainees every really ‘grok’ NLP, fully…It is an industry…like any priesthood… and if you imagine you invented something special, you want to ensure it is reproduced correctly, fully, and doesn’t get distorted into something else, and is applied as you want it to, to gain the results you felt you yourself got using your method…so be careful… In any case, most of NLP existed in some form before Bandler, and NLP is a logical progression where it did not exist formally in the form of NLP…and it is not necessary to use NLP terms to do most of NLP, as it is ‘borrowed’ or a mere ‘extension’ of existing forms…but Bandler should be given credit for the specific exercises that Bandler produced …though I will describe them in paraphrased form, in ways I think best explains their optimal use of the underlying concept…to avoid charges of ‘plagiarism’ and copyright and of ‘using NLP without permission…and even more importantly, to ensure transfer of meaning / value… I find most of NLP obfuscationist and disproportionately burdensome to users…and fails to give credit to its inspiration where it could and I believe should have…of course no-one gives David Hume the credit HE deserves…
My voice will go with you…Milton H Erickson’s therapeutic use of story

He was the founding editor of the American Society of Clinical Hypnosis. In the 1950s he wrote the article on hypnosis for the Encyclopaedia Britannica. Professionals often called upon him for advice on hypnosis and altered states of consciousness. He hypnotized Aldous Huxley in the 1950s and collaborated with him on his study of altered states of consciousness.

And I want you to choose some time in the past when you were a very, very little girl. And my voice will go with you. And my voice will change into that of your parents, your neighbors, your friends, your schoolmates, your playmates, your teachers. And I want you to find yourself sitting in the school room, a little girl feeling happy about something, something that happened a long time ago, that you forgot a long time ago. — Milton H. Erickson

"What you don’t realize, is that most of your life is unconsciously determined."

The positive value of any psychotherapy is obviously based on the ability of a person to change, largely as the result of an encounter with another person or persons.

Change is accomplished most effectively and permanently when the therapist focuses on influencing his patient’s unconscious patterns.

"Coming here and letting me tell them stories" involved expectations and communications on many levels. For example, anyone who spent time with Erickson was likely to experience various levels of hypnotic trance. With positive expectations, in a trance, we are most open to the messages and influences transmitted in Erickson’s stories. Erickson believed that if the listener "forgot" a story—developed an amnesia for it—its effect could be even more potent.

MHR probably Hollywood movies the reason people will feel certain they had seen factual evidence, even film footage, of the supposed ‘Holocaust’ gassings and cremations !! Without cultural reinforcement "brainwashing" tends to fade.
away. During the Korean War, for example, many "brainwashed" American prisoners-of-war were led to accept anti-American beliefs. In fact, thousands wanted to remain in Communist China rather than return home. Yet after they had been repatriated, it would seem, most, if not all, returned to their former beliefs.

In "telling stories" Erickson was, of course, following an ancient tradition. Since time immemorial, stories have been used as a way of transmitting cultural values, ethics, and morality. A bitter pill can be swallowed more easily when it is embedded in a sweet matrix. A straight moral preachment might be dismissed, but guidance and direction become acceptable when embedded in a story that is intriguing, amusing, and interestingly told. Toward this end, Erickson's tales utilize many effective storytelling devices, including the use of humor and the inclusion of interesting information, such as little-known medical, psychological, and anthropological facts. Therapeutic suggestions are interspersed in stories whose content is far removed both from the patient's concerns and the therapist's overt focus.

Trance, according to Erickson, is the state in which learning and openness to change are most likely to occur. It does not refer to an induced somnolent state. Patients are not "put under" by the therapist, nor are they out of control and directed by the will of another person. Trance, in fact, is a natural state experienced by everyone. Our most familiar experience takes place when we

During the movie, many of us enter into an altered state of consciousness. We identify with one or more of the characters, and we leave "trance-formed." However, this feeling lasts for only a short time—ten or fifteen minutes at most. By contrast, people find themselves, many years later, referring back to an Erickson tale. Their behavior and attitudes may be permanently changed.

Erickson explained these permanent changes by the fact that they occurred in the context of "hypnosis," which he defined as "the evocation and utilization of unconscious learnings." When a therapist is able, with or without the use of stories, to help a patient get in touch with his own unutilized knowledge, that patient is most likely to incorporate these forgotten learnings into his behavior. More constructive and self-reinforcing behavior may often result.

In the telling of stories, Erickson adds new data, evokes new feelings, and prescribes new experiences. A patient who has been struggling for years within a guilt-ridden, narrow view of life may be presented through these tales with Erickson's permissive, life-celebrating philosophy. These views reach him on many levels, including the unconscious. They may be presented to the patient in the waking state and the hypnotic state. The patient may then discover that he does not have to rely solely on his own well-established circular patterns of thought. He does not have to "make do" with his own limited philosophy and
limited mental sets. Partly through the medium of these stories, he becomes aware of new possibilities, which he is free to accept or reject on both conscious and unconscious levels. Sometimes the patient will identify with a character in a story, or with Erickson himself—the master, who can deal successfully with difficult challenges. He may then experience a sense of accomplishment. This sense of accomplishment allows him to approach a situation with a greater feeling of confidence.

When a patient has been able to experience himself successfully enjoying a sexual act while in a hypnotic trance, the therapist has added to his memories the feeling of success and the expectation of further success.

"Did you know that every blade of grass is a different shade of green?" popped into my head and I looked at the grass more closely. Indeed, it was true! For the rest of the day, I walked around with my eyes more open than usual.

A child in a story can represent the child within us…When the reader identifies with the child, he is likely to feel hopeful as he hears how the child overcomes blockages to growth and freedom.

Process of "reparenting." Erickson used this concept in a broader way than had Jacqui Lee Schiff in her book Transactional Analysis Treatment of Psychosis. Erickson applied the term to his method of replacing previous "parental" injunctions with new ideas, which he instilled by means of posthypnotic suggestions.

A phrase that Erickson often included in his hypnotic inductions: "And my voice will go with you wherever you are." This phrase enabled him to keep contact with the patient in trance, regardless of the depth of the patient's regression, while also serving as a cue to posthypnotic suggestions. Another cueing phrase might be "You will see a flash of color." Subsequently, long after the therapeutic session, whenever the patient saw a flash of color, he was likely to respond to other posthypnotic suggestions given in conjunction with the "flash of color" suggestion. These suggestions could include injunctions and points of view, which would then be "heard" (often in Erickson's voice) as the voice of an introjected parent or superego. This introjection of the therapist's voice can occur in any psychotherapy but is most likely to occur when the patient is in a hypnotic trance. One possible explanation for this phenomenon was given by Lawrence Kubie at a meeting of the American Psychoanalytic Association, Dr. Kubie noted that in a hypnotic trance the distinction between hypnotist and subject is abolished. The subject then hears the hypnotist's voice as if it were coming from inside his own head—as his own inner voice. This was true of Erickson. His voice would become your voice, and his voice would go with you, wherever you were.
One use of story / metaphor is like Zen Koan...to bring confusion / surprise, and break listener out of internal reverie, mental chatter, habitual frames of reference / patterns / limiting beliefs/attitudes/values etc

A story like Parables of Jesus, more memorable than moral lecture, philosophical discourse...and express the meaning in more accessible way ...

By observing the patient carefully and by mirroring his behavior and responses, Erickson gives the patient the feeling that his mind is being read and that Erickson really knows him. This kind of "knowing" leads to a very intimate relationship. "Rapport," which is imperative in all kinds of psychotherapy, is apparently formed more quickly during hypnotic therapy than in other forms of psychotherapy. (In this regard, it is of interest that Anton Mesmer was the first one to use the term "rapport" in conjunction with therapy.)

A strong therapeutic relationship leads the patient to feel understood, safe, and secure. With this support he may then venture into both inner and outer worlds with greater confidence and with a greater readiness to take risks.

His observations pertained not only to simple matters such as body movements, breathing, and pulse rate (seen in the neck), but also to the patient's responses, as he listened to the tales. For example, if a patient tightened up at a certain point in a story, this was a clue that some relevant point had been touched upon. Erickson might then utilize another story, or elaborate on the same one, in ways that enhanced the patient's responsiveness. Thus, the stories are not only therapeutic but also diagnostic.

The teaching tales were always used in conjunction with other principles of Ericksonian therapy. e.g. symptom prescription, utilization of the resistance, and refraining.

Erickson applied the principles of getting the patient's attention through surprise, shock, doubt, and confusion, with the generous use of implications, questions, puns, and humor in his stories. Each story has a structure and plot, often with a surprise ending. The stories often build to a climax, followed by a feeling of relief or success. The use of the teaching tales demonstrates a principle that Erickson outlined in Hypnotic Realities, that is: "When dealing with a problem of difficulty make an interesting design out of it. Then you can concentrate on the interesting design and ignore the back-breaking labor involved." First, you identify an interesting design in the patient's responses and symptoms. Next you select a tale or tales that provide first an analogue of the patient's designs and then a better design. Or, as Erickson told his daughter-in-law, "Cookie," "First you model the patient's world. Then you rolemodel the patient's world."
Calling people ‘stupid’ shocks / stuns / surprises them out of their habitual patterns... opens up Bardot of opportunity to challenge their limiting beliefs etc... then reframing e.g hard penis scary, but you can reduce it, with ‘malicious/vicious pleasure’ to a soft, pathetic little thing, via sex Vs fear of chronic rape / child abuse victim of erect penis... now sex empowering for her Vs sense of shame, powerlessness, worthlessness...

The business at hand—helping the patient to be more open, to find novel solutions and new frames of reference.

Having a repertoire of stories can give the therapist a feeling of mastery, control, and competence... i.e avoid feeling anxiety themselves... manifest confidence in client i.e placebo effect / self-fulfilling prophecies etc...

The best way for the therapist to select stories is through his own free associations. By this I mean not only cognitive free associations, but also bodily responses, emotions, perceptions, and, particularly, imagery associations

Erickson also behavioral therapy / logic i.e if client couldn’t wake up in morning, then drink lots of water before going to bed, so bladder would wake him up... and then start getting out of bed any time NOT asleep / sleeping i.e so learn to associate bed with ONLY sleeping / sex... so any time woke up during night, had to get out of bed, drink lots of water, and only return to bed when sleepy ... when he awoke to urinate, he was not to return to bed, but must begin the day, preferably with a cold shower...

"We all begin to die from the moment we are born. Some do it faster than others. All we can do is enjoy our lives."

Sometimes patients will note that even though they have an exciting session in the therapist’s office, fantasizing and even imagining successful resolutions of conflicts, there is no carryover. They complain that "there hasn’t been any change in me. I am still not doing anything differently outside this office." Sometimes in such cases, it is best for the patient to remain silent and passive while I tell an Ericksom’an tale. It may be a long, boring tale of childhood development. The patient will claim, at the end of the session, that this session was not as "good" as previous sessions and will state that he prefers to be more active. He may say that he was bored. I will remind him that the work that we are trying to achieve is on an unconscious level and that it does not matter what his conscious mind does. Subsequently, he may report major changes in his life. He has been, for example, more assertive socially, has established new relationships, or has changed a job. In other words, his activity takes place outside of the session. During the session, / assume responsibility for activity.
Receptive state is often most easily and quickly achieved by the inducing of a hypnotic trance. If one reads these stories in the so-called waking state, one might dismiss them as being "cliched," "corny," or "of interest, but not enlightening." Yet, in the hypnotic state, where everything that is said by the therapist is heightened in meaning, a story, or a single word in a story, may trigger a mini saton the Zen term for enlightenment. (MHR pronounced how? Maybe even ‘SayTen’? Imagine if called self Saton …:D) The only active ingredient in ‘mesmerism’ was found to be the imagination !!! Late 1700’s investigation into ‘animal magnitism’ …

—in the trance state—to re-experience the immense effort and frequent frustration involved in learning any new task like walking, riding a bike, learning to play guitar, juggle etc, is to suddenly realise you succeeded at THAT, so surely THIS will prove no greater obstacle i.e current ‘problem’ / ‘challenge’…

Erickson assumed there was a ‘normal’ development path, unique to each individual, that all humans move along…simply a matter of returning them to where they got ‘in a rut’ i.e ‘stunted’ / ‘arrested’, where things were proceeding smoothly / normally (LRon Hubbard return to last point felt competent), and to continue along this path that they, as unique individuals i.e THEIR path, would have continued along, had not the traumatic / limiting event / experience / etc intervened…maybe decades ‘later than normal’, but ‘never too late’…MHR…

Erickson’s great story of the horse that he merely helped find its way home, after wandering onto his family farm…he just ‘rode’ it out onto the road, and kept it on that road when it wanted to / wandered into fields to eat etc, until it found its way home…very powerful story…He told a story about a horse that wandered into his family’s yard when he was a young man. The horse had no identifying marks. Erickson offered to return the horse to its owners. In order to accomplish this, he simply mounted the horse, led it to the road, and let the horse decide which way it wanted to go. He intervened only when the horse left the road to graze or wander into a field. When the horse finally arrived at the yard of a neighbor several miles down the road, the neighbor asked Erickson, "How did you know that that horse came from here and was our horse?" Erickson said, "I didn't know—but the horse knew. All I did was to keep him on the road."

Often helpful to go back to the beginning of the real road, the real developmental course of the client /self…taking real likely events we know MUST have happened e.g ‘learning to stand up’, as the client walked into the office, and therefore MUST have, at some point, successfully mastered this very complex balancing act of ‘standing up’ and ‘staying standing’…can regress person in trance back to this very challenging development / stage / event / experience…relive it…and thus feel empowered / confident / competent about
whatever current challenges they have...also simply puts them back on their own road to development...and can continue from here, going through all the desirable developments that allow a person to feel ‘fit for life’ ... confident ... etc...I did THAT, I can do THIS / anything...like basic training in Army...we surprise ourselves...mind gives up before body...and if I can manage THAT, then anything is possible...i.e point of such otherwise pointless training / excessive pushing of boundaries / limits...until come to point where you stumbled / got stuck / your development became arrested...and then have identified the thing you need to re-live, this time with the resources required, and get through, so that you can then continue on your own ‘normal’ development, into maturity, as a confident adult ... fully functional...enjoying life ...

LEARNING TO STAND UP

We learn so much at a conscious level and then we forget what we learn and use the skill. You see, I had a terrific advantage over others, I had polio, and I was totally paralyzed, and the inflammation was so great that I had a sensory paralysis too. I could move my eyes and my hearing was undisturbed. I got very lonesome lying in bed, unable to move anything except my eyeballs. I was quarantined on the farm with seven sisters, one brother, two parents, and a practical nurse. And how could I entertain myself? I started watching people and my environment. I soon learned that my sisters could say "no" when they meant "yes." And they could say "yes" and mean "no" at the same time. They could offer another sister an apple and hold it back. And I began studying nonverbal language and body language. I had a baby sister who had begun to learn to creep. I would have to learn to stand up and walk. And you can imagine the intensity with which I watched as my baby sister grew from creeping to learning how to stand up. And you don't know how you learned how to stand up. You don't even know how you walked. You can think that you can walk in a straight line six blocks — with no pedestrian or vehicular traffic. You don't know that you couldn't walk in a straight line at a steady pace!

You don't know what you do when you walk. You don't know how you learned to stand up. You learned by reaching up your hand and pulling yourself up. That put pressure on your hands — and, by accident, you discovered that you could put weight on your feet. That's an awfully complicated thing because your knees would give way — and, when your knees would keep straight, your hips would give way. Then you got your feet crossed. And you couldn't stand up because both your knees and your hips would give way. Your feet were crossed — and you soon learned to get a wide brace — and you pull yourself up and you have the job of learning how to keep your knees straight — one at a time and as soon as you learn that, you have to learn how to give your attention to keep your hips straight. Then you found out that you had to learn to give your attention to keep your hips straight and knees straight at the same time and feet far apart! Now finally you
could stand having your feet far apart, resting on your hands. Then came the lesson in three stages. You distribute your weight on your one hand and your two feet, this hand not supporting you at all [E. raises his left hand]. Honestly hard work—allowing you to learn to stand up straight, your hips straight, knees straight, feet far apart, this hand [right hand] pressing down hard. Then you discover how to alter your body balance. You alter your body balance by turning your head, turning your body. You have to learn to coordinate all alterations of your body balance when you move your hand, your head, your shoulder, your body—and then you have to learn it all over again with the other hand. Then comes the terribly hard job of learning to have both hands up and moving your hands in all directions and to depend upon the two solid bases of your feet, far apart. And keeping your hips straight—you knees straight and keeping your mind's attention so divided that you can attend to your knees, your hips, your left arm, your right arm, your head, your body. And finally, when you had enough skill, you tried balancing on one foot. That was a hell of a job!

How do you hold your entire body keeping your hips straight, your knees straight and feeling hand movement, head movement, body movement? And then you put your one foot ahead and alter your body's center of gravity! Your knees bent—and you sat down! You got up again and tried it again. Finally you learned how to move one foot ahead and took a step and it seemed to be good. So you repeated it—it seemed so good. Then the third step—with the same foot—and you toppled! It took you a long time to alternate right left, right left, right left. Now you could swing your arms, turn your head, look right and left, and walk along, never paying a bit of attention to keeping your knees straight, hips straight.

Describing how he developed his powers of observation, being totally immobile, and observing others for entertainment. By describing plausible experiences that an infant might have in learning to stand and walk, he encourages regression of the listener to the infant level.

Erickson's negative statements (i.e., "you toppled") are in the past tense. He changes to the present tense to imbed positive suggestions ("you alter your body balance"). This "very early learning set" story is helpful at the beginning of any therapeutic program because it brings the patient back to a time before the onset of his neurotic problems, disrupting, at least temporarily, his fixed mental sets. It also reminds the patient that learning is or was difficult but that he will learn, if he persists.

Both giving and holding back the apple...an analogy...we both express, and repress...hold ourselves back...
"And you can imagine the intensity with which I watched." Here he is marking the word "imagine." Of course, this is the way his hypnotic work will be done, with imagery, with imagining.

He chuckled his way through all of his stories. He was going to have fun, and he was inviting you to play. If you did not want to play, that was your problem. He would still make invitations, but he was not going to be offended if you rejected them.

As you watch the person grab on to whichever associations that particular person has, and you could follow up on them.

Cueing the unconscious with words such as "straight" and "stand up." Later, when these words or phrases are introduced into therapy, the entire learning set and attitude toward learning are then automatically evoked.

One of his favorite prescriptions for enjoying life, perhaps even for prolonging it! "Always look to a real goal, in the near future."…when he had been expected to die overnight, he’d had his mother move a chest that was blocking his view of the window, and he’d be damned if he was going to miss his last sunset…went into coma for 3 days, but survived… is necessary that we have goals—immediate and achievable.

Dilation imagery / story about dilation etc …for mental and emotional and physical constipation…

Use a story, at the start, that sets the tone, positive expectations i.e of a similar case you treated successfully, someone who benefitted from the same treatment / applying the strategy you suggest etc…

‘Haven’t you had enough of …. Symptom / behavior X ?’ ‘Don’t you think it is time to be happy / healthy / successful’? After having induced trance state…

**Will Rogers, "It ain't what we don't know that gives us trouble. It's what we know that ain't so that gives us trouble."**

Milton had not yet begun speaking at the age of 4, while his 2 year old sister had…

**HE WILL TALK**
A lot of people were worried because I was four years old and didn't talk, and I had a sister two years younger than me who talked, and she is still talking but she hasn't said anything. And many people got distressed because I was a four-year-old boy who couldn't talk. My mother said, comfortably, "When the time arrives, then he will talk."

This last tale highlights Erickson's belief that the unconscious mind can be trusted to produce appropriate responses at the right time. When this story is told to a patient who is just beginning to experience hypnotic trance, it may encourage him to wait patiently until the urge to talk arises or until he is able to reveal unconscious messages in a nonverbal way.

How deep a trance is necessary? Any trance that is of sufficient level to let your unconscious mind take a look, a mental look, at what's going on, is sufficient. In those mental looks and understandings, you learn a great deal more than you do by conscious effort. And you should use your mind at the unconscious level, even while you are using it at the conscious level.

Milton tricked a client who he knew had a history of not paying his bills, by getting him to brag/show off about all his important, influential friends, and getting their addresses from him (perhaps acting like he didn't believe him, and needed proof/evidence), then the client realised he would contact these people and tell them if he didn't pay…that HE had been 'played' i.e. play on his arrogance/pride. ‘He knew blackmail when he heard it!’

Milton and others often put themselves into a trance, putting their confidence in the ability of their non-conscious mind to solve a problem/deal with a client…often emerging from that trance hours later with files/case notes/solutions…total unaware of the previous few hours…

Milton would tell stories giving illustrating how most of our behavior is unconsciously determined. Erickson is also inserting frequent references to "automatic" behavior. Thus, this tale is useful in encouraging a patient to allow himself to respond automatically in a hypnotic trance. The repetition in the story can easily lead to 3 hypnotic trance, especially if the words are delivered in a rhythmic way. Of course, this story can be used diagnostically as well. One can note a patient's response to words, phrases, events in the story you think might related to their real underlying problems i.e. diagnose their symptoms indirectly…without arousing conscious resistance…you can 'try and see', 'try out’ various possibilities, unobtrusively, to ‘fish’ for unconscious/non-verbal and verbal responses, without arousing denial / asking direct questions the conscious mind doesn’t want to answer/ can deflect/pretend/deny…which is how those stage performers can ‘read’ what you are thinking…by watching you as you attend to his story/comments/questions…
MHR see if any details / books written etc by these stage performers on how they achieve their apparently amazing ‘mind reading’ successes !!!

How much pressure used when writing can indicate the emotional intensity e.g conflicting choices…if write YES to all, one will be written with more pressure, THAT is the unconscious MOST desired outcome / choice…

Erickson credited with first use of INDIRECT suggestion? He introduced it to ‘walk around’ resistance…He tells clients to ‘Go into a deep sleep, and meet me in the middle of nowhere’…

3 classical aspects of hypnotism. Literalism, age regression and time distortion.

"All your life you have been learning things, transferring them to your unconscious, and using, automatically, the end results of the learning." He is suggesting that you, the reader, will transfer to your unconscious mind the learnings derived from his teaching tales and you will use the end result automatically.

Erickson age regressed a client to age of 3, i.e to a time before her phobia / symptoms appeared, in her case she had recently ‘learned’ to associate orange juice and the color with castor oil, after a chemist with the best intentions, unknown to her, placed her prescription of castor oil in a glass of orange juice, and offered it to her. She drank it. And ever since had felt sick at the mere thought, sight, etc of orange juice, or even the color orange. By taking her back to a point in her development BEFORE the event, and giving her orange juice to drink in that regressed hypnotic state, he cured her of this aversion / stimulus-response / conditioning…the basis of ‘time-line therapy’, though I have not heard of anyone in NLP attributing their ‘brilliant idea’ to Milton H Erickson !!! Basically age regress to a time BEFORE the phobia / reaction had appeared, and get the person to do whatever it is they fear / hate doing…

MHR are dreams subconscious’s way of re-programming itself?

Catalepsy…placing another person in trance, then lifting their arm, and leaving them there, in that rigid fixed position, in front of another person resisting trance…i.e antagonistic / hostile to the very idea, and determined to prove trance doesn’t work on them, that you cannot put them into a trance…He left them together for 15 minutes, and when he returned, the resistant client was in deep trance i.e the client had resisted the therapist, but couldn’t resist another person in deep trance already i.e the evidence / facts / clear proof that SHE was in trance i.e immobile in odd position a person could not normally maintain for very long…
Localising the symptom / restricting it / limiting it to one particular geographical location / situation / condition rather than attempting to fight it, avoiding resistance MHR and Erickson … intensely associating it with such limited triggers / stimuli, that it is effectively irrelevant.

Another way is to have a client resist you actively i.e. deliberately evoke / provoke the maximum resistance, by deliberately doing your spiel in a clumsy way bound to fail… while the client is sitting in chair X… or explicitly ask them to experience their fear / phobia etc as intensely as possible, sitting in chair X, then direct them to ‘leave the fear in that chair’, and get up and sit in chair Y. Erickson thus gets them to localize the fear / symptom in that chair… the implication to the subconscious being that the fear can NOT be experienced anywhere else… it is not so intensely ASSOCIATED (MHR) with that location… it is allowed to exist, remain, you have NOT resisted it / strengthened it by resistance… you have simply limited it to that one location… very Buddha like way… more subtle even than replacement …

Erickson got a chronic alcoholic to go to the botanical gardens and do a lot of thinking in the cactus enclosure… considering the miracle of how these plants can survive years without ‘a drink’ … it worked … the man realised his current job was high risk for drinking ‘occupational hazard’, and changed his workplace… stayed sober… he of course had been at the end of his search, desperate, highly motivated… the indirect suggestion was of course that he didn’t need to drink…

Like my idea of ‘glass me’ transferring pain from one thing to another, where it is not a problem any more, in same context of MIGRAINES.

Client with 9 year history of chronic, debilitating migraines… highly competitive person… after 3 years of daily treatments came to Erickson… "You have headaches, migraine headaches, which simply are killing you day after day. You’ve had them for nine years. You’ve been in daily treatment for your headaches for three years, with this doctor whom you trust. And you have made no progress at all. Now he has brought you out here, for me to work with you. And I’m not going to work with you, but I will do this. You put your hands on your knees and see whether your left hand will rise up to your face first or your right hand first." And the competition that developed between his two hands — it was marvelous! It took about a half an hour for one hand to win. Just when his hand was touching his face, I said, "The tension is in the muscles and you hold that tension in your hands while they are competing." It wasn't pleasant for him to
feel that tension. "Now, if you want to have headaches, why not have a headache free of muscle competition of the muscles in your neck and shoulders? I don't think you want a headache any more than you want competition in your neck and shoulder muscles. I'd like to have you know what muscle relaxation is by letting your hands compete in relaxing." So I gave him a lesson in tension and relaxation. And he's been free of headaches ever since. That was at least six or eight years ago. (MHR not sure if it was the relaxation exercises that did it or the suggestion...but at least the suggestion opened the way for him to do the exercises...often how most 'magical' cures work i.e get people to do reasonable things they otherwise wouldn't do / take seriously ...using the tricks / delivery of 'magic' e.g. reading runes / tea leaves...transferred authority of ...)

Inducing orgasm by suggesting it must be possible, as every boy experiences wet dreams

A 'frigid', sexually unresponsive female client found no pleasure in sex at all. It was merely mechanical. This disappointed her lovers. She wanted to become responsive/passionate. Erickson described, in some detail, how boys experience wet dreams all the time. Then suggest: "In every boy half of his ancestors are feminine. And what any boy can do, any girl can do. And so you can have a wet dream at night. In fact, you can have a wet dream any time you wish. In the daytime you may see a handsome man. Why not have one then? He doesn't need to know about it. But you can know about it." She said, "That's an intriguing thought." I noticed that she became abnormally still. Her face flushed. She said, "Dr. Erickson, you've just given me my first orgasm. Thank you very much."

Wet dreams, the author imagines, are how the body learns to move from manual orgasm to orgasm during actual sex??? Subconscious 'furnishes' him with a sex object? As if masturbating at some point NOT mentally associated with sex objects?

Erickson chose to speak about boys as this was less threatening i.e 'others' ... wouldn't trigger resistance...if he had talked about girls, risked her taking it personally / triggering resistance ... MHR also more erotic for girl to think about boys masturbating, OBVIOUSLY dear author...so he first uses 'harmless' example, then transfers the learning to her, at the end, AFTER she has accepted the point...before any resistance could occur...objections thus avoided !!!

With client that he had not managed to induce trance in, he suggested she could "learn to go into a trance," then had her imagine / make believe, that she was going into a deep trance...He told her a story about another patient, and how he succeeded with her...He had told her to close her eyes...then direct that 'when you open them, all you will be able to see is my hand... MHR did he say 'pretend' again? Make believe? Or direct her? ...he repeated got her to
SIMULATE a deep trance, until it became REAL...fake it till you make it...go through the motions...muscle memory etc...but he did it by telling her a story about ANOTHER patient he did this with, with success...!!!!

N.B During his lectures, members of his audience hearing Erickson tell this tale sometimes fell into a deep trance during the presentation.

I have indicated some of the "marked" phrases (MHR Italics?). Here, Erickson changed his tone of voice and slowed down. These phrases were then responded to as if they were direct suggestions—such as "You will see only my hand." With patients who have difficulty in going into a trance, I often quote recent research that indicates that people who simulate a hypnotic trance will achieve the same results as those who are "actually" in a trance. As we can see in this tale, one can simulate a light trance or a deep one. Erickson gives guidance by describing some of the phenomena of a deep trance—such as "negative hallucinations" (not being able to see the desk, the rest of his body, or the chair).

**PRETEND A TRANCE**

Putting Dolly into a trance was quite a bit of labor. She just couldn't go deeply into a trance. I gave her a suggestion to the effect that she could "learn to go into a trance," Then I told her about the experience of a hypnotic subject in Albuquerque, A professor had been working with her, on some hypnotic experimentation, and he had told me, "We tried and tried to have her go into a deep trance and she simply can't." So I had the subject essentially make believe she was going into a trance, I told her to open her eyes and just be able to see my hand. Then I told her that her peripheral vision would close down and down, until it was limited to my hand. And there are four other sensory areas. And pretty soon she felt sure that she could see only my hand, without the desk, or me, or the chair. Then I had her come out and go into her light trance, then repeat going into a deep trance. She repeatedly simulated a deep trance until it actually became real. Dolly listened to that story. She simulated a deep trance—until it became real.

Erickson pretended to be listening to music, cocking his head slightly as if listening to a far off orchestra...his client, who had previously claimed could not be induced into trance/hypnotized, adopted the same posture, and began listening...her left ear up in the posture of listening...which Erickson then copied...soon she was "hearing" the music...this is an indirect suggestion Vs the direction ‘You will hear...'... For we tend to want to help others finish their sentences etc...

Erickson had a mother remove all mirrors so her son, suffering acne, could not see his own face, for 2 weeks, during which the acne cleared up...he treated eczema the same way...
Warts produced by virus, and susceptible to changes in blood pressure...he told the client to soak her feet, first in ice-cold, then water as hot as she could bear, then ice-cold again...three times a day, until the warts on her face and feet disappeared...until she was so annoyed she'd give anything not to have to do it...i.e subconscious had to solve problem of these annoying interruptions, by curing the warts...she did this for months, until it became so irritating she forgot about doing this, and also forgot about her warts, which disappeared...the blood being drawn to the feet reduced the blood supply to the warts / virus...and her lack of attention to them ???

Paracelsus dictum, expounded in the fifteenth century: "As man imagines himself to be, so shall he be, and he is that which he imagines." e.g low self-esteem and bad posture, poor muscle tone, resonating lack of confidence which is manifest in self and others responses, blushing when we think about an embarrassing situation, erections / vaginal lubrication when having erotic thoughts.

Erickson's dictum "It's the patient who does the therapy."

Erickson seeds ideas and conies back to them later. We can observe his utilization of long-term posthypnotic suggestion and reframing.

KATHLEEN: TREATMENT OF A PHOBIA: complete transcript of an entire Erickson therapy process demonstrating indirect suggestion.

E: You realize you're in a trance, don't you? You can realize it better if you close your eyes. Now, in that trance, I want you to feel so comfortable. I want you to go into trance so deeply that it will seem to you as if you are a bodyless mind, that your mind is floating in space, free of your body, floating in space and floating in time. And I want you to choose some time in the past when you were a very, very little girl. And my voice will go with you. And my voice will change into that of your parents, your neighbors, your friends, your schoolmates, your playmates, your teachers. And I want you to find yourself sitting in the schoolroom, a little girl feeling very happy about something, something that happened a long time ago, that you forgot a long time ago. And there's one other experience I want you to have. And when I tell you to wake up, to wake up from the neck up. Your body will remain sound asleep. Now, it will be hard to awaken from the neck up, but you can do it.

Now, soon you'll begin awakening from the neck up. Now, don't be scared, because your body is sound asleep. Take all the time necessary to wake up from the neck up. It's hard work, but you can do it. (long pause) Now your head is
beginning to wake up. Your eyes are beginning to open, (pause) You can do it. And maybe your body, still sound asleep, will be that of a little girl. You are slowly awakening from the neck up. Your eyes are beginning to flutter open. As you lift your head, your neck unfreezes, (pause) Lift the head and see me. Is your head awake? You know that in this world, there are many adaptations to life. I would hate to go for a swim in the Arctic Ocean, but the walrus enjoys it; the whale enjoys it. I think the Antarctic is cold, I'd hate to be a penguin hatching an egg at sixty below zero, holding that egg between my feet, and starving for six weeks until my fat spouse came back from the ocean and took her turn hatching the egg. And, you know, the whales, such large mammals, live on plankton, microscopic particles in the ocean water. And I wonder how many tons of sea water pass through the mouth before they get enough plankton. Because, you know, I'm glad the whale can eat plankton and grow large and fat. And the famous scuba divers of Australia enjoy riding on the back of the leopard shark as it swims lazily about, passing seawater over its gills for oxygen, and combing its gills for plankton to nourish its huge body. Do you have any objection to whales and sharks living that way? And then I watched an education program of a woodpecker in the Black Forest, made by a bird-watcher. The woodpecker spent about three weeks chipping out a hole big enough and deep enough to rear a family in. The bird-watcher, in the absence of the parents on feeding trips, bored a hole in the nest and pushed away the wood, and put a pane of glass into place so the woodpecker's hole was a complete hole, solid and impenetrable. Then the bird-watcher fixed up an electric light so when the eggs hatched, their rate of growth could be filmed. Finally, he fitted a ring around the neck of the young woodpecker, and during the absence of the parent, he emptied out the throat of the baby woodpecker to see what kind of food it was living on. In that way he discovered that the woodpecker is vital to the preservation of the forest. He found leaf-eating beetles and wood-eating beetles that destroy the bark and leaves of the tree.

Of course, the parents go out to locate the beetles; they have puffs in their necks in which they predigest those hard beetles. And when they get back to the nest, they regurgitate the half-digested beetles into the gaping mouths of the nestlings. I think nursing, from my experience, is a much better way of getting food. If I were a woodpecker's baby, I'd much prefer the regurgitated beetles, already predigested. And so, human beings are the highest of all animals in development, but all these learnings so peculiar to other animals yet have their counterparts in human life. We use regurgitation to save life. Woodpeckers use regurgitation to save life. Human beings swallow things instantly only to have their stomach say, "You pitiful fool, get rid of this, now, and by the shortest route possible." Isn't that right? And I think it's wonderful that human beings have stomachs without brains and yet have enough intelligence to say, "Get rid of this rubbish, in the quickest route possible." Now, all these things in human living are very, very important and should be admired. Now, do you think you're ever going to be
afraid of vomiting again? No need to be. It's nice you don't have to depend on brains in your head. And you could say the reaction is often much more intelligent than mental reactions. So, would you like to tell us how you used to be afraid of vomiting? Kathleen: How did you know that?

MHR at this point reading this I felt the start of the urge to vomit…in my throat…seriously!!! …worried I was going to vomit!!!

E: In this world there are always a number of tattletales. Do you know when you developed your vomiting phobia? K: A long time ago. E: Do you know the phrase "ontogeny repeats philogeny"? The growth of the individual repeats the growth of the species. Though you might breathe through your nose, anatomically there are gill slits. How does it feel to be wide awake? How large is your body? Doesn't it amaze you that you can't use it? No, you can't stand up. K: What can't I do?" E: You can't stand up. K: Are you sure? E: Oh, I'm sure, but are you? K: Well, I was till a minute ago; I think I can. E: Practically everybody here knows they can. You only think you can. K: Well, I know I could until a minute ago. I've always had a great fear of not being able to move, or being crippled like my mother. E: What crippled her? K: For years I thought it was polio, but then I found out it was her mind. She had polio, but it was her mind. E: Mine is really polio, plus wear and tear of age. Someday, like the one-boss shay, I'm going to fall apart. I intend to stick around until that day, though. You know, when I was a little child I visited my grandmother's brother and his family. They were shearing sheep. I heard the sheep bleating. I ran away because I couldn't understand shearing the sheep. My Aunt Mary served fried liver, and for years I wouldn't eat the liver because I thought of those sheep's ears. Now, with my gout, I can't eat all the liver I'd like to, Close your eyes, and wake up all over now. All over. Wake up all over. And free. And try to keep the smile off your face.

Now, what do you think about vomiting? It's like when you have too many cans of soda pop; when you've gotta go, you've gotta go. K: Do you have a secret stable of tattletales? E: Your friend came in this morning and said you had a bad dream, remembering only the affects. That told me you have a phobia. One of my tattletales named the phobia. Aren't you glad there are tattletales? Do you believe in reincarnation? K: I'm going to come back as a French horn. E: I think you have to tip it over and drain it. K: You know, all my life I've been coming back as a French horn without knowing that! I get the picture now; all I had was the sound before! E: Let this be a lesson to you: all your brains are not located in your cranium. You know what Shakespeare says: "The stages of life really start with the infant." Now / think you ought to have a good start in life. And in Corinthians it says: "When I was a child, I spoke as a child. I did as a child. And now I have become a man I put aside childish things." And that includes fears, right? What is your first name?"  K: Kathy. E: Shall I officially change it for you? From now on, it shall be only Kathleen, not fraidy-cat, puking Kathy. How do you feel? K:
Somewhere between spacey and peaceful. E: There's an old Irish song; I don't want to call my wife out to quote it. I never quote exactly correctly. I wanted to introduce Margaret Mead saying I couldn't quote poetry correctly. But I have no difficulty introducing Dr. Margaret Mead. And the one other thing I was sure of: I could quote Gertrude Epstein's "A Rose is a Rose is a Rose is a Rose." Only to find out later from my family, who enjoyed it, that Gertrude Stein's name didn't have an "Ep," and that there are only three roses!

Now, the thing I have in mind is "Down went McGinty to the bottom of the sea," If the sea was Irish whiskey, he swore he'd never come up again. If the sea was dry, he wouldn't waste one drop of the sea by vomiting it! And Kathleen is a good Irish name! Now you have witnessed a demonstration of psychotherapy. I was not the least bit dignified. I laughed and I joked, I may have bored the life out of some of you by talking about whales and plankton and so on. Woodpeckers and beetles.

MHR I felt a need to smile, and went back and re-read his line, and couldn’t keep a smile off my face … Wake up all over. And free. And try to keep the smile off your face.

N.B Erickson leaves out the end of the Shakespeare quotation so that the patient herself can supply it. ("First the infant, mewling and puking in his mother's arms.") To make sure she gets the message ???

The initial hypnotic suggestion was,"And I want you to find yourself sitting in the schoolroom." In this case, Erickson takes a rather scattershot approach. He can't be certain which set of suggestions or which way of reframing the problem would be utilized by the patient, so he seems to hit her from all sides. There is no escaping his suggestions of health. He even lifts her out of her mess, when he gives her a new name, a new identity. Her new name will be associated in an almost Pavlovian way with the change. Erickson used this approach, giving people new names or allowing them to give themselves new names, long before this practice became popular in the encounter groups of the sixties. The new name becomes a posthypnotic cue so that every time she uses it or hears it, new associations of mastery or self-respect will be revivified. This approach is much more aesthetically pleasing, naturalistic, and geared to the individual than is, for example, biofeedback treatment, wherein cues are mechanistically introduced. For example, in one treatment of hypertension by means of biofeedback, patients were conditioned to have their blood pressure lowered every time they looked at a red dot on their watches. Ericsson's cue—in this case the name Kathleen—is beautifully woven in with all of the other cues and suggestions.

MHR notes: history of hypnotism:
In 1814 Abbe Faria, from India, demonstrated that there was no fluid, as Mesmer’s ‘animal magnetism’ posits, (MHR still feel E-M soup is ‘liquefaction / granular fluid’) but that the phenomena were subjective, purely within the mind of the patient, a.k.a imagination. He first introduced what is now called the "method of suggestion" in producing magnetism or hypnotism. In 1815 Mesmer died. In the 1840’s, James Braid invented the name of hypnotism, formed from the Greek word meaning 'sleep', and designating 'artificially produced sleep'.

Braid experimented and established that sleep could be induced by focusing on any object, inducing fatigue of the nerves, rather than the direct action of the magnetizer on the magnetized subject, or the use of ‘magnetized’ objects.

He noted that during one phase of hypnotism, known as catalepsy, the arms, limbs, etc., might be placed in any position and would remain there; he also noted that a puff of breath would usually awaken a subject, and that by talking to a subject and telling him to do this or do that, even after he awakes from the sleep, he can be made to do those things. Braid thought he could cure the patient of desire to commit crime, simply by suggestion, or command.

Modern scientific study has pretty conclusively established the following facts:

1. Idiots, babies under three years old, and hopelessly insane people cannot be hypnotized.

2. No one can be hypnotized unless the operator can make him concentrate his attention for a reasonable length of time. Concentration of attention, whatever the method of producing hypnotism, is absolutely necessary.

3. The persons not easily hypnotized are those said to be neurotic (or those affected with hysteria). By "hysteria" is not meant nervous excitability, necessarily. Some very phlegmatic persons may be affected with hysteria. In medical science "hysteria" is an irregular action of the nervous system. It will sometimes show itself by severe pains in the arm, when in reality there is nothing whatever to cause pain; or it will raise a swelling on the head quite without cause. It is a tendency to nervous disease which in severe cases may lead to insanity. The word neurotic is a general term covering affection of the nervous system. It includes hysteria and much else beside.

Dr. Ernest Hart in an article in the British Medical Journal makes the following very definite statement, representing the side of the case that maintains that any one can produce hypnotism. Says he:

"It is a common delusion that the mesmerist or hypnotizer counts for anything in the experiment. The operator, whether priest, physician, charlatan, self-deluded enthusiast, or conscious imposter, is not the source of any occult influence, does
not possess any mysterious power, and plays only a very secondary and insignificant part in the chain of phenomena observed. There exist at the present time many individuals who claim for themselves, and some who make a living by so doing, a peculiar property or power as potent mesmerizers, hypnotizers, magnetizers, or electro-biologists. There is no such thing as a potent mesmeric influence, no such power resident in any one person more than another; that a glass of water, a tree, a stick, a penny-post letter, or a lime-light can mesmerize as effectually as any individual. A clever hypnotizer means only a person who is acquainted with the physical or mental tricks by which the hypnotic condition is produced; or sometimes an unconscious imposter who is unaware of the very trifling part for which he is cast in the play, and who supposes himself really to possess a mysterious power which in fact he does not possess at all, or which, to speak more accurately, is equally possessed by every stock or stone."

Concentration is the prerequisite for producing hypnotism, one who has not the power of concentration himself, and concentration which he can perfectly control, is not likely to be able to secure it in others. Also, since faith is a strong element, a person who has not perfect self-confidence could not expect to create confidence in others.

Science teaches that all matter is in vibration. Indeed, philosophy points to the theory that matter itself is nothing more than centers of force in vibration. The lowest vibration we know is that of sound. Then comes, at an enormously higher rate, heat, light (beginning at dark red and passing through the prismatic colors to violet which has a high vibration), to the chemical rays, and then the so-called X or unknown rays which have a much higher vibration still. Electricity is a form of vibration, and according to the belief of many scientists, life is a species of vibration so high that we have no possible means of measuring it.

MHR Rapport is like ‘tuning’ a pitch-fork / tuner … finding the resonant frequencies of a person…finding sympathetic / empathetic resonances…’enter-into-it’ i.e often ‘in-tu-it-ive’ on the part of the therapist, or Zen observing skills, all seen in Erickson…so that can first find the ‘key’ of the person, then transpose it into the thousand flowers of the soul that have been repressed i.e limiting beliefs / habits like prison for full potential…growth of person…expression of full talent for living / loving / creativity etc…
MHR It is as if the person’s own will ‘sleeps’ and allows the will of the therapist to replace it e.g their suggestions ‘will be done’…thus acting congruent with the will of the hypnotist / therapist…as the person’s own will sleeps, content, relaxed, at peace…

MHR It appears the term ‘neurotic’ refers to someone who presents psychosomatic symptoms of some form which have no physical basis. Includes habits, ticks, symptoms with no known etiology in the organism…

Need to direct subject’s entire focused attention on the suggestion, focusing on some body part, traditionally the eyes…that some change will gradually take place e.g your eyelids will feel heavy, or your arm will raise, or become immobilized / you will be unable to move it…directing their full attention to this idea, forming a belief…which will become more potent as the feeling is induced, and more potent with each successful hypnotism / trance-induction i.e self-fulfilling prophecy … belief in efficacy of the suggestions / trance / hypnotism … the effect is usually felt / induced gradually…and as the subject experiences the changes, they become more convinced, and the effect more stronger, inducing a positive feedback loop and self-fulfilling prophecy…in the power of suggestion / ability to enter trance / ability to induce trance etc…

Neurotics more susceptible to trance induction?

Trance often associated with unusual strength, endurance, and even paranormal talents, and post hypnotic amnesia for what occurred during trance…

Various methods of hypnotism / trance induction

Command the subject to close his eyes. Tell him his mind is a blank. Command him to think of nothing. Leave him a few minutes; return and tell him he cannot open his eyes. If he fails to do so, then begin to make any suggestion which may be desired. This is the so-called mental method of hypnotization.

Give the subject a coin or other bright object. Tell him to look steadfastly at it and not take his eyes away from it. Suggest that his eyelids are growing heavy, that he cannot keep them open. Now close the lids. They cannot be opened.
In a monotonous tone I continue to suggest the various stages of sleep. As for instance, I say, 'Your breathing is heavy. Your whole body is relaxed.' I raise his arm, holding it in a horizontal position for a second or two, and suggest to him that it is getting heavier and heavier. I let my hand go and his arm falls to his side.

'Your eyes,' I continue, 'feel tired and sleepy. They are fast closing' repeating in a soothing tone the words 'sleepy, sleepy, sleep.' Then in a self-assertive tone, I emphasize the suggestion by saying in an unhesitating and positive tone, 'sleep.'

As no two minds are constituted alike, so they cannot be affected alike. The rule applies to gesture, tones of the voice. That which has a soothing and lulling effect on one, may have an opposite effect on another. Just as in drugs, one person may take a dose without injury that will kill another, so in hypnosis, one person can be put into a deep sleep by means that would be totally ineffectual in another, and even then the mental states differ in each individual--that which in one induces a gentle slumber may plunge his neighbor into a deep cataleptic state.

enhanced by a tone and air of profound conviction; and his voice has such fervor and warmth that he carries away his clients with him.

"After having inquired of the patient what he is suffering from, without any further or closer examination, he places his hand on the patient's forehead and, scarcely looking at him, says, 'You are going to sleep.' Then, almost immediately, he closes the eyelids, telling him that he is asleep. After that he raises the patient's arm, and says, 'You cannot put your arm down.' If he does, Dr. Liebault appears hardly to notice it. He then turns the patient's arm around, confidently affirming that the movement cannot be stopped, and saying this he turns his own arms rapidly around, the patient remaining all the time with his eyes shut; then the doctor talks on without ceasing in a loud and commanding voice. The suggestions begin:

"You are going to be cured; your digestion will be good, your sleep quiet, your cough will stop, your circulation will become free and regular; you are going to feel very strong and well, you will be able to walk about,' etc., etc. He hardly ever varies the speech. Thus he fires away at every kind of disease at once, leaving it to the client to find out his own. No doubt he gives some special directions, according to the disease the patient is suffering from, but general instructions are the chief thing.
"The same suggestions are repeated a great many times to the same person, and, strange to say, notwithstanding the inevitable monotony of the speeches, and the uniformity of both style and voice, the master's tone is so ardent, so penetrating, so sympathetic, that I have never once listened to it without a feeling of intense admiration.

The Hindoos produce sleep simply by sitting on the ground and, fixing their eyes steadily on the subject, swaying the body in a sort of writhing motion above the hips. By continuing this steadily and in perfect silence for ten or fifteen minutes before a large audience, dozens can be put to sleep at one time. In all cases, freedom from noise or distractive incidents is essential to success in hypnotism, for concentration must be produced.

Most persons will awake naturally at the end of a few minutes, or will fall into a natural sleep from which in an hour or two they will awake refreshed. Usually the operator simply says to the subject, "All right, wake up now," and claps his hands or makes some other decided noise. In some cases it is sufficient to say, "You will wake up in five minutes"; or tell a subject to count twelve and when he gets to ten say, "Wake up."

Care should be taken to awaken the subject very thoroughly before leaving him, else headache, nausea, or the like may follow, with other unpleasant effects. In all cases subjects should be treated gently and with the utmost consideration, as if the subject and operator were the most intimate friends.

not more than one person out of three can be hypnotized at all, even by an experienced operator, to effect hypnotization except in a few cases requires a great deal of patience, both on the part of the operator and of the subject. It may require half a dozen or more trials before any effect at all can be produced, although in some cases the effect will come within a minute or two. After a person has been once hypnotized, hypnotization is much easier. The most startling results are to be obtained only after a long process of training on the part of the subject.

Public hypnotic entertainments, and even those given at the hospitals in Paris, would be quite impossible if trained subjects were not at hand; and in the case of the public hypnotizer, the proper subjects are hired and placed in the audience for the express purpose of coming forward when called for. The success of such an entertainment could not otherwise be guaranteed. In many cases, also, this training of subjects makes them
deceivers. They learn to imitate what they see, and since their living depends upon it, they must prove hypnotic subjects who can always be depended upon to do just what is wanted. We may add, however, that what they do is no more than an imitation of the real thing.

Often several people, or a large group, of volunteers may be brought on stage, and those who do not respond are sent back.

Think your hands so fast that you can't pull them apart. They are fast. You cannot pull them apart. Try. You can't." The whole class made frantic efforts to unclasp their hands, but were unable to do so. The doctor's explanation of this is, that what they were really doing was to force their hands closer together, thus obeying the counter suggestion. That they thought they were trying to unclasp their hands was evident from their endeavor.

These suggestions were made in a loud tone, Miss Flint being no nearer one subject than another. The bare suggestion was given, as, "Now, think that you are a newsboy, and are selling papers," or, "Now think that you are hunting and are going into the woods to shoot birds."

In stage show harmless piece of wood left red mark on back of participant, as if it really was the 'hot iron' they had suggested it was?

The subject may be placed with his head upon the back of one chair and his heels on the back of another, and a heavy man may sit upon him without seemingly producing any effect, or even heavy rock may be broken on the subject's body.

Catalepsy is immobility Vs lethargy is total relaxation...

In the somnambulistic stage patients are manipulated by speaking to them; in the cataleptic stage they are equally under the will of the operator; but now he controls them by gesture

Heidenhain looks fixedly at the patient till the patient is unable to take his eyes away. Then the patient will copy every movement he makes as if he were a mirror

'I send V---- to sleep. I recite some verses to her, and then I awake her. She remembers nothing. I again send her to sleep, and she remembers perfectly the verses I recited. I awake her, and she has again forgotten
everything." But if commanded to remember on awaking, a patient may remember.

Memory much better / longer while in trance Vs awake…implies subconscious more powerful memory i.e the memories exist, but conscious mind limited … in focus/ attention?

The tone of the voice of the operator can have more effect as his words. If he speaks in a grave and solemn tone, for instance, even if what he utters is nonsense, the effect is that of a deeply tragic story.

While a patient will follow almost any suggestion that may be offered, he readily obeys only commands which are in keeping with his character. If he is commanded to do something he dislikes or which in the waking state would be very repugnant to him, he hesitates, does it very reluctantly, and in extreme cases refuses altogether, often going into hysterics.

MHR can be like patients who cannot respond, but feel an operation…and later forget…some people experimented with hypnosis, felt / knew they were acting, but continued to act i.e as if they could not feel the pin prick, which they in fact could feel…Then he stroked the arm and said it was growing numb. He said: "You have no feeling in it, have you?" Dr. Cocke goes on: "I said 'No,' and I knew that I said 'No,' yet I knew that I had a feeling in it." The operator went on, pricking the arm with a pin, and though Dr. Cocke felt the pain he said he did not feel it… He was induced into a deep hypnotic sleep by fixing his mind on the number 26 and holding up his hand, thus he learned that he could hypnotize himself…

Enthusiastic musical devotees at a performance of one of Wagner's operas appeared in a condition of self-induced hypnotism, in which their subjective faculties were so exalted as to supersede their objective perceptions. Music was no longer to them a succession of pleasing sounds, but the embodiment of a drama in which they became so wrapped up that they forgot all about the mechanical and external features of the music and lived completely in a fairy world of dream. Really 'enter-into-it', and become the action so suggested by the music / become one with the theatrical performance of it…entering-into-it fully…losing self in the music…the dancer becomes the dance…I am rhythm…I am music now…

In trance state, subconscious mind free to perform feats conscious mind could never do consciously e.g replace all the letter a’s with v’s, when
reading from something out loud…and rapidly changing the ‘code’ i.e changes…to test whether person pretending to be in trance…acting…MHR allows actor to be more convincing i.e is puts self in trance / in-character … enters-into-it…backstory etc…

A person can deliberately hypnotize himself when he wishes to till he has become accustomed to it and is expert in it … refuting claims of ‘magical powers’ residing in magnetized objects or special ‘gifts’ / ‘talents’ of the people employing them / hypnotism / trance.

Magnetic healer, mind reader etc can deceive self i.e really believes has super-natural powers i.e induced trance / belief / hypnotic state in self…so not actually lying to YOU, as first lied to SELF…so BELIEVES what saying to be true…thus deceiving BOTH of you… i.e power of his own imagination over his own perception / beliefs …

Dr. Cocke’s experiment in hypnotizing himself. "In my room that evening it occurred to me to try the same experiment. I did so. I kept the number twenty-six in my mind. In a few minutes I felt the sensation of terror, but in a different way. I was intensely cold. My heart seemed to stand still. I had ringing in my ears. My hair seemed to rise upon my scalp. I persisted in the effort, and the previously mentioned noise in my ears grew louder and louder. The roar became deafening. It crackled like a mighty fire. I was fearfully conscious of myself. Having read vivid accounts of dreams, visions, etc., it occurred to me that I would experience them. I felt in a vague way that there were beings all about me but could not hear their voices. I felt as though every muscle in my body was fixed and rigid. The roar in my ears grew louder still, and I heard, above the roar, reports which sounded like artillery and musketry. Then above the din of the noise a musical chord. I seemed to be absorbed in this chord. I knew nothing else. The world existed for me only in the tones of the mighty chord. Then I had a sensation as though I were expanding. The sound in my ears died away, and yet I was not conscious of silence. Then all consciousness was lost. The next thing I experienced was a sensation of intense cold, and of someone roughly shaking me. Then I heard the voice of my jolly landlord calling me by name." The landlord had found the doctor "as white as a ghost and as limp as a rag," and thought he was dead. He says it took him ten minutes to arouse the sleeper. During the time a physician had been summoned.
As to the causes of this condition as produced Dr. Cocke says: "I firmly believed that something would happen when the attempt was made to hypnotize me. Secondly, I wished to be hypnotized. These, together with a vivid imagination and strained attention, brought on the states which occurred."

MHR my own similar fear of imagining terrible things i.e fear of my own imagination running away with me, and scaring myself silly...terrifying myself...not scared that these would be real, but that I would nevertheless terrify myself with my own IMAGINED scary things i.e left home alone at night...

"Children's Crusade," in which over thirty thousand children from Germany, from all classes of the community, tried to cross the Alps in winter, and in their struggles were all lost or sold into slavery without even reaching the Holy Land.

Hypnotism may be accountable for many of the poet's dreams. Gazing steadily at a bed of bright coals or a stream of running water will invariably throw a sensitive subject into a hypnotic sleep that will last sometimes for several hours. Test subjects often describe beautiful scenes from nature, or some mighty cathedral with its lofty dome, or the faces of imaginary beings, beautiful or demoniacal, according to the will and temper of the subject."

Perhaps the most wonderful example of self-hypnotism which we have in history is that of the mystic Swedenborg, who saw, such strange things in his visions, and at last came to believe in them as real. MHR All prophets / Moses’s burning bush imagine staring at rocks waiting for god to appear...no surprise he’d enter trance, and see god !!! The performances of the dervishes, and also of the fakirs, who wound themselves and perform many wonderful feats which would be difficult for an ordinary person, are no doubt in part feats of self-hypnotism

MHR note practice makes perfect...those capable of being induced / hypnotized, then learn muscle memory, and after repeated ‘successes’ can self-induce it relatively easy...and then allow their full power of their subconscious / powers usually limited by limiting beliefs, to be available...persons may learn by practice to do seemingly impossible things, such as holding themselves perfectly rigid (as in the cataleptic state) while their head rests on one chair and their heels on another, and a
heavy person sits upon them. ...couldn’t normally do this...though it is PHYSICALLY possible, as often demonstrated...the limiting belief of conscious though usually prevents this power being enjoyed ...

Dr. Cooke says of himself: "I can hypnotize myself to such an extent that I will become wholly unconscious of events taking place around me, and a long interval of time, say from one-half to two hours, will be a complete blank. During this condition of auto-hypnotization I will obey suggestions made to me by another, talking rationally, and not knowing any event that has occurred after the condition has passed off."

While in a condition of auto-hypnotization a person may imagine that he is some other personality. Says Dr. Cocke: "A curious thing about those self-hypnotized subjects is that they carry out perfectly their own ideals of the personality with whom they believe themselves to be possessed. If their own ideals of the part they are playing are imperfect, their impersonations are ridiculous in the extreme. One man I remember believed himself to be controlled by the spirit of Charles Sumner. Being uneducated, he used the most wretched English, and his language was utterly devoid of sense. While, on the other hand, a very intelligent lady who believed herself to be controlled by the spirit of Charlotte Cushman personated the part very well." MHR Resources of subconscious still limited to what actually have learned over life e.g vocabulary...so cannot speak foreign language unless have, subconsciously, picked it up somewhere...etc...cannot 'fake' what don’t know i.e parrot...act...so reveals 'lie' of 'being someone else' / being 'vessel' for a spirit i.e possessed...if working class cannot faithfully represent nobility in gesture, vocabulary, all the things the noble would have picked up during their education / life etc...

Hysterical neuropathic individuals make the best hypnotic subjects. i.e those people most excitable / most imaginative. Deception seems to be an inherent element in nearly all such characters. Merely to attract attention is a mania with some people.

The case of a man who has such control over his heart and lungs that he can actually throw himself into a profound sleep in which the breathing is so absolutely stopped for an hour that a mirror is not moistened in the least by the breath, nor can the pulses be felt. To all intents and purposes the man appears to be dead; but in due time he comes to life again, apparently no wht the worse for his experiment.
If an ordinary person were asked to hold out his arms at full length for five minutes he would soon become exhausted, his breathing would quicken, his pulse-rate increase. But persons may easily train themselves to hold out the arms for any length of time without increasing the respiration by one breath or raising the pulse rate at all. So this would not be proof of trance.

In the Paris hospitals, where the greater number of regular scientific experiments have been conducted, it is found that "trained subjects" are required for all of the more difficult demonstrations. They were of dubious character/reputation, spent great deal of time ‘simulating’ i.e ‘practicing’ what was expected of them in the ‘demonstrations’…lived from it as their chief employment…etc…so simulated / faked … MHR but point is HOW…i.e still an achievement in many cases i.e self-induced ability to do extraordinary things… they had huge investment in ‘success’ of any induction i.e famous / lived well off this ability…

Claims can induce trance in well and sick patient, then transfer the symptoms from the well to the sick…after both emerge from trance, the sick is now well, but the well is once again well i.e the suffering only continued during the trance state…so now sick cured?

Many fakers Dr Luys had fallen for, ‘caught out’ acting i.e pretending to be made drunk by tiny bottle of alcohol held to neck, or to become a cat when valerian used in same way…tester pretended to be using alcohol, but was valerian, she simulated, and vice versa…

Same simulation re: a supposed magnet … she gave great performance, but was wrong e.g polarity pos/neg, and responded exactly same when presented with non-magnetised bar of iron etc…

Every book on hypnotism gives various rules for detecting simulation of the hypnotic state. One of the commonest tests is that of anaesthesia. A pin or pen-knife is stuck into a subject to see if he is insensible to pain; but as we shall see in a latter chapter, this insensibility also may be simulated, for by long training some persons learn to control their facial expressions perfectly. We have already seen that the pulse and respiration tests are not sufficient. Hypnotic persons often flush slightly in the face; but it is true that there are persons who can flush on any part of the body at will.

Mr. Ernest Hart had an article in the Century Magazine on "The Eternal Gullible," in which he gives the confessions of a professional hypnotic
subject. "The 'catalepsy business' had more artistic merit. So rigid did L. make his muscles that he could be lifted in one piece like an Egyptian mummy. He lay with his head on the back of one chair, and his heels on another, and allowed a fairly heavy man to sit on his stomach; it seemed to me, however, that he was here within a 'straw' or two of the limit of his endurance. The 'blister trick,' spoken of by Truth as having deceived some medical men, was done by rapidly biting and sucking the skin of the wrist. L. did manage with some difficulty to raise a slight swelling, but the marks of the teeth were plainly visible." (Possibly L. had made his skin so tough by repeated biting that he could no longer raise the blister!)

"One point in L.'s exhibition which was undoubtedly genuine was his remarkable and stoical endurance of pain. He stood before us smiling and open-eyed while he ran long needles into the fleshy part of his arms and legs without flinching, and he allowed one of the gentlemen present to pinch his skin in different parts with strong crenated pincers in a manner which bruised it, and which to most people would have caused intense pain. L. allowed no sign of suffering or discomfort to appear; he did not set his teeth or wince; his pulse was not quickened, and the pupil of his eye did not dilate as physiologists tell us it does when pain passes a certain limit. It may be said that this merely shows that in L. the limit of endurance was beyond the normal standard; or, in other words, that his sensitiveness was less than that of the average man. At any rate his performance in this respect was so remarkable that some of the gentlemen present were fain to explain it by supposed 'post-hypnotic suggestion,' the theory apparently being that L. and his comrades hypnotized one another, and thus made themselves insensible to pain.

"As surgeons have reason to know, persons vary widely in their sensitiveness to pain. I have seen a man chat quietly with bystanders while his carotid artery was being tied without the use of chloroform. During the Russo-Turkish war wounded Turks often astonished English doctors by undergoing the most formidable amputations with no other anaesthetic than a cigarette. Hysterical women will inflict very severe pain on themselves—merely for wantonness or in order to excite sympathy. The fakirs who allow themselves to be hung up by hooks beneath their shoulder-blades seem to think little of it and, as a matter of fact, I believe are not much inconvenienced by the process."

There are no special tests that can be relied on. The amateur can always be deceived. If a person is well accustomed to hypnotic manifestations, and
also a good judge of human nature, and will keep constantly on guard, using every precaution to avoid deception, it is altogether likely that it can be entirely obviated. But one must use his good judgment in every possible way. In the case of fresh subjects, or persons well known, of course there is little possibility of deception. And the fact that deception exists does not in any way invalidate the truth of hypnotism as a scientific phenomenon.

Post-hypnotic suggestion: a suggestion made during the hypnotic condition as to what a person will do after coming out of the hypnotic sleep may be carried out.

Claims you can hypnotise person against their will are patently false MHR but we can never know the TRUE will of a person i.e WHAT they actually WANT, and thus would allow us to ‘facilitate’ via the agreed illusion of ‘hypnotism’ i.e the condition / situation allows them freedom / inhibition…and the 1000 flowers of the soul can surprise people Vs some supposedly fixed ‘personality’ / ‘character’ i.e what we expect, and the repressed reality…even person themselves may be surprised what they are desirous of being ‘hypnotised’ to do i.e ‘allowed’ to do … especially in public…

All claims that you can get person to do something against their will have been disproven…though people ‘act’ out suggestions…they ‘know’ it is not really a gun they are pointing at someone and ‘firing’, and a rich person will NOT write you a will and sign it, granting you everything…the person ‘acting out’ may write an I.O.U or sign a check, but they know they don’t have the money to fulfill it, so they know it is not real…the rich person with the money will NOT do so, as they KNOW it will cost them real money…unless MHR of course, they secretly desire to do this e.g Francis of Assisi …

Person who just ‘stabbed’ you with a piece of cardboard, will now break down in hysterics if you replace the cardboard with a real knife, and will NOT be able to stab you…though nothing has changed in their ‘condition’…

Dr. Cocke declares his belief that no person can be hypnotized against his will by a person who is repugnant to him. Further, if the personality of the hypnotizer and the crime itself are repugnant to the hypnotic subject, he will absolutely refuse to do as he is bidden, even while in the deepest
hypnotic sleep. On this point nearly all authorities agree. MHR hence power of / importance of 'rapport' and ecology /

There is absolutely no well authenticated case of crime committed by a person under hypnotic influence. There have been several cases reported, and one woman in Paris who aided in a murder was released on her plea of irresponsibility because she had been hypnotized. In none of these cases, however, was there any really satisfactory evidence that hypnotism existed. In all the cases reported there seemed to be no doubt of the weak character and predisposition to crime. In another class of cases, namely those of criminal assault upon girls and women, the only evidence ever adduced that the injured person was hypnotized was the statement of that person, which cannot really be called evidence at all. MHR 'Holocaust survivors' inclusive!

Post-hypnotic suggestion, is very much weaker than suggestion that takes effect during the actual hypnotic sleep, so 10 times less likely you could induce a crime in this way.

While acting under a delusion at the suggestion of the operator, the patient is really conscious all the time of the real facts in the case—indeed, much more keenly so, oftentimes, than the operator himself. For instance, if a line is drawn on a sheet of paper and the subject is told there is no line, he will maintain there is no line; but he has to see it in order to ignore it. Moreover, persons trained to obey, instinctively do obey even in their waking state. It requires a special faculty to resist obedience, even during our ordinary waking condition. Says a recent writer: "It is certain that we are naturally inclined to obey, conflicts and resistance are the characteristics of some rare individuals; but between admitting this and saying that we are doomed to obey—even the least of us—lies a gulf." The same writer says further: "Hypnotic suggestion is an order given for a few seconds, at most a few minutes, to an individual in a state of induced sleep. The suggestion may be repeated; but it is absolutely powerless to transform a criminal into an honest man, or vice versa." Here is an excellent argument. If it is possible to make criminals it should be quite as easy to make honest men. It is true that the weak are sometimes helped for good; but there is no case on record in which a person who really wished to be bad was ever made good; and the history of hypnotism is full of attempts in that direction.
Funny example: a criminal will execute all the thefts suggested, but will NEVER return any object stolen, when THIS is suggested ... perfect example of what hypnotism is / can do ...

Dr. Courmelles notes: "I have heard a subject say: 'If I were ordered to throw myself out of the window I should do it, so certain am I either that there would be somebody under the window to catch me or that I should be stopped in time. The experimentalist's own interests and the consequences of such an act are a sure guarantee.'" This is why the simulator, or hypnotized, appears willing to do things dangerous / violent / criminal i.e secure in faith that he would NEVER be allowed to hurt himself or anyone else.

Hypnotism is a kind of experimental insanity. Really good hypnotic subjects have not a perfect mental balance. We have also seen that repetition of the process increases the susceptibility, and in some cases persons frequently hypnotized are thrown into the hypnotic state by very slight physical agencies, such as looking at a bright doorknob. Furthermore, we know that the hypnotic patient is in a very sensitive condition, easily impressed. Moreover, it is well known that exertions required of hypnotic subjects are nervously very exhausting, so much so that headache frequently follows.

MHR is that similar to migraine? Do we put ourselves in a sort of trance / fugue by worrying? With the same after-effects as any other induced trance state? Freud's migraines!

If person believes you can 'mesmerize' them, and that you are intending to i.e actively doing it, nothing you say or do will stop them beng 'mesmerized' e.g falling into trance...it is their imagination...their belief...that produces the effects...whatever they are...e.g if first time you put them under so they could get some sleep / stop coughing...if they so believe, any time after that they met you, they might imagine you were capable of, and actively, repeating the 'therapy', and fall asleep simply on seeing you... Dr. Hart notes that in reality mesmerism is self-produced, and the will of the operator, even when exercised directly against it, has no effect if the subject believes that the will is being operated in favor of it.
"So long as the person operated on believed that my will was that she should sleep, sleep followed. The most energetic willing in my internal consciousness that there should be no sleep, failed to prevent it, where the usual physical methods of hypnotization, stillness, repose, a fixed gaze, or the verbal expression of an order to sleep, were employed.

Patients have been injured by the misuse of every remedial agent ever employed for the relief of man. Every article we eat, if wrongly prepared, if stale, or if too much is taken, will be harmful. Every act, every duty of our lives, may, if overdone, become an injury.

Even persons who are not wholly under hypnotic influence may have an arm or a leg, or any smaller part rendered insensible by suggestion, so that no pain will be felt. This has suggested the use of hypnotism in surgery in the place of chloroform, ether, etc.

By 1860 some of the medical profession hoped that hypnotism might come into general use for producing insensibility during surgical operations. Dr. Guerineau in Paris recorded his own successful thigh amputation using hypnotherapy. The patient commenting: 'I was aware of all that was being done to me, and the proof is that I knew my thigh was cut off at the moment when you asked me if I felt any pain.' But a considerable time and a good deal of preparation were necessary to induce the patients to sleep, and medical men had recourse to a more rapid and certain method; that is, chloroform, in the year 1860.

One of the most detailed cases of successful use of hypnotism as an anaesthetic was presented to the Hypnotic Congress which met in 1889, by Dr. Fort, professor of anatomy:

"On the 21st of October, 1887, a young Italian tradesman, aged twenty, Jean M—, came to me and asked me to take off a wen he had on his forehead, a little above the right eyebrow. The tumor was about the size of a walnut.

"I was reluctant to make use of chloroform, although the patient wished it, and I tried a short hypnotic experiment. Finding that my patient was easily hypnotizable, I promised to extract the tumor in a painless manner and without the use of chloroform."
"The next day I placed him in a chair and induced sleep, by a fixed gaze, in less than a minute. Two Italian physicians, Drs. Triani and Colombo who were present during the operation, declared that the subject lost all sensibility and that his muscles retained all the different positions in which they were put exactly as in the cataleptic state. The patient saw nothing, felt nothing, and heard nothing, his brain remaining in communication only with me.

"As soon as we had ascertained that the patient was completely under the influence of the hypnotic slumber, I said to him: 'You will sleep for a quarter of an hour,' knowing that the operation would not last longer than that; and he remained seated and perfectly motionless. "I made a transversal incision two and a half inches long and removed the tumor, which I took out whole. I then pinched the blood vessels with a pair of Dr. Pean's hemostatic pincers, washed the wound and applied a dressing, without making a single ligature. The patient was still sleeping. To maintain the dressing in proper position, I fastened a bandage around his head. While going through the operation I said to the patient, 'Lower your head, raise your head, turn to the right, to the left,' etc., and he obeyed like an automaton. When everything was finished, I said to him, 'Now, wake up.' "He then awoke, declared that he had felt nothing and did not suffer, and he went away on foot, as if nothing had been done to him. "Five days after the dressing was removed and the cicatrix was found completely healed.

Hypnotism has been tried extensively for painless dentistry, but with many cases of failure, which got into the courts and thoroughly discredited the attempt except in very special cases.

Hypnotism has proven extremely useful in curing many disorders that are essentially nervous, especially such cases as those in which a patient has a fixed idea that something is the matter with him when he is not really affected. Cases of that description are often extremely obstinate, and entirely unaffected by the ordinary therapeutic means. Ordinary doctors abandon the cases in despair, but some person who understands "mental suggestion" (for instance, the Christian Science doctors) easily effects a cure.

The following is from a report by one of the physicians of the Charity hospital in Paris:
"Gabrielle C---- became a patient of mine toward the end of 1886. She entered the Charity hospital to be under treatment for some accident arising from pulmonary congestion, and while there was suddenly seized with violent attacks of hystero-epilepsy, which first contracted both legs, and finally reduced them to complete immobility. "She had been in this state of absolute immobility for seven months and I had vainly tried every therapeutic remedy usual in such cases. My intention was first to restore the general constitution of the subject, who was greatly weakened by her protracted stay in bed, and then, at the end of a certain time, to have recourse to hypnotism, and at the opportune moment suggest to her the idea of walking. "The patient was hypnotized every morning, and the first degree (that of lethargy), then the cataleptic, and finally the somnambulistic states were produced. After a certain period of somnambulism she began to move, and unconsciously took a few steps across the ward. Soon after it was suggested--the locomotor powers having recovered their physical functions--that she should walk when awake. This she was able to do, and in some weeks the cure was complete. In this case, however, we had the ingenious idea of changing her personality at the moment when we induced her to walk. The patient fancied she was somebody else, and as such, and in this roundabout manner, we satisfactorily attained the object proposed."

Dr. Bernheim states:"The mode of suggestion should be varied and adapted to the special suggestibility of the subject. A simple word does not always suffice in impressing the idea upon the mind. It is sometimes necessary to reason, to prove, to convince; in some cases to affirm decidedly, in others to insinuate gently: the subject thinks, reasons, discusses, accepts more readily than in the waking condition, but does not always accept…

The habit of the excessive use of alcoholic drinks, morphine, tobacco, or the like, may often be decidedly helped by hypnotism, if the patient wants to be helped. The operator hypnotizes the subject, and when he is in deep sleep suggests that on awaking he will feel a deep disgust for the article he is in the habit of taking, and if he takes it will be affected by nausea, or other unpleasant symptoms. In most cases the suggested result takes place, provided the subject can be hypnotized at all; but unless the patient is himself anxious to break the habit fixed upon him, the unpleasant effects soon wear off and he is as bad as ever.
Dr. Cocke treated a large number of cases, which he reports in detail in his book on hypnotism. In a fair proportion of the cases he was successful; in some cases completely so. In other cases he failed entirely, owing to lack of moral stamina in the patient himself. His conclusions seem to be that hypnotism may be made a very effective aid to moral suasion, but after all, character is the chief force which throws off such habits once they are fixed. The morphine habit is usually the result of a doctor's prescription at some time, and it is practiced more or less involuntarily. Such cases are often materially helped by the proper suggestions. Character is the deciding factor.

It is probable that a bird is fascinated to some extent by the steady gaze of a serpent's eyes, but fear will certainly paralyze a bird as effectively as hypnotism re: the charming of birds by snakes.

Horses are frequently managed by a steady gaze into their eyes. Dr. Moll states that a method of hypnotizing horses named after its inventor as Balassiren has been introduced into Austria by law for the shoeing of horses in the army.

LaFontaine, the magnetizer, some thirty years ago held public exhibitions in Paris in which he reduced cats, dogs, squirrels and lions to such complete insensibility that they felt neither pricks nor blows.

Moses/Aaron's biblical 'miracle explained: The Harvys or Psylles of Egypt impart to the ringed snake the appearance of a stick by pressure on the head, which induces a species of tetanus, says E. W. Lane.

Professor William James of Harvard College, reports the following experiments:

"Make a stroke on a paper or blackboard, and tell the subject it is not there, and he will see nothing but the clean paper or board. Next, he not looking, surround the original stroke with other strokes exactly like it, and ask him what he sees. He will point out one by one the new strokes and omit the original one every time, no matter how numerous the next strokes may be, or in what order they are arranged. Similarly, if the original single line, to which he is blind, be doubled by a prism of sixteen degrees placed before one of his eyes (both being kept open), he will say that he now sees one
stroke, and point in the direction in which lies the image seen through the prism.

"Another experiment proves that he must see it in order to ignore it. Make a red cross, invisible to the hypnotic subject, on a sheet of white paper, and yet cause him to look fixedly at a dot on the paper on or near the red cross; he will on transferring his eye to the blank sheet, see a bluish-green after image of the cross. This proves that it has impressed his sensibility. He has felt but not perceived it. He had actually ignored it; refused to recognize it, as it were."

Extending limits / overcoming habits / limiting beliefs...broadening mental sets...

Creativity comes from practising ‘divergent thinking’...Vs convergent thinking...i.e fractal branching Vs funnel MHR...go beyond normal ways of thinking...

Change frame of reference e.g treat each hole of golf as the first...so no extra pressure...focus on each as individual hole...and pretend you are alone, playing for fun...

Eliminate the past (go back on your timeline) and change the future (imagine already having what you want, and implanting that on your timeline in the future)... Statistically harder to make each successive bulls-eye in shooting...so pretend each shot is the first...gain focus on the present by focusing on body, from feet up, ensuring feet, then knees, then legs etc comfortable, right up to finger, ...focusing on sensations in the body in the here and now brings you to, and keeps you, here, now... trust sub-conscious to know when to pull trigger, as rifle moves around target...

‘When you go to X, you will see something very exciting’...in trance...sets up the expectation of seeing something exciting, in X, and of course this motivates you to keep your eyes open, to look about you, and of course then you are bound to see interesting things you’d normal overlook when you were ‘bored’ and ‘hated X’ ...and so never LOOKED for anything exciting in X... self-fulfilling prophecy / positive expectations motivate ...client said she ‘hated’ X...so move from kinesthetic (emotional feeling) to visual representation system also de-
potentiated the hate, and let her escape it, i.e not trying to directly compete with an emotion, this would produce resistance...so used the visual representation system as a ‘bridge’ from one emotion, ‘hate’, to another emotion, ‘curiosity’, thus doing as Buddha suggested, REPLACING one emotion with another, rather than trying to fight it, which would strengthen it as resistance training strengthens muscles etc...people get more stubborn etc when directly challenge...deny etc...

The basic method of helping a person out of a fixed mental set. The first step is to confuse the subject. The second step, during this confused period, is to give the subject has an experience of success. Thus the old set is replaced/displaced with a new one, without encountering the resistance you get when you try to resist an old mental set e.g denial, distortion, rejection, loss of face etc...very Buddha-like...displace / replace Vs try to dismiss, leaving a void, or resist / challenge directly.

Classic Zen is to confuse with a Koan, or whack of the stick...why did you do that? ... breaking the fixed mental set / habitual framework / habitual internal noise ... opening the Bardot / opportunity of NOW...

Erickson, to prove that man could walk over ice same as any normal pavement, had to first cover his eyes so he couldn’t see WHEN he was walking on ice, or when on pavement, so could not have his limiting mental set / habitual stimulus-response, triggered by the ice...so he walked over ice unknowingly, allowing Erickson to prove the point, without arguing / producing any resistance...e.g previous history of falls on ice produce anxiety, tenseness, that result in the falls...(but then why did he fall before, when hadn’t expected it?)...anyway, perhaps bad example, but good point...

Most people, having been harmlessly been lead around by someone blindfolded, with no bad experiences, having become confident of their guide etc, could easily be led to walk across a wooden bean between two highrise windows...whereas if they had known, they would likely have stumbled, fallen etc...

In Sufi tales or Zen stories, the recipient of the knowledge of the healer must be in a state of readiness to receive. The supplicant comes to the master but is refused entry until "the vehicle is ready to receive the riches of the teaching."
Erickson often told long stories, during which phrases like "There is something that you know but don't know that you know. When you know what it is that you don't know you know, then you will be able to ... e.g keep a dry bed, stop smoking, stop that nervous tick, enjoy sex, enjoy moderate eating, lose weight / gain weight..." would occur ... puzzling and intriguing the client / especially their subconscious...this stimulates the sub-conscious into beginning a search for the suggested piece of knowledge...an ‘inner search’...for the resources necessary for a resolution of the symptom / problem ... a solution...and by delaying gratification, Erickson builds up curiosity / attention / interest, the exact ‘state of readiness to receive’ that the Zen teacher seeks to produce in their student...’the readiness is all’...they are then in a state of readiness to receive...to value the wisdom / insight offered...

That laughter is associated with relaxation is indicated by a temporary relaxation of bladder control i.e ‘I pee’d myself I laughed so hard’ ?

He told a girl with a long history of untreatable bedwetting that he could not cure her. "But you already know something but you don't know that you know it. As soon as you find out what it is that you already know and don't know that you know, you can begin having a dry bed."

Then I told her, "I am going to ask you a very simple question

11 OVERCOMING HABITUAL LIMITATIONS

and I want a very simple answer. Now, here's the question. If you were sitting in the bathroom, urinating, and a strange man poked his head in the doorway, what would you do?" "I'd freeze!" "That's right. You'd freeze—and stop urinating. Now, you know what you already knew, but didn't know that you already knew it. Namely, that you can stop urinating at any time for any stimulus you choose. You really don't need a strange man poking his head in the bathroom. Just the idea of it is enough. You'll stop. You'll freeze. And when he goes away you will start urinating.

"Now, having a dry bed is a very difficult job. You might have your first dry bed in two weeks. And there has to be a lot of practice, starting and stopping. Some days you may forget to practice starting and stopping. That's all right. Your body will be good to you. It will always give you...
further opportunities. And some days you may be too busy to practice starting and stopping, but that's all right. Your body will always give you opportunities to start and stop. It would surprise me very much if you had a permanently dry bed within three months. It would also surprise me if you didn't have a permanently dry bed within six months. And the first dry bed will be much easier than two dry beds in succession. And three dry beds in succession is much harder. And four dry beds in succession is still harder. After that it gets easier. You can have five, six, seven, a whole week of dry beds. And then you can know that you can have one week of dry beds and another

week of dry beds." I took my time with the girl. I had nothing else to do. I spent an hour and a half with her and dismissed her. About two weeks later she brought in this present for me—the first present she had ever given with the knowledge that she had had a dry bed (it was a knitted purple cow). I value that present. And six months later she was staying overnight at friends', relatives', at slumber parties. All of you have had the experience of being interrupted and shutting off a stream of urine very suddenly. Everybody has that experience—and she had forgotten it. All I did was remind her of something she already knew but didn't know she knew it.

All of us have our individual language, and that when you listen to a patient, you should listen knowing that he is speaking an alien language and that you should not try to understand in terms of your language. Understand the patient in his language...i.e Zen listening...MHR basics...

Erickson would almost always introduce his stories with a comment such as "You will be especially interested in this story, X"

Erickson uses the bedwetting story to teach listeners the lesson that we do not come to control our symptoms by willpower, but by discovering which stimuli are necessary to induce ourselves to "start and stop." Then we must take the opportunities to practice "starting and stopping" the symptoms i.e which is what Bandler did with his NLP ... finding out how clients / we started / produced the symptom in the first place, then using the same method to replace the symptom with a desirable condition...the symptom is often a limiting belief that we can replace with a generative belief...a positive one...a productive one...a welcome one...in the same way we produced the negative, limiting, dysfunctional one...belief or symptom...reflexive beliefs and symptoms...if phobia / belief produced
quickly, so will the replacement / positive belief / condition...Bandler asked people how they got themselves into a panic...what process / procedure / steps they experienced...had to get people to attend to this, to be able to analyze, break down the steps...some people volunteered such information, which gave Bandler the idea, along with his modelling of Erickson's process...to realise that we DID start the process, and have different past successful examples / experiences of having also STOPPED such processes..

Erickson added some extra sentences that make this second point even clearer: "All she needed to know was that she could stop her urination at any time, with the right stimulus." And, "We grow up thinking that we have got to finish. That isn't true, that we must continue until we are finished." I have found this attitude to be a great help in accomplishing such tasks as writing. The coercive feeling that we must finish can easily block spontaneity and creativity. A far more effective way of getting something done is by "starting and stopping," according to one's inner rhythm. I have found this story to be effective in helping patients overcome blockages, such as writer's block.

So much of our learning is based upon limited instructions that bar us from our own development of our understanding—and we get into patterns of being limited. We are told to ‘do it this way’. Only this way. Think this way. This is the official history of...etc MHR

Many client’s won’t express their inhibitions / phobias...so need to observe while ‘auditing’ for reactions, then get them to break these prohibitions, and learn for themselves that they can ‘the world won’t end if I …’...

His prime method of helping someone break prohibitions, to extend her world experiences, to extend her possibilities, to extend her limits, to escape narrow, limiting beliefs, to build the ability to live independently and self-sufficiently is to induce person to put themselves into new situations. In these new situations they learn, from her own experience, not from the dictates of others, what their limitations actually are. E.g rather than threatening god will punish you for X, try X in controlled situations where no harm can come to you e.g get drunk at home...then hangover will give you feedback on whether you want to repeat that or not...most people, like myself, don’t become alcoholics or regular users of anything, just because we ‘tried’ it once or a few times...
n.B that Erickson suggest they act in ways that break their expressed or his observed limits / limiting beliefs / inhibitions that ruin their lives etc, while in trance...when they are more amenable to suggestion...bypassing conscious resistance to such suggestions ... they don’t argue while in trance...don't resist... MHR assuming it is something they really WANT to try, but don’t have the courage etc to do normally...they will NEVER do ANYTHING suggested if they do not WANT to, whether they consciously realise they want to or not...not in REALITY i.e may ‘act out’ murder with cardboard ‘knife’, but won’t with REAL one, unless SURE someone there will stop them harming self or others !!!

All elements of Erickson’s stories served a therapeutic purpose...e.g even speaking about the ‘expansion of rice or beans when cooking’ is ‘expansion of limits / growth’...‘surprising’, had to add more water, buy more pans...i.e this story here: ‘A young woman came to see me. She was brought up to believe that theaters are places where young girls are seduced and places of sin. She would not go into a drugstore, because they sold tobacco there and the Lord might strike her to the ground if she was in a place that dispensed tobacco. And she wouldn't drink wine or cider or any alcoholic beverage, because, if she did, God would strike her dead. God would strike her dead if she went to the theater; he'd strike her dead if she smoked a cigarette. I inquired about her employment. She worked for a doctor who belonged to her church. He paid her $100 a month. The average salary at that time was $270 a month. She had worked for him for ten years and she was still getting just $100 a month. And her typewriting speed was no higher than twenty-five words a minute. She lived at home with her parents, who guarded their daughter very carefully—against sin. It took her an hour to get to work, eight hours of work, sometimes overtime without pay. It took her another hour to get home. And she worked six days a week. She went to church on Sunday—all day long. It was a very rigid and limited family. When the girl left my office after the first interview, my wife, who seldom comments on patients, said, "Who was that thing that the cat dragged in?" I said, "Just a patient of mine." So I talked to the girl and I persuaded her that life is full of pitfalls and death comes to all and if it was God's plan for her to die at a certain time, I was certain that she would not die of smoking cigarettes, unless God was ready to receive her. I got her to smoke a cigarette. She coughed a lot and God did not strike her dead! He really didn't! That surprised her. Then I suggested that she go to the theater. It took a couple of weeks to build up her courage. She told me, very earnestly, "God will strike me dead if I go to a house of sin." I told her that if God did not strike her dead it would be
because it was not her time to die and that I had great doubts about it being her time to die. Would she please come and tell what movie she had seen? She returned after seeing The Lady and the Tramp. I didn't pick out that movie. She said, "The church must be wrong. There wasn't a thing bad in that movie. There weren't any corrupting men despoiling young girls. I think the movie was entertaining." I said, "I think the church has given you a false idea about movies. I don't think the church did it intentionally. I think the church did it out of ignorance." And she found other movies interesting—especially musicals. Then one day I told her, "I think you've improved enough to take a drink of whiskey." She said, "God will surely strike me dead." I said, "I have doubts about it. He didn't strike you dead when you went to the theater or when you smoked a cigarette. Let's see if he strikes you dead if you take a drink of whiskey." She took a drink of whiskey and waited and waited and God didn't strike her dead. Then she said, "I think I've got to make some changes in my life. I think I had better move out of my parents' home and get an apartment of my own." I said, "And you need to get a better job. You need to learn how to type. And move into an apartment of your own. You can't afford it, so feel free to ask your parents to pay for the apartment. And do your own cooking and rent a typewriter. As soon as you awaken in the morning you rush to the typewriter, the very first thing, and type, 'This is a beautiful day in June.' Then you go to the bathroom, brush your teeth, and type another brief sentence, typing full speed for each sentence. Make each sentence very short. Then start dressing. Halfway through dressing, type another sentence. When you finish dressing, type another short sentence. Start getting your breakfast ready and type another short sentence. Sit down to eat, and halfway through breakfast get up and type a short sentence—allways typing at top speed. You can do that interrupted practice, always at full speed, and you will learn to type at a much more rapid rate." In three months time she was up to a speed of eighty words a minute. As for her cooking, she said, "I thought I'd make some rice and I figured I could heat a cup of rice, I put it in a pan with water. Then I had to get another pan because the cup of rice filled that big pan. And I had to get a couple of other pans. I didn't know rice swelled like that." I said, "There's a lot of things to learn about cooking." I had her bake some beans. She measured that cup of beans very carefully and they swelled into an enormous quantity. She eventually became a good cook and she resigned from her church and told her parents, 'Til come to visit you now and then. I've got a good job now. It's $270 a month and I only have to walk eight blocks to get to my job." Then she came to me and about that time Mrs. Erickson said to me, "Milton, do you specialize in beautiful blonds?" I said, "The
cat dragged in that last one." Because that girl turned out to be very pretty. She took music lessons and enjoyed her work, Then she came to me after some months and said, "Dr. Erickson, I want to get drunk and I want to know how to do it." I said, "The best way of getting drunk is to give me a promise that you will not use the telephone, that you will lock your door and not unlock it, and that you will remain in your apartment.

Get a bottle of wine and enjoy drinking it, sip by sip, until you have got the entire bottle drunk." She came to me within the next few days and said, "I'm glad you made me promise not to use the phone, because I wanted to call up all my friends and invite them to conic over and get drunk with me. And that would have been terrible. And I wanted to go out into the street and sing. And I promised you that I would lock the door and wouldn't unlock it. I'm so glad you made me promise. You know, getting drunk was fun, but I had a bad headache the next morning. I don't think I want to get drunk again." I said, "For the joy of getting drunk you have to pay a bill, and that is a headache—a hangover. And you are at liberty to have as many hangovers as you want." She said, "I don't want any more hangovers." She later got married. Now I've lost track of her. I think it's very important to take the patient seriously and meet his wishes. Not to exercise cold, hard judgment. And recognize that people need to learn things, that you really aren't competent to teach them all the things they need. That they can learn a lot on their own. And that she certainly did. And they are usually marvelously polite in a trance.

A woman came to see me and she said, "I weigh 180 pounds. I've dieted successfully under doctors' orders hundreds of times. She said she wanted to weigh 130 pounds and she didn't care what I did, I told her she'd find it rather painful. She said, 'I'll do anything you say.' I said, "All right, I want an absolute promise from you that you will follow my advice exactly." She gave me the promise very readily and I put her into a trance. I explained to her again that she wouldn't like my method of reducing her weight and would she promise me, absolutely, that she would follow my advice? She gave me that promise. Then I told her, "Let both your unconscious mind and your conscious mind listen. Here's the way you go about it. Your present weight is now 180 pounds. I want you to gain twenty pounds and when you weigh 200 pounds, on my scale, you may start reducing." She literally begged me, on her knees, to be released from her promise. And every ounce she gained she became more and more insistent on being allowed to start reducing. She was markedly distressed when she weighed 190 pounds. When she was 190 she begged and implored to be released
from her own promise. At 199 she said that was close enough to 200 pounds and I insisted on 200 pounds. When she reached 200 pounds she was very happy that she could begin to reduce. And when she got to 130 she said, "I'm never going to gain again." Her pattern had been to reduce and gain. I reversed the pattern and made her gain and reduce. And she was very happy with the final results and maintained that weight.

For this patient, the gaming of weight is no longer either rebellion or an expression of something she wants to do. It has become something she has been coerced into doing. Therefore, just as she had previously resented having to lose weight, she now resents having to gain weight.

This method of reversing patterns or looking at things in a reverse way is one of Erickson's favorite approaches for changing mental sets. He liked to show patients a book called Topsys & Turvys, by Peter Newell, in which the stories and the illustrations change meaning when the book is turned upside down.

If a pattern can be changed, even in some small way, there is the possibility for further change. As we have seen many times, this is one of Erickson's basic approaches in therapy—to initiate a small change. What became popularized as 'baby steps'. E.g direct a patient who starves and binges, to allocate one day each few weeks to gorging...so stay with pattern...and have something to look forward to...once have broken the complete cycle / pattern, person is free of it...and can then move onto what they REALLY want i.e freedom from bingeing and starving per se..

Erickson often refused patients who clearly did not really WANT to quit e.g overeating, drinking etc...

Mirror and lead e.g I want a divorce, so help them, while going through all the details that would make a divorce really a pain in the arse, and directing them to have a romantic dinner and stay in a nice hotel the night before going to the lawyers...i.e lead them to reconciliation, carrots and sticks...remind of what good, what costs will be etc...and give them a ‘directive’ they have to follow, which puts them together in a positive situation i.e recreate their romance / love / attraction...remind what good ...

People will ‘resist’ a direction to NOT do what doing, or to do what NOT doing...so get them to do something else that naturally leads to doing / not
doing target action / behavior e.g move muscle in face moves muscle in chest...leads to moving arms... i.e there was something stopping that, so don’t try to force it...will only produce resistance...go around the problem...address it indirectly...to avoid that resistance...

Cure claustrophobia in tiny steps i.e stand in cupboard with door totally open, then merely IMAGINE it being 1cm closed...then actually move door 1cm, etc, until fully closed...with hand on knob, then just touching, then simply in closed closet, with no symptoms

Begin with IMAGINING the thing, while in a TRANCE state, and THEN later imagining in normal state, then move onto being able to deal with THAT...then move onto the real thing...

Reframing is changing the meaning of the same situation i.e the definition of the situation, without having to change anything about the facts i.e spin-doctoring is prime case...and Work camps beind reframed as ‘death camps’... 

Possible ‘suggestion’ i.e post-hypnotic of becoming a ‘big girl’ meaning independence etc i.e growing up...so when leave home suddenly literally become a ‘big girl’ i.e put on weight...MHR could some anorexia be wish to remain a child? To avoid ‘growing up’ and ‘getting big’? Becoming ‘their parents’?

Erickson turned unconscious eating, drinking, smoking into conscious acts, by requiring his client to buy food, drinks, and cigarettes, one at a time...and at a different location each time...so each time he wanted a smoke, he had to deliberately walk to a shop to buy one...giving him back volunatary control of his habits...leading to a ‘cure’ in his overeating, overdrinking, etc...

Erickson reframed bodily functions as miracles of god’s work e.g sphincter allows you to pass ONLY wind i.e fart...so farting is really a miracle of god’s creation...a wonder of engineering...turning farting from embarrassing to a celebration of god’s work (done in private, in celebratory mood!)...

"You also ought to learn that it’s not what you do, it’s not what you say, but what the patient does, what the patient understands. "

Reframe X as Y, e.g a ‘scar’ as a symbol of bravery i.e classic example
When Erickson says to the young woman, "You have a little psoriasis and a lot of emotions," he is equating the psoriasis and the emotions, suggesting that the more emotion, the less psoriasis and the more psoriasis, the less emotion. He then gives her the opportunity to direct her emotions toward him. When she got mad at him and stayed mad at him for two weeks, her psoriasis lessened. She had a lot of emotions and a little psoriasis. Thus Erickson prepares his patients to find a new frame of reference by challenging them, confusing them, or stirring up unpleasant emotions. The reframing is done in harmony with a person's own mental sets and beliefs. MHR the symptoms disappeared when they were given a different representation system to express themselves in, though both kinesthetic, so no resistance i.e anger is emotion, psoriasis is still in kinesthetic representation system/domain...THIS is what intrigues me most i.e possibility of telling kinesthetic ‘pain’ to express itself as a color or sound e.g ringing in ears, haemorrhoids, migraines, back pain, headaches, neck tension...all representations of ‘frustration’ ... so I guess you move within one representation system first i.e reduce pain, localize, then maybe ‘scream it out in rage’ and then can maybe make it an energetic color like red, then color grade down to green, blue, purple, lilac...then maybe tune it to high pitch ringing, down to gentle low frequency, soothing pulse, unrecognizable from your pulse...but maybe THIS is how you get high / low blood pressure???

The psoriasis patient realizes that she was angry. MHR the symptoms were a reflection of repressed anger, which once released / expressed, didn’t need to express itself in that form...She confirms for herself that Erickson was right and she did have a lot of emotion. On an unconscious level, then, the connection was made that he must be right about the other half of his declaration—that is, she had only one-third of the psoriasis that she thought she had. Her body proceeded to demonstrate this to her by losing most of its rash.

NOT A SINGLE ERECTION

I try to tailor therapy to the individual patient. Now, a doctor came to me and said, "I had intercourse the first time in a bawdy house. The
experience disgusted me. So much so that in the twenty years that have
gone by I have not had a single erection. I have hired women at all levels
and paid them big money and told them, 'Make me get an erection.' And
they've all failed. "Now I've found a girl I want to marry. I tried to go to
bed with her. She's very kind and solicitous, but I can't get an erection." I
said, "Let the girl talk to me and it'll be a private talk between the girl and
me and then I'll talk to the two of you together." I told the girl, "Go to bed
with him every night, but be a thoroughly cold woman. Don't permit him
to touch your breasts, touch your body in any way at all. Just forbid it. And
it's very important you obey these instructions." I called the doctor in and
said, "I told Mildred that she's to go to bed with you every night. I told her
to reject any attempt at kissing, touching of her breasts, her genitals, her
body. She's to be totally rejecting of you. And I want that to take place for
three months. Then you come in and discuss the situation with me." Early
in March he lost control of himself and "raped" her. Now, Mildred was a
very beautiful woman with a beautiful figure. And when he was
confronted by the impossibility derived from Mildred, not from him, it
changed the frame of reference. Mildred was making intercourse
impossible; he wasn't. MHR maybe all about 'conquest' i.e all the
women he'd been with had said Yes, as he'd paid them to...like
in that movie / t.v show with the musician who could get any
woman, but only one he couldn't have turned him on...i.e when
she pretended he could NOT have her...e.g 'taboo' sex is
hottest...part of sexual 'attraction' is rarity...so ALL relations that become
'routine' lose their passion...see T vol I for more...

If someone e.g a child, consciously or non-consciously doing something to
irritate her parents, siblings, teachers etc, as a form of hostility, to express
her hostility, communicate it... e.g thumb sucking was case study, then
'order' the child to do this thing...so it loses its appeal ... it stops being
'rebellion' and becomes 'conformity to the wishes of an authority
figure'...and the child will lose interest in it ... or if it is just bad habit, re-
direct it into a conscious expression of hostility to be employed
selectively, to best effect, rather than wasted on everyone...and not just
the choice targets...so it comes under the control now of the conscious
mind, and loses its irrational nature ... the motive is now conscious, and
available to criticism...and soon appears less ideal / optimal, given all the
other ways the same ends could be achieved...MHR
in many of Erickson's stories about the treatment of children, he begins with "I sent the parents out of the room and I talked with the child." On one level, he is respecting the child as an individual, away from his parents. On another level, he is talking to the child in all of us. The parents, who often represent coercion, impatience, and lack of acceptance, are banished. They must not interfere with the therapy. On this level, Erickson is telling us to put aside the demands of our own overly stringent superego, our overly strict "shoulds," and allow the potential of the child to emerge and develop. He may be telling us not to bury our childish impulses—our spontaneity, our curiosity, our impetuousness, our explosiveness, and so on—but to channel these impulses or direct them "intelligently." When, like this girl, we can see the connection between what we are doing and the response of others (e.g., their annoyance), we may decide to stop that particular type of behavior. This type of "symptom prescription" might also be considered an application of Alfred Adler's dictum about therapy. Adler once said, "Therapy is like spitting in someone's soup. They can continue to eat it, but they can't enjoy it." By making the thumb sucking obligatory, Erickson "spat in this girl's soup."

MHR remember Erickson's tales were meant for the therapists i.e told to groups of people, as metaphors, that could speak directly and indirectly to the subconscious ... the messages bypassing any resistance...a message...the 'moral' to the story...giving therapists more options / choices / generative methods / resources ... challenging some basic assumptions and 'mistakes' therapists tend to make...

Erickson is also pointing out that even though the hypnosis may not work, the therapy might. That is, the patient may go home and complete the work in a dream. After having been told this story, an intuUectualizmg patient may go home and dream that he is in a trance. They will come and tell you the next day, "I dreamed a solution to that problem." Therapy is primarily a motivation of the unconscious to make use of all its many and varied learnings.

He emphasizes the importance of not trying to understand experience while it is occurring. This principle applies, of course, to all experiencing, not only to hypnotic experiencing. If one wants to understand experiences it is best that the examining, reviewing, and analyzing be left to a later time, when one has achieved some distance from the experience. Most hypnotic subjects want to understand as they experience. Keep the experience separate. Just let things happen. Focus on what is happening,
here, now, and do NOT attempt to analyse it...let it be...it will takes its own course...allow your subconscious to employ / engage / begin its resources, and give it time...it will happen...often 'out of the blue'...the insight...the changes...

I have no intention of dying. In fact, that will be the last thing I do!

The day you are born is the day you start dying.

We generally have more knowledge of what is going on than we allow ourselves to know, even under anesthesia.

ZEN is about 'seeing things as if for the first time' i.e making no assumptions / violence of language...we stop actually looking...only 'seeing' what we expect to see / what we were 'told' to see / and only the things we were told were 'interesting' and 'worthy of our attention' i.e we wear a pair of 'social reality goggles' which exclude all the things we were not 'told' i.e conditioned , to attend to...we got rewards and punishments for noticing and ignoring particular aspects of 'reality'...not to see the animal's pain / misery /suffering...nor that of 'the enemy'...etc...if you leave a child alone to form their own opinions, they are likely to challenge those of authority / social reality...so you need to get 'em young, and condition them...ZEN is about breaking out of that 'social reality'...letting reality speak to you, directly, with no filters...so you actually SEE, often for the first time, the phenomena around you...like a child...free of 'idolatry' i.e 'fixed definitions' of 'reality'...

Every magician will tell you, "Don't let children too near or they will see through the trick." Adults have closed minds. They think they are watching everything. They aren't watching. They have got a routine way of looking.

When a six-month-old baby who is being fed Pablum looks at its mother's face and the mother is thinking, "That horrible stuff —it just stinks," the baby reads the headlines on mother's face and spits it out. All you have to do is watch small children study mother's face or father's face. They know just when to stop short of receiving a rebuke. And know just how many times to ask for candy and get it. No matter how many "nos" they receive. They can hear the weakening of the "no." They know when the "no" is very weak, and an urgent request for candy yields a "yes."
We were influenced by our parents' attitudes and tastes at a time when we were in no position to test them for ourselves. This type of influence is instrumental not only in determining our habits, values, and tastes, but also, unfortunately, in our adoption of parents' fears, prejudices, and phobias.

Being paralyzed after graduating from high school hasn't interfered with me at all. And I couldn't move any part of my body except my eyeballs. I learned body language.

A heliotropic tree! By the sunflower you can tell the time of day."

A flower-bed clock? My grandmother had a flower-bed clock. Morning glories opened in the morning, certain other flowers opened at seven o'clock, others at eight, others at nine, others at ten, others at noon. And there were the evening primroses, for example. The night-blooming cereus opens at about ten-thirty or eleven o'clock at night.

Erickson noted that a 'beautiful woman' 'directly' brushed lint off her dress...not making the usual 'manouvre' to go around breasts, which E has observed his daughter began doing at the very first signs of developing breasts...so he realised he was the right therapist for this client, who had tried everyone, as 'she' was really a 'he'. i.e ZEN observant!

"Does your husband know about your love affair?" She said, "No, but how did you?" I said, "Your body language told me." Her ankles were crossed. I can't do it. Her right leg was crossed over the left one and the foot tucked around the ankle. She was completely locked up. In my experience, every married woman who is having an affair who does not want it known always locks herself up that way.

People have the right to choose to keep a symptom if losing the symptom might involve greater pain and discomfort.

Fortune-tellers, mind readers etc have learned to observe and interpret minimal body movements, including those of the lips, neck (around the vocal chords), and face. This is often referred to as 'sub-vocal speech', the muscles tense and relax, as if speaking, and once you have sensitised yourself to this, accepted this fact, and learned to 'read' these muscle contractions, you can read them as distinctly as lip reading, and learn to read the 'involuntary' micro-gestures people make in response to your
comments. One need not resort to "supernatural" explanations. The "magician" has simply trained himself to observe / has become tuned into, the 'minima] sensory cues" that most of us ignore.

You can do the same with other senses, such as touch. A person was well known for his 'magical' powers. He would tell someone to hide a pin anywhere in the building. Then he would walk around with hand contact and he would read that person's mind, he said. So E repeated the 'trick' to show how it worked. "Why don't you hide a pin anywhere on campus? Then we'll hold hands and walk around the campus and I'll find the pin." I found the pin on the second floor, stuck in the frame of a painting. All you do is hold hands, you walk along, and the person withdraws slightly when you get near the pin. So as soon as I found a minima] withdrawal as I approached certain steps, of course I went upstairs. When you reach the top of the stairs there is tension again. Which way to turn? You turn one way and the hands relax. You turn the other way and they tense. So you go around in a circle!

It is only necessary to look at things from a different angle or perspective, e.g light will reflect off apparently 'smooth' card surface, from the side, revealing 'stamped' impressions e.g card readers, that the audience, seated in front of the 'trickster', will never notice. A card 'counter' can memorise all the cards that have been dealt. A card 'reader' can find tiny flaws in each card and memorise which card has which fault...i.e remember each of the 52 cards in the deck by tiny flaws in each card others never notice / look for...could be smudge of fingerprint, grain of paper, imperfection in the laminate...if there is a pattern printed on the back, the edges of each card are often slightly different i.e a larger sheet was cut up into smaller cards, so the pattern is often not exactly the same on the back of each card... true ZEN skill...

E's favorite maxims, "Speak in the patient's language," and 'Join the patient." (Bandler never mentions this fact?)

The principle of initiating a small change arid of gradually extending that change.

Erickson relies on the technique of "mirroring" the patients' behavior. In the first example, Erickson arranges for the delusion to be mirrored by another patient, who, conveniently, happens to suffer from the same delusion. In the second situation, Erickson himself mirrors the behavior,
by finding his own name on the page. This "mirroring" approach is utilized by Robert Lindner in his classic story "The /et'Propdled Couch." Erickson once told me that Lindner had been his student and had consulted with him before publishing his book The Fifty-Minute Hour, which contains this story. The story is about a therapist whose patient lived in delusional worlds. When the therapist belabors the patient with excited tales about his own "trips" and experiences in those worlds, when he joins the patient in his delusions, the patient assumes the therapist's role and tries to show him that the type of thinking in which they both had immersed themselves isr indeed, delusional.

Hydrotherapy room, and had him lie in the continuous bathtub. That's a bathtub with a canvas hammock. Your body is greased with Vaseline; you lie down and a cover is put over the tub. Only your head remains above the cover. You are lying down in the bathtub, and water, at body temperature, flows continuously over your body. Now, when that happens to you, you go to sleep! There's nothing else you can do.

On Sunday night, Herbert went to bed. I had the attendant spread-eagle him so that he was tied down by the hands and the feet, and couldn't get out of bed. And I had given him his evening tube feeding with plenty of table salt in it, Herbert got thirsty during the night—very, very thirsty. When he was released, in the morning, he rushed to the water fountain, but the water was turned off. He rushed to the toilet, to drink out of the toilet bowl, but the water had been turned off. He rushed to the mess-hall door, pounded on the door and yelled at the attendant, "Open these doors! I gotta have that water! I've gotta have that milk!" He drank it. When I came on the ward, Herbert said, "You think you're smart. I said, "You told me that before, I agreed with you then and I agree with you now." Herbert drank milk and soup. But he held out that he could not swallow solid food. When he was up to 115 pounds I told Herbert, "Next week, you're going to swallow solid food." Herbert said, "You're a lot crazier than I ever thought. I can't swallow solid food." I said, "Next week you will." Now, how did I make him swallow solid food? I knew that Herbert had once been a small child. I knew / had been. I knew that all people were once small children and that they all had human nature. Erickson proved to Herbert that his concepts were incorrect. Erickson deals with one symptom at a time. He starts off in a relatively peripheral area, and once he makes a change in that symptom, he works toward more central symptoms. Each success is predicated on the fact that there was a previous success.
Erickson felt that shock and surprise were useful in breaking up rigid mental sets. The surprise did not have to be administered in a sophisticated way. During my first visit with him, in the middle of our conversation, he reached into a drawer and pulled out a small tricycle horn. He squeezed the ball three or four times—toot, toot, toot—and commented, "Surprise always helps." It contributed to the general atmosphere that enabled me to enter a hypnotic trance and to respond to his suggestions.

The teacher in school manipulates you into learning to read and write. In fact, life is one big manipulation. I've been accused of manipulating patients. **Every communication must evoke responses and is, therefore, a manipulation.** We should not lose the playfulness and spontaneity of childhood.

MHR 'you tricked me' i.e you have to 'trick' people into looking at something from a p.o.v they would not otherwise have adopted...e.g seeing things from YOUR victim’s point of view... from an ‘opponent’s’ p.o.v...from ‘outside the box’, suspending disbelief / judgement / denial long enough to complete an argument and see who it potentially changes the context of your existing beliefs etc...

Erickson instructed therapists in ways of setting up stories. He said, "One thing I teach my students is this: Take a new book by an author who you know is good. Read the last chapter first. Speculate about the contents of the preceding chapter. Speculate in all possible directions. You will be wrong in a lot of your speculations. Read that chapter and then speculate on the previous chapter. You read a good book from the last chapter to the first, speculating all the way." Erickson stated that this was not only a good way to learn to set up a story, but it was also an effective way of learning how to speculate freely—in all directions. "And you break your pattern of rigid thinking. It is extremely useful."

**It’s when you do the unexpected thing that you cause a lot of rearrangement in a person's thinking.** MHR like me showing concern for a group of guys intent on beating us up when we got off the train, showing no concern for THAT, but giving advice about the damage they were doing to their finger joints by cracking their knuckles...they ultimately did NOT get off the train as they threatened...The unexpected can always derail a train or thought, a trend of behavior, and you ought to use it. MHR responding to someone who dominates the interaction with non-sequiturs e.g ‘Yes, I think pigs are funny too’ ??? WTF??? Totally
random stuff, that stops them in their tracks...opens up a Bardot of opportunity...

In medical school, when I was an intern, whenever a professor wanted to reprimand me, I always came up with an idiotic irrelevant question or statement—and derailed them. In the summer time a professor began: "Erickson, I don't like . . ." "I don't like the snow either," I said. Then he would say, "What are you talking about?" I said, "The snow." "What snow?" "The marvelous wonder—that no two snowflakes are the same," I think therapists ought to have ready, at any time, some irrelevant remarks. Then when patients sit down, saying a whole chapter that is irrelevant, get them off that conversational track. Derail them by some irrelevant remark. For example, "I know what you are thinking. I like trains too."

Erickson always made certain that he, not the patient, controlled the therapeutic sessions, Karen Horney once said, "Patients enter therapy, not to cure their neuroses, but to perfect them." If patients are to determine what happens in a therapeutic session, almost all of them will unconsciously do whatever is necessary to prevent real therapeutic change. Therefore, when the patient is on a useless track, it is important that the therapist derail him and direct him to a more fruitful one.

Erickson was supremely confident that patients would do what he asked. He was also confident that his therapy would succeed. This confidence was not based on wishful thinking, but on years of experience, careful observation, and painstaking preparation.

Reframe an observation task e.g sort apples for size and defects to get them to pay attention to task...reframe psychiatry as and interrogation / mystery novel etc i.e more in line with the interests of your interlocutor...find out what interests / turns them on, and frame your communication using analogy / metaphor / comparison / allusion / figures of speech from their interest area...using their preferred representation system...

Representation the way we encode our experiences of the ‘external’ world in our brains / minds...to produce our own internal ‘reality’ / model / map of it... some people ‘navigate’ the world more by sounds, others by vision, others by feel. The blind and deaf navigate by feel. The blind by sound and feel. Bats and dolphins have in-built ‘radar’. They can make sounds, then using the reflections those sounds make off objects, actually
form an idea of where the object is, if it is moving, how fast, what direction, and make out a basic outline of it. We are all ‘tuned into’ different impressions. Two people will thus experience the same ‘objective’ thing differently. One person will come back from a party raving about the music, another about the great food, another about the lovely house it was held in. Some people remember the sounds, others the smells, others the sights, of the party. Some remember only how they ‘felt’. You may remember the feeling of that special someone’s lips on yours, as you kissed in the kitchen.

Schopenhauer and Hume provided me with my initial full comprehension of how we tend to make a huge number of assumptions, every time we ‘believe’ something to be true. Most of these assumptions prove to be false, on closer examination. Of course the benefit of ‘jumping to conclusions’ is that it is fast. And it’s better to be wrong when you ‘run home after believing you heard / saw / smell a tiger in the woods’, and discover later that it was just a friendly dog, than it is to be wrong when you assumed that sound and movement was ‘probably just a dog’, only to become dinner for a family of tigers. Making assumptions, quickly, building models, jumping to conclusions, accepting what you are told by some ‘authority’, leaping to judgements based on ‘hearsay’ and ‘assumptions’, are all ‘efficient’ ways to increase your survival chances. But at some point, when the danger has passed, it makes sense to consider what you REALLY know. What was assumed. Whose opinion you took at face value, without analyzing to see if it was justified / valid. When the danger has passed. So of course ever liar, deceiver, manipulator, will try to make you feel ‘in danger’, ‘at risk’, at every moment, so that you never have a chance to pause, and consider, and think for yourself. You will always be jumping to your own, or someone else’s, conclusions…fearful of some imagined / illusory threat…like ‘hell’, or ‘gods’ or ‘terrorists’, or ‘enemies’…as long as you are held in the thrall of fear, you can never step back and evaluate the beliefs you have formed, and have been offered / often forced to accept, and at least behave as if you believed…and once your start behaving as if you believe, your mind will tend to rationalize that behavior, by actually BELIEVING … and defending those beliefs…so strongly that you often end up denying the facts of reality around you…this is how most people live today…this is why the world still needs philosophers, more than ever…

"Never take an insult." By refusing to see the student's behavior as an insult, Erickson took him by surprise. Then accepted his ‘blank book
review’ as a real effort, pointing out that he hadn’t signed it or dated it, and asking him to bring it back next lesson. Erickson was also demonstrating the "join the patient" principle i.e treating the insult as a real book review.

One day I got a call. "Ruth is on a binge again." I went to the ward. Ruth had torn the plaster off the walls. / tore off the bed clothes. I helped her destroy the bed. I helped her break windows. I had spoken to the hospital engineer before going to the ward; it was cold weather. Then I suggested, "Ruth, let's pull that steam register away from the wall and twist off the pipe." And so I sat down on the floor and we tugged away. We broke the register off the pipe. I looked around the room and said, "There's nothing more we can do here. Let's go to another room." And Ruth said, "Are you sure you ought to do this, Dr. Erickson?" I said, "Sure, it's fun, isn't it? I think it is." As we walked down the corridor to another room there was a nurse standing in the corridor. As we came abreast of her, I stepped over and ripped her uniform and her slip off so she stood in her panties and bra. And Ruth said, "Dr. Erickson, you shouldn't do a thing like that." She rushed into the room and got the torn bedsheets, and wrapped them around the nurse. She was a good girl after that. I really showed her what her behavior was like. Of course the nurse was an experienced nurse, and she enjoyed the episode as much as I did. All the nurses were horrified. All the rest of the staff was horrified at my behavior. Only the superintendent and I agreed that my behavior was right. Ruth got even with me by escaping from the hospital, getting pregnant, delivering the child, putting it up for adoption. Then she voluntarily came back to the hospital and was a very good patient. A couple of years later she asked to be discharged, went to work as a waitress, met a young man, married him, became pregnant. To my knowledge, that marriage was happy long enough for two children to be born. Ruth was a good mother and a good citizen. Often a patient can be shocked out of wrong behavior. That's true for the neurotics and for the psychotics.

Erickson often pointed out that it was important that the therapist direct the treatment. If he could not obtain obedience in at least one specific area, he would feel that there was no point in continuing treatment. E.G ‘climb squaw peak’ or ‘hang up on people if speaking with them is stressful / frustrating / irritatin’ i.e one for weight control therapy, other for severe stomach ulcers…which cleared up after the stress was ‘obediently’ reduced.
I spent one summer grubbing up brush on ten acres of land. My father plowed it that fall and replanted it, replowed it in the spring, and planted it into oats. And the oats grew very well and we hoped to get an excellent crop. Late that summer, on a Thursday evening, we went over to see how that crop was getting along, when we could harvest it. My father examined the individual oat stalks and said, "Boys, this is not going to be a bumper crop of thirty-three bushels per acre. It will be at least a hundred bushels per acre. And they will be ready to harvest next Monday." And we were walking along happily thinking about a thousand bushels of oats and what it meant to us financially. It started to sprinkle. It rained all night Thursday, all day Friday, all night Friday, all day Saturday, all night Saturday, all day Sunday, and in the early morning on Monday the rain ceased. When we were finally able to wade through the water to that back field, the field was totally flat; there weren't any upright oats. My father said, "I hope enough of the oats are ripe enough so that they will sprout. In that way we will have some green feed for the cattle this fall—and next year is another year." And that's really being oriented to the future, and very, very necessary in farming.

This theme—that tomorrow is another day, that the sun will rise again tomorrow, that no matter what happens it is not the end of the world, that no matter how flattened out you feel there's always the basis for some new growth and fresh beginnings—is a common one in the teaching tales. It's a great source of inspiration and it is certainly an effective antidote to self-pity.

Reframe any negative into a positive e.g. spin doctoring e.g. Homer and Bart not being elected class president i.e. there are always pros and cons to ANY situation…which you focus on will determine your response to it e.g. pleasure, pain, relief...are inherent in any situation / condition / outcome / circumstance...there is no pleasure that is pure and unalloyed by some pain, etc...if you focus on the things you like you don't have, you will feel unfortunate and thus unhappy...focus on the bad things you don’t have, and you’ll feel fortunate and thus happy...focus on what you’ve lost...or gained...what is better than before...worse than before...your failures...your successes...and you'RE a failure...you'RE a success...etc... but extremes of 'be grateful for blisters, it means you own shoes / have feet/ aren’t locked in a cage where you can’t walk etc...or for electricity bills which prove you have all these great appliances etc...
MHR humans are purposeful animals…we need a positive purpose / reason / motivation i.e to expect something good is in the future, waiting for us, if we do X, so we do X joyfully…it is satisfying, knowing X will bring us pleasure / relief / security to enjoy our pleasure…i.e psychocybernetics…we need a ‘yes’ and a ‘straight line’ as Nietzsche put it…a relatively near and attainable goal re: pleasure / relief / improvement … more and better something…in some way…find that…focus on it…each day, like Erickson…and you will always feel motivated, ‘happy’ etc…

I DON’T HAS TO: a disturbing story…the equivalent of 1984 ‘I want to believe’ … using force … power … to ‘break’ a person’s will, and have them ‘want’ to do something they really don’t, just to avoid that crushing power / force / restraint…

One Sunday, we were reading the newspaper, all of us. Kristi walked up to her mother, grabbed the newspaper, and threw it on the floor. Her mother said, "Kristi, that wasn't very nice. Pick up the paper and give it back to Mother. Tell her you're sorry." "I don't has to," Kristi said. Every member of the family gave Kristi the same advice and got the same reply. So I told Betty to pick her up and put her in the bedroom, I lay down on the bed and Betty dropped Kristi on the bed beside me. Kristi looked at me contemptuously. She started to scramble off, but I had a hold on her ankle. She said, "Wet woose!" I said, "I don't has to," And that lasted four hours. She kicked and struggled. Pretty soon she freed one ankle; I got hold of the other. It was a desperate fight—like a silent fight between two titans. At the end of four hours, she knew that she was the loser and she said, "I pick up the paper and give it to Mommy." And that's where the axe fell. I said, "You don't has to." So she threw her brain into higher gear and said, "I pick up the paper. I give it to Mommy. I tell Mommy sorry." And I said, "You don't has to,"

And she shifted into full gear. "I pick up paper. I want pick up paper. I want tell Mommy sorry." I said, "Fine."

Kristi was small, weak and intelligent, Erickson could have quit after Kristi had "given in," but he persisted until she could say, "I wants to." She had then changed the "has to" into a "wants to." She had internalized the socially desirable activity. In this story Erickson described, as succinctly as has ever been done, the development of conscience or superego. MHR of socialization into a social reality i.e mind control i.e brainwashing i.e 1984 ‘how many fingers am I holding up’…
During my internship, I took the temperature, breathing rate, pulse, an hour before patients received their visitors. An hour after the visitors left I took their pulse, respiration, and blood pressure. Every time a patient had a visitor, his temperature went up. His breathing rate became exaggerated and the blood pressure increased. I made up my mind then, if I ever had children or a wife in the hospital, I wouldn't visit until I knew it would be safe for the blood pressure, heart rate, and their breathing, and for their temperature. Patients in a hospital need to use their strength to get well and not to make their relatives who are well and healthy feel better.

I taught the kids the unimportance of pain and importance of physical comfort. For example, when Roxanna scratched her knee, she was really announcing it to the whole city. Her mother came out and looked at it; so did L Her mother said, 'Mother will kiss it here and here and then right on top, so all the pain will go away.' It's marvelous how anesthetic a mother's kiss for small scratches, it is all right to use "motherly" comforting. In serious, life-threatening situations, it is best to leave the patient alone as much as possible. In his response, Erickson is also correcting a serious misconception about self-hypnosis. He is saying that it is not necessary to go through ritualistic induction in order to achieve self-hypnotic effects. Simple awareness of "the unimportance of pain and the importance of physical comfort" can produce the same effect as hypnotic induction in which the patient is told these things by a "hypnotist." In other words, if one has accepted a value or belief, the effect on his responses is as permanent as if he had been "hypnotized" into acceptance.

Erickson's tales often focus on blood pressure, heart rate, and breathing. This strategy is part of his indirect hypnotic inductions. In this tale, he is pointing out that there is a disruption of natural physiological responses—of natural functioning—when parents impose their anxieties on a child. Or when the "parent" in an individual—the "inner sounds"—are operating on an anxious level. When this happens, "the kids cry." Intrapsychically, we have a feeling of sadness or self-hate, in Horney's terms, when the "shoulds" are too stringent. In the commentary at the end of the story, however, Erickson emphasizes the fact that the "mother" can accomplish marvelous results with a kiss. In other words, the ability to be a good mother to ourselves, loving ourselves, can have an "anesthetic" effect, that
is, it can relieve inner pain and doubt. This is similar to the ideas expressed by Antonia Wenkart in her papers on "Acceptance," and by Theodore Rubin in Compassion and SelfHate. And, of course, therapists must not interfere when their patients are doing good work.

"They do it in their own style," Erickson applies this principle to children as well as patients. It is always up to the patients to choose their own solution.

Another person's child slammed a door during one of Erickson's lectures. Now, if he were my child, I would graciously ask him, for no apparent reason, "Please slam the door." I would do this while he was busy looking at a picture book. He'd wonder why, but would obediently do it. I'd thank him and ask him to slam the door again. He'd slam it again, wondering. And I'd ask him to slam the door again. He'd say, "But I want to read my book." "Well, just slam it again," I'd insist. He'd slam it again and pretty soon he'd inquire why I had asked him to slam the door. I'd remind him of the original slamming and say, "The way you slammed the door made me think you liked to slam doors." His answer would be, "I really don't like to slam doors." You learn very rapidly in situations that are not to your inclination. Having Douglas slam the door when it was not to his "inclination" would lead him to discover that he really didn't "like" to slam doors. It would drive home to him that the door slamming had been unconsciously determined or reactive, rather than something he "wanted" to do. In the future, presumably, he would exercise more control over his actions, doing what he really "wanted" to do. At least he would have more awareness of what he was doing.

Erickson applied this principle in many different situations—-with children, with neurotic patients, and even with psychotics. He would either "mirror" the patient's undesirable behavior or would have the patient repeat it, under his orders, as with "symptom prescription." He never resorted to sarcasm, irritability, or hostility. His attitude could best be described as a "wondering" one: "I wonder what will happen if I ask Douglas to slam the door?" Erickson himself maintained that "childlike" wondering attitude, the attitude of the true scientist, to the very end.
‘Mind Lines’…

Mind Lines …Joseph O’connor

Reframing to MHR is ‘spinning’ … changing the ‘meaning’ of a fact, experience, idea, belief, understanding…looking at the same thing from different points of view…changes its ‘meaning’ i.e as meaning is the relationship between things…like a 2 dimensional drawing would appear as a mere boring straight line, when viewed from the ‘side’, no matter how complex and wonderful it is, when viewed from ‘above’, or at any other angle APART FROM ‘directly from the side’… so the ‘meaning’ of anything will depend upon where you are ‘standing’ in relation to it…what ‘angle’ you view it from…your ‘point of view’…so many people, observing the same phenomena / thing / object / situation, will have many different ‘meanings’ for it … describing it from their own point of view…and much much more problematically, their own unique assumptions, prejudices, definitions, belief SYSTEMS, noetic structures, dogmas, ‘learnings’, indoctrinations, mind control programs etc…

‘A thing is neither good nor bad, but thinking makes it so’.

We can free people of limiting beliefs e.g ‘I am a failure’.

‘A failure’ is a thing. A nominalisation of a past act of having failed. How did you get from a specific act/s, to this nominalisation? How did you construct it from the materials? What were the materials you used?

What pictures, feelings, and words do you use to create this meaning? How do you represent the action of failing at one thing as "making" you a failure?

What would someone else need to see, hear, feel, to convert the actions at which you ‘failed’, that formed the basis for your definition, into the feeling / nominalisation of ‘being a failure’?

How do you get from ‘failing at X’ to ‘I’m a failure’? What self-talk is necessary? What images do you have to call forth / produce / recall to get from the action to the feeling / nominalisation?

How do you do this? What steps do you take? To build this image / view / definition from the materials? What do I need to think, see, hear, say to myself? What process did you go through to get from ‘failure at X’ to ‘I AM ‘a failure’?

What do you first see in your minds eye, what do you have to say to yourself about what you see, what do you have to feel, to get from ‘failed at X’ to ‘I’m a failure’?
In reality, you’ve learned what does NOT work, have you not? You are still free to try out different possibilities, are you not?

Failure is quitting, is it not? Not trying out different possibilities, is it not? So you are saying to get from ‘failed at X, Y, Z to ‘I’m a failure’, you need to quite trying, do you not?

So all you have really done is quite trying, have you not? And this is your decision, is it not? And you can change that decision, can you not?

You can start trying different possibilities, can you not?

As a child, how many times did you ‘fail’ to stand up and walk, before you learned walk? How many times did you fall off your bike, before you learned to ride? How many times did you stall the engine when you learned to drive a car with a manual gearbox? How many girls rejected your propositions, before one accepted? (The player operates on try and see, many misses for each hit, without being dejected / giving up, never giving up…so never turns ‘failed’ into ‘I’m a failure’…

Change attitude towards ‘failure’…what it means…does it mean ‘the end’, or is it just part of the process, indicating you are ‘in the game’ and still ‘a player’…do you focus on your objectives, or on the ‘failures’ the process MUST include…the most successful ‘hitters’ in baseball miss MOST of the balls they swing for…FACT…

Defining yourself as ‘a failure’ protects you from the pain of the process…the failing required in achieving anything of value…how else could you protect yourself from that pain, while continuing to strive? MHR cease striving is a way to avoid pain, you imagine, but it is in reality impossible…unless you really die…

Recall a ‘successful’ experience, then remember all the little ‘mistakes’ you made, during it…did everything go perfectly? How did you overcome those little errors, to turn it into an overall ‘success’?

Does ‘being a failure’ get you anything, other than avoidance of ‘pain’? Is that what you want for yourself? Just avoiding failure? Is that going to be satisfying?

At the end of this life, would you look back and say ‘hey, I avoided failing, what a rich and rewarding life I had?’

Can you really avoid pain? Or is there a better way to relate to pain? A way to make it your ally? A friend?
Why do you use every failure to ‘torture yourself’? Who / how / when / where / why did you learn to do that? What benefit do you derive from that sort of masochism? Does it benefit anyone else? Do you WANT to feel bad? Do you FEAR success? Do you think / feel / belief you don’t DESERVE to be happy? Who ‘taught’ you that? What, how, when, where did you start living THAT idea out? i.e. That limiting belief must have come from somewhere. How do you RE-produce that belief / feeling, each time? What pictures, sounds, self-talk, feelings do you need to generate to end up feeling / believing THAT?

What does making a ‘success / failure’ judgement about every action contribute towards your overall goals for yourself and others? Does it help? Is it WORTH it?

Would you feel right in applying your own standards / behaviors / judgements on OTHERS you loved, as you do to yourself? Would you be this HARD on your own children? What is the REAL motive for these judgements?

Is it NECESSARY to think of ANY experience in terms of ‘success / failure’? If these all happened in the past, they do NOT exist…only things in the here and now exist…why are you letting them ruin you’re here and now? Imaginary things? If they were just bad luck, then nothing was to be learned, except how resilient you are, and that you can handle bad luck…If you learned what NOT to do, then it was a learning event, a success…a SUCCESSFUL learning experience…which you learned from…and it is over…you do NOT have to re-live it habitually, vividly, over and over…

MHR How much control do you imagine you had over events? Hindsight is 20/20 vision. Do you have super powers? That you can know what to do, every time? Do other people have them? Do you expect other people to be ‘perfect’ and make no mistakes? Always succeed? Do you realise how often your ‘successful role models’ actually ‘failed’, on their way to ‘success’. That they learned that success is all about taking risks, rolling with the punches, falling down and getting up, overcoming the dog days…learning what NOT to do, trying out 1000 ideas to find one that ‘works’…of course YOU only see the ‘Hits’ and not the misses…and you are kinder on other people than on yourself…you do not expect your hero athlete to succeed EVERY time, do you? Don’t you ‘forgive’ them their ‘failures’, but still idolize them for their ‘successes’. What do you focus on? Their hits or their misses?

If you are teaching someone something new to them, do you harp on about ever mistake, telling them ‘give up, you’re a failure’? Would you even CONSIDER doing such a thing? To people trying their best? (as opposed to myself not bothering to give any real effort, needing to be insulted / provoked into actually trying, then getting a 25mm grouping on the rifle range, and later the best 100m range results)…
Why not fail at defining yourself as a failure, by exclusively focusing on what you did NOT succeed at? You are such a SUCCESS at making yourself FEEL like a failure, at SEEING yourself as a failure, at negative self-talk telling you you are a failure…what a huge achievement…when most people would see all the things you have SUCCEEDED at and wonder how it could be possible that you convinced YOURSELF that you are a failure…

To be ‘A failure’ you would have to be dead, with no hope of having another try at something...are you dead? You want to live like the living dead?

When my daughter Jessica turned nine months, she began the process of learning to walk, but she couldn't walk upon the first attempt—nor upon the first hundred attempts. She constantly fell down. And she would sometimes cry. But most of the time she would just get up and try again. As she did, she learned more and she developed more strength in her legs, and more balance and movement, so that eventually she got the hang of it, and had a lot of fun in the process. And I wonder if this says anything that you can take and apply to yourself now.

MHR ‘Sleight of mouth’ (from ‘Mind-lines authors) as equivalent of ‘sleight of hand’ magicians use to trick you. Sleight of mouth is about bypassing conscious resistance to suggestions which replace limiting beliefs with generative beliefs, offering more choices to the subconscious mind…these can then be manifest and ‘owned’ i.e retrospectively post rationalized by the conscious mind, as if it was IT’S idea all along…side-stepping, rolling with the punches, and while the conscious mind is watch the left hand, we slip the right hand in, with a very powerful, generative, choice increasing, suggestion. These suggestions facilitate major ‘transformations of meaning’…re-writing the BIOS, the basic programs, your mind-computer runs on, avoiding GIGO…it eliminates ‘bugs’, and ‘trojan horse programs’, ‘viruses’ like religion and other dogma (idols / ‘truth’ / ‘knowledge’/ ‘traditional consensus reality’ / ‘social reality’ / ‘cult-beliefs’ etc…

How to enter (yourself) and Generate (for others), THE most RESOURCEFUL states…

Consider how mere WORDS (In the beginning was the word, and the word was god, and the word was with god) can CREATE entire universes, populated with entirely imaginary beings, which can produce REAL fear, terror, and lead people to commit the most horrific crimes against each other, and other sentient beings, often in the name of some utopian vision, some ‘greater good’, some ‘heaven’, or to avoid some totally non-existent, imaginary, HELL.

This is the MAGIC of language. The BLACK magic of language. I am a WHITE WIZARD / Magician…oops, no racism intended…can’t even say ‘Dark arts’ ??
Words can produce the most dramatic REAL WORLD effects... ask the victim of an Israeli fundamentalist if the Jew’s belief in the ‘Torah’ and Talmud, mere words written on paper, and spoken by mere men, has any power ‘in the real world’. How many people have been the victim of words. Words like ‘enemy’, or ‘terrorist’, or ‘debt’, or ‘tax liability’, or ‘conscription notice’ or ‘crime’, or ‘illegal’ or ‘hate-speech’, or ‘god’ or ‘everyone knows X is true’...

What about words like ‘You’re useless’, ‘You’re just like your father’, ‘You’re a loser’, ‘You’re ugly’, ‘You are the reason your father left us’, ‘You’re evil’, ‘You’re a citizen and must obey the laws of this nation’.

It’s about what others say to you, about you, and most importantly what you then say to yourself, as a result...

Throw a few ‘insults’, mere words, at someone, and watch their blood begin to boil, literally, their heart-rate rise, and they suddenly become fearful or aggressive, taking flight, or preparing for a fight... watch out... you’ve throw words, they may soon be throwing punches, or worse, bombs. And you still think words are NOT all-powerful? Nothing to be concerned about, for good or bad?

I ran that Visual-Kinesthetic Dissociation process (the technical name for curing phobias) with several people and, lo and behold, one minute prior to the process they could make their neurology go into an absolutely freaked-out state of total panic and autonomic nervous system arousal by just thinking about some aversive stimuli. And then, a few minutes later, they could think about the same object and remain calm and cool. I would even invite them to really try as hard as they could to freak out all over the floor. But they couldn't.

Conscious of the power and use of language in creating change

Languaging in a variety of modes creates our human "programs" for thinking, feeling, Speaking, behaving, and relating

NLP study includes learning thoroughly the Meta-Model, the Milton Model, the use and structure of metaphor, playing with verb tenses, reframing, Presuppositions, Satir Categories and "Sleight-of-Mouth" patterns. And I thoroughly loved these facets of language.

Alfred Korzybski (1933/1994), Science and Sanity. Then in 1936, he introduced the term neuro-linguistic. It arose from his Neuro-Linguistic Trainings

What we do "mentally" and "linguistically" activates neurological processes in our bodies.
MHR ‘By our thoughts the world is created…Thinking makes it so?’

(Have you noticed our use of quotes around certain words, "mind" "body," etc.? This represents another Korzybskian device for cuing us that while we use a particular word, as a linguistic map, it does not adequately represent the territory. Recognizing this enables us to then take special care and caution with it.) Today we call these ‘air quotes’, indicating ‘supposedly’, or ‘so-called’, very ZEN, to indicate that the map is not the terrain, we ‘know’ nothing at all, in terms of Humean Skepticism, and need to take care not to ‘idolize’ (MHR) anything…the ‘living’ thing cannot be ‘reduced’ to any concept…we use words heuristically…to communicate ideas / feelings / concepts…we should NEVER fall into the trap of idolatry, dogma, assuming we ‘know’ anything at all, that any ‘fact’ is incontrovertible, or should be given legal protection / status of ‘fact’, whether by the Vatican, or ‘The Shoah Industry’ a.k.a ‘The Holocaust’ industry and its high priests, acolytes, and fully paid up membership.

How language works, how it works in how it constructs our internal "realities," and how it can serve us as either a resource or a limitation

Nominalisation is another word for ‘idolatry’. Taking a living thing, an ongoing process, a dynamic pattern of relationships, and reducing it to a dead idol of stone or wood, or in the case of language, a ‘noun’, an ‘object’. More specifically taking action words, verbs, and turning them into things, objects, ‘nouns’. This kills them. This is what DOGMA is. All and any DOGMA. Any assumption of ‘fact’. Any belief in ‘certainty’. Any notion of ‘the last word on the matter’. Beyond doubt. Beyond debate. And usually give some special legal status that makes it a crime to ‘challenge’ it. Socrates died for challenging such ‘idols’, literally, when he merely questioned whether ‘the gods exist’. He was an original ‘denier’. Today of course it is ‘The Holocaust’ that you dare not deny. More recently it was the ‘truth’ of the Vatican and Catholicism having a monopoly on ‘truth’ and ‘religioin’. But I wonder how many ‘master NLP practitioners’ ever bother taking their own medicine to the logical next step. And how many would risk being criminalized for questioning the very right of anyone to ‘criminalise’ skepticism, the very basis of all scientific progress.

Our sense receptors (eyes, ears, skin, taste buds, etc.) receive input of information from "the dance of electrons" out there in the process world of energy manifestations (here I have described the world using modern physics). From there, the neurology of our body transforms that information into nerve impulses and chemical "messages" that move along neuro-pathways. From there that information experiences more transformations as it activates cells and cells assemblages in the cortex, which then pass that information on to appropriate "parts," whether the central nervous system, the autonomic nervous system, the immune system.
MHR information ‘informs’… it is not just communication, which means ‘sharing in common’ i.e ‘sharing’, but actually ‘helping’ ‘ aiding’, ‘supporting’…these things are all implicit in ‘inform’…thus ‘informed’ consent means you have been given the necessary information to make a sound decision…to form sound decisions…Vs propaganda, ‘noble’ lies…MIS-inform…the opposite…deceive you…so you do NOT have sound inputs into your input-output system / black box called your ‘mind’…lies in / lies out…rubbish in / rubbish out…holocaust in / jew world order out…

A nerve impulse is encoded and decoded in a unique way? To give a unique quanta of accurate information e.g temperature, texture, etc…the ‘language’ of the body…pre-linguistic…so the words that describe / refer to / share these ‘sensations’ ‘ impressions’ ‘sensory inputs are the closest to our direct / personal experience…these sensory based words, exist at the lowest level of abstraction i.e ‘concrete’…the closest to our actual experience…though already subjective, they are more personal than social…closer to ‘reality’…when you use such words people can easily decide if their own ‘reality’ agrees with the one being expressed or not…so much more productive level to ‘debate’ at…i.e is there a blue stain here indicating use of Zyklon B, or not? Vs were there mass murder gas chambers in Auschwitz...

We can use words to evoke sights (V), sounds (A), sensations (K), in our mind and thus ‘experience them’ as vividly as if the nerve impulses coming from the brain, were coming from the other end of the system, the nerve ENDINGS in the skin, retina, and ear-drums…

Outframe. "So those are the ideas and beliefs you built as an eight- year old boy and then on top of that, at 17 you built that stuck-and-can't change belief." ["Yeah, so?"] "And now here you are at 30 living out these old beliefs- how well do you like those beliefs? Do they serve you very well?" ["No, not at all."] "So the conclusions you drew at 8 and 17 don't work very well. Well, that's probably the best kind of thinking that younger you could do at those times. Yet, after all, they do reflect the thinking of a child, not a grown man who can look back on all that and recognize them as misbeliefs and erroneous conclusions. Because children tend to self-blame rather than recognize that their parents didn't take 'Parenting 101' and never learned how to affirm or validate ..."

"Logical fate." Korzybski used this phrase about the internal psycho-logics of our neuro- semantics. After all, beliefs and ideas have consequences. If you believe that you "won't amount to anything," that you "can't do anything right," that you "don't have the right to succeedv-the logical fate involved in those psycho-logic statements will show up in how you present yourself, talk, walk, act, think, feel, etc.
'Framing' is another NLP unnecessary term to appear more interesting and 'new'…refers to changing the frames of reference, or 'point of view' i.e how you look at a thing. Etc…Framing best explained by example…Euthanasia can be framed as ‘mercy killing’ or ‘murder’…killing an unborn baby can be framed as ‘abortion’ or ‘murder’. Killing women and children can be framed as ‘total war’ or ‘mass murder’. The context of the act can ‘frame’ it e.g during wartime Vs peacetime, the same actions are either criminal or patriotic / commendable? Actual fact of the suffering / death / destruction is the same. It is how you ‘define’ it that changes. Which shows the power of framing. It changes NOTHING in ‘objective reality’, but EVERYTHING in your mind, in terms of ‘what it MEANS’…in terms of subjective and social reality. Social reality usually overrides personal subjective reality, and this is usually far from being an accurate representation that objective measuring instruments would make….and of course what they are measuring is just ‘flux’ in the electro-magnetic soup of ‘objective reality’…

We each ‘frame’ anything from our own point of view (remember the 2D graphic seen from the absolute side) and then our own experience of the thing e.g traumatic, joyful associations with e.g ‘dogs’ or ‘Allied Victory in Europe’…One mans terrorist is another’s freedom fighter…all language is loaded with personal and societal specific connotations … what is ‘evil’ in one culture is ‘normal’ and often even ‘admirable’ and ‘praiseworthy’ in another…One side puts a medal on you, and the other hunts you down as a war criminal…the REAL war criminals usually go onto well paid careers after the war, and the true patriots, fighting for truth, justice, and freedom for their people, rot in jails, or are hanged.

‘External’ impressions / the vibration of ‘atoms’, a.k.a electro-magnetic ‘soup’ vibrating at different frequencies, ‘trigger’ nerve impulses which trigger electro-chemical messages, which trigger ‘receptors’…which lead to the ‘black-box’ we have no way to describe or explain known as our ‘experience’…so we see, hear, feel, taste…all things we can describe as processes, but can never have any real idea of where they take place…in the brain? … the brain may be just another part of some ‘non-visible’ nervous system i.e we, our ‘selves’, our ‘sentience’, could be ‘located’ anywhere in the multiverse…and merely ‘remote operating’ ‘remote sensing’ through these bodies, with the brain being a mere transmitter / receiver coupling in the process…or the whole thing we call ‘reality’ merely a virtual reality…zeros and ones…string theory suggests this…with looped strings the zeros, and open strings the ‘ones’…

What is ‘real’ is our ‘state’ …our internally constructed ‘tastes’ and ‘scents’ and ‘textures’, and ‘heat’ and ‘impressions’, which are CONSTRUCTED out of the nerve impulses and ‘receptors’ for molecules, and vibrations in the E-M spectrum of different bandwidths…i.e ALL our reality, as we know it, perceive it, experience it, is constructed INTERNALLY…what, if anything, is ‘out there’ is
totally beyond human ways of being and seeing, of experiencing and ‘knowing’, to ‘know’.

We ascribe meanings by association, by relating one thing to another, and to all other things. Good and bad relate to pleasure and relief, and pain. T vol I stuff in detail...

We have a special kind of consciousness that reflects back onto itself (which we more technically call, self-reflexive consciousness). ??? WE? SPECIAL????

The ‘qualities’ of beliefs are really the qualities of the representations and their submodalities e.g your ‘know’ you are right? How? How does it look, sound, feel...specifically...is that ‘certainty’ about this particular ‘knowledge’ a memory of something seen, heard, or felt e.g cat’s fur is soft...is THAT knowledge ANCHORED in a memory of actually touching cat fur? Or having a cat rub itself against your bare legs? Nazi’s are evil. Is THAT belief ANCHORED in a personal experience with a Nazi? Or a mere viewing of thousands of Hollywood films...and ‘documentaries’ made by the same people...were these films based on actual FACTS? Was anything omitted from these films? Did the makers have any biases for or against Nazi’s, which would make the film mere ‘propaganda’? Did you READ somewhere, or many places, that Nazi’s were evil? Did the authority figures around you act confident that THEY knew for sure, that THEIR confidence was based on FACTS, on some PERSONAL experience...and then what about the supposed thousands of ‘eyewitnesses’...what did they REALLY see...is it what the films depict? Did they SEE this with their own eyes, or imagine it? ‘happening on the other side of the wall’?...Soon we find the ‘certainty’ dissolving, and requirind laws to ‘prop it up’. What sort of ‘fact’ requires a ‘law’, other than ‘laws of physics’, which themselves are constantly being ‘revised’. If ‘the laws of physics’ are open to revision, why not ‘The Holocaust’ and ‘The Hollywood Nazi’?

When we ‘interrogate’ beliefs, in this way, we can ‘de-frame’ our total system i.e move down in levels of abstraction from ‘Everyone ‘knows’ ‘The Holocaust’ happened’ to ‘The things we actually DO know, and HOW we know them’...we move down in levels of abstraction until we get to REAL stuff like someone’s actual sensory perceptions / impressions / experiences i.e what they actually saw, heard, and felt (with their hands etc)...and while even these are very prone to distortion, filtering, etc, at least the level of abstraction frees these representations i.e of sights, sounds, textures, smells, tastes, etc, from their ‘prisons’ a.k.a ‘frames’...which, like colored glasses, prevent us ‘seeing’ the real colors, like ear plugs, prevent us from hearing certain frequencies and amplitudes, and like thick gloves, prevent us from actually ‘feeling’ the textures of objects in our hands, and like alcohol and other drugs, prevent us from actually sensing much at all...like propaganda, which is all of these things, which prevents us ‘feeling’ the
appropriate emotions we would feel in the absence of the lies, deceptions, misrepresentations, distortions, exclusions, etc...

What TROONATNOOR does is go right back to the very fundamental assumptions we have been given, or have made ourselves, to ‘reset’ our buggy software programs. To re-enter new data, based on the lowest level of abstraction data we can get i.e sensory data...what we see, hear, and touch, and smell with our senses...we should ‘interrogate’ these like David Hume, before even starting on our quest for ‘truth’ and ‘knowledge’. We must remain ‘skeptical’, i.e. open-minded and ‘suspending judgement’ while testing all our assumptions, and only then start moving up levels of abstraction, and constantly re-iterating between the concrete induction and the theoretical, apparent patterns a.k.a. ‘theories’ e.g of cause and effect’. We must observe like ZEN practitioners, and let ‘reality’ speak to us...alert, calm, silent of mental noise, avoiding the typical human action of ‘imposing’ our beliefs / accepted definitions / assumptions upon reality...and distorting reality to make it fit our preconceived notions, our ‘prejudices’ i.e pre-judgements, the ‘judgements’ we brought with us to the interaction / situation...’Judge not’...let the experience speak to you...let it define itself...

What we learn from studying hypnotism, trance, NLP, metaphor, etc is that the things we ‘learn’ earlier, set us up for failure later, in terms of ‘truth’ and ‘knowledge’...our earliest impressions, formed at a time when we were LEAST able to judge them / validate / interrogate them, have a power to prevent us actually experiencing reality in the Zen manner...they ‘trump’ most experiences that follow...it is very hard to give them up...we are genetically / biologically programmed to latch onto ‘knowledge’ for its survival value...to ‘listen to our elders’, to ‘learn second hand’, to ‘jump to conclusions’...

So the original ‘learning’ is like a hypnotic trance. It is a post-hypnotic suggestion, to assume, in future, that whatever was ‘suggested’ at this time, over this time, is ‘TRUTH’ and ‘KNOWLEDGE’...this is very efficient...and fine, as long as, at some point in time, when you are more able to judge ‘beliefs’, to ‘interrogate them’, you REALISE this, and are capable of DE-programming your beliefs...of challenging them, and changing them, in the face of more compelling arguments and sensory data...

We are all walking around in various states of lucidity and trance. The Zen practitioner is right up near the lucid state. The average person right down near the zombie, trance state. One allows reality to communicate i.e ‘share’ itself with them, the other imposes their own illusory reality upon that, imposing ‘augmentations’ over the reality that block it out, filter it out, distort it, hide it, emphasise certain bandwidths while eliminating others...in a way that is self-fulfilling i.e the impressions gained through the augmented virtual reality goggles re-inforces the erroneous beliefs...making them even more real...more stubborn,
more prone to ‘tripping you up’ when it comes to interacting with reality...in your virtual reality goggles, your GOOGLE search result world, there is no tiger, so you walk straight into its open jaws...the tiger is happy, but confused...these humans seem to be blind to tigers...the tigers adapt to this, assuming any human won’t see them, so they just casually walk around, eating the tastiest humans as they come by them...and of course if they had the power, they would pass a law saying that EVERY human must, at all times, where their goggles, and rely ONLY on their GOOGLE search results...and of course any human that dared to question the GOOGLE search result given data, or wear the goggles, would have to be locked up...can you blame the tigers? They have it so good right now. Why would they want to lose such a beneficial situation? Of course the tigers in this analogy are the Jews.

Put most simply, you have many more options, choices, alternatives, than you realise. Many of these would make you happier, richer, sexier, more fulfilled, and better people i.e ethics. Once you are ‘out of the box’ and have taken off the restricting goggles, which were ironically sold to you as ‘augmenting’ reality i.e increasing your freedoms / information, you are free to define reality for yourself, in ways that benefit you, rather than your slave masters.

But it is a tough road to pursue, waking up zombies. They are ‘comfortable’ wearing their goggles. Even if their quality of life is well below what it could be, it is still ‘what they know’. So first we have to look at ‘why’ and ‘how’ they know it...without attempting to engage with them at the highest levels of abstraction called ‘social reality’ and ‘consensus opinion’ and ‘public opinion’ and ‘expert opinion’ and ‘tradition’.

We have to learn how to ‘trick’ people into interrogating their beliefs, and especially ‘how’ they came to ‘believe’ something. How they ‘know’ something. They won’t see any reason to ‘interrogate’ their own self-evident, confident, carved-in-stone, ‘frozen’, ‘nominalised’, obvious, normal, natural, god-given beliefs.

How you express an idea, suggestion, direction, etc in words, changes its impact. Making it more or less effective at persuading someone. At influencing them. It is not just what you say but how you say it. So we need to learn the skills that up to now have been the exclusive assets of the ‘bad guys’. The propagandists. The marketing experts. The public opinion manipulators. The impression engineers. The managers of the social reality. The gatekeepers of belief systems. The people who decide what you think about, and how you think about it. What things you are aware of, and how you will define them.

NLP employs such tricks as ‘sleight of mouth’, to bypass the conscious, implanted, limited, limiting, conditioned, habitual ‘ways of thinking and defining’, the ‘models’ and ‘assumptions’ forced on us from birth, and constantly
repeated, and thus reinforced. These attract 100% of our attention. In fact they overwhelm our attention, so we have no attention to give to any ‘competing’ definitions of reality, to any ACTUAL OBJECTIVE HEURISTIC reality…being held in a constant state of anxiety, fear, stress, frustration, irritation, hatred, and confusion, that saps all our energy.

We need to escape back to the playful ZEN state. The Humean state of ‘skepticism’. And ‘start again’. Hit ‘reset’. ‘Let’s start at the very beginning, it’s a very good place to start’…but don’t let someone ELSE tell you where the start is…because THEY will ensure you only go back a few steps, to where THEY have defined everything. TROONATNOOR takes you ‘way way back’ to the REAL start. Like David Hume. Like any great philosopher.

You don’t believe words have power? Well, imagine yelling out ‘BOMB’ in a crowded subway. Or ‘Poison gas’. And watch the terrified panic and confusion that resulted from these mere utterances. Abracadabra? Or watch how ‘political correctness’ can leave you speechless, literally, and too embarrassed to speak up, for fear of being ‘labelled’ racist, sexist, anti-semitic, a nazi…

Mental constructs carry tremendous neurological effects. We change, alter, and transform OUR "reality. by the changing of meaning, our emotions change, as do our behaviors, habits, moods, attitudes, skills, health, etc. and our life.

Sticks and stones may break my bones, but WORDS can do MUCH MORE SERIOUS DAMAGE, damage that is much harder to heal. Most people NEVER heal. But this book is all about that HEALING.

**Bandler’s ‘Swish’** represents the changing of frames…moving a person from one frame, e.g fear, self-loathing, despair to another frame e.g confidence, optimism, motivation…i.e representations of confidence / despair etc…and their submodalities … how we think about something i.e ‘frame’ it…”framing’ is another way of saying ‘define’ … or ‘experience’…because our subjective experience is determined not so much by any ‘objective reality’, but by how we interpret / define / distort/ filter etc and thus ‘experience it’, coding it into our own version of it…our own subjective reality…what we attend to in the ‘external’ world, and how we ‘spin’, filter, distort, and ‘construct’ our models / maps / interpretations of it…

We have ‘knee jerk’ reactions like Pavlov’s dogs to simple words like Nazi, holocaust, hell, terrorist, money, sex, Russia, trump, Hitler, vegan…all conditioned, programmed, implanted over time and sometimes instantly…it is time to stop acting like Pavlov’s dogs, and showing a bit more of what we claim for ourselves as our ‘superiority’ as ‘humans’.
Thoughts produce emotions. Emotions massively influence our state of mind, at a wholistic level. Consider the physiological effects of constant fear, stress, terror, anxiety, on your health. On your heart. Your muscle tension. You posture. Your looks. Your sex drive. Your eating habits. Your drinking and smoking habits. Your other drug habits. Words are ‘triggers’ that can trigger powerful physiological states. That is what ‘hypnosis’ is all about. Every experience you’ve had has been a form of hypnosis, implanting ‘suggestions’ about how to feel, how to respond, what ‘knee jerk’ and habitual responses to have to words such as ‘Holocaust’ or ‘Holocaust denial’ or ‘Nazi’ or ‘Islam’ or ‘Mother’, or ‘Terrorist’, or ‘Alternate media’.

Please support my work on this current book project...go to my TROONATNOOR Patreon page. Any resources you provide will be the best investment you could possibly make in your future, and that of your children. This latest 'book' will be the MOST powerful defensive weapon we have...the ONLY real antidote and defense measure short of actually strapping bombs to ourselves and 'taking out' the leaders in the conspiracy to deny us our constitutional rights and freedoms, and our basic human rights as free thinking, free, individuals. If I have the resources I can go online, podcast, and make serious videos. The money will not give me any luxuries. It will ALL go to helping YOU and YOUR family. If you don't help, I will do what I can do with what I have. But with YOUR help, I could be so much more effective.

You already know how to be happy, successful, content, motivated…but most of your ‘frames’ are of failure, defeatism, self-sabotage, despair, sadness…all you need to do is take existing positive, generative, resourceful frames, or construct these vividly in your mind, and then replace the negative ones with these…using Bandler’s SWISH method …

What frame-of-reference have you, and will you, use in reading and studying this? A "This is overwhelming!" frame? A "Too many big words!" frame? An "Oh this is complicated!" frame? A "Oh boy, mind-lines to empower me in moving through life!" frame? An "I find this very interesting and wonder about the exciting ways to use this!" frame? An "One page and pattern at a time and I'll learn this thoroughly" frame? Well, which one of those frames would work best for you? What frame would you like to use?

MHR what ‘state’ are you in, and do you approach this book in? What assumptions are you making about your ability to learn and understand and apply all this stuff? You want to access the most successful state you’ve ever had, or imagine what state you’d want to be in, then enter-into-it, and adopt that state…so that you are IN that state now. By learning how to construct, and move into, the most optimal states for the particular tasks at hand, and generally, you can make learning how to change states easier, more efficient…so that soon you
will be able to ‘switch states’ or ‘swish’ from one state that isn’t optimal, to a
more optimal state, almost habitually, almost automatically…like a knee jerk
reaction…only instead of debilitating fear being your knee jerk reaction, it will
be calm, resourceful, creative, alert, brave, observant, capable, confidence…

It really IS that simple. But you just need to escape your current mind prisons to
see it for what it is. Simple. This is the capstone to my TROONATNOOR
enterprise / endeavor/ massively ambitious plan for us all…

First step is to discard anything you think and feel ‘you know to be true’ or ‘self-
evident’ or ‘obvious’ or ‘traditional’ or ‘everyone believes this so it MUST be
true’…the majority are usually wrong. How often have YOU been wrong about
something or someone? If never, then YOU are most in need of this book.

I know nothing. That is the starting point. David Hume takes us way way back to
the start, to confirm this.

Then I need models and maps, to be practical. HEURISTIC rules of thumb. I
need to identify apparent patterns. And formulate practical, efficient, ways of
interacting. What patterns seem reliable? Fire burns? Dropped objects fall. I need
water and food.

But always remaining SKEPTICAL i.e open to new and better ways of seeing
and being and defining. Better models. Better maps. Always willing to discard
my current beliefs, if more compelling ones appear. Better maps. Models that are
better at predicting the outcomes of interactions. While NEVER assuming
anything. Especially that I ‘KNOW’ anything. That the belief I have is TRUE.
Thus rejecting ALL dogma. All assertions to being ‘the final truth’. Rejecting all
people who claim to be ‘The final prophet’. Rejecting all ‘LAWS’ of nature. IF
the laws of Physics are open to challenge, then surely EVERYTHING you ever
thought was true must also be open to interrogation and challenge.

We have to ‘explode’ our current belief systems, and start from scratch.

But why would anyone bother? This is very disturbing work, questioning
EVERYTHING. It is like being in free fall for the time you do it. Most people are
uncomfortable in free fall. Kids are not. Children love such ‘games’. They
approach life ‘playfully’. So you will have to become as fearless as a child. They
haven’t been ‘conditioned’ yet, by pain, embarrassment, rejection, disapproval…hopefully…they are still open minded, and expect good things.

How to return to that state and be able to join David Hume in his process?

What motivation could you have to overcome your fear of ‘free falling’ and
‘being wrong’?
Why would you question things you KNOW to be true? Isn’t that a waste of time? After all, you KNOW what you KNOW, don’t you? So what if the majority of people in the world KNOW something else YOU are right. AREn’t you?

How did you get into THAT state of confidence. WHAT is it that gives you such confidence to defy the odds? To be so smug and self-satisfied that YOUR truth is self-evident and compelling?

We need to get people, and ourselves, to ‘enter into’ that feeling of certainty, and discover what it is made of….how we get into that STATE of certainty….what makes us FEEL we KNOW something for sure? What are the representation systems and submodalities of that certainty.

Think of something you are CERTAIN of. Some ‘fact’ or ‘truth’. How does it ‘feel’? Where do you feel ‘certainty’? What does it look like, in your minds eye? What does it sound like? i.e what internal images, sights, sounds, voice-overs, memories, etc are associated with that feeling of certainty. That KNOWLEDGE?

Compare this ‘certainty’ with a ‘doubt’. Something you do NOT feel certain about. Something you ‘doubt’ is true. How do you construct ‘DOUBT’ internally? What is it made of? What sorts of images, visuals, sounds, feelings are associated with Doubt?

Recall a specific ‘certainty’ and a specific ‘doubt’, and compare all the submodalities of it i.e the feelings, sights, sounds, memories, associated with them.

You were ‘sure’ of X. Did you form an image in your minds eye? What did it look like? Big, close, small, distant, blurry, clear, vivid, vague, colorful, black and white, movie, still image, to the left, to the right, down to the left, up to the right, angled away from you or towards you? Did you hear a voice in your head with a particular tone, pitch, speed, coming from the left, right, down, up, behind your head? Was it someone’s voice in particular? Did it have a particular quality? Was it your own self-talk voice? What does IT sound like? What are its qualities. Are certain smells associated with it? Pay attention to your body posture. Do you slump, stand upright, feel strong, feel weak, feel clear headed, feel vauge? Does your pulse rate go up or down? Does your rate of breathing increase or decrease? Do you breathe shallower or deeper? Is your face flushed red or bleached white? Do your muscles tense up or relax? Which muscles? Do you smile or frown? Do your blink or remain unblinking for unusual amounts of time? Are your neck and shoulder muscles tensing or relaxing? What about your jaw, is it tense and tightly biting down, maybe even grinding your teeth? Or relaxed, and hanging slightly open? Is your tongue pressed to the top of your mouth, or relaxed, resting lightly
on your bottom teeth? Are you sexually aroused? Is your anus clamped tight? Are you tensing any particular muscles in your body, you scalp, face, legs, arms, back, feet, hands? Do you feel warm or cold? Happy or sad? Confident or Despairing.

Do the same for Y, that you doubted.

Soon you will learn that different ‘states’ of ‘confidence that I KNOW’ are ‘anchored’ in particular physiological states.

And the REAL reason you are SURE you KNOW something is NOT because you have reliable, sensory data about it i.e you SAW it with your own eyes, and really UNDERSTAND what you saw, making no assumptions at all, but letting ‘reality’ speak to you, but because you enter into a particular STATE of mind and body, when you think of this ‘FACT’.

The ‘fact’ triggers a whole set of responses, which you interpret as ‘KNOWING’. You may have NO reason to BELIEVE something. NO evidence to back up that belief. You probably NEVER even interrogated / questioned your beliefs with much motivation / effort. Buy you BELIEVE because that idea is associated with all these phenomena.

These responses are literally post-hypnotic suggestions that are being triggered by the thought. A node of associations is triggered by that thought. It is THESE associated feelings / sensations / images / sounds etc that give you the confidence to imagine you KNOW something to be TRUE.

But most of what you think you know, has NO basis in reality. Can be clearly shown to be imaginary. As David Hume demonstrated. As modern science demonstrates.
