ENTERTAINING BELIEFS

Zen Humean skepticism for Homo Fideo (believing man)

Because believing is seeing

And becoming all you can be, is so much more satisfying than simply being what you think you are
Forward / Introduction

Little of our ‘knowledge’ is gained first hand via direct induction from sensation, from our senses of sight, sound, touch, smell, and taste, from direct experience with the subjects and objects of our ‘knowledge’.

Even this is distorted, filtered, contaminated, and polluted, by our own languaging. That is, how talk to ourselves, in our internal voice, about what we are experiencing. Most of the time the voice in our head, and the images, are not located in the here and now, sensitive to the environment, lucidly attending to the ‘external’ ‘reality’, but are wandering amid past memories, and future hopes and fears that we are imagining at the same time…so we are not really ‘paying attention’ to the here and now…we are ‘hearing’ the voice in our heads, and not what is right before us, around us. We are not ‘hearing’ the ‘now’.

Most of the movies and audio playing in our head was itself the result of other people’s languaging, about can’ts, shouldn’ts, definitions of reality, etc…

So we face layers of other people’s languaging, and our own copies of it that we have adopted as our own internal voice, needing to be penetrated, or wiped away, before we even stand a chance at experiencing reality, as the Zen practitioner, here, now, experiences it.

We are born to believe. To jump to conclusions as fast as possible. To accept warnings without hesitation or doubt. These are survival friendly attributes. In the immediate term. Where it is question of ‘instinctively, automatically, habitually, thoughtlessly, muscle-memory REACT and RESPOND to stimuli, IMMEDIATELY, without wasting time on thought, and analysis, and interrogation, such as hearing something that COULD be a tiger in the forest, this innate ‘stimulus-response’ patterning, this ‘one step learning’, is of survival value.

But what is someone benefits from this, and it harms YOU? What if there are no tigers, but the fear of tigers has motivated you to submit to the warlord or priest who claims, confidently (and everyone else believes him), who offers to ‘protect’ you from those ‘tigers’? What if the priests go out at night making noises like Tigers, near your village, and leaving dead animals, that appear to have been killed by tigers? What if they continually tell warning tales of ‘tigers’ terrifying attacks on people, on children like yours? What if they constantly announce ‘tiger warnings’ on a scale from blue to red? And lately these warnings always seem to be orange or red? What if THAT is the source of their power, privilege, wealth, status, benefits?
By ‘jumping to conclusions’ then nominalising the results in language e.g I know \(X+Y = Z\)... MHR Our language produces ideas which produce beliefs, which produce the subjective world we inhabit, which produce ‘real world ‘actions, which produce the OBJECTIVE world we, AND OTHERS live in. We also live in these worlds that OTHERS have generated / produced, from THEIR faulty inductions and deductions, which they implant in us via their mere LANGUAGUIN, thus infecting / contaminating / polluting OUR minds with THEIR ideas and beliefs and actions. Most of THEIR ideas were implanted by OTHERS. Received second-hand at best, but usually at a HUGE remove, in terms of thousands of years between one guys faulty induction or noble lie or self deception, and todays idolized / nominalised / dogma... Change our own, and others, languaging, ideas, beliefs, and therefore actions, and we change our world. For better or worse.

Language is one of the most powerful tools. But our toolbox is overflowing with others. Let’s see what we have to work with. Let’s learn to use these tools. Become really ‘handy’ with them. Until we can repair, and rebuild, and design, and construct, a REALITY that is a great place for EVERY sentient creature that inhabits it.

We can define reality for ourselves. A definition is just a belief. Beliefs determine our langugaing, thoughts, and behaviors. Stop letting other people define YOUR reality. They’ve made a real mess of it. It’s time for you to take back you response-A-ibility, and take respons-I-ibility for your own life, security, happiness, satisfaction, and joy.

We are biologically programmed to ‘jump to conclusions’, to ‘learn quickly’, to ‘make assumptions’, to ‘construct patterns’ from the flimsiest of data...to learn as fast as possible, so that we stand a chance of surviving to maturity...at which point, ideally, we will go back and challenge everything we THINK we KNOW about ourselves and the world.

That time is NOW. Here. Welcome to your new self. Welcome to your new REALITY. You are going to LOVE it here. You are going to LOVE the new YOU.

All I ask is that you suspend judgement until the end. Suspend disbelief. Be curious. Approach this as a child. Playfully. With an open mind. There is no other way. You have to be the ‘person’ who entered this world, full of curiosity and desire to learn. You were so motivated you learned really quickly. Often you learned stuff that was ‘wrong’. But you learned enough to survive. Pat your self on the back. You’ve made it this far. Far enough.
that now you can begin to use all the resources of your mind and body to OPTIMALISE your experience engine. This ‘self’. This ‘world’.

You want to don’t you? You want to do it, didn’t you?

MHR the real secret of magic is that our emotions are NOT determined by anything ‘out there’, but by our own thoughts...how we ‘define’ our experiences of ‘out there’, and ‘out there’ itself. Nothing can CAUSE us to FEEL a certain way...we have control of our feelings...e.g pain does NOT force you to suffer...failure does not FORCE you to feel ‘like a failure’, and ‘depressed’. THAT’s all YOU...nothing can make you quite...you CHOSE to quit...or continue struggling / perservering... vividly imagined things are as real as anything supposedly ‘objective’, as ALL things are constructed and experienced ‘in your mind’...NOT ‘out there’, if any ‘out there’ really exists, is totally speculative...we have NO way to know if there IS any ‘out there’, or if it is ALL ‘in our minds’. THIS is the most empowering fact. It is also the way OTHERS have gained CONTROL and POWER over YOU...in fact they have NO control over you. They have NO power over you. They can DO X and Y, withhold X and Y, offer X and Y, but YOU chose whether you care about X and Y, and whether you will desire or fear X and Y, or simply pay it no attention, ignore it, and go YOUR way, FREE.

Beliefs have INERTIA...change of beliefs is very UN common... most people’s later beliefs can easily be ‘predicted’ from their earliest ‘imprints’...socialization...parent’s beliefs...inherited ... social...

Dilt’s naïve notion that our ‘sensory’ experiences determine our beliefs is striking and revealing...how absurd...fatuous...which of YOUR beliefs could you claim were the result of ‘sensory’ impressions? Induction from actual first hand experience of something... there is little ‘sensory’ about education...it is purely words someone spoke, and wrote down in books ... and movies...and novels...and stories...’they are typically updated and corrected by experience?’ Really? How? Do people go back in time? Do they ‘revise’ history (those who do are viciously punished in every way possible ... so who is Dilts speaking about? Which beliefs? Do people who never saw god, suddenly find his absence disturbing, and reject him as a fictional character? A manipulation of fear and hope? How many people REALLY become emancipated from their cult upbringings? Who ‘updates’ their beliefs? What percentage of people? How are they to ‘revise’ their beliefs if it is a crime to inform them? To ‘offend’ some cult member?

Why are values necessarily ‘positive intentions’? Why POSITIVE? The predator has the positive intention of eating you. Can you validate THAT? People are malicious, and willfully seek to doharm...how is THAT positive? To satisfy a
desire to harm others, out of envy, jealousy, competition, is somehow a POSITIVE intention?

Do we ‘believe’ as a means to ends? i.e to secure and gain benefits? Or as affects? Of programming? Conditioning? Are people in control of their own beliefs? Can they choose the most convenient / productive / constructive/ rewarding / satisfying beliefs? Yes and no.

Where are the ‘new data’ and ‘counter examples’ to come from, when one cult controls all sources of information for most people…and has all other sources defined as ‘evil’ and ‘crazy’ and ‘malicious’ and’ conspiracy theory’…no matter how compelling and documented / scientific, and has all potential whistle blowers threatened with loss of benefits / costs, and any who still continue to seek to enlighten others, put in jail for over a decade…with the potential for lifelong solitary confinement and medicalization of their ‘insistence’ on speaking the truth / seeking the truth / speaking their minds…?

How are people to have their beliefs challenged, if doing so is a criminal offense known as ‘offense’ or ‘hate speech’, because the listener doesn’t want to hear it? Cult leaders even ban their members from listening to anyone the Cult leadership feels is a threat to their own power and privileges…and add to his the total lack of desire among most people to WANT to reconsider ANY of their beliefs…let alone have them debunked as nonsense…to have their sense of being ‘a chosen people’ etc taken from them, with all the rights and special privileges they were promised that went with those beliefs…such as the right to oppress, exploit, enslave, and murder other people / people with OTHER beliefs or who simply do not AGREE with THEIR beliefs…

WOW…these NLP dudes are so keen on avoding giving credit to anyone…imagine deliberately avoiding the concept ‘circular argument’ so you can replace this generic concept with some ‘TradeMarked’ ‘Patented’ ‘Corporate’ term like ‘Self-referenced’? And to avoid giving David Hume credit, and to give it to another Cult of Judah ‘man’ Einstein, when Einstein himself was paying homage to Hume…something stinks here…I will use the ‘original’ terms and ‘existing’ concepts in my own book, but if you are reading these notes, which I will keep for myself, as I usually do as ‘extra notes’, you may recognise a pattern forming…an attempt to ‘own’ the collective birthright of intellectual property / intellectual capital all humanity should have inherited from the past masters like David Hume…

So circular arguments…where you use an assumption to justify the assumption i.e circular…you refer to something you have NOT proven / demonstrated, but have simply ‘taken on faith’ and ‘assumed’, to justify that actual assumption…God is the creator and thus god created the world. So loaded with tacit / implicit / unflagged / unstated / unrecognized / unspoken assumptions.
Such as ‘something can be created’, ‘some being can create’, ‘some being we refer to as ‘god’ exists’, and so on. You can’t ‘argue’ with ‘The Holocaust’ as the entire ‘argument’ rests on the assumptions that ‘we have millions of eyewitnesses, and their testimony’...when we have thousands of people who merely were TOLD something, then BELIEVED it...and NEVER saw it with their own eyes...they are NOT eyewitnesses...no EYES were laid upon ANY death camps, gas chambers, or mass cremation ovens...the few ‘eyewitnesses’ ever to CLAIM they SAW any of these, contradict each other and lay on the extravagant, impossible lies, so thick, that they discredit themselves...and there are so FEW such people who CLAIMED to have SEEN what we are told there are MILLIONS OF EYEWITNESS TESTIMONIES / EVIDENCE...that this itself beggars belief...if it happened, LOADS of people would have SEEN it...not just a few ex professional actors and hysterical women seeking attention, and lapping up the ‘sympathy’, and working as fully paid (via noble prizes, publishing deals, etc) up frauds like Elie Wiesel...it’s a lucrative ‘gig’ that ‘Shoahbusiness’, being an ‘eyewitness’...imagine what crime syndicates will pay Jury members and ‘witnesses’ to ‘forget’ or ‘remember’...then imagine what the Cult of Judah CAN and WILL and HAS paid its own ‘eyewitnesses’...Remember BILLIONS of Euros and control of the entire world are at stake...we are talking about THE biggest criminal gang that ever existed...and they run YOUR governments NOW...

Asking a liar to tell the truth is absurd. But you ask them, hoping they will trip up over their own lies, and reveal and expose their lies, and accidentally reveal some truth, by ‘interrogating’ them. But who EVER got to ‘interrogate’ a ‘Holocaust Survivor’? And risk ‘making a middle aged woman cry’, or ‘force a victim of a horrific crime to relive it over and over again’? Even once? You see apart from the paid actors like Wiesel, and that Italian pro actor turned ‘Holocaust survivor’ who took to the lecture and television circuit and earn millions, like Wiesel (got to find his name in my notes / books), NO supposed ‘survivor’ of a ‘Death Camp’ (a contradiction in terms I would suggest, given the supposed ruthless efficiency of the Nazi’s) has EVER given us actual EYE witness testimony of having seen ANY death camps, gas chambers, or mass cremation ovens...EVER...we have not forced any real ‘eyewitnesses’ to ‘relive’ ANYTHING...they’ve been allowed to say ‘I KNOW THESE THINGS WERE REAL’ without EVER being even asked ‘Oh, so you SAW THEM WITH YOUR OWN EYES’...it is ironic that the man who made millions from blatantly fictional ‘Holocaust’ stories like Schindler’s list and Sophies choice, books and movies that are admitted by the authors, (clearly stated in the books the films were based on) FICTIONAL (though supposedly revealing /exposing THE TRUTH by making up LIES? a.k.a ‘fiction’), Spielberg (SchisseHaufen is more appropriate then ‘Play Mountain), was the one to REVEAL this OPEN SECRET... please watch the Shoah interviews...in FULL...there are hours and hours of people ADMITTING THEY NEVER SAW ANY DEATH CAMPS,
GA S CHAMBERS, OR OVENS, WITH THEIR OWN EYES…BUT KNOW THEIR FAMILY MEMBERS WERE GASED AND WENT UP THE CHIMNEYS....THEY KNOW...? HOW? THEY WERE TOLD THIS BY OTHER JEWS…WARNED THIS WAS GOING TO HAPPEN BY OTHER JEWS…AND THEIR LOVED ONES WERE SEPARATED FROM THEM AFTER THE WAR BY OTHER JEWS…THE JEWISH SOVIET KOMMISARS OF THE ‘JEW’.S.S.R…FACTS PEOPLE

So what is a ‘belief’, something you ‘KNOW’, when it is based on assumptions. Hearsay. Literally ‘hear and then say’. Repeat gossip. Repeat propaganda. Repeat what you were forced to ‘learn’ at school as children. In the various propaganda / mind control centers known as ‘Holocaust museums’.

The ‘survivors’ ‘believed’ what they were told. Then hundreds of millions of people believed what THEY were told. TOLD. Assumptions passed around as ‘facts’. LEGALLY ENFORCED facts. Like being forced to believe in the magic of transubstantiation, the resurrection of Jesus, and the Trinity, by the Inquisition. Or in ‘God’ by the Pharisees. Being tortured until you ‘believed’. Then murdered by your own loved ones, and the rest of your friends and neighbours. Today you lose your credibility, your reputation, are demonised, lose your job, your career, have all your books unpublished and literally destroyed, your life’s work destroyed, you are fined into bankruptcy, and if you persist, imprisoned, indefinitely…with no chance to actually defend yourself…because this ‘assumption’ the Jews made / were given to believe, is L.A.W law. How is that for 21st century, enlightened legal system and government?

You have been TOLD something, and you BELIEVE it, just like any superstitious medieval peasant. You are punished if you publicly ‘DENY’ what the ‘authorities’ TELL everyone. Just like the Catholic Church way back then. Just like the Cult of Judah (The Main Branch / Head Office of all the ‘religions’ of ‘the book’, whether Bible or ‘Das Kapital’), who TOLD you WHAT to believe. And if you DENIED these ‘legal facts’ publically, your own family would be forced to throw the first stones at your public stoning to death.

What the FUCK is wrong with us, as a species, that we can be so EASILY and readily manipulated into believing the most absurd and patently deceptive / fictional ‘beliefs’. So that we feel we ‘KNOW’ things that are as far from ‘self-evident’ and ‘demonstrable’ and ‘logical’ and ‘rational’ and ‘reasonable’ and ‘inductive’ and ‘based on sensory impressions and compelling argument’ as it is POSSIBLE to get.

We are NOT talking about ‘tricky’ things like ‘cause and effect’ and ‘free will’. We are talking about obvious lies. Frauds. Superstition. Propaganda. All which obviously provides benefits to a small elite of privileged, powerful, selfish, sociopathic, often psychopathic individuals. Cult Priests for the most part. And
their ‘Golems’ and ‘puppets’. These ‘Preside’ over nations occupied by the Cult, and Preside over YOUR enslavement, and/or extermination. They have for the last 3000 years. Today their MEANS are beyond the mere imagination of the original Cult masters. Their ENDS are the same. Total enslavement of humanity. But the MEANS placed at their disposal TODAY, mean they will soon have realised their evil ambitions. True EVIL. Slavery and genocide.

The ‘Holocaust fact’ is a perfect example of a circular argument that NEVER goes OUTSIDE of its loop to validate / verify / legitimate / justify itself.

Anyone who DOES step outside this loop is defined as a ‘Holocaust Denier’ and as ‘evil’ and ‘malicious’ and ‘mentally defective’ and ‘mentally ill’, and ‘a Nazi, and ‘anti-Semite’, and A CRIMINAL.

This is the clearest case of a legal system and power system enforcing a ‘belief’ as ‘truth’ and ‘fact’ and ‘knowledge’. We escaped the Inquisition. You can publically ‘deny’ that Jesus was the son of some god. You can DENY the trinity, transubstantiation, the power and sole monopoly right of Catholic priests to ‘mediate’ between this ‘god’ and humans, the right of this cult to steal a tenth of your property (tithes) etc. But when it comes to the NEW dogma, ‘The Holocaust’, you’d better keep any ‘dissent’ to yourself.

But you’d have more reason to believe something as ludicrous as ‘transubstantiation’, as clear lies like ‘Jews of different nationalities gave off different colored smoke when cremated’ or ‘The Germans FAILED to kill millions of Jews, due to incompetence, and lack of organizational skills. Or ‘I escaped dozens of ‘death camps’, and was given transit visas and transporation by the people trying to kill me, so I could travel all over Europe, from one ‘death camp’ to the next. HELLO KITTY!

There is NO / ZERO feedback from ‘reality’. From ‘outside the loop’. You are NOT allowed to bring in ‘evidence’ from ‘outside’ the loop. If the ‘evidence’ does not ‘support’ the assumption / lie / propaganda / official ‘knowledge’ e.g in Germany the legal system KNOWS the holocaust happened and 6 million Jews were gassed and cremated, with no coal even…fictions don’t need ANY Evidence…in stories you can cremate people without ANY fuel, without ANY coal…any evidence that does NOT support the lie, is ‘inadmissible in a court of law’. In other words the lie can only be maintained if no-one is ALLOWED to challenge it with hard concrete facts / evidence/ scientific research / documents and compelling arguments. THAT is why ‘Holocaust DENIAL’ was made a criminal offence. Because that LIE would have been debunked decades ago. In fact within the first years after WWII

Imagine a cybernet system, one that requires feedback from its environment to operate, was given a faulty map of its environment, then told to ‘go out into the
world’. Imagine if it was NEVER allowed to ‘UPDATE’ its maps. EVER. What if its original maps were faulty? Even if they were perfect for thousands of years ago, what would happen if they were to ‘stumble into New York today? Assuming forests and swamps. And encouterning trucks and cars and buildings etc? How long would they survive, walking blithely across busy roads through traffic, assuming they were walking in empty fields and woodlands? THAT is how YOU are operating right NOW.

Your computer demands you constantly update its ‘definitions’. IF you fail you, you end up with nasty viruses.

Another word for update is REVISE. Historical revisionism has been demonised. But all it means is ‘updating’ our definitions and ‘understandings’ based on new, updated, more precise, more honest, more compelling, more scientific, more advanced research, understandings, discoveries, and findings.

If you BELIEVE Islamic terrorists carried out the 911 attacks, and act on these assumptions / beliefs / ‘knowledge’, and it turns out it was you’re the occupational government acting on behalf of the Cult of Judah, then all your RESPONSES will be self-defeating, and actually self-destructive. You will end up fighting for your own slave masters, and assisting them in enslaving and killing you and your family.

Everything has become so lucid and clear to me. And I realise that the ONLY way the Cult of Judah can continue operating is by DESTROYING anyone like me, and ensuring YOU NEVER step outside the ‘loop’, and join people like me out here. So I KNOW what a threat I am to them. Even though you are too lazy and stupid and gutless to venture outside ‘the loop’. They still fear that some of you MIGHT. Just enough of you to replay the War of Independence, and re-take our nations back, to kick out the occupation governments of the Cult of Judah. So I realise that my survival depends on ‘keeping to myself’ what I have learned. But that if I do this, I will end up a slave and/or dead anyway. Or if not me, then EVERYONE ELSE who comes after me, and inherits a TOTALLY CLOSED LOOP. A totally closed society. A total mind-prison. With ZERO chance of ever having access to any information / arguments / facts / impressions from OUTSIDE of this loop. Just like in the middle Ages. Just like under the Inquisition. Just like in ANY of the slave societies that have existed on this plane.

I naively thought I’d been lucky, and did not have to deal with the censorship and risks that Socrates and David Hume had to face. In fact I never would have realised how tight the censorship has ALWAYS been, and how dangerous it has ALWAYS been to be a real ‘free thinker ‘and ‘philosopher’ and ‘conscientious observer’ of this world and its goings on, had I not woken up to the facts about 911, and ‘The Holocaust’. That started me on a journey that opened my eyes.
Only to realise that the price of trying to help YOU, and others, was going to be fates WORSE than death.

And so few of the potential listeners will ever take me seriously, and benefit from my risk, sacrifice, and effort, and true suffering that I’ve endured, and am sure of being forced to endure, for my conscientiousness, and good will, and honesty, that is makes a mockery of that suffering, and my endurance of it, for the sake of OTHERS. Jesus suffered very little in comparison with what awaits the dedicated ‘Holocaust de-bunker’. And YOU have made a mockery of his (probably fictional) suffering. And you even ‘believe’ him to be ‘god’. So imagine the fatuousity, the absurdity I have to deal with, in doing what I do?

You could not possibly relate to it. You will just ignore me. Dismiss me. When I go to prison just forget about me. Even if anyone tells you about me. And even if you bother to listen, and wonder about me. And why I am willing, like others before me, to sacrifice and suffer so much for a few sentences.

What could be so important about MY beliefs that I will go to such lengths? Why have all the OTHERS been willing to suffer so much to utter a few utterances of truth in a world of lies and propaganda?

And us Holocaust ‘deniers’? What possible motive could WE have? Given that all we get in return is misery, rejection, abandonment, ostracism, demonisation, bankruptcy, unemployment, isolation, prison, and worse?

All those Hollywood movies want you to believe that the ‘Pagans’ were converted to Christianity after being impressed by how much the ‘Christians’ were willing to suffer for their beliefs. Their willingness to go to prison, for one.

In reality they were forced to ‘convert’. Charlemagne, for example, had 10,000 Saxons beheaded simply because they would not destroy their own sacred groves’, after the Saxons turned up, unarmed, to a peace conference. Just one example of how ‘conversion’ REALLY took place. By force. By murdering anyone who would not ‘submit’. THIS is true Cult of Judah business practice. Political strategy. Coming to YOUR town, and YOUR HOME, very soon.

‘The Holocaust’ and ‘911’ are the two most recent additions to the ‘Torah’. If you do NOT ‘publicly believe’ in these two myths, you WILL be punished until you submit, or die. This is how all Cults operate. This is how the Cult of Judah has operated for 3000 years. It works. They gained control. They are in the last stages of their total enslavement of us all.
‘The Holocaust’ and ‘911 was Islamic terrorists’ are the two latest DOGMAs produced by the Cult of Judah. The other recent one was called ‘Scientific Marxist-Leninism’, again another ironic self-contradiction in terms. During the Jewish rule of the ‘Jew.S.S.R’, it was DOGMA. An article of Faith. If you dared publically challenge it, you lost your job. Then if you tried communicating your ideas to others, you were sent to the Gulag, as a slave, to be worked to death, or until you decided to ‘submit’.

Anything YOU experience as ‘torture’ can be used to ‘convince’ you to change your beliefs. Beliefs CAN be changed. You CAN convince yourselves of anything. If you are sufficiently MOTIVATED, your subconscious will step in and change your beliefs, to save you from what you fear, and from the real suffering of what you are experiencing as unbearable torture. Whether that is slave labor in Siberia, the threat of losing your job and family, or solitary confinement for 10 years in a super-max concrete box, or simply loss of social approval / acceptance / status. You can LITERALLY be brought to BELIEVE anything, if the alternative, NOT believing it, is painful enough. Unbearable enough.

Or if believing offers you benefits. A lucrative publishing contract and speaking tour deals. Movie deals. Promotion. A good job. Public acceptance and approval. Some limited freedom that is at least better than a concrete box. Even so you can feel ‘righteous’ and ‘good’, and ‘noble’, even ‘superior’, without having to actually DO anything to ‘EARN’ these self-definitions. You can imagine you are ‘superior’ to those evil Nazis and holocaust deniers. It costs you NOTHING. You risk NOTHING. And yet you get to feel ‘superior’ and ‘smug’. You can criticize someone ELSE. Feel better than someone else. Simply by going along with the propaganda. THAT is a reward for many people strong enough to ‘pay’ them for their ‘submission’. Only of course they have NO idea what they are sacrificing, and what the consequences will be, of this submission. Until it is too late for any effective resistance to the prison state. If Russians had only suspected what the ‘Jews’ had in store for them, they would have fought to the last man and child to prevent becoming slaves to the Cult of Judah. Even Germans would have made a greater effort, and would NEVER have surrendered as long as there was a single weapon, and a single bullet. What is coming is THAT monstrous. But then again, Germans were slaves, to the Romans, and to their own Germanic tyrants, for most of their history. Their brief freedom under Hitler was not typical. Germans seem to be quite submissive. Like most people. Few humans ever fought against their masters. They were too busy fighting among themselves for the scraps their masters threw to them.

The ‘authorities’ working for the Cult of Judah, knowingly or unwittingly (most people serving the Cult of Judah imagine they are serving ‘god’ or ‘Jesus’ or ‘Equality’ or ‘Justice’ or ‘Social Justice’ or ‘Equal rights’ or some ‘utopian’
ideal), will ask ‘why did you insist on using VPN and encryption? I would respond ‘Why do you have doors and curtains on your home? Do YOU have something criminal to hide? Do YOU wear long sleeves because you have swastika’s tattooed on your arms? Or because you do NOT have a work camp tattoo there? Like that Weasely Wiesel?

When people claim (I have no evidence) that Homosexuals were imprisoned in Nazi Germany, I would ask them to check the historical records of their own nations, to see the record of the last criminal prosecution for a homosexual in THEIR nation. And then to compare the ‘penalty’ for Homosexuality dictated by the ‘laws and statutes’ of the Cult of Judah in their Torah / Old Testament. Death by stoning is what Homosexuals have to look forward to under the coming ‘Jew’ World Order. And I personally think Homosexuality is GREAT, but still disappointing compared to BI-Sexuality, which is the only FULL and COMPLETE sexuality, and expression of our full natures, and a a pre-requisite, it seems to complete enlightenment and freedom from our mental prisons, and perhaps this entire ‘prison plane’. And to counter that stupid self-hating cinema of Germany and Europe, Hitler was NOT allowed to remain in his ‘box’ during the medal ceremony for Jessie Owens. However Owens states emphatically that Hitler made a congratulatory wave of recognition to Owens after his Olympic victory. Hitler was not ABLE to be present at Owen’s award ceremony. He was keeping his word. His agreement with the Olympic committee, regarding how long we would be allowed to ‘preside’ over the Olympic events. These are documented FACTs you can confirm. Unlike the Jewish propaganda, which has ZERO basis in reality. Work Camps. Yes. Documented deaths from disease reported and recorded by the INTERNATIONAL Red Cross, Yes. It was not Hitler who was the racist, but Roosevelt, who not only refused to congratulate Owens, but presided over the extreme racist laws of his nation, before, during, and after WWII. Owens would NOT have been forced to ‘back door’ when attending public events, in Nazi Germany. But what care do YOU have for ‘reality’, when you ‘believe’ everything you are told, and then ‘know’ with confidence. With smug, complacent, self-satisfaction. What hope did a philosopher EVER have with this species of Homo fideo you call ‘Homo Sapiens Sapiens’. What DOES this species REALLY ‘KNOW’ to justify this epithet? Or was it intended as an ironic joke? That we ‘KNOW’ so much, when in reality, we can KNOW NOTHING. And the more we THINK we know and BELIEVE we know, the more STUPID and mislead and ignorant and self-destructive we become?

123/168

It may be significant that people are dissociated from their ‘beliefs’…most come third hand ‘read in a book’ or ‘heard someone say’…. It’s possible that forgetting the source can give beliefs greater authority…i.e ‘why do you believe that’? Few
people will admit ‘oh, someone said it / it was written in a book / I saw it on t.v.’…this gives the belief less credibility, perhaps, than a belief ‘based on concrete sensory perceptions i.e I was an eyewitness…? When you forget your ‘reason’ or ‘source’, the belief can seem more compelling…i.e ask people what they ‘KNOW’ about Nazi Germany and Hitler…that they did NOT see or hear in a Hollywood movie, or ‘official’ govt. propaganda…or about 911…or Iraq…or global climate crisis…people are prone to ‘remember’ something they merely read about in the newspaper, as a ‘real’ memory…this is one reason why ‘eyewitness’ testimony in criminal trials is so problematic…people can read something in a paper, forget they read it, then ‘believe’ they have some independent, even personal, evidence to justify their belief, which is no more than the reproduction of a biased newspaper article etc…

A disassociated belief is like an assumption people have made at some point, and no longer view as an assumption…it is implicit in all they do, but they treat it as ‘self-evident’…there is no remembered context i.e ‘I heard it in church’ or ‘Saw it on t.v’. they have forgotten the source. It is a ‘free floating’ belief with no context. Accepted as self-evident, when it is really someone’s assumption…who ‘implanted’ it is forgotten now…the belief remains, but not the recollection of how it was formed…it is an unchallenged assumption…the person is unaware they are making it…it just seems ‘natural’ to believe that…‘everyone does’…e.g ‘God’ or ‘911 was Islamic terrorists’ or ‘Nazi’s were evil’ etc…when you recall that your ONLY reason for thinking this is something someone said, read in a book, saw on t.v…it becomes ‘fair game’ again for interrogation…which an ‘unflagged’ assumption never is…it bypasses your critical faculties as it seems ‘natural’ and ‘self-evident’ i.e has become dissociated from the sources of it…stands now alone…with zero context…nothing to interrogate…it SEEMS just ‘reality’…. You take it so much for granted that you never realise it is merely an assumption…someone’s, that you adopted at some point…uncritically…such assumptions / beliefs become ‘circular’ and self-reflecting…I think I am, therefore I am? … it is true because I KNOW it…I am SURE of it…but why? I just ‘KNOW’…

It is impossible to correct or revise / update a belief that is not considered as a belief at all, but simply ‘knowledge’ and ‘intuitive’ and ‘self-evident’, and ‘not up for discussion’ … if you KNOW something, you are unlikely to interrogate it…it becomes a basic tenet of belief that becomes invisible…it falls into the background, and becomes part of the structure that determines how you define EVERYTHING ELSE…it colors / distorts / filters / excludes a lot of sensory impressions, to ensure everything NEW is ‘adapted’ to it…the unchallenged assumptions are never put to the test…if something contradicts the assumption, the NEW thing MUST be wrong…because it is inconsistent…there is NEVER any direct consideration / evaluation of the ‘fundamental assumptions’…the most basic ones that underly our whole world view etc…in T…
A Virus, such as HIV, is a chunk of genetic material similar enough to the DNA of humans and Chimps (the only animals who are affected by HIV) that it is ‘defined’ by the body’s immune system as part of the body…some viruses are wrapped in harmless proteins, so the body ignores them….like Trojan horses…computer viruses are chunks of program, not complete programs…that fool the computer into ‘executing’ their code…

Immunization is about ‘teaching’ the body to ‘identify’ certain viruses as ‘not me’…???

Deep question MHR ‘why’ do we believe? Why do we HAVE beliefs? They motivate and demotivate, limit and promote, expand and contract our actions, potentials, etc…learning…compression…heuristics…all related to beliefs…efficiency of reaction / decision making / response…

Finally an NLP person / Dilts, who observes the basic ‘problem’ I identified in T vol. I, that most of our ‘Beliefs’ are taken, as Aristotle does, as ‘first causes’…FIRST causes…as if ‘Will’ itself is a FIRST cause of everything else…as if Aristotle was unable to accept that even HE was driven by emotions, and NOT reason…that ‘reason’ is really ‘reasonS’ for doing something…rationalisations of the emotional urges / drives / desires / fears / hopes / aspiratoins etc…underlying all the ‘identified’ and ‘recognised’ and ‘flagged’ ‘beliefs’, among them explicit assumptions e.g O.K I admit I cannot ‘prove’ X, but I am going to assume it, for various reasons…etc…these are the EXPLICIT and FLAGGED assumptions we have made, usually have had made for us….we are given the assumptions and the ‘reasons’ they were made by others before us, and accepted by others before us, and supposedly the more of these ‘others’ there are / were, and the longer the ‘tradition’ is of making these assumptions, and ‘justifying’ them as they are, as a bundle of assumptions and justifications for making them…the longer back in history this bundle has been inherited and reproduced, from generation to generation, from location to location, the more ‘validity’ we grant them…the more ‘respect’ we have for them…this itself is an ASSUMPTION i.e that we SHOULD honor / respect something based on the number of people who have believed it, and the length of time the belief bundle has been in existence…as if stupid and lies would never have ‘stood the test of time’ as well as ‘truth’ and ‘wisdom’…

It is THE most challenging aspects of changing the surface, and deep, beliefs structures … BELIEFS… the assumptions that are NOT open to interrogation, because they are never flagged / identified / have the spotlight placed upon them / been invited to explain themselves / been required to justify THEMselves…they remain silent, hidden, out of the spotlight of attention, and so they evade interrogation… THESE are the true enemy of reason and
ethics...of social progress towards the optimal level of justice, fairness, equality etc...

You will notice that no ‘Holocaust’ ‘researcher’ / ‘presenter’ / ‘promoter’ EVER deals in sensory impressions...in the lowest level of abstraction...they ALWAYS deal in colorful language, and ‘half’ truths...you will constantly hear from ‘eyewitnesses’ that they ‘KNOW’ their loved ones were gassed and incinerated...what you RARELY if EVER hear (you have to real LOOK for these facts in the Shoah interviews”) is the REST of their testimony...where they ADMIT that THEY NEVER ACTUALLY SAW ANY EXECUTIONS, GAS CHAMBERS, OR CREMATORIA... in the usual propaganda presentations, they will INSIST THEY KNOW THEIR LOVED ONES WERE KILLED...but only in the honest Shoah interviews Spielberg financed from his lucrative ‘Shoah Business’ i.e faked propaganda versions of Nazi German history, will you hear ALL the ‘eyewitnesses’ up whom we are supposed to place ALL our belief i.e trust they wouldn’t lie...a Jew? Lie? OMG...the father of all lies? The writers of fiction, from the Torah to Schindlers list to that weasel Wiesl fraudster? ...what YOU NEVER HEAR is the REST of the statement...’NO, WE NEVER SAW’...only a Torah-trained speaker / mind can do that ‘self-negation’... and EYE-witness...giving EYE-witness testimony, who did NOT EVER SEE what they are giving EYE-witness testimony ABOUT...if you research, you will find one or two ‘eyewitnesses’ who appear over and over again, who are willing to lie...but like criminals who never first ‘agreed on what they were going to lie to the police’, they never get their story straight, and contradict each other constantly, and make absurd allegations such as ‘the ‘jews’ of different nations gave off different colored smoke when they burned in the ovens’...and stories of impossible feats, of ‘dragging full grown adults with hooks to the ‘elevators’ to the ovens...when not even the Jew.S.S.R Soviet propaganda and faked gas chambers EVER mentioned anything about ‘elevators’...that ‘eyewitness’ was, by the way, a professional actor, before taking the most lucrative / rewarding acting role of his career, that of ‘Holocaust survivor’...the HONEST eyewitnesses tell us how they were taken into ‘gas chambers’ (they were told by other jews that they would be gassed) where soapy water, rather than Zyklon B gas, poured from the ‘fake’ shower heads’...again more Torah-speak...fake shower heads and fake shower facilities where warm soapy water pours down on you...go read Brendon O’Connell’s trial notes, to see why I call this ‘Torah-Speak...only ‘Jews’ do it, as far as I am aware...and I’ve dealt with so many ‘mobbers’ and ‘victimisers’ and ‘cheats’ and liars and misrepesenters...and never heard them utter a self-negating sentence, one where they seem to be affirming something, but end up negating what they just affirmed, leaving you totally bewildered as to what they MEANT to say...in other words they can seem to ‘admit’ or ‘agree’ at first, but by the end of the utterance, they negate that admission / agreement...so what did they say? The Judge can simply ignore the negation at the end, which the jury won’t...it will
seep into their subconscious…and claim ‘they answered that question, now more on will you’…it really shocked me…that they were allowed to get away with this…leading me to to question the integrity or intelligence of the judge…who I do NOT feel was worthy of Brendan’s positive comments, in the end.

So really I have come full circle…the key to unlocking the prison, the mind prison we live in, is to challenge all the UNflagged and tacit, implicit, unstated, glossed over, ignored, ETC assumptions upon which our beliefs are built…or simply other less problematic seeming assumptions are layered…for we are willing to ‘admit’ some assumptions…just not the most basic ones…the ones BENEATH these admitted assumptions, which make them at least plausible, and more easily ‘digested’ and ‘taken on faith’ and ‘allowed’ as ‘reasonable’ and maybe even ‘self-evident’…though if you want to ESCAPE the mind prisons, you really must adopt the Zen Humean Skeptic Heuristic position of merely ‘entertaining’ beliefs…never taking ANYTHING ‘on faith’, a marketing way of saying ‘ASSUME it is so’, with ZERO reason for doing so, except ‘tradition’, ‘authority’, ‘transferred authority’, ‘convenience’, ‘keeping out of jail by agreeing with it’…

Aristotle stopped short, unwilling or unable to accept / consider that our ‘Will’ is derived from out desires / impulses / needs / wants / fears / hopes etc…which we do NOT have any control over…we can NOT (really truly honestly authentically) ‘love eating shit’ (though actually we can pretend this, as many do…it is called ‘hypocrisy’ and ‘faking it’ and today NLP, yesterday ‘self-hypnosis’, and earlier ‘willingness to believe’, even ‘necessity’…you swallow their Torah shit, and say it is delicious, so your loved ones won’t be forced to stone you to death…how’s THAT for an example…yes the TORAH is SHIT…SHITTY…disgusting…the diarrhea of the Priests of the Cult of Judah…it comes out their mouths, they then ‘store it’ in books and movies…the latest ‘chapter’ of the torah is ‘the holocaust’…and the coming chapters are all our own armageddom, and our enslavement to the cult of Judah’s ‘Jew’ World Order…

So we do NOT get to choose what gives us authentic pleasure, pain, or relief. Though, ‘thinking about a thing can make it (seem) so’…you can play act…like the hypnotized players on stage, who ‘believe’ they are eating cake, or a dog, or on fire, or in love…they are play acting / pretending…it is very powerful…but all self-induced …if people don’t WANT to play this game, you can NOT hypnotise them to do so…they will NOT do anything they don’t secretly WANT to do…are willing to do…have chosen to do…the idea of hypnotizing someone to kill someone they wouldn’t otherwise kill, is a myth…BUT you can program / condition / trick people into a state where they will murder a hundred thousand children, old people, and women, in one night, in Japan, or Germany, say Tokyo or Dresden, or Hiroshima or Hamburg…then machine gun the survivors and the rescue workers, and even the zoo animals…in true TORAH
tradition / role modelling…even though you are a CATHOLIC or atheist or Buddhist…it is called ‘propaganda’…humanity’s greatest enemy…it should be YOUR greatest enemy…as it is OUR greatest threat…the thing that leads us to our own self destruction, and self-enslavement, to the Cult of Judah…

Some call assumptions ‘pre-suppositions’, form the Latin to ‘put underneath’…this is literal…a pre-supposition is thus the unconscious / unstated / tacit / unflagged / hidden/ secret/unchallenged/uninterrogated/unquestioned assumption UNDERNEATH the assumption you ARE aware of, and DO recognise and DO see and CAN interrogate and CAN question and CAN flag and CAN put in doubt and CAN talk about…

We are back to the metaphor of the dreamer dreaming they have awoken, in their dream. To the ‘trance in trance’ states. The trance within the trance. The dream within the dream.

All these metaphors apply to the PRE-supposition…the foundation for the surface assumptions…even Aristotle was tricked…he felt he’d awoken…had left the trance state he saw his fellow humanity as still being under the spell of…he felt that while they were still dreaming, as he had once been, he was now awake. But he was like the dreamer who dreams they’ve awoken, and is now the more so convinced by the dream…he remembers having been dreaming, and now feels he is awake, and can trust / believe his current dream experiences…most of us have had this experience…it is very compelling …a great trick of the mind…and the greatest trick played upon us by our would be slave masters…

Most people feel ‘satisfied’, like Aristotle, that they have gone down the rabbit hole as far as it goes…that they have ‘challenged’ their beliefs as far as it is possible…they have come to the ‘first causes’ as Aristotle put it…the ‘ultimate questions / assumptions … e.g assuming something CAN be CREATED, and thus that something MUST have CREATED us, we rest on the apparently ‘self-evident’ assumption that some GOD must have created US…when in fact NOTHING can be created…there are NO ‘causes’…just interactions and outcomes…in fact something always existed…conscious-energy-matter…sentient resonant primery… and this interacts to produce all the apparent complexity, the order and disorder, that we experience…I’ve explained it all in my T books…even a child can ‘grok’ it, if they are freed from the mind prison, and allowed to do so…

Just a note…I have ZERO sense of direction…it is as if I was never fully ‘integrated’ into this matrix…this may be why I am one of the few able to fully ‘grok’ it, as a part ‘outsider’…never fully integrated…this metaphor works on the social level too…I was rejected at birth, by my family, and the world…and continued to be…mobbed, victimized, rejected, ostracized, facing prison now as
I write this, and demonisation for all history...I have NEVER been integrated / accepted fully by this matrix...I’ve never been ‘immersed’ FULLY in it...it has rejected me / didn’t integrate me...I have rejected it...it is possible I rejected it from birth...despite my good nature / good will towards my own family, and desire to be of service to them, and all sentient beings, I have rejected this matrix, this world, from birth...so maybe that is why it rejected me?...I have always sensed something is not right here...some trick is being played on us...like Schopenhauer and Buddha...but still, out of good will and a conscientiousness impossible to thwart by will, I have sought to ‘correct’ what is wrong...hoping it can be ‘remedied’ and optimalised...because maybe I will end up back here...and have to endure it all over again, over and over, until I solve the riddle, and free EVERY sentient being from this prison...or maybe by seeking to serve others, I can learn the lesson this ‘classroom’ was ‘designed’ to teach us all, and be ‘ready’ to move onto the higher planes / dimensions of existence, where the average being from this planet would be nothing more than a threat, a real hazard, a security risk, a liability...imagine letting loose the human on a plane where every other being was gentle, kind, honest, good willed, respectful of other’s rights, without any sense of entitlement to exclusive rights / priveliges...it would be like freeing a deranged wild hungry angry demented monster in a kindergarten...this is one of the many convergences between David Icke’s ideas and my own...

Now to be typically rigorous, I feel the tag ‘presupposition’ is itself too ‘active’...and ‘conscious’...the REAL point of the underlying assumptions is not that YOU pre-suppose them...but that they are pre-supposed FOR you...YOU are never aware of them as assumptions / presuppositions at all. YOU never said to yourself ‘Suppose X is ….’. YOU only EVER ‘supposed’ the next layer up. YOU are never even CONSCIOUS that there is an under-lying assumption a layer down...like the person who ‘awakes’ within a dream, or into another level of trance (Erickson used this trick often, as it is so convincing, and ‘feels’ like reality, and thus the ‘suggestions’ and ‘anchors’ seem REAL after finally awakening...you ‘REMEMBER’ them not as trance states, but as actual MEMORIES...you remember the trance BEFORE them as a trance, and then remember WAKING UP and HAVING A REAL EXPERIENCE...this is how he could implant ‘fake’ experiences...good therapeutic ones...not ‘false memories of being raped implanted by angry feminist man hating lesbian ‘therapists’...like the woman who got to relive her life, but this time with all the ‘right’ things being said to her, and being ‘nurtured’ and ‘supported’ and accepted and approved of and loved...and learning the right lessons from wise mentors...all Erickson himself, but experienced as real life experiences...in the ‘trance within the trance’...so convincing, like the dreamer who is now convinced they are awake, and everything MUST be real, because they can remember having woken from a dream, just a moment ago!!!
As long as the purveyors of the Holocaust fraud / hoax / lie can avoid YOU ever seeking ‘deeper’ than they want you to go, which is basically just moving beyond ‘the millions of eyewitness testimonies of holocaust survivors’ and ‘the Nuremberg trial verdicts’ based on ‘testimony gained by torture’, they can maintain the lie…the propaganda…which only started long AFTER the war had ended…facts people…make a tiny bit of effort, and hear the ‘REST OF THE EYEWITNESSES EVIDENCE STATEMENTS’ I.E ‘NO, I NEVER SAW WITH MY OWN EYES ANY DEATHS, OR GAS CHAMBERS, OR OVENS…AND ASK YOURSELF…WHAT DOES ‘EYE-WITNESS’ MEAN, IF THEY DIDN’T ‘SEE’ ANYTHING…then go on from there…after a few hours reading you will dismiss the entire Holocaust narrative as the latest chapter of the Torah…if you will invest a few days reading my books, and watching my videos, you will see what a dangerous situation you have produced for yourself and your family by ‘believing’ everything your government tells you…and realise the massive cost your ancestors paid for doing so, which your own future descendants will pay several fold, for eternity, if YOU do NOT wake up out of your trance state, and challenge the propaganda being fed to you, starting with ‘The Holocaust’, then ‘911’…

The elecromagnetic spectrum...in terms of 'wavelength' i.e resonant frequency wavelength...with reference of 1, so that a house is 10, and baseball 1/10th ... or 10 to the power of minus 1 ... so a single cell is about 10 to the power of minus 3, bacterium 10 to power of minus 6, virus 10 to the power of minus 7, proton 10 to the power of minus 8, water molecule 10 to the power of minus 10...then at other end radio waves around 10 to power of 6 to 8 (AM to FM), microwaves as in
oven 10 to power of 9, Radar 10 to power of 11...humans resonate at around 10 to power of 13, just below a traditional filament lightbulb at 10 to the power of 15 or so... Visible light is a very narrow bandwidht between bacteria and virus, i.e tiny band located between 10 to power of minus 6 and minus 7...Ultraviolet ranges upwards to around 10 to the power of minus 8, while infrared ranges down to around 10 to the power of minus 3...all very roughly...

Monsters and magical sticks Heller

Schopenhauer and Hume provided me with my initial full comprehension of how we tend to make a huge number of assumptions, every time we ‘believe’ something to be true. Most of these assumptions prove to be false, on closer examination. Of course the benefit of ‘jumping to conclusions’ is that it is fast. And it’s better to be wrong when you ‘run home after believing you heard / saw / smelt a tiger in the woods’, and discover later that it was just a friendly dog, than it is to be wrong when you assumed that sound and movement was ‘probably just a dog’, only to become dinner for a family of tigers. Making assumptions, quickly, building models, jumping to conclusions, accepting what you are told by some ‘authority’, leaping to judgements based on ‘hearsay’ and ‘assumptions’, are all ‘efficient’ ways to increase your survival chances. But at some point, when the danger has passed, it makes sense to consider what you REALLY know. What was assumed. Whose opinion you took at face value, without analyzing to see if it was justified / valid. When the danger has passed. So of course ever liar, deceiver, manipulator, will try to make you feel ‘in danger’, ‘at risk’, at every moment, so that you never have a chance to pause, and consider, and think for yourself. You will always be jumping to your own, or someone else’s, conclusions…fearful of some imagined / illusory threat…like ‘hell’, or ‘gods’ or ‘terrorists’, or ‘enemies’…as long as you are held in the thrall of fear, you can never step back and evaluate the beliefs you have formed, and have been offered / often forced to accept, and at least behave as if you believed…and once your start behaving as if you believe, your mind will tend to rationalize that behavior, by actually BELIEVING … and defending those beliefs…so strongly that you often end up denying the facts of reality around you…this is how most people live today…this is why the world still needs philosophers, more than ever…
If someone is lost in the wilderness, it is foolish to build a base station and wait for them to find you. You have to go where they are and lead them out. To sum up the point, we could say that the individual has been hypnotized into believing that certain things are a certain way and will always be that way. Through circumstances, the individual in his problem area at least, begins to develop reliance on a particular system—whether kinesthetic, visual or auditory—for attempting to deal with the problem. Through these processes, the person begins to "distort" reality, and by so doing, they continue to "see," "hear" and "feel" the same thing over and over. In effect, they keep themselves in a hypnotic state during which their belief system takes precedence over so-called "consensual" reality. I believe that if you use the same mechanism that produces the problem—hypnosis—you can help them to quickly break patterns, develop new skills and respond with new choices. If a person already is skilled at using a hammer, help them to use the hammer differently while showing them how to use a screwdriver. Don't demand they fly a plane instead. (You will have to think about that.)

It stands to reason that hypnotic techniques are the antidote to hypnotically produced and continued problems and limitations.

MHR … WHATEVER YOU ARE, YOU SUCCEEDED AT BECOMING, AT MAKING YOURSELF…YOU HAVE DEVELOPED AMAZING SKILLS…THE ONLY PROBLEM IS, YOU HAVE USED THEM TO BECOME SAD, LONELY, DEPRESSED, UNHAPPY, DESPAIRING, OVERWEIGHT, BULUMIC, PHOBIC, NERVOUS, ANXIOUS, SELF-DEFEATING, SELF-SABOTAGING…SO NOW IT IS TIME TO USE THOSE VERY SAME TALENTS TO BECOME THE PERSON YOU WANT TO BE, HAPPY, SUCCESSFUL, LOVING, WARM, FLEXIBLE, ATTRACTIVE, CREATIVE, FREE… YOU’VE PRETENDED TO BE THE YOU YOU ARE, SUCCESSFULLY…YOU ARE A GREAT ACTOR…WHEN PLAYING ‘YOU’…NOW IT IS TIME TO START PLAYING THE PERSON YOU WANT TO BE, USING ALL THE VERY SAME TALENTS YOU HAVE, AS PROVEN BY HOW WELL YOU’VE ‘ENTERED INTO IT’ I.E IMMERSED YOURSELF, IN THE ROLE YOU ARE CURRENTLY PLAYING…A ROLE YOU DON’T WANT TO PLAY ANY MORE…BUT YOU FORGOT HOW YOU GOT HERE, AND NOW IT’S TIME TO REMEMBER, AND TO START BEING / PLAYING THE ROLE OF YOUR DREAMS…YOU ARE A GREAT ACTOR, YOU’VE ALREADY PROVEN THAT, JUST LOOK AT HOW CONVINCING YOU ARE AS A SAD, DEPRESSED, LONELY, FAILURE…THE OSCAR FOR BEST ACTOR GOES TO YOU…NOW LETS WORK ON THE ‘CHARACTER’ YOU REALLY WANT TO PLAY…NOW...

‘METHOD’ ACTORS WILL PUT ON WEIGHT, LOSE WEIGHT, CHANGE THEIR POSTURE, THEIR MANNERISMS, THEIR TONE OF VOICE, THEIR
HAIR STYLES, THEIR CLOTHING, AND LEARN NEW SKILLS TO BE
MORE ‘CONVINCING’ AND ‘AUTHENTIC’ IN THEIR ROLES…WATCH A
BEAUTY TRANSFORM HERSELF INTO A ‘WALL FLOWER’, SIMPLY BY
CHANGING HOW SHE DRESSES, HOLDS HER BODY, GESTURES, TONE
OF VOICE, LACK OF EYE CONTACT, UNTIL SHE SUCCCEEDS IN
APPEARING UNATTRACTIVE, WITH NOTHING TO OFFER, AND
SUDDENLY THE SEX GODDESS CAN’T ATTRACT ANY MAN AT
ALL…THIS IS THE REALITY OF OUR LIVES…WE INHERIT SCRIPTS
(YOUR PARENTS, SIBLINGS, PEERS, MASS MEDIA ALL GAVE YOU
YOUR SCRIPTS, AND YOU ADOPTED THEM, THEY BECAME YOUR
‘INNER VOICE’ OF SELF-DEFEATISM/LOW SELF-ESTEEM/ LIMITING
BELIEFS/SELF-FULFILLING PROPHECIES…, PROPS (RESOURCES THAT
SUPPORT YOUR IDENTITY AS RICH, ATTRACTIVE, SUCCESSFUL,
INCL. CLOTHES, CARS, ETC) , ROLES (EVERYONE WAS ASSIGNED
ONE AT BIRTH E.G WORKER, INTELLECTUAL, DESTINED FOR THE
FACTORY OR ‘BIG THINGS’, CHARACTERS, DIRECTORS (THAT’S MY
JOB IN THIS BOOK, TO GIVE YOU HINTS ABOUT HOW TO ‘BECOME’
THE ROLE YOU WANT TO PLAY SO WELL YOU CONVINCE
YOURSELF, AND THUS EVERYONE ELSE) , PRODUCERS (RESOURCES
LIKE MONEY, CLOTHES, VOICE COACHES, TRAINERS)

MHR GO BACK TO MY ORIGINAL T IDEAS OF ‘ROLES’ AND ‘SCRIPTS’
AND ‘LIFE AS AN EXPERIENCE ENGINE’…WE DIDN’T GET TO CHOSE
MOST OF THESE THINGS…BUT YOU CAN DO THIS NOW…

YOU HAVE ‘SURVIVED’ UNTIL TODAY. WELL DONE. THANK YOUR
‘INTERNAL DIRECTORS’ YOUR ‘NON-CONSCIOUS SCRIPT WRITERS’,
PRODUCERS ETC…BUT WE WANT MUCH MORE THAN MERE
SURVIVAL, DON’T WE? WE WANT TO BE HAPPY, CONTENT,
EXCITED BY OUR LIVES. WE WANT SATISFACTIONS THAT JUSTIFY
ALL THE EFFORT, RISK, SACRIFICE LIFE DEMANDS OF US.

I STARTED AT THE WAY BOTTOM, IN MOST ASPECTS. BUT I
SURVIVED. SADLY MOST OF WHAT ALLOWED ME TO SURVIVE THEN
DESTROYED ALL MY CHANCES OF HAPPINESS AND SUCCESS.

THEN I LEARNED HOW TO USE THESE VERY SAME TALENTS / SKILLS
ETC TO …WHAT WE ARE GOING TO DO RIGHT NOW…AREN’T WE?
HAVEN’T WE? DIDN’T I?

REMEMBER, YOUR NOT-CONSCIOUS MIND CONTROLS MOST OF THE
INPUTS INTO THE ‘MOVIE’ THAT IS YOUR LIFE. IT CONTROLS THOSE
INTERNAL RESOURCES WHICH CAN BE EMPLOYED TO MANIFEST
EXTERNAL RESOURCES … TO MOTIVATE OTHERS TO SHARE THEIR
OWN INTERNAL AND EXTERNAL RESOURCES WITH YOU…TO WORK
WITH YOU...SO MOST OF IT IS IN YOUR CONTROL...ONLY YOUR GREATEST POWERS RESIDE IN YOUR NON-CONSCIOUS MIND...SO WE NEED TO RE-PROGRAM THAT...HAVEN’T WE? ...DIDN’T I? ...

EVERY FEELING YOU HAVE IS YOURS TO REJECT, MODIFY, CONTROL. THAT IS A FACT. WATCH A BUDDHIST MONK CHEERFULLY AND CALMLY BURN TO ASHES...THAT IS THE PROOF...OR WATCH THE HEALTHY, GOOD LOOKING, SUCCESSFUL, RICH YOUNG TALENTED GENIUS DESTROY THEMSELVES WITH DRUGS...SAME TRICK, JUST DIFFERENT OUTCOMES...THEY BOTH ENTERED A TRANCE STATE AT ODDS WITH THE ‘OBJECTIVE’ REALITY...THEY BOTH SHOWED HOW OUR ‘FEELINGS’ AND ‘PERCEPTIONS’ OUR OWN REALITY, IS THE ONE THAT DETERMINES OUR OUTCOMES...

ARE YOU AS BEAUTIFUL, ATTRACTIVE, HEALTHY, EDUCATED, SELF-REALISED, CONFIDENT, HAPPY, CONTENT, POSITIVE, ETC AS YOU CAN BE? DON’T YOU REMEMBER BEING HAPPIER, MORE ATTRACTIVE, MORE POSITIVE ETC? AT SOME POINT IN YOUR LIFE? HAVE YOU SEEN PEOPLE ‘TRANSFORM’ BEFORE YOUR EYES, IN MOMENTS, OR OVER YEARS OF HARD WORK? PEOPLE YOU THOUGHT ‘JUST LIKE ME’...WHOM YOU THEN ENVIED FOR THIS VERY FACT...THEY WERE JUST LIKE YOU, BUT LOOK WHAT THEY DID WITH THAT...WHAT THEY ARE NOW...WHAT DID THEY DO? WAS IT JUST GOOD LUCK? CONNECTIONS? MAYBE. BUT IF THEY WERE ‘JUST LIKE ME’, THEN THAT CANNOT EXPLAIN IT. NOW I AM GOING TO EXPLAIN IT. HOW PEOPLE EITHER MAKE OPPORTUNITIES, OR SEEM TO FIND THEM. EITHER WAY, THEY GET STUFF WE ALL WANT FOR OURSELVES AND OURS. SO HERE’S HOW TO GET IT. AT NO COST TO ANYONE ELSE. NOT TAKING SOMETHING LEAVING OTHERS WITH LESS. BUT GENERATING MORE OPPORTUNITIES, MORE JOY, MORE GOOD STUFF, SO YOU CAN TAKE WHAT YOU’VE GENERATED, SHARE SOME OF IT, AND EVERYONE IS BETTER OFF...NO-ONE WORSE OFF...THEN THE DESIRE TO HAVE WHAT ANOTHER HAS WILL LEAD TO EMULATION OF THE PROCESS THEY CARRIED OUT...RATHER THAN DESTRUCTIVE ENVY ...AND THOSE WITH WILL NOT FEEL THE NEED TO KEEP IT FOR THEMSELVES, OUT OF A MOTIVE OF JEALOUSY, TO JEALOUSLY GUARD THEIR ‘SUPERIOR’ FORTUNE, TALENTS, INSIGHTS ETC...THEY WILL SEE THAT BY SHARING, THE ENTIRE PIE GROWS, AND EVERYONE, EVEN THE ONE WHO FELT LIKE THEY WERE GIVING UP SOMETHING THEY COULD HAVE KEPT A MONOPOLY ON, SOME SECRET, SOME SKILL, SOME KNOWLEDGE, WILL SEE THAT BY SHARING IT, THEY WILL END UP WITH MORE THAN IF THEY HAD JEALOUSLY MONOPOLISED
IT FOR THEMSELVES…I'M TALKING TO YOU, JEW WORLD ORDER PLAYERS…ALL YOU NEO-CO(HE)NS WITH YOU NEO-CON-MEN…

GIGO = garbage in – garbage out … a computer is a fast calculator, nothing more…precise…accurate…fast…it doesn’t judge or discriminate or ‘correct’ the input YOU give it…or others ‘program’ into it…so if your programs are junk, your output, your ideas, beliefs, behaviors, habits, will be junk / garbage / sub-optimal / destructive/ self-limiting / self-sabotaging etc…the subconscious acts just like a typical computer…Hobbes reduced mental activity, centuries before computers were built, to pure calculation…the movement of electrons…which is literally what computers are…electron movers…on-off switches…they have no ‘intention’ other than the program…literally…what goes in, is what comes out…what you tell it to do, no matter how insane and fatuous, is what it will do…tell it 2+2=7 and it will base ALL its calculations on this erroneous assumption…even Einstein made such simple errors, and they stopped him realising his ambitions for decades… so what are the chances YOU have inputted something similar…some ‘false assumption’, some erroneous belief, some faulty conclusion, into YOUR computer…do you think you SHOULD trust that everything you have ever been told, and rewarded for agreeing with, and ‘working’ with i.e inputting into further calculations, was actually correct? That no-one ELSE could have made a mistake? Or that no-one could possibly have any vested interest in deliberately LYING to you, misleading you? Even though the hero of all religions and governments, PLATO, stated clearly that ‘The State’, those in ‘Authority’, have an OBLIGATION, and a RIGHT, to deceive you…with what he called ‘NOBEL’ LIES? Even though the favorite of all politicians, Macchiavelli, insisted that ‘The ends justify the means’, and the best means of warfare and subjection and persuasion are LIES…actually suggestion FALSE FLAG operations to instill fear into the population, so that they would be willing to SUBMIT to YOUR rule over them, to pay ‘protection money’, to give up their freedoms to you, all in the false belief that you were protecting them from some real threat…EXACTLY what 911 achieved…and motivate them to join you in your wars of conquest, which were totally avoidable, and never would have happened, in the name of DEFENSE… when the attackers were the very same people running this oldest form of ‘PROTECTION RACKET’. How do you think the Zionists got Jews to move from their privileged, comfortable positions in Europe, to to inhospitable desert? If not via Hitlers KZ labor camps, and faked ‘Holocaust’ fear mongering…
And then there is another layer to our mind-computer analogy that is perfectly apt. You can input a perfect program, free of any bugs or errors, say the perfect philosopher, the most compelling argument, but it will still produce GARBAGE if there is a problem with the computers Basic Input Output System, or some sub-program. What in this analogy would be the basic assumptions imprinted into our muscle memory, neural networks, from birth, during our earliest years. During our pre-rational years. During our most ‘impressionable’ years…assumptions that then remain unchallenged / as they are so unobtrusive…you didn’t ‘write’ them into your new code, the philosopher didn’t write them in their compelling argument…would never dream of saying such stupid things, making such terrible errors, including such propagandistic lies…but they are there in the BIOS, and other sub-programs, which in our analogy would be our subconscious, most basic, assumptions about TROONATNOOR. The assumptions we take for granted as natural, normal, universally agreed upon, beyond question or doubt (which nothing should be to the scientific / skeptical mind).

Every propagandist and ‘noble’ liar has their favorite ‘lie’ they have implanted in your mind. So deeply, so early in your life, and so repeatedly reinforced as ‘self evident truth’, as unquestionable fact, that you literally never challenge it, question it, doubt it, interrogate it, investigate it, and therefore never come to see it for what it is…a lie…‘noble’ or otherwise…usually malicious…serving the interests of some narrow elite group, such as the priesthood, nobility, royalty, or current privileged and powerful hegemonic groups…

So dear Deborah Lipstadt will insist that ‘the holocaust’, one of the most blatant ‘noble’ lies to date, after ‘religion’ and ‘man-made global climate crisis’, should be given a privileged status like those other ‘noble’ lies. That YOU should be forced to accept it. And criminally punished for daring to question it. For asking questions. Let along finding fault with it and ‘denying’ it. This should be the clearest ‘red flag’ to anyone interrogating TROONATNOOR. Interrogating the ‘beliefs’ they have been implanted with at birth, and have had continually reinforced by the mass media, Hollywood, the education systems, television ‘programming’, religion, and on and on.

You see, no matter how great the inputted program is, say, of the Historical ‘revisionist’ who attempts to ‘correct’ the previous programs inputted, it will be thwarted in its attempts to produce good outputs, by the pre-existing, (they got there first, which is why every hegemonic group from priests to holohoaxers are so keen to force you to send your young children to ‘institutions’, whether it be Sunday school, pre-school, or ‘Holocaust’ ‘museums’) programs. The more basic programs that the program writer, the Historian, writer, philosopher, etc, has no power to ‘re-write’…or at least it is VERY hard to. You have to open up the basic programs and re-write THEM, before the new program can run and produce good results. Correct calculations. Logical deductions and inductions.
This is the challenge to the philosopher of every variety, whether their specialty be history, politics, medicine, etc... That their "updates" cannot produce the desired correct results as long as the BIOS and other pre-existing, previously imprinted, hard-wired, programs are operating.

The more basic programs will ALWAYS produce garbage from whatever input you program. No matter how perfect the program you write. For millennia philosophers have written the most compelling arguments, and offered them to people. However once the perfect program is inputted, it is distorted, corrupted, ruined, by the existing, pre-existing, more basic programs. In this analogy, the basic assumptions about TROONATNOOR, and 'history'.

This is why they NEED laws to stop us UN-corrupting the existing programs. 'The Holocaust' lie is not just some independent phenomena aimed at 'justifying' Allied war crimes, and Israel's current war crimes in Palestine, or benefitting 5 million 'survivors' with life-long pensions and compensation, or emotionally blackmailing Germans and North Americans into subsidizing the criminal state of Israel to the tune of Billions each year. It has a much WIDER impact. It contaminates ALL programs.

I realise that as most social realities are implanted during trance states, or over long periods of repetition, and that the hegemonic powers will never allow us to compete i.e to invest the huge resources THEY have invested in brainwashing us, into de-programming us back to a 'clear' state i.e 'error –free' state, and that most people won’t see any problem with their ‘self-evident ‘noble’ lies, and won’t submit to a ‘de-bugging’ trance / program...and so the position of the Philosopher, as always, is pretty pessimistic. It is amazing that the few of us who have escaped the social reality imprinted on us from birth have managed this feat. And we need to model the process. Find out how WE did this.

Our only hope is to eliminate, one by one, the ‘noble’ lies that have been implanted in all of us. To realise they are NOT noble in intent, no matter what the Plato’s of the world think. Everyone will define that which appears to serve their own narrow vested interests as ‘noble’...and so everyone with power will use that power to impose lies upon us that server THEIR perceived vested interests.

The ‘holocaust’ lie may appear to many Jews to be ‘noble’. But what they miss is the bigger picture. THEY are being used as pawns in a bigger game. And THEY are soon to be offered up as a ‘burnt offering’ a true ‘holocaust’ to the long term, end-game objectives of what at first appears to be a ‘jew’ world order, but in fact is hiding behind that appearance, to get the compliance of the ‘jews’ with their real goals. Unwittingly the clever jews are being used to further the ends of a very small group of powerful, hegemonic, elites.
You must understand that ‘The Holocaust’ is not just some side issue that we can neglect, while focusing on something that appears more important. It is key to the whole new world order operation. Which is why they are ramping up their censorship, increasing criminal fines and penalties, and insisting that that lie known as ‘The Holocaust’, be given exceptionalist, privileged status…the same the Vatican gave ‘Catholic dogma’ in the middle ages.

It is the basic ‘noble’ lie of the new world order. The Jews are being lead to their graves by this group, all the while thinking they are ‘outsmarting’ us stupid goys. Many have been brainwashed to the point of paranoia. A fear of all non-jews. A fear they feel justifies using all weapons at their disposal in DEFENSE of themselves … and the most powerful weapons have always been ‘lies’. Deception.

TROONATNOOR markus rehbach Youtube Channel…

It is my belief that all presenting problems and symptoms are really metaphors that contain a story about what the problem really is. It is, therefore, the responsibility of the therapist to create metaphors that contain a story that contains the (possible) solutions. The metaphor is the message... Hypnosis is, in and of itself, a metaphor within a metaphor... — Steven Heller, Ph.D

Christian Science uses hypnosis (calling it Faith healing), just like Scientology incorporates many elements of Freud’s psychotherapy, in its ‘Dianetics’ and ‘Scientology’. Just like L.Ron Hubbard demonised Freud, to avoid any of his followers ever looking into his work, and discovering that most of what they were doing, which Hubbard took credit for, was really Freud’s work, Mrs. Eddy never admitted she was using hypnosis, and demonised it in her books, the same way. Hubbard made films to this end. Eddy dedicated a whole chapter of ‘Science and Health’ to denouncing hypnosis as the work of the devil, and demonizing tis practitioners. I’ve seen Hubbard’s films demonizing Freud, the evil drug addict, and enemy of Scientology. Of course psychology in general, and the medical profession, are equally loathed by both ‘founders’, as unwelcome competition. That many of their criticisms of both may still be valid does not change the fact of their malicious, self-interested, motives in ‘outing’ this competition. And going much further than compelling argument, the facts, etc, would otherwise justify.

Gerry Adams, President of Sinn Fein, notes that ‘language is the means by which culture, the totality of our response to the world we live in, is communicated, and for that reason the Irish language had to be destroyed. When a people have spoken a common language for thousands of years that language reflects their history, sentiments, outlook and philosophy’. The number of Irish speakers in
Ireland decreased from nearly 100 percent circa 1800 to around five percent circa 1900 after the introduction of the ‘bata scoir’, a stick used in 19th Century schools in Ireland to hit a child each and every time they spoke Irish. The stick was then notched to record the number of such offenses. This is a clear case of stimulus-response conditioning.

If you went to high school between 1900 and 1945, the Germans and Japanese were the bad guys in the world, and the Russians were our gallant allies in the war against fascism. By 1950 the Russians were the bad guys and the Germans and the Japanese were our gallant allies in the war against communism. This is how conditioning/hypnosis is used for social reality engineering.

Between 1970 and 1980 I lived in Northern California. Although there are some "redneck" or "moral majority" enclaves even there, in the cities where I lived virtually everybody was some kind of radical—a political radical, a philosophical radical or a radical therapist. Abortion was a civil right. There was no legal gambling anywhere, although I hear that has been liberalized a bit since I left. Bisexuality was a permissible variation and very commonly seen. Science and Eastern mysticism were about to merge in some New Paradigm which would combine the best of both global and brain hemispheres. Socialism, however, was the opinion only of an eccentric minority, and pacifism, although universally respected in our crowd, never had any influence on the national government. But there is no such thing as hypnosis. In the last five years, I have lived in Ireland. Abortion is illegal, and even telling a patient where abortions may be obtained in England can cause a doctor to be prosecuted. Gambling on the other hand has been legal as far back as anybody remembers. Bisexuality, if it exists, has only vaguely been heard of, and homosexuality is known to be very offensive to the Deity who invented AIDS to punish the bloody sodomites. Science and Eastern mysticism are hardly known, and the possibility of their joining in synergy arouses the blank stares that you might expect if you said a bicycle and a cow were about to mate and reproduce. On the other hand, two of the five largest political parties are openly socialist (the Labour Party and the Workers Party) and one of those two (Labour) was part of the most recent coalition government; Ireland is surrounded by socialist states all over Europe, and cannot understand why Americans think socialism is diabolical and impossible. As for pacifism, it is written into the constitution and all five major parties are officially pacifist: no legislation contrary to Irish neutrality is ever even introduced into Dáil Éireann (the Parliament). And yet there is no such thing as hypnosis. MHR Social Reality programming…

MHR consider the huge variety of ‘belief systems’ a.k.a. ‘social realities’ that exist, with each member of each maintaining their ‘reality’ is ‘reality’, and all others ‘illusions’, and their members either ignorant at best, or evil, at worst.
One person’s ‘illusion’ is another’s ‘reality’... one person’s brainwashing is another’s enlightenment / education...

Reprogramming the human bio-computer

Learn the necessary tools and techniques that help direct individuals to their own inner resources and creativity.

Hypnosis as any use of words, tonality, expressions or movement to (deliberately or without any explicit intention) elicit and/or evoke within another person an internal experience, which then becomes a reality of its own.

For example, if I write or speak the word "rose," you might think of a particular flower, perhaps red in color. I could mean a person named Rose, and someone else might remember someone getting up. If I change the meaning to a beautiful red rose, one person might remember a special occasion, the feelings, sounds, pictures, smells and, in effect, relive the entire experience. Yet another person might make a terrible face because they are allergic to roses.

Smell can regress you to a past experience, immediately... an example of automatic / autonomous / accidental ‘trance’ / auto-hypnosis... though of course manufacturers add scents to all sorts of products, and to supermarket air conditioning, to deliberately elicit certain internal states / induce trance... in customers...

Deletion in utterances an example of negative hallucination...

2000 years ago told the world was flat, then a bit later we were told it was a sphere, and today many people are convinced, with very sound, compelling arguments, that the world is in fact a sphere again... like homosexuality was once normal, then evil, and now it is celebrated as ‘diversity’... Christianity was once banned, then you were forced to be Catholic, and today it is a crime to say prayers in school, or place religious artefacts in court-rooms, in many U.S states... The Germans went from being our friends, to being our enemies, to being the victims of Versailles, to being ‘evil nazis’, to being our allies... Russia went from being our allies, to our enemy, to our allies, and now the neocons are trying to make them our enemies again...

Belief systems, when acted on, contradict reality... dangerous... not only distort our perceptions, but lead us to act in ways irrational, vis a vis ‘objective reality’... we fight wars, put people in prison, criminalise some valid beliefs while celebrating and rewarding / glorifying, and demanding ‘acceptance’ of invalid, absurd, clearly impossible, beliefs... e.g ‘The Holocaust’ and ‘the official version of 911’... punishing even those who seek to enlighten us, and rewarding the propagandists to the tune of Billions each year, making wealthy, famous,
celebrities of individuals who have not only stolen other people's books, but their identities...e.g use example of that guy...and censoring reality, literally, by censoring anyone and anything that contradicts the official fiction, the social reality being produced, propagated, reproduced, rewarded, glorified, conditioned, programmed...etc...

Any distortion, deletion, or positive or negative hallucination, is the product of some form of conditioning / hypnosis / trance induction...‘social reality’ is the enduring, hegemonic, reinforced, rewarded ‘trance’ that has been induced, and reinforced by the mass media, govt, education, religion etc... we are talking about anything that produces a change / distortion in consciousness / awareness / experience / perception...

There is no ‘consensual reality’ that we ALL share...we all live in our own trances...and so it cannot be surprising that we construct most of the apparent conflicts which we kill and die for, and suffer for, and pay for, in a form of trance...interacting at some level as zombies...living in different realities...and unable to come to productive, generative settlements in disputes...we simply are living in different realities...we must learn to escape our trance...to become lucid...and get others to join us in ‘reality’...MHR

Any assumption is a positive hallucination...and any prejudice is often both a positive and a negative hallucination e.g you see a ‘type’ rather than the individual before you...you hallucinate a bunch of qualities, good and bad, that you associate with that ‘type’ e.g ‘blonde’, or ‘African American’, or ‘German’ or ‘Jewish’. THAT is the power of suggestion...conditioning...PROOF that we live in a trance...not lucid...our brainwashing / conditioning / stimulus-response programming is ‘triggered’ by mere skin color, some other part of a person’s appearance, their accent or slang...etc...like one of B.F Skinners poor victims in some conditioning experiment...called ‘Society’...we are ALL victims...we live in a trance...our emotions played with / engineered, and triggered at will by the hegemons who designed this ‘Skinner box’ called ‘The U.S.A’ or ‘Free world’...how else can you explain the massively variable emotional, completely irrational, responses to the SAME stimuli...e.g one person, conditioned (educated / raised / brought up) in one Skinner box called ‘California’ and another in another Skinner box called ‘X’...or at different times as they changed the protocols of each of these skinner boxes, in the same place...simply changing the conditioning / education / mass media exposure changes the reality of the person...what will trigger hate, love, attraction, repulsion...what and who will be defined as good and bad, evil, holy...etc...that is all my original T stuff...

Consider the power of a novelist to create entire worlds in your mind, or an inspiring speech writer to motivate and move you, and then consider the power of those who may choose what books you have access to, what ideas you are free to
consider, those people with the power to censor, and basically destroy entire worlds, deny you entire worlds, deny you entire outlooks on the world, entire possible ways of seeing the world and experiencing it, intent of ensuring you experience the world, see it, understand it, interact with it, only the way THEY and their masters wish…to only have THEIR ONE world available to you…at the cost of all the alternative, possible other worlds they are censoring from you, keeping you out of…stopping you from being able to choose for yourself, YOUR world…how YOU will see the world, how you will INTERPRET what you see…etc…whose assumptions are you going to adopt? When you are only ever offered THEIR assumptions…those of the hegemons of your particular world…society…nation…religion…political party…government…

Author uses the term hypnosis to include basic communication i.e sharing of meanings…using words, tone, gestures, imagery etc i.e to trigger reproduction of the meaning in another, so they ‘see’ what we ‘see’, hear what we hear, feel what we feel, understand what we understand, know what we know, feel what we feel…

People rarely listen…they actively finish your sentences, ascribe meanings not there, attach associations never intended, and thus ascribe meanings never intended, transmitted…they basically write their own scripts, using your utterances as a coat hanger to hand them on…they ‘expect’ something then ‘hear’ it … ascribe it…add it…augmented hearing … etc…

Using the same tone of voice etc, in similar situation, can put person in trance so they regress back to another place and time, where someone used that tone of voice to them etc…subconscious associations, or actual regression…i.e everyday trance occurrences…non-Zen here now listening / attending Vs typical jumping to own conclusions / ascribing own meanings / assumptions etc…so actual message has little chance of being shared / in common…trigger past stimulus-response reactions…

Vividly describing / re-telling a story / incident etc often puts person in everyday sort of trance condition i.e lose touch with present reality, actually re-live, go back, are there, then…

"TA" (Transactional Analysis) therapists follow a concept they call "Life Scripts." They believe that individuals are given a "script" to follow, that, if painful and not changed, will cause that individual to act in ways that are self-defeating. "You can't drink kid, you can't drink until you are a man." That kind of message can translate unconsciously into: "To be a man, I have to drink." Here is the implantation of a suggestion that may take such firm hold that the individual ends up an alcoholic. In fact, the "TA" people contend that this is not uncommon.
If we encourage a positive reverie i.e recollection of a positive experience, using vague terms, the person fills in the blanks, and then can imagine we must have been there, otherwise how could we have known so much about it? Like cold reading subjects forget the info they just recently volunteered, and are shocked when the cold reader repeats the same info they volunteered near the start of the session...

A computer does not have an intention / consciousness, as far as we know. The intention and consciousness inhere in the operator, the programmer, and the viewer / listener of the output of the computer.

The computer uses the two representation systems, so far, not having ‘feelings’. Though it can ‘detect’ any bandwidth of the electromagnetic spectrum we give it ‘sensors’ for...much wider bandwidths than human sense organs have...and we must then recode the input of the computer sensors into the sense perception data bandwidths of human senses e.g convert infra-red heat to some form of visual or audio display, or haptic pressure / vibration output.

If individuals always responded in a "here-and-now" manner, they would probably have little or no need to be therapized. In the areas of their "dysfunction," it is a safe bet that they are responding to something other than the "here-and-now." To past experiences, imagined now, or future feared experiences, being imagined now. In the here and now most problems do NOT exist.

MHR assumptions, pre-programmed assumptions, represent the past...and produce expectations of the future...so even in the here and now there is no direct interface with TROONATNOOR...we have models / filters / etc that determine what we will actually perceive here and now, and these were implanted in the past...whoever got to us first determined these e.g whether we will be Christian, muslim, Buddhist, catholic, jewish etc...i.e which particular ‘noble’ lies and misunderstandings we inherited along with the rest of our holistic inheritance...

Being ‘here, now’ is a zen state...unknown to most of us...we are usually in some form of trance...some particular thought, fear, hope, or present stimuli, engage us always to the exclusion of all other impressions / stimuli...so we do not usually see or hear that much of what is going on around us...we are in a trance...focused narrowly on some good or bad feeling, positive or negative impression, idea, sound, sight, hope, dream, fear, ...

Meanings are inherited. We learn meanings over time. During our past. Without a past there would be no meanings. Just ‘stuff’. Just ‘things’. Just immediate impressions, sensations, heat, cold, bright light, hard and soft objects...no ‘mother’, ‘father’, pine tree, cat...just pleasure and relief...to have ‘meaning’ you need to imagine a ‘pattern’ of relationships...imagine ‘cause and effect
relationships’... that $X+Y = Z$, and $Z$ is pleasure, pain, or relief. So you get $X$ is good because $Y$ is good i.e. gives pleasure or relief. Or $Y$ is bad because $Z$ is bad because it gives pain or removes sources of pleasure or relief... etc... these are what all meanings reduce to... pleasure, pain, relief. We imagine many patterns that are not there... gestalt metaphors... etc we erroneously conclude cause effect relationships not justified by the facts... often concluding $X$ is good for us when it is bad, that $X+Y = Z$ when it doesn’t’, or that $Z$ is good when it is bad, or that $X$ can even be added to $Y$... etc etc T vol I...

Monsters and magical sticks... MHR: We are all MK Ultra ‘weapons’, and participants in one huge B.F Skinner conditioning experiment. Education (especially indoctrination e.g. the holocaust and religion) as trance induction / hypnosis with post hypnotic suggestions and reinforcement / conditioning (inspired by Steve Heller’s ‘Monsters and Magical Sticks—There’s No Such Thing as Hypnosis

Teaching as a hypnotic suggestion e.g. 2+2=4, with post-hypnotic suggestion ‘now remember that’, with repetition as conditioning, and stimulus-response conditioning of ‘smiles, yes, great work X, correct, well-done, A’s for you’ when you get it right, all from an authority figure... i.e. repeat it e.g. ‘The Holocaust is historical fact, and those who question it are evil, malicious, nasty people’... and ‘frowns, wrong, X’s, you’re dumb, stupid, ‘failed’, you failure’ when you do NOT repeat it... or worse, prison, loss of career, social stigma, huge fines, in case of ‘The Holocaust’...

Now, if someone were to ask you to add 2 + 2, you would feel confident in giving the correct answer. If you were asked how you knew the answer, you might reply that you learned it as a child. In other words, the question itself caused you to go back into your personal history and find the "proper" associational connection. You would have done that instantly, without conscious awareness of the process. Another way of stating the 2 + 2 example might be as follows: When you were a child, an individual who was an authority figure—called a teacher—stood in front of your class. S/he wrote on a blackboard $2 + 2 = 4$, and verbally repeated that information many times. In addition, s/he asked the class to remember the answer so that when you were asked to add 2 + 2, you would automatically respond, 4. We might agree that the above transaction could be given the labels: teaching and learning. If we examine the transaction more carefully, and from a different perspective, we might also agree that it bears a striking resemblance to the classical definition of "hypnotic suggestion" and "post-hypnotic response."

MHR reinforced by parents when you bring home that ‘A’, and teachers positive comments... parents happy with you, may reward, or unhappy, punish... and so THIS reward/punishment schema VERY powerful, even if no rapport etc with
teacher...child will always seek this from parents even if no real rapport, sadly...so in any case, child wants to please parents, and will seek to please teacher for this reason, even if hates teacher...as teacher has this power to make parents happy with A's etc...report cards...and entire system reinforces with 'get good grades, get a better job / promotion etc...

i.e most significant when it comes to religious indoctrination, why people THINK and FEEL CERTAIN that they KNOW many things that are rubbish...even though they know other people think, feel certain, and know, that what THEY think is rubbish, and are just as confident in the matter of their own 'rubbish' ideas...e.g 'The Holocaust' propaganda Vs actual real history...

So there are lot's of 'triggers' to reinforce the muscle memory that 2+2=4, or 'the holocaust' happened...and lots of continual schedules of reinforcement and punishment...'good boys and girls' who repeat the lies get elected, slush funds, campaign election contributions, promotions, 15 minutes of fame on Oprah, get their books become best sellers / wildly promoted, win nobel prizes for books someone else wrote (Wiesel’s ‘Night’) etc...

Repeat 'god' myths to become President, or at least go to congress...become mayor or ... you want to go to Cambridge Mr Hume?...or don’t you? ... So everyone you see who is rich, powerful, successful, is repeating the lie...everyone in power, authority, with best sellers, academic success, acclaim, praise, wealth, acceptance, approval, sex, love, affection, status, rank, privilege, power...they ALL appear to subscribe to the same myth...the same 'social reality' e.g 'The Holocaust', while those who challenge it are destroyed, outcast, disapproved of, have their reputations, along with their careers, families, financial situation etc ruined, end up in prison, vilified, demonised, ... by the ongoing, cradle to grave onslaught / promotion of the myth...whether it be some particular version of god-ism / religion, or other form of propaganda e.g 'The Holocaust' or '911 was Arabs and hijacked passenger planes' and 'Hitler was evil' and 'Nazi's were evil' and 'Germans are evil'...

All the associations you experience trigger reinforcement of compliance with the myth / lie / belief ... you constantly see people with what you want, agreeing with belief X, and people with stuff you want to avoid / hate, disagreeing with it, going to prison, being unemployed / fired/ rejected etc...over and over...so you are bound to end up complying...collective ignorance thus leaves most people complying, even if they disagree, just to 'go along to get along'...so the numbers themselves become powerful triggers e.g 'everyone believes X, who am I to question it? Not believe?' and at minimum triggers compliance, social 'agreement' with the 'consensus reality'...all T vol I stuff... so you have the appearance of consensus, even if no-one really believes it...and the most powerful social reinforcers of it actually behaving totally inconsistent with what
they publicly claim to believe, and laughing at everyone for being so stupid in falling for their act...and believing such idiotic stupid inane fatous things...from the Catholic Priest to the President of YOUR nation...whichever that is...

Then many people feel obliged / find it easier, to actually convince themselves it MUST be right...i.e auto-trance / self-hypnotism...just to make it easier for them i.e to avoid mental breakdown, they immerse self in 'belief' and act as if it is true, so it is easier to go along to get along...actually end up convincing self it IS true...and become the 'true believers'...just to avoid mental breakdown i.e they KNOW it is NOT true, but to go along to get along have to play along, and this is easier if you first convince yourself it is true...i.e if you have integrity, it can really grate on you to have to lie...so by lying to yourself, you refgain your sense of integrity i.e whole-ness...Vs fractured/dis-integrated...all in T vol I

MHR we are all being actively recruited into one or more 'social realities'...the hegemonic one is called the 'social reality', and it is assumed that consensus exists by a mass media that pretends this, and a polity that pretends this, an education system that pretends this...e.g that certain 'facts' exist...that the world is flat or a sphere, depending on what time you live in, that 'the holocaust was not propaganda, but that the propaganda is 'historically accurate depiction of real events'...there are other sub-realities we call cults or religions, most of 'ours' are the products of 'Jews', from Judaism to Marxism to man-made global climate crisis tipping point...brands are actively recruiting to you their team, to the social reality that 'Coke is the real thing', 'Real men smoke X brand of cigarettes and drink Y brand of beer, or don't', depending on the cult / group / marketing franchise / company...whether that company be called 'The Vatican' / Catholicism, or 'Zionism', or 'Coca Cola company', or 'General Electric'...what's good for MM industries is good for America...you are recruited into a nation at birth, e.g 'America', and indoctrinated with all its pro self propaganda, and anti-competition propaganda...this America is really an idea produced by the top few hundred leading families, corporations, institutions etc...and doesn't exist outside the trance called 'consensus social reality'...there are some things you dare not question...others you are allowed to e.g you dare not question that corporations have the right to brainwash you into consuming toxic chemicals, poisons, etc, but you are allowed to argue that brand X tastes better than brand Y...you are expected to belong to some religion, and anti-competition propaganda...this America is really an idea produced by the top few hundred leading families, corporations, institutions etc...and doesn't exist outside the trance called 'consensus social reality'...there are some things you dare not question...others you are allowed to e.g you dare not question that corporations have the right to brainwash you into consuming toxic chemicals, poisons, etc, but you are allowed to argue that brand X tastes better than brand Y...you are expected to belong to some religion, but you are allowed to argue that religion X is better than religion Y...you are expected to fight in wars, and obey your leaders in killing women and children, but you are allowed to 'feel bad about it' up to a point, as long as you don't affect the 'morale' of other trance-induced assasins...you are allowed to criticize Islam in one nation, or Jews in another, but try to criticize ALL of them, and you will find yourself unwelcome EVERYWHERE...you are allowed to hate only certain groups, defined by your mass media, depending on where you live...and what times you live in...you may hate gays in one time and country, or Germans in
another, … but step over the line, and hate the wrong people, and you become a criminal and outcast…be careful to chose the state-sanctioned, hegemonic consensus group currently defined as a legitimate target of your hate…in some countries, today, it is hard to find anyone it is considered acceptable, let alone desireable, to hate…and so the hegemons pick on new religions like Scientology, historians who challenge the WWII holocaust war propaganda, and whoever they desire you to fight the next war with, in the U.S this is Syria, Iran, and Arabs in general, though as in Germany the policy is total extinction of the German people, don’t dare hate Arabs, because they are to be welcomed, invited into Germany to do the work of the hegemons in breaking down German society so that it is unrecognisable from any other ALREADY dis-integrated, divided and conquered, OCCUPIED territory…where the current consensus reality is to be replaced with division, conflict, confusion, chaos, … to totally break down the remnants of ‘German’ culture and social organisation…to eliminate the very IDEA of ‘Germany’ and ‘Germans’ as a nation, and a people, as something EVIL…something responsible for both World Wars, and ‘The Holocaust’…a people with an innate desire to conquer the entire world, and willing to enslave themselves to their own masters, in order to achieve this evil end, if you will believe supposed ‘anti-new world order’ (automatically controlled opposition if they manage to ‘succeed’ and flourish while others are totally starved out / imprisoned / extirpated) like Carrol Quiggley, and any other form of ‘controlled opposition’ out there, not to mention the openly hegemonic dominant mass media fake news regurgitators and manufactures of mis-informed consent…

You are expected to vote, like in the U.S.S.R (Jew.S.S.R), as if your vote mattered, but you are allowed to get very excited and argue for or against any particular candidate, as long as it is one of the pre-selected candidates already bought and paid for by the hegemons to do their bidding…if people are not in a trance, then how can you explain that fact that people keep turning out to vote, when their vote has NEVER had any impact on the policies of their nation? From promises of ‘no war’ ending in world war a few months later, to ‘no new taxes’ leading to increased taxes a few weeks later…when each supposed ‘opposition’ party ends up introducing the exact policies the voters voted the last part OUT of office was intending to introduce…and you say we are no living in a dream world? Living in a trance? Literally flesh-eating zombies? Literally MK Ultra murder machines, in the millions, ready for ‘activation’ and ‘triggering’ by the hegemons propaganda, at any moment…to suddenly be ‘activated’ to invade some peaceable nation like Iran, or international law abiding, and democratic, popular regime like Syria?... and you claim MK Ultra is just some story? Some fiction? But still you will go to murder, and be murdered, the next time you hear that trigger word ‘conscription’, and march off to your death, and to fire bomb women and children, simply because this ‘trigger’ is produced … some piece of paper, delivered by a person in the right clothing, in the right tone of voice, appears at your door, or in your email, and suddenly you are activated as a mass
murdering machine? And that is normal? That proves you have free will, and live in a free society? That proves you are not some brainwashed, B.F Skinner conditioned lab animal? That you are NOT living in a trance? That you whole life has NOT been an experiment in social conditioning? In stimulus-response conditioning? In post hypnotic suggestion induction trance? When all it takes is for the ‘trigger’ to be ‘fired’ by some ‘anchors’, such as a written document ordering you to appear for induction into the mass murder machine, and you, like a dog salivating at the sound of a bell, immediately activate that post-hypnotic suggestion ‘obey’? And you are NOT living in a B.F Skinner conditioning experiment? Called ‘Society’?

The moment they ‘trigger’ you, you suddenly HATE people you have never met…while you may have good motives for murdering your boss, or someone who has done you harm, you will instead feel a sudden unleashing of all that pent-up, justified hate, for all the wrongs your society has done to you, and be given a legitimate target for expressing it / for projecting it onto people who have never, and would never have even thought of, harming you in any way…and you say you are NOT living in a bubble of social reality?

You laugh at the ‘victim’ of the hypnotist during the entertaining stage performance, as they suddenly start barking like a dog, just because the hypnotist has clicked their fingers…after the trance induction and post hypnotic suggestion that they do this…while you, at the whim of some people called ‘government’, waste years of your life, risking life and limb, in order to go somewhere to murder men, women, and children, and then spend the rest of your life paying taxes to pay for that ‘war’…and you tell ME you are sound of mind? That you are in control of your own mind? That you have free will? That you live in ‘the free world’? That you live in a free nation? That other people are jealous of YOUR freedoms? People who you are going to murder, in the most horrendous, painful manner, simply because some people you have never met, or maybe only seen on television, have apparently SUGGESTED you do? Remember, the recent wars were fought by ENLISTED military personnel…they VOLUNTEERED…someone SUGGESTED they volunteer, to commit mass murder, and they DID…imagine THAT…now tell me you are NOT curious about HOW this state of affairs came about. Or will you continue in denial? Continue fighting a few elite’s wars for them. Like some game. Like some commercial business transaction. Which YOU pay for. Not just with sacrifices before and during the wars, but for as long as you live, in repaying the costs of those wars…

Ideas, beliefs, possibilities, fantasies, and much more, are continually being "suggested" to you from birth to death, and you have been accepting these suggestions. Some have been authoritarian of the ‘directive’ kind. Others have been associated with warmth, rapport, e.g the loving family, kindly priest,
generous educator kind…as soon as you begin acting upon these, your mind
wants to feel in control, and will justify the actions with some explanation /
justification e.g I hate X because X did this…etc…When you go to war, it will
not be simply because someone told you to, but because ‘we are fighting an evil
enemy, the enemy of everything I love, the enemy of freedom and justice…we
face an immediate and huge threat…I am defending my nation, my family, my
god…It is a fact that if you can get someone to DO something bad or nice to
someone or thing, they will then post-retrospectively re-define that person or
thing accordingly as worthy of that act, as good or bad, and thus have justified
your action…and this new belief / definition of them will become embedded /
implanted / imprinted, and become muscle memory, automatic, natural,…
beyond rational debate…accepted…a BELIEF…which you are then emotionally
invested in, and will seek to justify / prove / get agreement for / find agreement
for/ find examples that support it / find ways to justify / rationalize etc it…so you
will filter out examples that contradict it, and actively seek out anything you
could possible distort into being a ‘support’ or ‘proof’ or ‘evidence’ for what you
believe…beliefs are mostly irrational…emotional…post-retro-septive
rationalisations for something programmed into your head by others i.e
propaganda / conditioning, or to justify some act you carried out…were tricked
into by someone e.g you were tricked into fire bombing thousands of women and
children in a foreign land, and so either you are evil yourself, or it was
‘justified’…of course who wants to define themselves as an evil murderer? Or a
really gullible puppet? That their acts were horrific and evil? No-one. So they
accept the propaganda given to them as the original justification, and invest in
it…WANT it to be true…because if it is NOT true that the germans were
monsters, then what would that make the U.S bomber pilots who fire bombed
Dresden? Etc etc etc…Please think about it before YOU become the next mass
MK Ultra killing machine, and find yourself in the same situation i.e of either
having to admit you were fooled into becoming the incarnate of evil, or going
along with the propaganda…for decades afterwards, including ‘The Holocaust’,
and then finding yourself, or your own children, repeating the same horrific
scenario, and going off to murder women and children for the same people, with
NO way of stopping yourselves…no more self-control than the stage hypnotists
‘victim’ making a fool of themselves acting like a dog just because someone
suggested they do…

So this is an answer to that old question ‘… ‘can you hypnotise a person to
commit a crime’…what a joke…we have thousands of years of human history
proving just that…that you can ‘hypnotise’ people, via lifelong conditioning, to
commit the most atrocious acts of barbarism, in the name of ‘civilisation’, and
‘freedom’, and a ‘god’ of love…
And still people will ‘debate’ about some silly university experiment where people gave ‘fatal’ electric shocks to other participants, about whether people will commit crimes just because an authority figure directed them to !!!

If THAT does not prove to you that we are all living in a trance condition, what will? Open any history book and look at the horrific acts we have committed against one another, simply because someone ‘directed’ us to, or simply ‘suggested’ we do e.g conscription and enlistment…and we have the age old question answered…why do we continually go to war? … it is because of what I have been fighting with my TROONATNOOR writing all along. We are all living in a trance state. In a social reality. We are being conditioned to respond to suggestions, and authoritative commands, from birth. We are ALL MK Ultra ‘weapons’ for the hegemonic ruling classes who control our mass media, our education/indoctrination systems, our laws, our governments…and it is time to wake up from our dogmatic slumbers…from our trance state…to free our minds…to start living in ‘reality’…to escape the social reality, consensus reality, ‘bubble’ we have been raised in, like some B.F Skinner conditioning experiment…in which WE have been the ‘guinea pigs’ all along.

Several times, they may become a conditioned part of your behavior. In addition, under certain circumstances, a conditioned response can be established in one trial without repetition, and without "practice."

As J.D Salinger noted, we are not the same person we were a minute ago. All our impressions accumulate, and (ideally) modify each other in interaction…some beliefs / definitions / stimulus-responses are reinforced, others weakened…we may become more or less of anything e.g anxious, confident, angry, motivated…we construct meanings ‘one off’ from powerful experiences / traumatic events or gradually, by observing / ascribing patterns to interactions…we require memory for this…to construct a pattern … i.e antecedence and precedence required for construction of ‘cause-effect’ relationships…David Hume…and even notion of Humean uniformity i.e expectation that pattern will continue…assume this…as logical progression ‘ascribed’ to interactions…consistency…predictability…etc

You can ‘suggest’ something with words, symbols, gestures, tone of voice, facial gestures, body posture, a certain ‘look’, tone, gesture, … i.e hypnotism / trance does NOT require direct verbal commands or verbal suggestions…most trance inductions use music, images, and all these more subtle suggestions…e.g that brand X can make you sexier, richer, more acceptable to others, … without a word being uttered or written…using images…military marching music has no words…the ‘drummer’ in old wars effected a ‘feeling’ of ‘courage’ in the listeners, or ‘patriotism’…Most suggestion is done without ‘linguistics’…directly
bypassing the Linguistic / rational centers, and affecting the neurology directly…suggesting emotions like hate, love, happiness, confidence, satisfaction, joy, acceptance, approval, self-esteem, etc…directly…completely bypassing any ‘rational’ brain centers, any logical judgement…reason…the ‘higher faculties’…hence the ancient fear of the power of music as ‘entrancing’ people, and leading them into ‘sin’…

Subconsciously we can be manipulated with such non-verbal suggestions…after a life of conditioning…of stimulus-response training…of trance induction called the hegemonic social reality’, in which it is suggested, and reinforced, that this hegemonic social reality is the only REAL reality…that any other competing belief systems are erroneous, even evil, and either the work of the devil, or some of malicious conspirators with bad intentions…whereas your own ‘masters’ are well intentioned…have your interests at heart…are competent, wise, all knowing, all seeing, and have graciously, benevolently, taken you under their protection, to protect you from the ‘evil’ and ‘bad’ people out there who will try to trick you into thinking war is NOT necessary, ‘the holocaust’ never happened, money is fraud, debt is unnecessary, slavery is unnecessary, god is a myth like all the other gods that came before him/her, that you should be allowed to think for yourself and base your opinions on your own direct experience, and the compelling arguments of ‘philosophers’ etc…

If we are to solve our problems, we must work out which ones are ‘real’, and which ones have been hypnotically implanted in us as part of the trance induction called ‘socialisation’ and ‘education’… therapeutic trance inductions can be used to find out if we are responding to the here and now reality, or whether this is merely triggering some imprinted / conditioned / engramic response to a past traumat / interaction / experience / suggestion / hypnotic-transaction that took place in an institution, as part of the official conditioning process all ‘citizens’ are compelled to participate in, e.g education… legal systems…mass media…propaganda…or as ‘accidents’ e.g traumatic events, chance words / interactions uttered by parents etc i.e significant others… any and all of which could be responsible for having implanted, over time, through reinforcement and deliberate conditioning, or in one-off ‘one-shot’ imprintings…such as very exceptional, often traumatic, incidents…e.g phobia of all dogs imprinted by one incident of one dog bite…or mother saying ‘never spend money on girls’…or ‘you are responsible for your father leaving us (in these terrible conditions we / I must now suffer)’…etc…often forgotten as ‘repressed’ to the subconscious…but constantly being ‘triggered’… thus giving rise to actions / behaviors / moods / emotions that seem totally irrational to others vis a vis the objective situations the person is ‘acting out’ in…e.g terminally depressed though very ‘successful’ in every way e.g sex life, romantic life, rich, famous etc…but sad? Despairing? So ascribed ‘imbalance in brain chemistry’, when really the feeling is being triggered by some past ‘suggestion’, implanted in a one-shot incident, or over
time, by reinforcement e.g. ‘you are guilty of …’ ‘it is your fault…’ ‘you are a bad person’…’you are unacceptable, unwanted, undesirable, rejected…unworthy of happiness / success etc…so success itself can trigger despairing depression, as it triggers all these past imprints…leading to anxiety that ‘I won’t be allowed to be happy, as I don’t DESERVE to be happy, so something horrible is going to happen…so I better sabotage my own happiness now, before something worse happens i.e I am punished for being so happy etc….so common or?...

Of course the mind wants to believe it is in control…has free will…so it will find ways to ‘legitimate’ this feeling e.g. maybe even doing bad things that deserve punishment, failing, doing bad job, getting in trouble, just so the ‘reality’ now matches the feeling i.e. legitimates it…e.g. I feel worthless, so if I do bad stuff so I really AM worthless, this feeling will be legitimate i.e. like post retrospective revisionism…make reality fit the subjective feeling, by creating conditions in which it appears valid…I am guilty…I FEEL guilty…if I commit a crime it will make sense.. and now once more the mind feels back in control…with free will…it has given itself a ‘rational’ for that feeling…like low self-esteem leads to dressing badly, bad haircuts, poor nutrition, poor posture, etc etc so end up being rejected i.e. people see you as you feel yourself to be…and so your mind can now feel it has ‘free will’…as shown in so many experiments in ‘Convergences’…i.e mind wants to feel in control, so will take responsibility for actions of subconscious…will construct narratives that put it back in charge i.e. ‘I did X, because I wanted Y, when in fact the real motives were subconscious e.g. I sabotaged my happiness because I had ‘learned’ in a one off incident, or over time, that I am unworthy of happiness e.g. I made my family miserable, my dad left us because of me, I am a burden, I am guilty…Edipal complex etc…fear of exceeding achievements of own father…etc…

But if you find out how the belief got implanted in the first place, you can replicate a similar experience which implants a more optimal belief…i.e don’t argue with irrational subconscious motive…replace it…find out what ‘language’ it used i.e. representational systems, to program / implant this stimulus-response, and then use the same system to replace it with a generative / positive / productive/ more optimal belief…don’t try to REASON with it…it is NOT reasonable…it is emotional…hysterical…an engram…an implant…a suggestion…a directive…that was implanted over time via repetition, in that trance condition known as ‘family’ and ‘school’ and ‘mass media’, or by some powerful, one-off ‘association’ implant e.g. One X did this, so now I will fear all X’s’……you can LEARN instantly, and so you can REPLACE that lesson instantly, using NLP quick phobia ‘cures’ etc…

Words, and other forms of communication, may cause an individual to turn inward and create a hallucinated world to which the individual responds, one in
which choices are reduced or excluded, and the individual is conditioned to respond in set ways.

This is what we call ‘society’. Socialisation. Education. Propaganda. This is what TROONATNOOR is struggling to help us all break free of.

In other words the compulsive neurotic is behaving ‘as if’ responding to some suggestion / trigger, in the same way as a hypnotized person, or an animal in one of B.F Skinner’s conditioning experiments. So nowe see the possibility of replacing the conditioned set of responses with a new set of responses. Ones that do not harm, limit, etc the person. Each person will respond with their own unique set of responses to any given hypnotic suggestion, and POST-hypnotic suggestion, just like in real life neuroses, compulsive obsessive disorders, phobias etc…so the neuroses can surely be identified as a form of post-hypnotic suggestion…conditioned over time, or ‘implanted’ by a one off experience…a form of ‘hypnotic experience’ or ‘trance induction’ of the everyday sort. Either planned by the ‘authorities / state / institutions / religion / mass media’, or ‘accidental, occuring during the usual course of events, often traumatic, or dramatic in nature, but also more subtle, as in non-verbal child-parent interactions i.e what is NOT said, what is NOT offered e.g acceptance / approval / love, and what is hinted, and often conveyed in sarcasm, and neglect as much as active abuse, what is NOT said that NEEDED to be said, and done … but wasn’t…which itself is often a more powerful communication than any other…

Freud defined amnesia as the repression of traumatic material that the ego (I might call it the conscious mind) is not capable of handling. If we accept that definition as accurate, it would be safe to assume that the traumatic information is still there, but the individual has no conscious awareness of the trauma. If that trauma is still there, then in all probability the affect and the consequences are still active. However, due to the amnesia, the individual will experience unpleasant feelings without knowing their source. Since people do not like not knowing, they find something in their external reality to blame. That "thing" may be totally unrelated, symbolic, or it may contain a feature that reminds an individual, unconsciously, of the original trauma The individual may then react with what some psychologists term the "as if" affect: responding to a current situation with responses and feelings as if they were responding to a past situation.

Posthypnotic amnesia is a well known phenomena, with people forgetting that a suggestion had been made, while in the suggestible, hypnotic trance. So Freud’s idea of repression and conscious ignorance / amnesia of the imprinting incident/s, is consistent with everything else we know about trance.

While doing research on hypnosis, a professor of psychology induced a somnambulistic trance in a subject. The subject was capable of the most profound
hypnotic phenomena, including posthypnotic amnesia. The thrust of this research was to test the theory that, upon carrying out post-hypnotic suggestion, the subject would re-enter the hypnotic state. While in this somnambulistic state, the subject was told that when a clock chimed 10:00 P.M. at that evening’s faculty party, she would remove one of her shoes, place it on the dining room table, and put roses into the shoe. Further, it was suggested that she would have no memory of the suggestion, it would appear to be her own idea, and she would feel compelled to finish her task. "A very interesting thing happened on the way to the forum." While she was carrying out the hypnotic suggestion, the professor asked her what she was doing. She replied that her husband had given her a beautiful crystal vase that looked just like her shoe and she had never known what to do with it. She went on to state that it had suddenly dawned on her how to arrange flowers in the vase and she had to try it in her shoe before she forgot. While her explanation appears absurd, she acted as if she believed she was telling the truth. As the professor tried to explain to her how ridiculous her story was, she became anxious, agitated and very defensive. The experiment was terminated due to her extreme anxiety and discomfort.

This is completely consistent with all the T vol I evidence I collected and presented on the conscious mind taking responsibility for actions that it played no part in e.g writing a narrative to 'explain' actions it did not initiate. As if it executed some plan of action, rather than being the 'puppet' of some other force. It hate the notion that it does NOT possess free will. It becomes very agitated and anxious when threatened with the full disclosure that it does NOT have free will. That its actions are determined. And any time you come close to bringing this fact to the conscious mind, it becomes very disturbed, defensive, even denying facts, distorting them, filtering them selectively, trying to reconstruct a narrative from the facts consistent with its desire for free will, self-determinism…to the point of emotional desperation…maybe accounts for many neurotic symptoms…and people subconsciously producing the conditions / situations that would 'make sense of' their otherwise irrational behavior / emotions….eg if everyone now approves of them, applauds them, loves them, but they feel miserable, defective, unworthy, unacceptable, rejected (this suggestion having been implanted / learned decades earlier, and still resonating in the subconscious parts of the organism), then they may commit terrible acts to provoke people into behaving consistently with their subconscious self-definition as being 'unloved' etc…a 'failure', a bad person…and so that now their condition makes their feelings appear rational, and convergent…so that now they feel hated, and people DO hate them, they are relieved of the cognitive dissonance…the lack of integrity…the contradictions between how they felt, and how the world treated them…and now life makes sense again, they feel more comfortable, and do not have to challenge the conditioned reflexive responses, the suggestions, the post-hypnotic suggestions i.e as emerging long after the incident/s that produced / implanted them…
FEAR OF HEIGHTS  An example of one hypnotic technique I use along with a partial case history should illustrate how the above fits together. A woman in her 50s had a terrifying fear of heights. She "knew" it was because she had fallen off a five-foot ladder at about eight years old. I told her if the ladder was the cause, then anyone who fell off something five feet high would have the same fear she had. I asked her to close her eyes and see herself climbing a ladder until she felt all the fear and to signal with the first finger of her left hand when she was in touch with that fear. I observed her facial expression, breathing rate, and general appearance. As she evidenced a state of fear, I touched her right arm lightly and said in a slow, even tone: "Hold onto that feeling, and remember when I touch you, you can experience the fear immediately." I then snapped my fingers and said in a faster pace, "Replace that picture with one of beautiful flowers, smell them and feel the pleasure." I observed the changes until she appeared calm and relaxed. I then told her that, when I touched her arm, she would feel the fear and, as if watching a slide projector, she would see scenes clearly going back to the source of that fear and to signal when there. When she signaled, I told her to let go of the uncomfortable feeling as I snapped my fingers and to watch as if seeing someone else until she saw and/or heard something that connected for her and that she wouldn't return to conscious awareness until that connection was made. After approximately five minutes, she opened her eyes and told the following story: When she was about five, she had a friend who used to climb on boxes and jump off. Her mother caught her one day and told her that one day she was going to break a leg and it would serve her right. Her mother also said that wouldn't be a good thing because otherwise she would fall off something high and kill herself. That was a powerful hypnotic suggestion planted beautifully. When she fell off the ladder, it was the same as shining a red light and having the subject raise a hand. From that point on, in her mind, the next fall would kill her and she had no memory of the "suggestion." She then protected herself by developing a phobic reaction to heights. If she avoided heights, she wouldn't die. None of this makes sense except in her mind; there it was real. The resolution of the problem was accomplished by having her close her eyes and see herself as an army demolition expert. I then touched her arm and told her to "see" all those fears as time bombs and safely blow them all up; that she would then feel the pleasure of the flower and see herself in the garden and to signal when she completed the task. When she signaled, I told her that she would arouse herself bringing back those good feelings. With that, I snapped my fingers to remind her of all those good feelings.

Having someone blowing up time bombs doesn't make any more sense than the original hypnotic trauma, except it works. I have observed people evidencing severe anxiety and then a deep sigh of relief when they have finished. Later, many have told me that they were less afraid in general and were responding more comfortably to what had been their problem area. If we again grasp the concept that the problem is really a metaphor, then blowing up time bombs is simply the right tool for the right job, metaphorically speaking.
Our past conditioning as suggestions / directives given in trance states e.g. boredom of school, excitement of television / movies / novels / sports events, half time military recruiting / religious rituals-churches … all as form of programming … e.g. television PROGRAMS … sports PROGRAMS … theatre PROGRAMS … programs are like count-downs and targeting programs on guided missiles … the fuel is the motivation i.e. fear and desire, pleasure and relief, hope and anxiety … the emotions that motivate us to act on the programming … which has become ‘self-evident’, natural, normal, obvious, i.e. sub-conscious, taken for granted ideal goals / objectives e.g. don’t lose face and appear stupid, ‘a coward’, selfish, ignorant, ‘evil’, ‘heretical’ … so when the trigger is pulled ‘enlist now to stop the fiendish Bosch from taking over the world, and throwing babies out high rise windows (WWI Hollywood, or old men in wheelchairs if you are Spielberg making WWII and Zionist ‘we are innocent victims not terrorists’ propaganda)

Fear of death, failure, loss of face, embarrassment, rejection, abandonment … fear as a trance state perfect for implanting suggestions, subliminal and blatant, subconscious and conscious …

Consider the case of a young woman who couldn't say "No." She was labeled nymphomaniac. Hypnosis revealed that, as a child, she was expected to obey without question. Her mother would fly into rages if she didn't. One day, she said "No" to her mother. Her mother beat her and she fell back into a stove and was burned by hot water while her mother screamed, "Don't you ever say 'No'!" As a young woman, whenever a man asked her for sex, she would always say "Yes." Without even knowing why, the fear of saying "No" was so great, she carried out the hypnotic suggestion by saying "Yes."

Freud was quite familiar with young men who, every time they got close to being better than their father, sabotaged themselves so they'd never figuratively 'castrate' or 'kill' their father, and related it to the deeper Edipus complex, as the real ‘fuel’ behind this destructive behavior, often literal ‘explosions’ resulting in the young man ruining his own chances of happiness and success, over and over, without consciously being aware of the motive.

Fear is an emotion. Often without any rational, reasonable, basis, such as in many phobias, or the terror I experienced the first time I tried to make a prepared presentation to my small English class in H.S. It is easy to produce irrational fear with lies called propaganda and fake news, and tales like ‘The Holocaust’, just as parents used to use those children’s tales of terror to scare their kids into not sucking their thumbs etc…

Fear can block the effects of pain killers, and Dentists are aware that a highly fearful patient has a much higher than usual risk of dying under anaesthetic, requiring a higher dosage to overcome their fear.
Fear of rejection, abandonment, ostracism, being socially marginalised, all fundamental to power of ‘praise’ and ‘criticism’ from significant others and peers…we all want to belong…it is scary being alone…we need others, so we are vulnerable to their suggestions…the fear putting us in trance as much as the good feelings of praise…so that we are, by nature, highly suggestible, especially during our most vulnerable, formative years…which is why every brainwasher can’t wait to get your child into some institution as soon as you will let them…and will condition YOU to comply with these demands…get the children, and you have the adult primed, conditioned, locked and loaded…like any good MK Ultra sleeper agent just waiting for a activation…for the ‘Uncle Sam needs You’ recruitment poster, the ‘Half-time Super-Bowl recruitment campaign on television, or to accept that a piece of paper called a ‘call up notice’ has some overwhelming magical power that it is impossible to resist, as if ‘conscription’ were a law of nature, or ‘god’, rather than just the typed print of some Bureaucrat in some office…

The same goes for religious indoctrination / suggestion / programming…just walk into a ‘quiet’ school classroom or church, and see what impact it has on you…what sort of ‘trance-states’ it induces in yourelf, and those around you…e.g have you ever considered calling out during a Sermon or school lesson? To contradict something? At very mimimum you meekly put your hand in the air and wait to see if you will be ‘allowed’…

How many times do ‘bad’ parents criticize their kids saying ‘Oh, you’re just like your father’, or worse ‘Your father left because of YOU’, openly and tacitly, by their manner, communicating your guilt for everything wrong with THEIR life, and the family problems…the need to be perfect to avoid their wrath and condemnation, and maybe gain a tiny bit of acceptance, approval, and who knows what miracles may happen, love…or at least avoid their rejectin, disapproval, beatings, neglect, and even literal abandonment…is it any wonder most children end up following their parent’s ‘choices’ / ‘suggestions’ re: religious affiliation, socio-economic-status group, and political affiliations, though they may appear to consciously ‘reb’ in their youth, only to return, often to return to the ‘comfort zones’ they have been programmed into, by suggestions, conditioning, and where they feel they ‘belong’, and are ‘at home’. Even reproducing abusive relationships and terrible family dynamics lets them feel ‘at home’ in their ‘comfort zone’, because it is ‘what they know’…which is, as Virginia Satir believes, THE most powerful motive underlying ALL human behavior and interaction…the desire to reproduce the FAMILIAR…FAMILIAR…so it couldn’t come as any surprise to see inter-generational reproduction of all the dysfunctional family dynamics we like to laugh at on television sit-coms like ‘The Simpsons’, but which in real life lose their appeal, and are merely painful, miserable, soul-crushing, potential destroying, life-denying, death affirming, nauseating, despair-filling, depressing, destructive, etc…
If religion is a taboo subject for you to work with, simply consider why one child spells DOG as HUNDE? As Heller reminds us, isn’t that just stimulus-response conditioning? The acting out of a post-hypnotic suggestion after leaving the trance-induced state called ‘school’? Whey does one person believe one stupid idea and another a different one? And why so many different stupid ideas? When they all claim to have come via ‘divine revelation’ from the same god? It is clear that it is nothing more than conditioning. Leave people to their own devices, and see how many reproduce the entire rule-book of Moses, or re-write the Koran, or Book of Mormon, on their own, with god to inspire them...these are all works of many minds working together to construct a fiction that is compelling...but ONLY when trance has been induced by FEAR of hell / punishment / ex-communication (being abandoned / rejected / ostracized LITERALLY from your society and ALL other members of your human group), and all the lovely rituals we associate with religion, from chanting, incense, humming, singing, huge interior spaces, icons, lights, images of ‘holy’ people and saints…etc etc...

A subject in deep trance / hypnotic state, will react as angrily and defensively to any suggestion that what they are experiencing (what it has been suggested they experience) as any religious zealot, when challenged about the reality or otherwise of their beliefs. The two sets of beliefs are of the same nature and quality. Illusory to all but the person experiencing them. Unless of course you manage to induct a large group into the same hypnotic state and suggested experience. That is, basically, what ‘social reality’ is. What ‘cults’ are. All religions are cults. All social groups are a form of cult. The difference is only a factor of how many people you manage to recruit to YOUR cult. If you get millions of people, it is given the respectable title ‘religion’. Or ‘nation-state’. Or ‘Western Society’. Or ‘humanity’. It is just a question of getting people, at birth, and continually immersing them in a soup of suggestions, positive and negative reinforcement for compliance with these suggestions, and then ‘institutionalising’ these beliefs as ‘education systems’ and ‘religions’. How easy this can be done is proven by ‘The Holocaust’ illusion most of YOU accept as reality. Or that a piece of paper, or the words of an authority figure, can compel you to devote months to training, so you are competent to burn alive thousands of children, women, and men, you have never met, who never harmed you in any way, and never would have even thought of harming you, EVER.

You don’t believe in ‘magic spells’? ABraCdabra? That words have power? That we ALL live in trance states of varying ‘depth’? That most of what you consider ‘reality’ was merely something suggested to you early in your development, and continually reinforced with positive (rewards) reinforcements and negative (punishments) reinforcements? Until you accepted a ‘social reality’ one step beyond your ‘subjective reality’ of your own experience, and far from any potential ‘objective reality’ that might be perceived under ‘ideal’ conditions of inquiry, in which there was no-one influencing you, suggesting you ‘interpret’
and ‘experience’ things any particular way, offering you inducements, carrots and sticks, for ‘conforming’ with THEIR definitions and interpretations of TROONATNOOR. Imagine if NO-ONE profited from ‘The Holocaust’. Would it exist as a ‘social reality’? As a revision of the true history of the Jews during WWII?

Who benefits. Cui Bono. That is the question you must ask yourself, if you doubt that anyone could possibly have a MOTIVE for leading you astray. That any group could possibly think so far ahead as to plan for your indoctrination, from birth to death. Consider the power, wealth, privilege, and luxuries enjoyed by the Vatican in its day. And by ANY cult leader. By ANY leader of ANY group. By the priests of old. Even today they enjoy ‘privileges’ like immunity from the law, immunity from taxation. Billions of people STILL suffer under the influence of the malicious / self-interested suggestions of religious leaders, cult leaders, political leaders, and most importantly, those who control the mass media and entertainment industries.

Many people are calling ‘The Holocaust’ the new religion of the Zionist Jews, as it embodies all the typical qualities of a religion. The mass induction of a social reality. A trance state. A hypnotic state. Watch the stimulus-response when a Hollywood director places completely fictional characters and situations on the screen. Just say ‘The Holocaust did NOT happen’, and see what a barrage of emotions are triggered. As if you are torturing puppies. When all you are doing is stating a fact that can easily be demonstrated. But try ‘demonstrating’ i.e ‘proving’ to the hypnotized person that the tigers that are hungrily circling them, waiting to pounce, to tear them to pieces, are NOT real, but actually positive hallucinations. And then when that same person INSISTS they cannot see anyone in the room but YOU, when you KNOW there are 20 people standing around, that these 20 people are REAL. You will get the same angry, defensive, emotional responses as when trying to show an ‘Holocaust hoax denier’ some important piece of scientific evidence, some piece of historical fact, like the admission by the Soviets that they found NO gas chambers in Auschwitz, except that used for clothing, and that THEY constructed what people are today shown as being ‘Gas Chambers’...and that the bricks in these same ‘gas chambers’ supposedly used to kill people, contain NO residue of Zyklon B, no stains of ‘Prussian Blue’, whereas the chamber used for clothing is literally SOAKED in Prussian Blue and Zyklon B residues.

That we are dealing with EMOTIONS and not REASON, with IR-RATIONAL subjects in both these cases, i.e the positive and negative hallucinations of the hypnotized subject, and the ‘Holocaust believer’, becomes clear as soon as you try to introduce reasoned arguments. Facts. Historically proven evidence. Documents. Scientific reports. Chemical analyses. Statistical calculations. Aerial photographs. Factual Data. To EITHER of these subjects. They simply DISMISS
them. For they already KNOW what is real. They will NEVER attempt to refute, using facts, logic, or reason, your arguments. As they have BYPASSED reason. They are NOT rational. They are reacting compulsively to suggestions made to them in some level of trance.

Remember, the trance can be explicitly induced, in a few minutes, or slowly, gradually, and unobtrusively ‘built-up’ over years of exposure to the desired ‘social reality’, the ‘suggested’ ‘reality’, in the form of subtle and less subtle ‘hints’, ‘suggestions’, ‘directives’, all of which are positively and negatively reinforced from birth to death…with anyone who dares publicly challenge the hegemonic social reality ‘suggested’ to all members of that society being publicly ruined, economically, socially, and even imprisoned, often for more than a decade, simply for publically announcing that ‘The emperor is naked’, that the ‘social reality’ ‘suggested’ is full of holes, flaws, inconsistencies, defects, deceptions, etc etc…

The sad thing is that, give people a faulty, delusional ‘map’ of the world, and they will often follow it, no matter what the consequences. Consider the history of WWI trench warfare if you doubt this. If the map people have in their head, which has been carefully implanted there, shows a bridge joining two cliffs, then millions of people will walk off the edge of the cliff, to their deaths, even as they see and hear the people in front of them falling to their deaths, wailing and screaming in panic, fear, and pain. They will simply negatively hallucinate / deny these sights and sounds, and continue to ‘cross the bridge’ to their own deaths, carrying their children with them. FACTS people. I am not exaggerating. Look at ALL the wars of the past. How many of them made any REAL sense to anyone involved, apart from the financiers who gained unimaginable wealth and power from them?

Consider the trance state called ‘I am in debt’. ‘I owe money to the bank’. When that bank LITERALLY just typed some numbers into their computer program, which then added that ‘debt’ to YOUR account. Not even growing money on trees is easy enough for the Banksters. First they got control of the printing presses, to print their own money, a.k.a ‘The Fed’, a.k.a ‘Central Banks’, and today they just sit at a keyboard and ‘create’ ‘money’ i.e ‘debt’, from nothing. But YOU end up a slave to that imaginary ‘debt’. You prostitute yourself to pay it. YOU murder children, women, and men, to ‘service’ that debt. You will sell your soul for that ‘illusion’ called ‘money’. Something that DOES NOT EXIST. Literally.

Belief systems, noetic structures, are the maps by which we navigate our worlds. Few people stop and consider that ‘the map is NOT the territory’. Some great minds like David Hume demonstrated just how far the map strays from the reality. Lesser minds spontaneously noticed a few errors, that the map was not
the territory, while failing to go as far as Hume travelled in his thought experiments and interrogations of the map as a supposed representation of reality, but people like Bandler took some baby steps. Enough of them to step a little to the side of the ‘social reality’ sphere, if not, like Hume and myself, totally escape it.

My TROONATNOOR books allow YOU to escape the mind-prison called 'social reality'. If you dare. If you will, for one moment, allow me to break the trance you are in. WHACK. That's my metaphorical 'ZEN whacking stick'. I used 'arguments' instead. My own version of Zen 'koans'. See 'TROONATNOOR Vol. I' and 'Convergences' and 'Religion' if you are dissatisfied with the results of your TRANCE STATE and socially implanted SUGGESTIONS.

The maps you live your life by are not only misrepresentations of the reality, the terrain they claim to accurately depict, they exclude huge amounts of data you would need to live a truly satisfied, joyful, rewarding, creative, positive, life-affirming, LIFE. TROONATNOOR fills those gaps, removes the lies, the distortions, the errors, that make you current maps so terrible guides. For your current maps are leading you into debt slavery, once more, and once more, into war.

N.B that the fear etc responses to the suggested hallucinations are as real as they would be for the ‘real’ thing…e.g Jews fears of ‘the Holocaust’ repeating…do they fear it? If so, why do they behave so badly? Not give up their Semitism? Racism? Racial supremacist ideology? Criminal acts in Palestine? Banksterism? Excessive lobbying of Congress? Intrigues? What other ‘people’ would be so bold as to blow up several huge buildings in the middle of New York City, in the middle of the day? And attack the top military institution i.e the Pentagon, at the same time? And these people ‘FEAR’ something? Or is it they were put in camps for VALID reasons?

You can ‘suggest’ / hypnotically induce a temporary belief, but for a short period of time, deliberately via trance induction / suggestion. In the real world these ‘suggestions’ are the product of associations, often repressed, and not available to interrogation / rational rejection…and often ‘one shot’ inductions e.g phobias usually induced, naturally, during ‘one-off’ events…but endure for life if not ‘corrected’…a.k.a historically revised…‘revised’…like the new ‘corrected’, ‘updated’, ‘improved’ version of an existing publication is termed ‘the new and revised webster’s dictionary / Office training program etc…i.e errors found and removed, updates added, the latest developments included, to make it better, more functional a.k.a ‘revised’ as the REAL meaning of ‘historical revisionism’ i.e correcting and improving upon our understanding Vs the Zionist ‘spin’ mass media distorting ‘revisionism’ to mean ‘fake news’…
Absurd how many writers go only as far back as Bandler and Grinder, as if the idea that we do not directly experience the world, but rather through the filters of our representation systems isn’t as old as Zen, Schopenhauer, Buddha, The ancient Greek philosophers, and my fave Dave, Mr Hume himself. It doesn’t help that Bandler cultivates this like L. Ron Hubbard did his own ‘image’ as a unique innovator rather than a ‘borrower’ of Freud, et al…coining new words when the existing terms were apt already, simply to ‘throw off the scent’ of association with the ‘originators’ of his supposed ‘own’ ideas…‘insights’…etc…while he deserves credit for his modelling, and very elegant ‘methods’, he could be more honest and transparent in the sources / inspirations of his work, giving credit where it is due…and also devote more time to explaining …writing…which any writer knows is really hard, lonely, demanding work…and most people avoid where they can, and simply hope people will ‘get’ what they are trying to explain from what they do…rather than actually testing it…interrogating it…making SURE it is clear and ANYONE could copy it…of course that might hurt business, and reduce some of the ‘shine’ or ‘halo’ around THEM…etc…

As I took great pains to explain and describe in my T books, belief systems are at least as much about negative hallucinations, what we exclude from our world view, and do NOT see, hear, include in our models, as it is what we positive hallucinate i.e add to our model without rational, scientific, reasonable justification e.g ‘god’, ‘the holocaust’, just because someone told us to…a.k.a ‘suggested’ we do…‘directed us to’…as a hypnotic suggestion…which remained by continual reinforcement, continual re-suggestion…like a post-hypnotic suggestion…we ‘own’ it…forget where it came from…how we came to ‘believe’ this and ‘why’…the ‘why’ is mostly retrospective post rationalisation…once you can get someone to ‘give money to the church’ their own conscious mind will want to justify this as logical, rational, reasonable…otherwise what a fool it has been…it is a known fact that if you get someone to help or harm a person or cause, they will then retrospectively post rationalize this action, as having had some GOOD reason…as being justified by something concrete and reasonable…like in the ‘free will’ experiments done with open brain surgery patients described in ‘Convergences’…

Why do YOU believe ‘the Holocaust’ happened? Try to work out why you have the ‘feeling’ that it ‘certainly did’. Compare this certainty with the same feeling someone who believes something YOU find absurd experiences. Ask THEM how THEY came to THEIR feeling of certainty, of ‘FAITH’, of belief…what you will find is usually a very long series of suggestions, which go back way before the ‘rational’ part of their mind became competent at evaluating / judging arguments etc…to a pre-rational time…their infancy, childhood…and then tell me how many people, after this time, are ever actually taught how to think? How to reason? How to judge? To work out which arguments are compelling and why? Did school teach you any of that? Even university? By that time you are so
fully invested, emotionally, in your ‘beliefs’, that your conscious mind will employ every possible trick in the book to deflect, deny, distort etc your later experiences and ability to interrogate reality, so that the earlier beliefs tend to remain fixed…protected…defended to the end…

Once you ‘step outside the social reality bubble’ you notice things you never had the chance to because your own defenses were so active and clever.

Consider how a block of marble can be chipped away at to ‘reveal’ any form…and by chipping away further, that form can then be totally altered…from demon to saint, from beast to angel, from beauty to ugly … it is as much what we ‘remove’ from the host of possible impressions that surround us, demanding our attention, as what is added by suggestions e.g the equivalent of putting clothing on that statue, glueing bits on…interrogation would reveal them to be ‘augmentations’ of reality i.e ‘lies’ / fakery / trickery / costumes … and over time they usually wear out, leaving the bare stone, unless they are constantly newly decorated…the lie re-produced….the social reality re-produced…

In areas in which they are evidencing pain and dysfunction, their belief system, in that area, is either "the problem" or prevents them from finding the solution…the reason you should CARE about these facts…they are NOT harmless, like comforting children with noble lies about their beloved dead pet, or family member. Very FEW so-called ‘noble’ lies are at all noble. They may SERVE the interests of people who define THEMSELVES as noble, but they are usually no more noble than the thief, rapist, or murderer with a ‘sense of entitlement’ to rape that person, possess someone else’s property, or have ‘their will be done’…whatever the victim believes / desires, has a just right to…

Plato lost his credentials as ‘philosopher’ the moment he suggested that the ‘state’ had a right to lie to the people it was supposedly set up to protect the interests of…a lie is an act of violence…in his case it was to enslave the ‘citizens’ of his ‘Republic’ to serve the will of the ‘masters’, because he couldn’t trust the ‘citizens’ to know what was best for them, themselves…and somehow imagined that power would never be abused…when he was abusing it, himself, from the very start…to make his own life easier,…to avoid having to convince people / persuade them, via reason, of the ‘truth’ of his own arguments…from there it was a quick, dirty slide down into the valley of the shadow of death…”for when a man lies, he murders a part of the world’, to Quote James Hetfield quoting whom?

Of course, like David Hume, I am heuristic. We need maps, in order to move around. The question is whether we assume the maps are the territory, and thus never work on improving them, when it appears that the territory, the reality, is different to our maps…do we defend our maps, and throw a tantrum at reality? Deny reality? Walk off cliffs to our injury and death, just because our map shows
a bridge, or simply no canyon? Do we send in bull-dozers to knock down mountains because they are not shown on our maps? Do we fight wars because we each have a map showing a different property boundary? Do we fight over our maps, when ALL our maps are wrong? When we could instead be working together to ‘revise’ ALL our maps, interrogating and auditing ‘reality’, the terrain, to draw up more and more precise and accurate maps? All the while NEVER falling for the old illusion that the map we were given, and are told is accurate, is actually the terrain, is actually precise and accurate. Always assuming that our maps maybe wrong, and can always be improved. And instead of ridiculing the maps of others, when our own maps are so absurd, we BOTH, together, work on drawing NEW maps? Even as we NEVER assume it is possible to KNOW reality…to draw the terrain as it is…and never insist anyone do so, and be forced to PRETEND a.k.a ‘dogma’, that they had a privileged glimpse of the actual terrain, in a vision, or encounter with angels, and thus we should believe THEIR map to be accurate, and reject all other maps as the work of some devil?

T was always about mapping the terrain, and challenging the faulty maps of others…by first following their maps and seeing where they lead…most people never put their maps to the test…and when they do, and the maps fail them, they make excuses for their maps…scared of ‘losing face’ for having such bad maps…they feel a sense of loyalty to the map, via the sense of loyalty to the loves ones who passed these maps onto them, and who believed they were doing a good thing…even in overlooking the constant flaws they had, throughout their own lives, found with the maps…attributing the problems / flaws to themselves…rather than to the maps…feeling guilty because, although they tried to follow the maps, they didn’t get where they wanted to go, didn’t find the things the maps indicated were there…they blamed themselves…their own inferiority…their own inadequacies…their own senses, their own eyes and ears, rather than accept that the map was simply wrong…why?…surely all those authority figures, those ‘godly’ men, those brilliant, wise, glorious ‘leaders’, MUST have known what they were doing when they drew these maps?…surely? They spoke with angels and burning bushes and look at how happy and successful god or their own talents have made them…surely THAT is proof that the maps they ‘sold’ us MUST be accurate…look how well using the maps turned out for THEM…or is it that map sellers tend to get rich and powerful, because of the promises they make for their maps…buy my map, use my map, and you will be happy, successful, in this and the next life…and people see the rich powerful successful map salesman / drawer and associate it with the product, rather than the scam, and buy the maps…who wants to then look foolish, for having bought into a scam? Snake oil anyone? Pyramid scheme anyone? And so who is going to be the first to admit they’d been fooled? Conned? Tricked? That they could have been so foolish? And anyway, where there is faith there is hope, so maybe, just maybe, if we get back onto the path shown on that map, maybe we
WILL get where we want to go…maybe the fault lay with US?…maybe we didn’t follow the map correctly? Maybe we just need to start again, and try harder…maybe it as us after all, and NOT the map…I mean, look at everyone ELSE, they appear to be happy, using the SAME map we have…so SURELY the fault lies with US, and NOT the maps etc etc..

The first step is to get a copy of the map your client etc is using…make no assumptions…get them to draw it out for you…or observe them, and make a copy using your observations…for many parts of their own maps are NOT obvious to them…they are not aware of the faults / mistakes in their maps…they are not even aware of what is ON most of their maps…

That is called ‘psychology’ and ‘research’…studying of all the religions, superstitions, illusions, narratives, propaganda etc of the world…to see all the absurd maps that are circulating out there as ‘reality’…as SOMONE’s reality…if millions are using the same map, it is known simply as ‘reality’ to THEM…but to use ‘Social Reality’…just one of many different POSSIBLE social realities they COULD have been inducted into / had suggested / been hypnotically inducted into…just ONE of the many TRANCE states they could have become trapped in...

Then we compare all these maps to what we CAN demonstrate. Like David Hume. And then when we are humbled by how little we can ‘prove beyond doubt’, we start working on a new map, starting at the very basic assumptions…and flagging them as we go…noting in the ‘legend’ that ‘this is the best approximation / interpretation we have at the moment, but it is open to question, and please do…then go back and start from THIS point, NEXT time you REVISE this map…or start a new one…from the ground up…from this point…because everything that comes after it is now questionable, in light of this new revision…and entire institutions of millennial tradition and authority may need to be challenged, and taken down, and we will need to start new-building, from the point at which we found the error, the basic assumption that proved unreliable … and if it means the earth was flat, then a sphere, then flat again, then so be it. We must begin from where our best ‘intelligence’ informs us we have erred. Where experience and demonstrated tests, and compelling argument, have lead us. So no map may ever be considered SACRED or ‘set in stone’ like any other IDOL, or DOGMA…every map is open to public scrutiny, verification…when we send explorers off with these maps, and they come back puzzled, with new data, we ask them what they saw, and we correct / revise our maps…we do not put them in prison, define them as mad, torture them until they ‘see’ what they were ‘supposed’ to see, according to the map…we get them to draw maps, then we go out and test their maps, compare which ones work best, get us where we want to go most elegantly, effortlessly, efficiently,
optimally…THAT is Heuristics…THAT is how we progress as individuals and society…as a species…as a planet…

And of course a map wouldn’t be a map without the warning ‘Here be dragons’…because we are going to experience some very puzzling, even terrifying, things, when we start re-drawing maps. Testing maps.

It is great to love your parents and culture, and feel loyalty to all the people that brought you all the great things you have to enjoy. But when this loyalty is extended to the maps they gave you, with the best intentions, it is misplaced. Love the person who gave you the map, but question the map itself. Don’t just blindly reproduce the maps, and pass them onto your own children, with the best intentions, or simply out of lazy habit, or fear of being marginalised by everyone else in your group using that map…

Love and trust the map maker, but be suspicious of the map.

Other words for ‘map’ are ‘tradition’, ‘authority’, ‘public opinion’, ‘mass media apparent public opinion’, ‘expert opinion’, ‘religion’, etc etc…

Take a map of your town or city from today, and compare it to one from 100 years or 200 years earlier. What do you find? Do you really think that the other forms of ‘maps’ have somehow remained accurate / precise over the same time period? Your ‘belief systems’ are maps. You really believe that people have no learned anything since 2000 years ago when your ‘books’ were written, the books that you’ve used as ‘maps’ to guide you through life?

Consider THESE maps ‘No-one could love me’. ‘I am doomed to failure’. ‘I’m just no good’. I’m stupid. I’m ugly. No-one likes me. I can’t do anything right. I don’t deserve to be happy. I don’t deserve success. If I succeed, it makes my father look stupid / incompetent / a failure. It’s my fault dad left, and we lived in poverty. I’m no good. I’m a failure.

Call them definitions. Expectations. Limiting beliefs. They all form part of your map. Your mental map. The map of YOU and YOUR LIFE. YOUR reality. Your subjective reality. They appear on your maps as ‘Do not enter here’, or ‘here be dragons’ or as impossible to pass obstacles like mountain ranges or canyons or oceans. So you don’t try. You don’t go there. You go back to where you are now. Unhappy. Miserable. Conflicted. Depressed. Anxious. Despairing. Self-sabotaging. Self-fulfilling prophecy fulfilling…

Consider THESE maps ‘Fear god’, ‘Obey authority’, ‘God blesses the people who bless the Jews’, ‘Jews MUST re-found Israel before Jesus will return and ‘Rapture’ us all to heaven’, Tobacco is sexy, Alcohol is fun, Enlist in the army today, A piece of paper saying ‘Go overseas and firebomb women and children’
MUST be obeyed…it is impossible NOT to obey this command / directive / suggestion…

Consider hypnosis as itself a metaphor. Hypnosis substitutes one subjective reality for another, for the duration of the trance state, or longer for a post hypnotic suggestion.

Everything is metaphor. E-M soup.

A trance / map includes negative hallucinations i.e. people don’t see what IS there, and positive hallucinations i.e. see things that are NOT there…

If you’ve gotten into a trance of ‘I’m not worthy of love / success etc, then you will fail to see all the evidence that contradicts this…all the past experiences, and all the current opportunities, that contradict the trance belief / suggestion…so you can break the cycle by getting the client to see all the contradictions they have been overlooking, redefining, spinning, distorting e.g. ‘oh, she just felt sorry for me’, oh, that was just an exception, oh, no, she didn’t mean it that way…oh, well, no idea, some people are just crazy I guess, oh, they didn’t realise but then when they did they…i.e all the ways people manage to take their experiences and make them ‘fit’ with their belief systems / internal maps / definitions of reality / subjective reality and of course the official ‘social reality’…

Of course it is comforting to imagine some ‘fixed reality’ exists, and that you already KNOW it…that someone else found it and gave it to you…told you…lucky you…you are grateful that they found the truth, and saved you the hassles of finding it for yourself…life is much easier when someone hands you a ‘bible’ or ‘pre-printed map’ you can follow…whatever the source or nature, from Scientology to Catholicsm to Judaism to Islam, to Marxism to…

The comfort of ‘the known’ and ‘familiar’ is powerful, as anyone who seeks to challenge ‘tradition’ or simply ANY belief ANYONE has lived with for a long time, has found out to their displeasure / cost / frustration.

So even our ‘false friend’ psycho-somatic symptoms are welcome guests, simply as we are familiar with them, and feel comfortable around them…even if they are really working against our interests…the devil we know…often can lead us to closing the door on the Angel we don’t, who comes knocking at the door…

MHR    THIS MAY BE WHY CORRECTION OF MAPS / THERAPEUTIC SUGGESTIONS / GENERATIVE BELIEF IMPLANTS, WORK BEST / OFTEN ONLY WORK, ON PEOPLE PLACED IN A NEW TRANCE STATE … TO REPLACE AN OLD TRANCE STATE, YOU NEED TO IMPLANT IN THE TRANCE STATE ITSELF…IN WHICH ALL THE ‘SUBJECTIVE REALITY’ WAS ORIGINALLY PRODUCED, IS CONTINUALLY
REPRODUCED…IN THE SUBCONSCIOUS IF YOU LIKE…IN THE ACTUAL PROGRAM…AND TO RE-PROGRAM, YOU HAVE TO GET INTO THE CODE…TO RE-CODE…THE PROGRAMS RUN IN TRANCE…AND NOT IN CONSCIOUS THOUGHT…YOU HAVE TO BE IN THE SAME STATE AS YOU ORIGINALLY WROTE YOUR CODE / PROGRAMMED YOUR REALITY / LEARNED YOUR DEFINITIONS / WERE IMPRINTED / HAD BELIEFS IMPLANTED…A STATE OF TRANCE…AND ALSO WHY REPEITION IS KEY TO IMPLANTING IDEAS / BELIEFS E.G ADVERTISING MUST BE CONTINUALLY REPEATED, IN DIFFERENT FORMATS / FORMS / MEDIA, TELEVISION COMMERCIALS RE-RUN OVER AND OVER…PROPAGANDA REPEATED OVER AND OVER…AS THESE ARE THE MAIN WAYS IDEAS / BELIEFS / SUBJECTIVE-SOCIAL REALITIES ARE IMPLANTED ORIGINALLY…OVER TIME BY REPETITION BY ‘RAPPORT’-SUPPORTED TRUSTED FIGURES E.G PARENTS, PRIESTS, TELEVISION, RADIO, NEWSPAPERS, TEACHERS…AND TRANCE STATES…EVEN 911 WAS A TRAUMATIC EVENT INTENDED TO INDUCE A TRANCE STATE VIA FEAR AND HYPE, SO THAT A NEW REALITY COULD BE ENCODED E.G THE BELIEF THAT ISLAM / IRAQ / SYRIA / IRAN WERE THREATS TO YOUR LIFE…ETC…

People resist having their reality challenged…consider how terrifying it would be to ‘go mad’. How much fear people have of ‘going mad’. Losing their mind. Under hypnosis they will resist the challenge that there are hungry tigers waiting to tear them to pieces, because they SEE hungry tigers etc…In the day to day world we act the same way. He entered trances in order to participate in the ‘reality’ of society...of our family...of our social group...otherwise we couldn’t...why would you go to church otherwise? How could you disappoint your parents who have done so much for you, by rejecting their beliefs? How could you even communicate with people around you without first ‘entering into’ their subjective reality? Just try ‘getting along’ after arguing with someone about their religion, about ‘the holocaust’, about Adolf Hitler and the Nazis’...just say ANYTHING that contradicts the official fictions, the social realities, the consensus narrative, e.g about 911, and see how fast your career prospects evaporate, how many ‘friends’ you lose, how many ‘problems’ you encounter, simply for challenging the ‘social reality’, the ‘consensus map’ you were given…

Oh, and of course you will NEVER realise how many other people secretly reject / challenge all the things you are told EVERYONE believes and ‘KNOWS’...because of self-censorship...everyone assumes everyone else believes it, a.k.a ‘collective ignorance’, and so everyone acts as if they too believe it, to avoid being victimized, the odd one out. Appearing foolish, etc etc...and so you could have the majority of people believing that ‘the holocaust’ is fiction, but being scared to say so, and pretending to believe it, and so giving
the impression that EVERYONE EXCEPT YOU really DO believe it…oh, you and a few nutjob conspiracy theorists and hate-filled Hollywood Nazi types…and you see what THEY have to deal with…loss of employment, family breakdown, prison, fines, social outcast, exile (me), etc etc…so who would bother thinking about it…who wouldn’t just ‘go along to get along’, and assume that THEY must somehow have got it wrong, as EVERYONE ELSE seems to disagree with them, and seem to be quite convinced about THEIR map…so why bother…and anyway, what difference does it make it if happened or not? It’s not as if anything would be changed by stating the truth, would it? It’s not as if world war three is going to result from the ‘holocaust’ lie, is it? Its not like some group is using that lie to enslave all of humanity, in the near future, is it? Or is it? Maybe THAT is what motivates those ‘Crazy people’ to take all those risks, endure all that sacrifice, personal hardship, personal costs ???? Do they know something MORE than simply that ‘the holocaust’ didn’t happen? Do they know WHY the mass media, government etc continue to reproduce and enforce that LIE ???

SOCIAL REALITY = COMMUNION I.E SHARED REALITY … TO SHARE SOMETHING…CONSENSUS REALITY IS SHARED BY ALL…THEY ARE ALL ‘COMMUNING’…SHARING SOMETHING…ENTERING INTO THE SAME THING…THIS IS THE TRUE MAGIC…AND WORDS CAN INDUCE HYPNOTIC STATES IN WHICH SUCH COMMUNION BETWEEN THE ACTOR MAKING THE SUGGESTION, AND THE PERSON RECEIVING THE SUGGESTION…IN THE SAME WAY THE PRIEST SUGGESTS ‘ THIS WAFER IS THE BODY OF CHRIST AND THIS WINE IS THE BLOOD OF CHRIST’ AND THE RECIPIENT AGREES / ACCEPTS THIS REALITY…ENTERS INTO IT…THE MAGIC IS SUPPOSED TO BE THAT BY EATING THE GOD, YOU BECOME ONE WITH THE GOD…THIS IS THE BASIS OF HOMEOPATHIC MAGIC…but the REAL MAGIC IS THAT YOU HAVE ENTERED INTO A TRANCE, INTO A SUBJECTIVE SHARED REALITY IN WHICH YOU ARE NOW PARTAKING OF THE GODMAN, AND BECOME ONE WITH THE GODMAN, AND GOD…

So ‘Holy communion’ is a trance induction / hypnotic phenomena that reinforces the ongoing trance of ‘religion’ that was implanted at birth, with religious rituals being performed from then on, phrases like ‘god’ and obsessive compulsive behavior like ‘crossing oneself’ and uttering mantras like ‘god protect us’…

MHR… THE REASON YOU CAN’T UN-TRANCE PEOPLE, CHALLENGE THEIR TRANCE REALITY IMPLANTS AND POST-HYPNOTIC SUGGESTIONS (E.G BEFORE LEAVE CHURCH SERVICE, CLASS, THE TELEVISION ‘PROGRAM’) IS THAT PHILOSOPHERS ETC LIKE MYSELF TRY TO DO THIS OUTSIDE OF TRANCE STATES…I.E IN LUCID STATES…USING REASON...COMPELLING ARGUMENT…AND THE ONLY WAY TO COUNTER A TRANCE REALITY / DEFINITION / STATE /
SUGGESTION IS WHILE IN TRANCE … WHICH IS WHY THERAPEUTIC
TRANCE / HYNOTIC INDUCTIONS PROVE SO MUCH MORE
SUCCESSFUL THAN ANY OTHER FORM OF THERAPY, IN WHICH
PEOPLE MAY INTELLECTUALLY REALISE WHY THEY ARE
BEHAVING IN DYSFUNCTIONAL, SELF-LIMITING WAYS, BUT STILL
NOT BE ABLE TO CHANGE THEM … BECAUSE THEY ARE SEPARATED
BY AN INVISIBLE BARRIER FROM THE SOURCE CODE … THEY MUST
ACCESS THE CODE TO RE-PROGRAM IT. TO RE-WRITE IT. AND THE
HUMAN MIND – COMPUTER CAN ONLY ACCEPT INSTRUCTIONS /
PROGRAMMING WHILE IN TRANCE STATES OR FROM CONTINUAL
REPETITION I.E THE BASIS OF PROPAGANDA-ADVERTISING-
INDOCTRINATION-EDUCATION SYSTEMS. AND AS WE DO NOT HAVE
THE BUDGET GOVERNMENTS AND CORPORATIONS DO, OR THE
POWER TO COERCE PEOPLE TO PARTICIPATE IN OUR RE-
PROGRAMMING E.G COMPULSORY EDUCATION AT SCHOOL AND
WORKPLACE, OUR ONLY POSSIBLE CHANCE OF SUCCESS IS
INDIVIDUAL TRANCE INDUCTION, DURING WHICH WE CAN FREE
THOSE WHO VOLUNTARILY CHOOSE TO EXIST THE SOCIAL REALITY
BUBBLE, TO BECOME FREE TO DEFINE REALITY FOR THEMSELVES.
WHICH IS WHY I AM WORKING SO HARD TO TOTALLY UNDERSTAND
AND MASTER HYPNOTIC / TRANCE INDUCTION.

THE COMPLETELY FICTIONAL MOVIE 'SCHINDLER'S LIST' IS AN
EXAMPLE OF HOW HOLLYWOOD JEWS INDUCE TRANCE, VIA
VIVIDLY EMOTIONALLY MOVING STORYLINES AND IMAGES, AND
THEN IMPLANT, AND REINFORCE THE SOCIAL REALITY KNOWN AS
'THE HOLOCAUST', SO WELL THAT A JUDGE WILL ACT AS IF 'THE
HOLOCAUST' WAS ALREADY PROVEN BEYOND ANY DOUBT, AND
THERE IS 100% CONSENSUS AMONG ALL GOOD AND SANE PEOPLE
THAT IT IS REALITY. MOST PEOPLE ACTUALLY TAKE THE
REPRESENTATIONS SHOWN IN 'SCHINDLER'S LIST' AS A
DOCUMENTARY FILM OF WHAT ACTUALLY HAPPENED.

MHR… THE REASON YOU CAN’T UN-TRANCE PEOPLE, CHALLENGE
THEIR TRANCE REALITY IMPLANTS AND POST-HYPNOTIC
SUGGESTIONS (E.G BEFORE LEAVE CHURCH SERVICE, CLASS, THE
TELEVISION ‘PROGRAM’) IS THAT PHILOSOPHERS ETC LIKE MYSELF
TRY TO DO THIS OUTSIDE OF TRANCE STATES … I.E IN LUCID
STATES … USING REASON … COMPELLING ARGUMENT … AND THE
ONLY WAY TO COUNTER A TRANCE REALITY / DEFINITION / STATE /
SUGGESTION IS WHILE IN TRANCE … WHICH IS WHY THERAPEUTIC
TRANCE / HYNOTIC INDUCTIONS PROVE SO MUCH MORE
SUCCESSFUL THAN ANY OTHER FORM OF THERAPY, IN WHICH
PEOPLE MAY INTELLECTUALLY REALISE WHY THEY ARE
BEHAVING IN DYSFUNCTIONAL, SELF-LIMITING WAYS, BUT STILL NOT BE ABLE TO CHANGE THEM...BECAUSE THEY ARE SEPARATED BY AN INVISIBLE BARRIER FROM THE SOURCE CODE...THEY MUST ACCESS THE CODE TO RE-PROGRAM IT. TO RE-WRITE IT. AND THE HUMAN MIND – COMPUTER CAN ONLY ACCEPT INSTRUCTIONS / PROGRAMMING WHILE IN TRANCE STATES OR FROM CONTINUAL REPETITION I.E THE BASIS OF PROPAGANDA-ADVERTISING-INDOCTRINATION-EDUCATION SYSTEMS. MOST PEOPLE ACTUALLY TAKE THE REPRESENTATIONS SHOWN IN 'SCHINDLER'S LIST' AS A DOCUMENTARY FILM OF WHAT ACTUALLY HAPPENED.

OF COURSE MOST NOVEL WRITERS STARTED OUT WANTING TO SHARE SOME MESSAGE WITH THEIR READERS, AND THE ENTIRE NOVEL WAS INTENDED AS A VEHICLE TO GET THEM TO FIRST PAY ATTENTION, AND TO CREATE THE MENTAL STATE IN WHICH THEY MIGHT BECOME RECEPTIVE TO THE MESSAGE. A MENTAL STATE IN WHICH THEY WOULD NOT RESIST THE MESSAGE. DENY THE MESSAGE. THE NOVEL IS A WAY OF DELIVERING THE MESSAGE THAT BYPASSES THE CONSCIOUS RESISTANCE TO ANY CHALLENGE TO WHAT IT 'KNOWS', IS 'COMFORTABLE WITH', AND 'BELIEVES'. IN OTHER WORDS ITS 'SUBJECTIVE REALITY'. JUST WRITING A PHILOSOPHICAL TREATISE WILL HAVE LITTLE IMPACT. FEW WILL
READ IT. AND MOST WILL SIMPLY DENY AND REJECT ANYTHING IN IT THAT DOES NOT REINFORCE THEIR COMFORTING, KNOWN, FAMILIAR PREJUDICES, IMPLANTED BELIEFS, AND PRIOR DEFINITIONS OF 'REALITY'. WHICH IS WHY I WROTE MY OWN NOVELS.

BUT NOW I REALISE HOW SOCIAL REALITY IS IMPLANTED, AND THE ONLY WAY FORWARD TO CHALLENGING THE MAPS PEOPLE HAVE INHERITED, AND ARE BEING CONSTANTLY CONDITIONED TO ACCEPT AS 'THE TERRAIN' ITSELF. AS REALITY. AND I WILL SEEK A WAY TO USE THE TOOLS THAT HAVE ALWAYS BEEN USED AGAINST PHILOSOPHERS AND PHILOSOPHY, IN FAVOR OF PHILOSOPHY. WHICH I DEFINE AS BEING THE LOVE OF TRUTH AND JUSTICE. OF MAP-MAKING. OF MAKING MAPS THAT CORRESPOND AS CLOSELY WITH THE TERRAIN AS POSSIBLE, BUT NEVER RESIST BEING REDRAWN TO REFLECT PROGRESS IN OUR QUEST TO COMPREHEND TROONATNOOR, THE REALITIES OF OUR NATURES, AND THE NATURES OF OUR REALITIES, EVEN IF REALITY TURNS OUT TO BE TOTALLY FLUID, A DREAM OF OUR OWN CONSENSUAL IMAGINATION, WITH NO FIXED POINTS AT ALL. FOR IT IS THE QUEST FOR TruthS, RATHER THAN FOR ANY PARTICULAR 'TRUTH', THAT DRIVES US. WE DON'T SEEK TO PROVE OURSELVES, OR ANYTHING, RIGHT. WE SEEK THE TRUTH. SEEKING TruthS DOES NOT REQUIRE THAT ANY OBJECTIVE TRUTH EXIST. IT COULD ALL BE ELECTRO-MAGNETIC SOUP THAT WE RESONATE TO VIBRATING AT DIFFERENT WAVELENGTHS AND FREQUENCIES TO PRODUCE WHAT WE EXPERIENCE...OR IT COULD ALL BE INSIDE OUR HEADS, A PURELY VIRTUAL EXPERIENCE...WE LOVE DRAWING MAPS THAT ARE AS ACCURATE AS WE CAN DRAW THEM...SO PEOPLE DON'T FALL OFF CLIFFS, OR DROWN IN OCEANS...OR WORSE...FALL INTO RELIGIONS, AND DROWN IN PROPAGANDA ...

Supposed ‘facts’ are interpreted differently, by different people, at different times i.e not just a question of ‘facts’ … but their interpretation...

Every definition is either given by an authority figure or significant other, thus gaining ‘credibility’ and ‘transferred authority”, or is induced from experience, often single, dramatic, often traumatic, experiences...Meaning is reflexive, the relationship between things...many things connote other things by association...loaded with meanings not shared...though attempt of religious etc authority is to ‘commune’ / ‘communicate’ / suggest the same belief / meanings / definitions in every member of the group, even where the leadership know these
to be lies a.k.a Plato’s ‘Noble’ lies…i.e Atheists make the ‘best’ Catholic priests, and even ‘better’ Popes and Bishops…

We ‘inherit’ other peoples decisions in the form of their ‘noble’ lies, misunderstandings, superstitious belief formations, etc…every ‘definition’ or ‘belief’ or ‘idea’ NOT based SOLEY on personal experience, (which would require growing up from birth totally isolated, therefore won’t happen, as we need others to survive), is someone ELSE’s decision / conclusion / judgement / interpretation…most of us ‘go along to get along’ because those who do NOT conform suffer active penalties, or at very least are passively denied benefits / affection / approval / acceptance / rewards / social status / belonging / comfort / love / careers / perks / privileges all associated with ‘toeing the consensus line’…reflecting back the social reality that has been imposed upon them…at very least acting as if they believe the same things…and at very least never contradicting the social reality ‘consensus’ in ANY observable way, either linguistically, or through gestures, …e.g ‘you LOOK like you are in contempt of court / insubordinate…

a traditional definition of hypnosis (hypnotic belief systems) holds that hypnosis is the communication of ideas and attitudes that take a firm hold on an individual’s inner belief systems and then lead that individual to respond to the "implanted suggestions,"

Our reality is limited to the prescribed ‘consensus’ social reality…we are prisoners of invisible chains and walls…in our minds…excluding as the opportunity cost of ‘belonging to the group’ all the other possible, alternate, ways of being, seeing, experiencing, defining, interpreting…

In personal subjective reality take form of phobias and irrational beliefs about the self i.e delusions of grandeur or worthlessness, unlovability, doom to failure / rejection etc…

Imprinted beliefs often contradict each other…but as subconscious / irrational, this poses no ‘problem’ to mind-body… often supplant existing, or replace it, depending on strength of ‘conviction’ i.e affect of implant…power of engram…priorities of belief systems…i.e plural…multiple…

MHR arguing with someone, ‘proving’ their beliefs are false / erroneous / invalid/ unjustified, does NOT solve problem…as problem was implanted during trance state, and/or constantly repeatedly reinforced by all representational systems, over long period of time e.g birth to now in many cases…e.g neglected / unwanted child…feeling of being unlovable / rejected / undesirable / disapproved of/ abandoned is going to be implanted, then constantly reinforced until at least child leaves home…but then will seek out ‘proof’ of this, positively and negatively hallucinate in ways that strengthen the ‘feeling’ / belief … until comes
across a therapist or other trance induction situation that can approach within the trance state, the problem...in a trance state...and then encourage conscious habits of deliberately seeking out evidence that ‘I’m O.K, people like me, I can make friends, I can gain approval / acceptance / love like anyone else...etc...

MHR working class taboo on ‘success’ and ‘achieving’ enforced in school even by principal ‘don’t get a big head’ etc...don’t shine and make others feel less worthy...all working class / Marxist ideas to keep the mass of people ‘equal’, while preventing any climbing out to the elite classes i.e jealously guarded for idiot children of existing elites...

I asked Dr. Erickson the following question: "Would you say that you perceive all presenting symptoms and complaints as being metaphors that contain a story about the 'real' problem, and that your basic approach is to build metaphors that contain a story about the possible solution?" Dr. Erickson's face lit up and, like a little boy finding a surprise, he said, Exactly!

Belief systems are metaphors; that the individual operates and responds metaphorically to the world! It takes metaphoric approaches to help expand each individual's choices.

After the odyssey through the Magic Theater, the hero in Herman Hesse's Steppenwolf laughs out loud as he realizes that reality is nothing but the free choice of one of many doors that are open at all times. — P. Watzlawick, cited

Once an individual discovers 31 flavors of ice cream, he will find it difficult to insist that there is only vanilla. I hope to point out throughout this book that hypnosis is, itself, a very powerful metaphoric state; that the problem itself is a metaphor based on old belief systems that were produced by conditions that could be labeled hypnosis. It would seem logical, therefore, to grasp and use this powerful tool called hypnosis to help build new, graceful and efficacious metaphors. These new metaphors will then be directed toward new choices and responses to the "real" world. Paul Watzlawick (cited) approaching the same destination from a different direction stated:

The aim of realistic, responsible therapy can only be increased skill in dealing with life's problems as they arise, but not a problem-free life.

It is imperative that we know how to translate another's metaphors.

Processing will be based on our past experiences, belief systems, expectations and values. By processing, meaning encoding of ‘out there’ into our personal
representational systems...some parts of which ARE shared, but many unique to our background, past, education, experiences, physiology e.g color blindness, tone deafness etc....It is MAJOR MISTAKE to assume all these are also shared...as then only hallucinate COMMUNICATION i.e SHARING of meanings / intended communication...

Estimated that 40% of the population, at least in the United States, tend to prefer a visual system for expressing their experiences to another. These individuals tend to use highly visual words such as, 'I see what you mean,''That looks good to me,' "I am still not clear as to output systems. Could you show me an example? A second 40% of the population that tends to prefer a kinesthetic "output" system in communication to others. They tend to use such phrases as, "This is hard for me to grasp," "I want to get a handle on it," "Hey! It is starting to fall into place." In short, these individuals tend to feel it is important to put out information in a firm and solid manner so you can get a hold of it. Last, but not least, there is another 20% who tend to prefer an auditory "output" system. These individuals tend to use many words so as to insure understanding. In addition, they use phrases such as, "That sounds all right to me," "It is starting to ring a bell," Each person will use all systems to some degree, but one will dominate the others, which will be employed to support this dominant one. So you'll get a mix, with one system dominant. That is the system to employ yourself. To paraphrase your usual way of communicating in. So they 'hear what you're saying', 'see what you mean' or 'grok what you mean / feel you / get it'.

Sometimes people emphasise different representation systems depending on the situation. But generally they favor one over the others.

Being ‘stuck’ in the representation system associated with an implanted belief can be an observable indicator of the ‘location’ of the source of a symptom...

Depressed people tend to be ‘stuck’ in negative, painful, uncomfortable, even miserably, kinesthetic representation systems i.e ‘feelings’ and ‘emotions’. I ‘feel terrible’. I feel like...It feels like...weight of the world...weight of my problems...overwhelming power of emotion...weighed down...out of touch...feel hopeless ... though they may ‘hear’ a negative internal voice, and ‘see’ no future for themselves...

If the representation system we are ‘stuck’ in does not have enough options / has limited resources and therefore choices, simply using other representation systems can open up alternatives, choices, opportunities i.e generate potential solutions...free us...get us ‘out of the rut’ (kinesthetic !) so we can now ‘see some hope for the future’ and ‘that sounds like a plan’...
It is like freeing the 1000 flowers of the soul...some are activated by color, some sound, some feeling...defined by...like 'resource partners' or 'dimensions of the self' that are not activated, consulted, allowed to participate...

'Grasp my meaning?' Are we on the same page? 'Get it?' Vs 'See what I mean?' Do we see eye to eye now? Vs 'Do you hear what I'm saying?' Does that sound right?

Consider each representation system as a resource, with its own unique approach...if you don't deliberately activate all of them, you are missing out on what they have to offer...and if you got 'stuck in a rut', then you definitely NEED their help...so encourage to use different expressions e.g visual, audio, kinesthetic, and also to focus on different impressions / memories that arrived via / were processed through, these channels...MHR if one channel blocked, maybe because an experience processed in this channel in the past i.e traumatic one / dramatic one, was repressed, along with the representation system...

Use their dominant representation system to induce trance i.e do NOT ask visual person to 'feel their arm getting heavier', instead get them to VISUALISE their arm falling, or weights attached to their arm...you are more likely to get success...and reinforce belief in efficacy of trance induction...instill positive expectations and confidence...which is basis of all trance / hypnotic induction...belief that you are being induced / hypnotized...it is ALL acting...all metaphor...all a decision at some level...a consensual reality like all experience...so use natural process of trance called 'reality perception construction' to induce this particular trance state, for therapeutic use...

When seeking to induce age regression, focus on the representation system them are most able to work with e.g suggest they 'see' what they saw, or 'heard' what they heard, or 'felt' what they felt, back then, in that situation...or to get them to pretend to regress, use the representation system they use, to induce them into imagining a situation...don't ask them to imagine sounds, if they are visual, etc...

I would like to give you an example from my clinical practice. A colleague of mine, a physician, asked me to consult with a patient. This patient was suffering intractable pain throughout his back. He had been hospitalized for a series of tests. The tests had revealed that he had terminal cancer, but he had not been informed of the findings at that point. When I met with the patient, he made statements such as, "It hurts. I feel torn up by the pain. I can't stand up to the pain much longer." By his output systems (words), I knew he was, at least in his present experience, kinesthetic. I asked him what he, in the past, had found peaceful and relaxing. "Sailing," he replied, and his face relaxed slightly. I then asked him what he liked about sailing. His reply was most informative. "I like the sound the boat makes going through the water, and the rippling sound the sails make when you have a good wind." With those brief remarks, he had told me...
what system he used to reach the feelings of relaxation and peacefulness. I asked him to close his eyes and remember the sound of rain hitting a window. After a few moments, I asked him to remember the sound of crackling fire. When I could see the signs of relaxation (deeper breathing, facial muscles relaxing), I asked him to "see" the flames as he listened to the sounds of the warm relaxing fire. I then said, "As you begin to feel the peaceful warmth of the fire, your whole body knows how to remember all the pleasure. Then you might want to see yourself sailing." There was now evidence of deep relaxation. After several more requests by me for auditory memories leading to kinesthetic experiences, he had entered hypnosis.

What follows is Heller doing what I came to do myself, with my 'glass markus' after reading some NLP stuff about representation systems…which worked for me to control migraines during a few day, stressful period when moving / buying a flat, without any medication…

Where you have an individual who is in physical pain, whether from an accident or illness, that person will be very much into their kinesthetic system. The goal is to help them move into another system; e.g., visual. This will help them to actually utilize a different area of the brain from the part that controls pain. When you have accomplished that switch, their perception of pain drops while their perception of comfort increases. To put it to you in another way: You are helping them to use a different system for the "expression" of their problem (pain). One way of producing that result is to ask the "pain patient" to make a "picture" of what the pain would look like. For example, a woman was complaining of a severe headache in my office. She said that it was so bad that she didn't think we could continue our session. I asked her to close her eyes, and see what color her headache was. She looked at me as if I was crazy. Of course, she was right. I just get paid well for it. Finally, she shrugged her shoulders and closed her eyes. After a short time, she informed me that she did have a picture of colors, and that "it seems to be bright reds and oranges." I then instructed her to listen to the steady sound of her breathing, and with each exhalation, she would breathe more and more of those colors out of her system. She was told to continue until she could see it "all" across the room, as if a painting hanging on the wall. It was several minutes before she signaled that the picture was on the wall. I asked her to see someone walking into the room, taking the picture off the wall, and to hear that person's footsteps as he walked out of the room. In less than five minutes she terminated the hypnotic state that she had spontaneously achieved, with the headache gone. From what you have just read, I know that you can see and grasp firmly the concept that each system has a different way of "expressing" itself. If an individual is unable to "solve" a problem—pain in the above example—you, as a people-helper, can help him/her utilize a different system. In the areas of "emotional pain,"
perhaps "looking" in a new way may help him/her to see a solution. Perhaps "listening" or "grasping" something new might do the trick. Changing the "pain patient's" kinesthetic system to a visual one will almost always do the trick. I have used that method with severe burn patients, cancer patients, and for surgeries in which anesthesia could not be used. You could...TRY IT YOURSELF. You may be very pleased...

I overheard a conversation between a well-known actress and her two companions, one of whom was evidently her producer. She was describing her last few days as "being uptight." She made statements such as, "I've really been tied up in knots; the stress of our shooting schedule is crushing me; I finally had a good night's sleep; I just floated off and woke up this morning feeling lighter; I have decided to stay loose." The producer listened politely and then responded, "You should see the rushes. You look great. We have a good product and when they see it they will be impressed." As the producer talked, the actress began to look annoyed and then bored, and then, totally uninterested. As soon as the producer finished, she turned to her other companion and began talking with animation. She hardly said two words to the producer from that point on. Here was a beautiful example of how not to communicate. i.e using totally different representation systems...

Listen to and watch the people around you. Pay attention to the fact that some people will paint vivid pictures with their words. If they are describing a trip to the mountains, they may use words that describe what the mountains looked like. As they talk, some may even paint a picture by the movement of their hands. Another person may describe the same subject by the feelings of the experience. "I felt so calm and relaxed in the mountains, and the soft mountain breeze really felt good." As they talk, their hand gestures will be that of "getting in touch" with something; contact to their own body; touching their chest areas; contact with the other person. The auditory will tend to talk about how the mountains sound to him. They may use many words to describe the experience in detail. Even when they are describing the feelings or something visual, they will tend to use many words. Some people may fool you at first. As you really tune in, you will grasp their system more easily and see clearly how different those systems are. Keep in mind that each system is important and that no system is "better" than another, and that all of the systems exist within us.

After you have practiced listening to the people around you, and are becoming comfortable in recognizing their (preferred) output system, you are ready for the next step. You can now begin to take a more active role in discovering their preferred output system. In general conversations, you can begin to ask neutral questions, such as, "What does comfort mean to you?" or "What did you enjoy most on your vacation?" To questions phrased in that manner, a kinesthetic might reply, "I feel loose, relaxed, without pressure," or "It really felt good to get away.
I could feel the everyday stress fall away." A visual, in responding to the question about comfort, might say something like, "I see myself in a beautiful piece where the sky is blue, and everything looks peaceful." To the question about their vacation, the visual might respond, "Wow! The scenery was great. There was so much to see." In any case, you will be pleasantly surprised to discover the differences. Be careful when you are asking these questions, however. If you ask someone, "Can you describe what the mountains looked like to you?" you will, in most cases, get a "visual" answer. Through "demand characteristics" you are asking them to switch to a visual system. "How did you feel on your vacation" demands a kinesthetic response. Most individuals, unless they are under stress, are flexible enough to "switch."

Suppose a person enters a therapist’s office and says that they are suffering from depression. S/he goes on to say that s/he is being crushed by his/her feelings, and is really feeling down. S/he is, at that moment in his/her life, stuck in the kinesthetic system. S/he is in pain, which is a kinesthetic experience. As long as s/he continues to stay in that system, the problem will remain. If the kinesthetic system contained choices s/he could easily use to be more comfortable, I believe s/he would have made that choice. As you begin to help that person step back and look at what is going on in his/her life, you are helping him/her to "switch" systems. This often leads to "seeing" different choices. Switching an individual from their conscious output system will often result in that state that does not exist...hypnosis. In addition, it helps the individual "use" another part of their brain from the part that is causing the "problem." In effect, you help them to break their "mind set," and enable them to call upon another "partner," or system, for the solving of their problem.

MHR purposeful action = calm, happy, satisfied, content...we tend to use tobacco, food, or alcohol, even coffee, to ‘justify’ a break i.e to continue feeling purposeful, but taking a break from something...few people define ‘a nap’ as purposeful or a walk outside as purposeful...then taught to ‘reframe’ these as a ‘power nap’ or ‘power walk’ after hearing how famous inventors took naps during day, on day beds in their offices...etc...so if can get self to adopt some ‘break’ activity that is purposeful, without adding calories, toxins, drugs, etc to your system...e.g juggling, power nap, walk, cleaning, meditation...to replace eating, drinking, smoking...some ‘other’ purposeful action to ‘feel right’ and ‘maintain the feeling’ produced by ‘work’ or ‘study’...whenever time comes to ‘take a break’... don’t need ‘excuse’ of ‘a smoko’ or ‘coffee break’, or ‘lunch break’...just a ‘break’...because in reality THAT is what you REALLY want...not the food, tobacco, alcohol, coffee...you want a break, and these are just great excuses, as they feel ‘purposeful’...EXCUSES to take a break...but you do not NEED any excuse...though easier with concept of ‘power nap’...etc...
CASE 4: SYSTEMS — DEPRESSION A woman entered my office in what I could best describe as a "crushed" state. She sat slumped in a chair, and used one kinesthetic phrase after another to describe the state of her life and being. Using kinesthetic phrases, I asked her to really get in touch with those feelings, and to hold them. She was instructed to close her eyes and to really feel all the feelings, with particular effort to be made experiencing her physical sensations. This part of the procedure began a process of directing her attention away from her emotional state to that of her physical state. Next, she was told to feel her mind beginning to build a clear picture of what all those feelings would look like. I said, "The picture you get may be colors, or some situation, it may look sensible or nonsensical." Within a few minutes, her breathing rate had deepened and her general demeanor was much improved. Several minutes later she began to laugh, and stated, "I have a picture but it doesn't make any sense. In fact it looks ridiculous." I said, "You now have several choices as to how to deal with that picture"—an implied suggestion that there were options in reaching a new solution. "You can either remember the sound of the wind and see the picture being blown further and further away until you can see a beautiful sky. In that clear sky is a bright warm sun, and you can soon feel all that warmth and comfort." This last statement offered her the option of moving back to her kinesthetic system, but now in a pleasurable way. This would result in a basic restructuring of her kinesthetic experience. "Another choice you have is to question some object or person in your picture. If you do so, listen first to the sound of that voice, and then the words, until it is clear to you." She chose the second method, and within five minutes she opened her eyes with a start. She informed me that she now knew what was bothering her. I asked her to again close her eyes, which she did. I then said, "I would like you to let your creative unconscious mind produce a new picture. This picture will be from some time in your past when you felt stuck in a similar situation, but where you had found a solution. I would like you to then watch that part of you as she updates that solution to fit your present situation until it looks just right. Then wait until what you see feels good and strong, and you experience those feelings now." It was nearly ten minutes more before she opened her eyes. She smiled and said, "I'm not sure what happened, but I feel very good." I then asked her to practice changing any uncomfortable feelings into pictures, just as she had done in my office. Two days later her husband called. He told me that his wife was happier and more relaxed than he had seen her in months, and that "she even looks and acts younger." The procedure as described was not a cure, but it was a giant step in the direction of new choices.

SYSTEMS: RAPPORT

An important and practicable application of the use of output systems concerns the establishment of rapport. Meeting someone in "their system" establishes rapport almost instantly, and improves rapport with those people you are now
interacting with. In addition, being able to communicate in another's system can help you to quickly make a connection to the so-called emergency e.g actively suicidal patient. He was feeling totally hopeless. Mine was one of the three names he had been given. When he called me, I listened carefully to the way he expressed himself. Some of the statements he made were, "I feel crushed by my problems; I don't know if I can stand up to it much longer; I know I'm going to collapse soon." To his (kinesthetic) statements, I responded, "It must be rough trying to carry that burden yourself. You must get really down from the struggle. I would like you to reach down and grasp just enough strength to get in to my office. I really feel that if we get together and tackle this problem, we will be able to pound out a solution. Once you get a handle on things, the weight will fall away." He responded, "Thank God! I finally found somebody who understands my problem." Now, I had no idea what his "real" problem was. I knew that he was stuck in one system, at least as to his present problem. I needed to meet him in that system before I could even begin to lead him out. Rapport was established, on the phone, within a few minutes. He kept his appointment, and within a few sessions he was beginning to "look" for new solutions, and was beginning to "see" things that needed to be "clarified."

What you have been reading describes the conscious output system: How an individual communicates in their own conscious mind (internal dialogue) as well as to the listener, what their present experience is. I hope you have a clear picture as to what the visual system is. I have made every effort to paint a clear picture for you. I also want you to grasp the concept of the kinesthetic system. I feel confident that you will get comfortable with it. For those of you who are auditory, you could read all the words again until they sound right and ring true. Keep in mind also, that in helping someone to use all their systems, you help them to discover new choices. Within each system is information that may include a solution: information they may have heard, something they may have seen, or a time they responded with different feelings in a similar situation.

Among all of their systems there is an answer. However, where an individual is only relying on one system and is stuck, they are, in effect, excluding from their conscious awareness at least two-thirds of their history and experiences. If that is the case, it is not surprising that they are in pain.

Every impression e.g experience sensory inputs, like any word, can have denotative and connotative meanings i.e the literal, dictionary meaning, the 'objective' data / statistics e.g sunny day at beach, air humidity, temperature, wind speed, sand, bikinis, water…all of which will be experienced subjectively…so 'objective' always in ‘ marks’, like ‘truth’, ‘fact’ etc to qualify them… but on top of all these, and which often ‘blinds’ people, deafens them, and numbs them to the sights, sounds, textures, feelings a ‘clear’ person will experience, or a child for the first time…are all the connotative meanings, all the
associations every input on that beach has for each individual...often just ONE of these impressions will block out all the rest e.g. self-consciousness of ‘I’m fat, everyone is laughing at me’...or ‘sharks are going to eat me’...so very hard to be ‘here, now’ and ENJOY all the great feelings of ‘beach’...fear of skin cancer, fat shaming, looking silly, sharks, drowning, blue-bottles, waves...and of course consider meanings of ‘waves’ to surfer or family with young children...a wave from a child vs and adults perspective...start ‘inhabiting’ the P.O.V of other people, enter-into-it, to improve your intu-it-ion...

The ‘clear’ person, to borrow a term from L Ron Hubbard, and use it in a similar way, or ZEN practitioner, would experience everything the beach had to offer, would be aware of every impression, every stimuli, have a very intense, full experience, attending to every detail as it made itself felt on his sensory system, on the nerve endings in their retina, ear-drums, nose, tongue, feet, skin, etc...would be there, then...on the beach...not off someone in their mind, reflecting on something else, carried away on lines of association to some past experience, or some future, anticipated, imagined one...either way not present, but off in some imaginary world inside their own mind...they are mostly non-conscious of their immediate environment, what is going on around them, and lost in their internal reveries...somewhere ELSE...very dangerous if they are operating a car or truck, or even walking along a crowded beach...

**ORIGIN OF EYE ACCESS CUES TODAY ASSOCIATED WITH NLP AND BANDLER:** What NLP calls ‘eye access cues’ began their life In 1969, when Bakan discovered a relationship between eye movement and hemispheric recall. He and others developed the idea, which later Bandler and Grinder systematized and made famous. Though I’ve never heard Bandler credit any of the people who he borrowed most of his ideas from, suspiciously changing the names and introducing / coining new terms beyond what was ‘necessary’, and appearing to be more of an attempt to ‘cover his tracks’, so people would credit him with more originality than he deserved. Quite disappointing when you pull back the screen to see Oz, your ‘heros’, naked!

We need to practice our ZEN observation skills...calmly, alertly, with an ‘empty’ mind free of any mental chatter or noise or reverie...being right here, right now, allowing this person, there, to be themselves, and to attend to their every communication, verbal and non...with ‘eye accessing cues’ offering us potential information / insights the un-trained therapist / interlocutor would probably miss, or otherwise only ‘intuit’, without being able to explain ‘how’ i.e subconsciously ‘reading’ the interlocutor’s accessing cues...

Ask a question, and attend to their EVERY response as a potential answer, piece of the puzzle...where their eyes move will offer an indicator of which representation system they prefer / dominates their process...are they accessing
some past memory? Imagining some future situation? i.e recalling or constructing internal experiences in response to your question / utterance? …

Steve Heller is more like myself than any other person in this field, in terms of his approach / philosophical method…actually clarifying what is going on more than anyone else…and so he is most useful for comprehending what is going on…he approaches writing about subjects, his own guides, in the same way…being explicit…working out what is happening and why…so we can ‘grok’ it too…first he has to grok it…then he really bothers to find a way to express this…rather than simply let people tape his lectures / sessions…i.e he like me works much harder at the hardest bit…communication / how to express this so others can share it…so Heller reminds us that everything is hypnosis / trance…and that the moment the person begins ‘accessing’ their representation system, they are no longer here, now, but somewhere else, in their imagination, in their mind…and if that place is a bad place, full of fear, failure, rejection, etc, the person will be doomed to relive it / create that place in reality e.g a job interview, attempt to meet people… person will positively and negatively hallucinate…seeing things NOT there, and NOT seeing what IS there…e.g seeing negative signs of gloom / doom / failure, that are NOT warranted by the facts, and NOT seeing the positive signs of opportunity / choices / chances for success / positive feedback, that ARE there…i.e responding to subjective reality rather than ‘objective’ reality…missing opportunities for positive experience / outcomes … as stuck in a trance state … the trance state ‘induced’ by that past experience / or series of past experiences e.g of failure, embarrassment, disappointment, rejection etc…in some cases REAL series of such experiences…but often each ‘experience’ was itself ‘poisoned’ and ‘sabotaged’ by an earlier implanted definitions …the earliest ‘implants’ being the most ‘real’ to the mind…the most vivid and compelling and powerful…each later experience was modified to ‘fit in with’ the earliest ‘definitions of reality’, of TROONATNOOR…and unless that re-production and continual ‘distortion’ and ‘contamination’ cycle is broken, by new implants of more generative, positive, realistic definitions of T, then the distortions will get bigger, snowball, until all the person can perceive here and now are those elements consistent with the distorted, inherited ‘subjective reality’…and thus the old distorted reality, with its limiting beliefs, will be further strengthened / reinforced / solidified…leaving little prospect of the person ever being ‘freed’ from this mind prison…

The belief could be ‘the holocaust’ and the consistent round of propaganda films ‘excreted’ by Hollywood ever year or so, along with continual ADL propaganda, and total full spectrum domination of all the mass media and education…or a belief that ‘I’m ugly’, or ‘I can’t learn anything cos I’m dumb’ or ‘people don’t like me’, or ‘I can’t write essays so I’d better learn to use my hands’ or ‘I can’t do manual stuff so I’d better learn some other ‘trade’…”I’m not worthy of love, respect, acceptance, approval’, ‘I can never win the approval of others’, ‘I’m a
loser’, ‘I’m a failure’, I don’t deserve to be happy, I will never be happy, My parents/ the world’s unhappiness is my fault’, or even ‘If I try hard enough, I can save everyone’ i.e a typical syndrome for intellectually gifted, conscientious, children of divorced parents where one blamed them, or they assumed the blame, for the father ‘dissappearing’…etc…

So to prepare client for date / job interview / life, have to find source of these distortions… i.e first find ‘subjective reality’ person is inhabiting…interrogate it e.g generalisations, distortions, etc to ‘clear’ their mind of the rubbish / faulty / erroneous patterns / definitions…so they can now see the present for what it is…free of these past distortions / glasses / filters…that prevented them being here, now, and realising their full potential, seeing all their real options / choices / opportunities…

‘I always….’ E.g fail…well find ONE example…such as getting to appointment on time…breaks ‘reality’…defies the lies… go back to find ‘first’ time this was imprinted? Implanted? Traditional therapy. Or just replace the implant, NLP style.

In movies people ‘flash back’ to earlier episodes in their life e.g a bully beating on them, when trying to face a bully today…I clearly am a perfect example of being bullied…due to own family beating on me from birth…never learning that ‘I can defend myself’…as during my formative years that was simply impossible…everyone was that much bigger and stronger…so I learned I could not…when in fact, compared to my peers, I could easily have managed any of my later bullies…

Where an individual is looking up to their left, s/he is triggering that part of the brain in which PAST VISUAL memories are stored.

When that individual looks up to the right—your left as you look at them—they are CONSTRUCTING VISUAL images, forming a picture of a new idea, understanding or something they have never seen before.

So observe if your interlocutor appears to be doing what you asked / following you i.e are they imagining a future situation, or falling back into remembering a past one? And to calibrate, ask questions that would normally require them to either remember something they’ve seen, or construct an image of something they haven’t…and if you are ‘painting a picture’ for them, watch and see if they are really painting along with you…if you have really ‘got’ them…if they are playing along…doing as you suggest, and ‘painting that same picture’…

If you asked him/her to get a clear picture of the colors red and orange, they would again look up to the left. If you then asked them to get a clear picture of a red and orange polka-dotted elephant, they would look up to the right. (They
might first look briefly up to the left to "recall" each piece, before looking to the right.

In most people these eye movements are ‘standard’ and pronounced, easy to ‘read’… Many of the best therapists / motivators / teachers / trainers / communicators do this intuitively, without being aware that they are reading their interlocutors’ eye accessing cues as part of their general ‘intuitive’ ability to communicate i.e share meanings with people… understand people… ‘get’ people…

When, in response to a question or in any other situation, an individual looks down to their left—your right as you look at them—they are, at that moment, into their internal AUDITORY SYSTEM. In effect, they are having an internal dialogue. They may be rehearsing what they are about to say, or re-hearing a past conversation or any previous auditory experience. Another possibility is that they are "analyzing" something they have heard or wish to say.

When an individual looks down to their right—your left as you look at them—s/he is recalling PAST KINESTHETIC EXPERIENCES. As you observe that person, you will often see evidence of their kinesthetic experience: facial color changes; bottom lip becoming fuller; changes in breathing rate. As a general rule, when someone is experiencing a present kinesthetic experience, s/he will tend to look in the general direction of the listener and make physical contact to their own body. It is when that individual is attempting to recall a past experience of "feelings" that the individual will look down to their right.

People who usually respond to a question by moving their eyes up to the left are usually accessing some visual representation… in order to respond / answer the question… They will tend to do this… as their preferred / dominant representation system is visual… they process information this way… visually… they use lots of visual imagery / figures of speech in their communications…

Some individuals will almost always move their eyes down right when searching for past information. In effect, they are trying to grab hold of, and get the feeling of the information. A few individuals will look first down to their left in searching for information, or recalling a past experience. This tells you that they are using words as their "program" for recall.

Remember to calibrate, and observe… make no assumptions… even if they ‘usually’ do X, don’t assume this time they are… be all ZEN… THAT is the key to success… not learning rules… the ‘rules’ are just there to ‘open your eyes, ears, and mind’ to the existence of communication channels / information that you might normally not pay attention to, look for, listen for, … and thus filter out / ignore, miss, not perceive… it is ZEN training… sensitivity training… training in ‘being here, now, and actually listening / observing the person there, now, as they
are, and not as you ‘imagine’ them to be, ‘assumed’ them to be, ‘thought’ they were, were ‘told’ they are…’appear’ to be (based on some prejudice re: clothing, accent, age, the ‘file’ they came with, etc)…

By paying attention to eye movements, you, as a communicator, as a people-helper, and as a person who cares, will gain a great deal of information. You will know just how an individual is, at that moment in time, processing information or experiences at an unconscious level. You will "see" just what their "program" is. With this information, you will be able to communicate in a very powerful way. You can begin to communicate to that person at both the conscious and unconscious level.

If you’ve ‘established’ that the person is processing ‘visually’ right now, you can speed up and intensify your ‘rapport’ with them by not only using ‘visual’ figures of speech and language, but actually moving your eyes up for a split second before you speak and as you finish. Then you will have communicated to that person's unconscious system. You eye movements signal that you "understand" how that person is generating their experience at that moment in time. And the feeling of ‘being understood’, accepted, approved of, listened to, is among the most powerful of ‘carrots’ you can offer an interlocutor. It is a very ‘agreeable’ sensation / feeling. They will enjoy interacting with you. Want to continue. To access more of these agreeable feelings. It can become addictive. This is how people are ‘seduced’ into doing things they really WANT to do, but were too inhibited to do. From buying a luxury item to spoil themselves, to having sex with someone.

Think of ‘representation systems’ as the ‘programming language’ their computer uses. While machine code is just zeros and ones, all the applications you use on your computer are programmed in ‘specific languages’ such as C++ or FORTRAN. You can’t write / implant / add code in C++ if the program was written / implanted ORIGINALY in FORTRAN (need to check for the right analogy, as don’t know enough about programming languages etc0…

If you want to ‘appeal’ to people, you have to use the triggers that motivate them...that they care about...what their priorities are...what their dominant motives are...their ‘triggers’...their own personal ‘carrots and sticks’...and in THEIR language...using ‘figures of speech’ that THEY would use...metaphors that mean something to THEM...that mean the SAME thing to YOU AND THEM...i.e SHARED metaphors / meanings / language... and not just their ‘native’ language e.g English, but which figures of speech in English...

Consider trying to read Shakespeare or some other literature or poetry from hundreds of years ago, where the analogies, metaphors, famous people and incidents, and references, does not translate well into the current era. Because we don’t have the same experiences. We don’t use the same technologies. We are
not familiar with the events, people, etc. referred to, in the figures of speech, in
the references, in the 'jokes'...many things just do not 'translate' well...which is
why we need to read Shakespeare with a study guide, in which all these things
are explained, and translated, into the current vernacular, ... where all the
allusions and analogies are clarified...so we know what the author was TRYING
to say...and clearly DID say to the people of their own time...many 'jokes' do
not translate at all...you had to be there'...there is so much information missing
in the explicit statements...so much implicity / not said, which the readers of the
day would have 'gotten' ... it would have been obvious to them...they knew the
references...they knew who the writer was alluding to, and what events and
people, famous in their day, they were referring to...implicitly...

It is not just about the lack of shared definitions of words, i.e how are THEY
using the word, to mean WHAT exactly...or the lack of shared ASSOCIATIONS
i.e connotations that words / utterances have for different people...but also the
fact that ALL language has some figurative element...the phrasal syntax
produces the meanings via 'figures of speech'...you can rearrange word orders to
give totally different meanings...much more than just 'the cat chased the dog' Vs
the dog chased the cat', but there are so many different meanings that can be
produced by rearranging the words...and often not shared by the interlocutors e.g
'He drinks'...She's easy.

Of course we need our interlocutors to be 'genuine' in their desire to
communicate ...Vs propaganda, spin doctoring, misleading, tricking, deceiving
etc...

Where an individual is planing his/her eyes back and forth on a more or less mid-
line, s/he is experiencing an internal (auditory) argument with him/herself. In
many instances, they are also generating very rapid, and often confusing, visual
images. This "program" can occur in any individual from time to time, but is
most often seen where the individual is under extreme stress. In fact, severely
dysfunctioning individuals often evidence this pattern.

The "straight ahead" visualizer. This is a "program" where the individual appears
to be looking at the listener, but is, instead, generating internal visual
experiences. Often, such an individual is nearly oblivious to the people and
events that are occurring in the world around at that moment. There are two main
clues for spotting this program: Staring without blinking, and pupillary dilation.
If you believe that an individual is engaged in this pattern, you can test to see if
you are correct. You might hold your hand out and say, "What color rose am I
holding?" If the individual looks puzzled or confused, s/he was probably not
"picturing" straight ahead. On the other hand, if s/he continues to stare, and gives
you an answer—e.g., "It's red"—you have guessed right. If you were to then
reach out and "hand" him/her that rose, s/he might even take "it." You could even
suggest that s/he close her eyes and continue to hold and look at the rose. If you do so, be prepared to be somewhat alone. S/he will probably enter into hypnosis. I could be incorrect. S/he may already be into the hypnotic state.

Where an individual seems to be "looking right through you," s/he is really auditorializing and making a picture of what s/he is saying. In effect, s/he does not even see you, the listener. Instead, s/he has literally altered consciousness; is looking in the distance at an imaginary blackboard; talking internally and picturing either the words, or the scenes that match the words. Most individuals find this pattern disconcerting when directed at them. It is probably the single most misunderstood of all patterns. When a man uses this pattern with a woman, she will often feel as if he is "undressing" her. In reality, he hardly knows she is there. Where it is a woman using this pattern with a man, he will often feel as if "she acted as if I was nothing." Again, she is so into her own process, she's unaware of the world around her. I believe that this pattern always results in a form of "self-hypnosis." If, while someone is using this pattern, you make a sudden move (e.g., raise your arm high) or make a sudden noise (e.g., snap your fingers), you will see them almost jump. They will look confused and startled. It will be almost as if they were brought out of a "trance" too quickly. Often, that person will evidence amnesia for what had transpired just prior to their "awakening." MHR I've been accused of staring at women this way, while lost in some thoughts…

Where the individual is left-handed, it is an easy transition. Just reverse the meaning of eye movements. If a lefthander looks up to his right, he is generating past visual. If he looks up to his left, he is constructing new pictures. Eyes down right equals auditory, while eyes down left indicates kinesthetic memories. The variations mentioned above have the same general meaning regardless of left/right hemispheric dominance. Sounds and looks simple, does it not? Well, it is and it is not. There is a category of individuals that I term "cross-brain dominant." These are individuals who may be right-handed, while they are right-brain dominant as if they were left-handed. On the other hand (pun intended), they may be left-handed and left-brain dominant as if they were right-handed. When in doubt as to how a person is organized at the unconscious level, ask questions. For example, you might ask questions that require past visual recall: What color was your first car? What style was the first house you lived in? Pay attention to where the individual puts his eyes. If he looks up to the right for past information, forget what "hand" he is. His hemispheric dominance will tell you from where he is getting his experience. His handedness will only tell you with which hand he will sign his name.

It is only where their mixed system produces pain and lack of choices that I would label their mixed systems GIGO.
We change our preferred unconscious system depending on the circumstances and our internal "memories." may have one preferred unconscious system in a pleasant experience, entirely different in a painful situation. Two different programs depending on the emotional content of their experiences.

Heller warns us that a person may be accessing a visual system i.e visualizing / constructing, but is simply incapable of being consciously aware of it i.e it is happening at a level below / above consciousness. And it may be THESE visualisations that are the etiology behind their symptoms i.e producing them...Out of Conscious Unconscious System, any system (K—A—V) that an individual is unable to bring into awareness, or that they are unaware of, is their out of conscious system. In the areas of dysfunction and pain, the out of conscious system may prevent the individual from having choices as to change.

BLOCKED SYSTEMS: EXAMPLES If you or I were to visually recall an unpleasant experience from our past, we would probably begin to experience some unpleasant feelings. You might pause now...and remember some past trauma; see it as clearly as possible...and now become aware of feelings that match what you are "seeing." Since you are aware of the connection between what you are "seeing" and what you are "feeling," you have several choices that will change your feelings. You could stop the pictures, or change them to something that is pleasurable, or remind yourself that it is in the past and you survived it. But the individual who is seeing something painful, without the ability to "know" that they are "seeing" it, has a painful problem. That person will become aware of their painful feelings, but will have no idea from whence they come. Without that awareness, s/he has little or no control over what s/he will continue to experience consciously.

The individual whose visual system is out of conscious, or who claims that they cannot get visual images, is someone who, during some period of their life, was forced to, or accidentally saw things that looked very scary and caused a great deal of pain. To protect themselves from that pain, they brought down a mental curtain over those (visual) memories, and, in effect, produced amnesia for those events—at least in the visual experience. Those pictures from the past are going on internally, but that person is afraid to see them. To avoid looking at these painful images, they block out "seeing" any pictures.

Another example of the Out of Conscious Unconscious System would be that of the person who, in processing information, looks down to their right (K), describes events visually, and informs you that they have trouble "getting in touch with my feelings, the channels for bringing those feelings into conscious awareness are blocked. The person who leads with their eyes to a kinesthetic system— that is, their unconscious system is kinesthetic—but tells you things Pictorially, or announce that they have trouble feeling things, or that they cannot
get in touch with feelings, is someone who, in all probability, was forced to endure such physical and/or emotional pain that to protect themselves, they literally disconnected from that part of their experience. As a result, they have difficulty using their kinesthetic system as a resource. You will find that such individuals tend to have many somatic complaints. MHR Migraines?

Both of the preceding examples may have been very efficacious choices at the time they were first used. For instance, if I break my leg and I have the ability to disconnect from the pain while I go to a doctor to get my leg fixed, I have used that ability to make myself more comfortable. However, if I continue to block the pain in my leg and walk around on it without getting it set, I am going to end up with gangrene and the cure will become worse than the disease. People who appear in a therapist's office have, at some point in time, developed a cure worse than the disease.

MHR So ZEN: people who are not functioning well, who are in pain, tend to be making feelings out of pictures that they see in the back of their head, or they turn words into pictures into bad feelings. They do these things without awareness and, therefore, without choice. They do not deal with the world around them, but rather their inner belief system and inner reality has taken precedence over outer reality. They, in effect, use the same system to come up with the same painful memories to come up with the same painful feelings in spite of the world and the options around them. But, of course, there are those who still insist that there's no such thing as hypnosis. Yet, there are people who can sit in a perfectly quiet room with nothing going on and, in their mind, begin to hallucinate things out of the past, respond with physiological responses, and emotionally feel fear, apprehension and depression. Even if you tell them there is nothing going on around them, they continue to feel bad.

MHR … data can inform us ‘don’t do X again’, as long as all the language is precise and explicit…and the assumptions correct e.g that X is the problem / to be avoided…overgeneralization typical … fear of noise in dark… will keep you alert…but if spend all time in dark, in noisy place, you will become a nervous wreck…need to be more precise…

You can DESTROY rapport, rather than generate it…rapport is KEY to all processes…MHR ‘getting their attention’ pre-requisiste?)

PT: Things just look hopeless. I just cannot see a way out of my problem. It is all so black and white and I feel trapped.

DR: I know how you feel. I have been stuck myself. We can make an effort to get in touch with some solid new choices that can help you to feel hope. Talking in a system that is not your patient's conscious output system. If you watch carefully,
you may see that many people will evidence pupillary dilation, altered breathing, a blank stare and a sense of not being there.

VS

DR: I know that when things look dark, we can end up feeling trapped. Perhaps the two of us can find a different way of looking at this situation. When I have a clearer picture of the situation, I might be able to help you to see things you have overlooked. There are many other colors in addition to black and white.

Once you feel reasonably confident that you have identified the individual's conscious output system in the area of his/her problem, the next step is to find out if that system changes when s/he is talking about something that is pleasant. In many cases, there will be a definite switch. You can discover this by saying, for example, "When things aren't so unpleasant for you, what do you like to do?" When s/he answers, ask: "What do you like most about..." If there is a definite switch, you will have some very valuable information. You will know what systems to which to move the individual in order to help him/her feel better; what system needs cleaning up; and to start communication in the "painful" system, while slowly moving to the one s/he knows how to feel good in.

The following is an example from my practice:

ME: What brings you here... That is, what would you like to have a new choice about?

PT: I've been really down. I don't have any energy, and I just don't care about anything. [This was followed by several minutes of "kinesthetic" comments.]

ME: I'm sorry you're feeling so badly. Problems can sometimes feel so heavy that we can feel good and stuck.

PT: [Nods head vigorously] Yeah. You have it. I'm just so tired of feeling this way.

ME: If I could wave a magic wand and take all those bad feelings away, what would you do that you enjoy?

PT: Paint. I love to paint. [With this statement, there was a noticeable change in her demeanor, and she appeared to be a little more relaxed.]

What do you like most about painting?

I like to see the painting take shape. I really enjoy putting the different colors on the canvas, and when I finish, I feel really good just looking at what I have
created. [At this point, there is a definite shift to a visual output, and she is actually smiling.]

What else have you seen yourself doing that you are proud of?

[Pause] Oh, I know! I once designed a dress from scratch! That may not sound like much to you, but to me it was a big deal. I looked all over for a pattern that looked like what I wanted, but I couldn't find one. They either looked awful, or they wouldn't fit me. So I actually designed my own dress pattern and adjusted it to fit just me. It came out just beautiful and it looked great on me. [At this point, she is sitting up straight, with good eye contact; her voice is strong, and she looks anything but depressed.]

That's great. You saw that someone else's idea of a pattern did not fit you, and you did something about it. I can see how proud of that you must be. Now I would like you to do us both a favor. I want you to close your eyes, and see yourself designing that pattern, and cutting it out. Then I want to see yourself going through all of those steps that led you to creating a pattern and dress that looked right for you. As soon as you have that picture clear in your mind, I would like you to signal YES by raising the first finger of your left hand. [As I said this, I reached over and lightly stroked that finger. With the emphasis on the word yes, and the stroking of her finger, I was setting up an ideomotor response.]

OK. [Closes her eyes and continues to appear very relaxed. After a time, her finger moves up.]

Thank you. Now I want you to watch that you who is so deeply involved in what she is creating...A NEW PATTERN. [This was the beginning of helping her to disassociate and to focus her on the enjoyment of creating new patterns.] I want you to pay attention to how much she is concentrating on the new pattern...the feeling of pleasure...the feeling of the scissors in her hand. ..the determination to design a beautiful new pattern that fits her, and helps her to really look good. [I continued to discuss her experience in great detail for close to 20 minutes. I emphasized losing track of time and place; of not paying attention to sore muscles or feelings; of solving the problem of the wrong pattern; of accepting that the patterns designed by others may not be right for her, and that she could choose to discard them and create her own.]

[Opens her eyes; looks around and sighs] That was quite an experience. At first the picture was very vague, but then it became very vivid. I felt like I was floating and observing myself. After a while I could hear your voice, but it was far away, and I don't know if I paid attention. I feel very good. I know I'm looking at things in a different way, but for the life of me, I could not tell you what happened.
That sounds like you had a nice learning experience, and enjoyed yourself in the process. Now our time is almost up [Pt. looks surprised, and glances quickly at her watch], but I would like to ask you something else. How would you like to attempt to paint a beautiful picture, or create a new pattern while you were blindfolded so that you had to do that by feelings only?

[Laughs] I wouldn't. It would probably be impossible. Even if I could do it, I'm sure it would be frustrating, and I don't think I would enjoy it. I probably wouldn't like to look at the finished product.

That's Right! I was sure you knew that, and that you only forgot for a while. Now that you see that clearly, I know you will get the picture and continue to feel better!

[Looks puzzled] What? I don't know if I understand [smiles...head nods slowly yes].

Good! She sees what I mean, and can show you a pleasant surprise. I will see you next week.

CASE: SECOND SESSION

PT:

ME:

I really had an interesting week. For three days after I saw you, I was really floating. Things looked brighter, not only in my life, but even colors. I was much more aware of what was going on around me. On the fourth day, I crashed. I felt just as depressed as before.

You don't look depressed now... In fact, you look very good.

I feel great. As I was sitting around being depressed, I suddenly heard your voice. I heard you asking me how I would like to try to paint blindfolded, by feelings only. I suddenly realized that I was busy running my life by feelings without looking at other ways. Then I saw myself cutting a dress pattern that didn't fit me, and, if I wanted it to change, I had better make a new pattern. I began to look at what I was doing to make myself so unhappy, and after a while I saw it [She went on to explain how she would focus on everything that could go wrong; thinking "crazy" thoughts, etc.; and how she was making herself look at the whole picture, etc.] Now I would like to ask you a question.

Ask away.
You hypnotized me, didn't you?

Well, it looked to me as if you decided to go into that state.

Well, it was wonderful, only I didn't believe I could be hypnotized.

It's nice to see that you are able to learn new ideas.

I didn't tell you before, but I had gone to a doctor who used hypnosis, and it was a disaster. He kept telling me to feel heavy, and to sink down in the chair. The more he told me to feel heavy, the more upset I became. I thought he was telling me to be more down than I was already. So I really fought him, and never went back.

Maybe he didn't know how to show you what you needed to see. [At this point, I gave her a brief lecture on the principles of the systems, and pointed out how well she responded to visual communication.]

PT: That makes sense. When I first closed my eyes, I started to get tense. Then you talked about seeing myself making the pattern, and I started to get the picture in my mind. It seemed very natural. The next thing I knew I was floating that fits her, and helps her to really look good. [I continued to discuss her experience in great detail for close to 20 minutes. I emphasized losing track of time and place; of not paying attention to sore muscles or feelings; of solving the problem of the wrong pattern; of accepting that the patterns designed by others may not be right for her, and that she could choose to discard them and create her own.]

[Opens her eyes; looks around and sighs] That was quite an experience. At first the picture was very vague, but then it became very vivid. I felt like I was floating and observing myself. After a while I could hear your voice, but it was far away, and I don't know if I paid attention. I feel very good. I know I'm looking at things in a different way, but for the life of me, I could not tell you what happened.

That sounds like you had a nice learning experience, and enjoyed yourself in the process. Now our time is almost up [Pt. looks surprised, and glances quickly at her watch], but I would like to ask you something else. How would you like to attempt to paint a beautiful picture, or create a new pattern while you were blindfolded so that you had to do that by feelings only?

[Laughs] I wouldn't. It would probably be impossible. Even if I could do it, I'm sure it would be frustrating, and I don't think I would enjoy it. I probably wouldn't like to look at the finished product.
That's Right! I was sure you knew that, and that you only forgot for a while. Now that you see that clearly, I know you will get the picture and continue to feel better!

[Looks puzzled] What? I don't know if I understand [smiles...head nods slowly yes].

Good! She sees what I mean, and can show you a pleasant surprise. I will see you next week.

CASE REVIEW

Let us review the above case together. When she first explained her "problem," she was in her kinesthetic system. I began by talking to her in that system. I next asked her to recall something pleasant, and she switched into a visual output system. With that information, I was ready to help her have some new choices. I knew that I needed to help her back into her visual system, to help her have recall of more pleasant kinesthetic experiences, and to use her skills (painting and designing the dress pattern) to create a metaphor that would help her to approach her situation in a new way (pattern) and to understand just how she was creating her bad feelings. As you re-read this case, I am sure it will become very clear. Last, but not least, her comments regarding her previous experience with hypnosis should give you cause to...pause now...and recognize the importance of using the individual's system of communication.

FINE POINTS

There are a few more points about the conscious output system that I would like to have you get a handle on so that it will be very clear. A visual individual needs some time and space to "make" their pictures. If you move too close too quickly, the visual individual will usually respond with anxiety. Once a visual person has evidenced that they are comfortable with you, it is then OK to move in (slowly) and make some physical contact. On the other hand, a kinesthetic individual will feel that you are cold and unfeeling if you sit (or stand) too far away and don't make some physical contact. These two points are important. If you want to "blow" rapport in a matter of a few seconds, move in very close and touch a visual, and stand way back from a kinesthetic. Next, where an individual is in physical pain, they are in a painful kinesthetic system. Helping them to move from kinesthetic into either visual and/or auditory will produce some profound and interesting changes. In addition, moving an individual slowly from his conscious output system to another system, and then continuing to loop through all three will, in most cases, result in the individual "taking a trip" to that "other state."
Communicating on two levels at once, and to produce so-called "informal" hypnosis without an induction or "formal" trance.

THE NEXT STEP Once you have ascertained the individual's conscious output system in both the problem area and in a more pleasant area, you are ready for the next major step. It is now time to learn what the unconscious system is. Again, you will want to find out if there is a shift in the unconscious system where the individual switches from the problem to a more pleasant experience. When you have spotted the unconscious system, you are ready for some powerful work. You have what you need to begin communicating on two levels at once, and to produce so-called "informal" hypnosis without an induction or "formal" trance.

A man enters your office, sits down and begins to discuss his problem. You have discovered that his conscious output system is kinesthetic, and you are responding in kind. You next discover that his unconscious system is visual (his eyes almost always move up left and then back to you before he speaks). One choice you have is: when he finishes a statement, you look up briefly to your right (his left as he looks at you), then at him, and then "talk kinesthetically." When you finish your statement, again look up briefly to your right. In effect, you are telling him that you understand just how he is creating his experiences, and where he keeps "finding" a source for his problem. Instead of this method, or added to it, you might choose to be a mind reader. As you talk in his system (kinesthetic), you can slowly change to his unconscious system, and tell him what he is doing. Example: "I know that you are feeling bad right now, and you're tired of those feelings, and when you become aware of those pictures from your past [move your eyes up right—his left—as he looks] and learn to stop seeing all that or to change those pictures, you will be surprised at how quickly you can feel better." With this method, many interesting things can, and often do, happen. I have had people suddenly recall past events and their attendant pain. In one instance, a man just froze, stopped breathing for several seconds, and then began to cry. He had claimed to have no feelings and to be a cold person. Most often, the individual will just stop and stare, and, in many cases, nod his or her head, or in some other way affirm what you have just said. Often, the individual will simply go into hypnosis... I forgot...there's no such thing. But, if there was, when the individual stops and stares, you may notice pupillary dilation, a marked change in breathing and other interesting "things." Sometimes, I simply say, "That's right. Now you can close your eyes and drift...and those pictures will soon be that much clearer."

MAKING UNCONSCIOUS CONSCIOUS Another powerful approach is to simply help an individual become aware of the relationship between their unconscious system and what they are experiencing. Once they understand, it is relatively easy to help them learn to stop the process, and to change it. Example:
A 12-year-old boy, "P", with behavioral problems at school. In addition, his parents had informed me that the boy was withdrawn and nearly totally non-communicative.

ME: Well, "P" what do you think your parents brought you to see me for?

"P": [eyes down left] I don't know. I just get into trouble a lot.

ME: Sounds to me as if you don't feel too good inside.

"P": [eyes down left] Yeah, I feel bad.

ME: Before you started to feel bad, what did you like to do for fun?

"P": [eyes straight ahead, then up left, then straight ahead] Baseball I guess. That's fun, and it makes me feel good.

ME: What part of baseball do you feel the best about?

"P": [eyes up left for split second, then looks at me] I like it all, but hitting is fun. I feel good when I get a hit.

ME: I'm glad you know how to feel good [at this point I reached over and touched his arm lightly], but I think it's sad that you have been feeling so bad inside.

"P": [eyes down left] Yeah.

ME: You must get real tired of those bad feelings, and I wonder just what that voice is telling you that makes you feel that way?

"P": [head jerks up straight] What do you mean?

ME: I would like to help you to feel better, but I need you to help me. You don't have to tell me any secrets or anything you don't want to. [P now looks much more alert and is beginning to interact and talk with increasing ease.]

"P": [smiles... for the first time] Sure, what do you want me to do.

ME: I want you to look up to your left and pretend that you can see yourself getting a real good hit in baseball.

"P": OK. That's easy, [eyes up left, nods his head and grins]
ME: I can tell by your face that feels good. [He nods head yes] Now, I want you to look down to your left and find out what happens to your feelings.

"P": [eyes down left; body slumps; facial expression changes] I feel sad again.. .and scared.

ME: Tell yourself STOP! I don't want to feel that way, and then look up to your left and see yourself hitting the ball.

"P": [pause, head moves up, eyes up left and he smiles] Hey! That's weird. When I told myself to stop, I didn't feel scared anymore, and when I saw myself hitting the ball I started to feel good.

ME: That's great, "P." I knew you could do it. [again touched his arm] Now, I would like you to practice that all by yourself, and I'll just watch.

After several practices, "P" was having a problem keeping his eyes down to the left. Every time he began to look down to his left, his head and then his eyes would "pop" back up. He was also smiling, alert and very talkative. At this point, I knew the following: "P's" conscious output system in both his painful area and his "success" area was kinesthetic. However, there was a definite switch in his unconscious system from auditory (painful) to visual (successful). I also knew that he had some old painful tapes running in his head that were the source of his painful loop. I also knew that the next step was to help him to bring into consciousness the voice or voices he was hearing, and what was being said. That was my next task.

ME: "P," I would like you to close your eyes, and listen to the sound of those voices you have been hearing. You don't need to hear what they are saying, but just the sound, and when you hear that, nod your head.

"P": [Head nods] I hear it. [sounds angry and his body tenses]

ME: Now "P," I want you to begin to see the face of the person or persons who match that sound, and then see the whole person, at about that time and place those scary things were first said.

This procedure was simply moving him from his unconscious auditory to his unconscious visual...which also resulted in "P" entering into hypnosis. Before we had finished this portion of the work he had an arm levitation as well as ideomotor responses.

ME: ["P" nods slowly] Now see that younger you at about that time in his life when those things happened that caused him to be sad and afraid, [pause.. .head nods yes] Now see one of your favorite baseball players taking that younger you
by the hand and telling those people to leave you alone, and that he is going to protect you. Keep on watching until that younger you looks happy and then see him growing up strong and happy.

I saw "P" two additional times. After the first session, his parents reported that the change was like magic. He was talkative, helping around the house, and getting along in school. And he had told his parents that he didn't like it when they yelled at each other, and that when they did he was going to go somewhere and not worry. Two years later I saw his mother for another matter, and she reported that his "problems" never came back. (By the way, I have "blown" them just as dramatically as I have been successful.

AIM is to get person to replace dysfunctional / self-destructive / limiting etc automatic / habitual / non-conscious stimulus-response patterns / frames of reference / noetic structures / belief systems / beliefs / definitions / ways of seeing and being…with desirable / generative / resourceful / positive / constructive patterns of auto-response / reaction / internal dialogues / self-talk / imaging / visualization / positive and negative hallucinations …

SYSTEM INTERRUPTIONS i.e Zen whacking stick to ‘break the reproduction from moment to moment, of the past pattern…open up a ‘Bardot’ of opportunity to implant new / replace old pattern…escape history…break the cycles…introduce / implant / suggest alternatives…

For example, the individual looks up left for a split second, and then looks straight ahead when s/he is discussing some positive experience. When s/he begins to talk about the area of difficulty, the eyes go up left, then down left (auditory) then down right while s/he discusses a painful situation. The next time s/he begins to talk about the problem, you snap your fingers at the moment s/he starts to move his/her eyes down left. In addition, you ask them, or signal them, to look at you i.e straight ahead, while they talk. The result will be: that you have directed them into using the unconscious successful pattern—in this case, eyes up left, then straight ahead.

MHR employ muscle memory / association of physical gestures with states…i.e they are ‘anchored’ in those gestures, and those gestures can thus ‘trigger’ the states…once you have identified the gestures e.g eye accessing cues, you can RE-organise them, i.e RE-associate i.e RE-anchor i.e take the gesture that usually triggers ‘happiness, confidence, joy, safety, security, calm, etc, and associate it with the idea that previously was associated with the negative trigger / gesture / anchor…so muscle memory will trigger the feelings we want them to experience, in association with the idea / imagined situation etc that used to trigger their unwanted symptoms…
MASTERING OUT OF CONSCIOUS The next area for you to begin mastering is that of the out of conscious unconscious system (out of conscious system). That is of particular importance in the area of the individual's dysfunction. For example, a patient's conscious output system is kinesthetic, while the input system is visual, and you do not observe any evidence of his/her using the auditory system to check out "reality." The indication here is that the auditory is the out of conscious system. Another example, using the same systems as above: you ask the individual what s/he is seeing in his/her mind and the reply is, "I'm not seeing any pictures"—or words to that effect—equals out of conscious visual. Another pattern might be: Patient looks up left, then down left and the conscious output system is very visual. This could indicate that the kinesthetic is the out of conscious system; or, if you were to ask what s/he is saying to him/herself and the response is, "I'm not saying anything" or "I don't hear anything" equals out of conscious auditory.

Once you have determined which is the out of conscious system, you have two primary choices: to bring that system into conscious awareness so that the individual stops giving him/herself hypnotic suggestions for which there is then "amnesia," or to use that system as the one in which you structure your hypnotic and therapeutic work. Since that system is out of conscious, almost any hypnotic work you do in that system will, in most cases, lead to amnesia for that work. When that happens, it makes it very difficult for your patient to "block" or "sabotage" the therapeutic process.

MHR it is always the ideation we are unaware of i.e that is so habitual and automatic, or in this case, using a representation system we never consciously attend to...that bypasses rational reasoning...and is most powerful for this reason...can't reach using 'reason' or 'self-knowledge' i.e 'understanding, which conventional 'talking' therapy is limited to employing...Heller employs it to bypass the conscious mind's limits / resistance...

To bring the system into awareness, so that they realise how they are sabotaging themselves with negative self-talk they previously 'forgot', as soon as they did it, is to do system overlays. That means starting in the individual's conscious system, moving to the unconscious system and then to the out of conscious system, and repeating the procedure until you get the desired results.

Example. Your patient has informed you that s/he really likes to go to the beach. You might then ask him/her to close his/her eyes and picture the beach on a beautiful day. As your patient responds, you would then spend a few minutes describing visual experiences common to the beach. As you observe signs of relaxation, or calmness, or concentration, or even trance, you would then begin to introduce kinesthetic experiences: e.g., watching the beautiful blue sky and the clouds, and feeling the warmth from that bright sun. After a few minutes of
visual/kinesthetic, you would begin to introduce the auditory experience: "And
the sound of the waves crashing in helps you to relax even more, and as you hear
the sounds of the waves, you watch the waves building and then falling, you feel
a deep calmness. You can see children playing and hear the sound of their
laughter, and remember a feeling of pleasure from your past," etc., etc. With
system overlaying, one of two things will happen; in many cases, both will
happen. Your patient will move into that state of mind that we might call
hypnosis, and, perhaps more slowly and with more "experiences" of system
overlay, the out of conscious system's "block" will crumble. I have had dozens of
individuals report that, as they experienced what I was describing, they began to
hear the sounds clearly, or feel all the feelings, or get clear pictures. What is even
more important is that in subsequent sessions they report and give evidence of
"cleaning up" that block in their real world.

MHR this sounds great…got to try it…on self !!!

UNBLOCKING VIA COMMON EXPERIENCE Another approach to the
unblocking of an out of conscious system is to begin simply talking about
common, pleasant experiences in that system: e.g., out of conscious kinesthetic =
talk about what it feels like to take a warm shower after a hard day's work; the
feelings of a freshly laundered sheet when you get into bed; the warm afterglow
of making love. Use your imagination, almost anything will do it. If, as you are
describing common feelings, you begin to more and more describe pleasant
feelings of childhood, you will stand a good chance of producing hypnosis and a
regression to their childhood. This will happen because your communication will
cause them to have to go into their out of conscious system in order to find that
experience. Once the individual goes into that system, they must leave their
conscious output system somewhere else. In short, an altered state of
consciousness.

UTILIZING OUT OF CONSCIOUS SYSTEM. You can use an out of conscious
system to "mind read" and provoke internal searches. For an individual with an
out of conscious auditory system, you could say something like: "And soon you
will remember just who that person was that said those things that are still
causing you to feel that way," or: "And I know that as you become aware of what
that voice is saying, you will know how to solve that problem." Such an approach
will "stir up" a lot of internal activity, and generally will cause the individual to
soon discover what that auditory system is doing.

The out of conscious system can also be used to produce amnesia for beneficial
suggestions (thus bypassing conscious resistance i.e the conscious mind cannot
reject these, as it is "deaf" to them, only the subconscious mind 'hears' them.
Example: A patient whose conscious output system was visual, while her out of
conscious system was kinesthetic. She told me that "everything looks hopeless.
When I see the way People look at me I really get upset." I asked her to tell me what the sound of hopelessness was. Her face went blank; she looked confused, and, after a moment, her eyes went down left, then up left. At that point, I said, "OK, instead you can begin to feel stronger and feel calmer." She looked at me and said, "What? I didn't hear what you said." Since my "suggestion" was made in her out of conscious system, while she was using her other systems to search, she had amnesia for my words. As this session progressed, she became very relaxed. As we finished she said, "I'm not sure what happened today, but I feel much calmer, and I think I may be strong enough to beat this."

THE SHOCK METHOD There is one more approach to the out of conscious system I would like to give you: The shock method. With this approach, you simply ignore the conscious and unconscious system, and go straight to the out of conscious system. Example: Conscious output system equals kinesthetic; unconscious input system equals auditory; out of conscious system equals visual. The patient is talking "kinesthetically" about how bad s/he feels. You respond, "When you see what those feelings look like, I know you will be able to change the picture to one that looks much better." With this method, you have a good chance of producing amnesia for what you have said, causing an informal hypnotic state for a moment (or much longer) and/or producing an unconscious restructure without the patient being aware of how all of this took place.

With hostile client / interlocutor, observe for indications of their preferred representation system, and then start talking about stuff using e.g visual, kinesthetic, or auditory language, i.e whichever the appear to prefer...to build rapport, lower the hostility / resistance, until person 'opens up' to you...then move into the unconscious of whatever system...e.g from visual to kinesthetic i.e feelings, typical for middle aged man etc i.e we are not taught to live in our feelings...for woman might be reverse ...so now have person in sort of trance, and can communicate with their subconscious i.e bypass the resistance / hostility of their conscious mind...like the subconscious understands Chinese, not English, so start in English, then move to Chinese, speak to subconscious mind, in sort of trance state...

got to make these definitions REALLY clear, and each time refer to them, make clear again...so slippery / new...i.e don't expect people to rememeber too much...so if describe 'looks up to left', state clearly that you have calibrated this to mean....X rep system preference...so not overloading / overburdening understanding i.e do NOT assume person has already groked fully all the previous...remember they are reading...not studying, then being tested, before moving onto the next chapter...can be too frustrating...most people not so motivated / committed / so much time to invest in...make process as easy as possible...i.e how I write for myself...as reference for me, is how everyone NEEDS to write for others...
I asked him what he thought the trouble was, and his response was to merely shrug his shoulders. The only other information I had was that "R" stared to his left, with his eyes in a slightly upward mode. Since he wouldn't talk, I began to use metaphors with my emphasis on visual experiences. Each story was filled with visual information. After about 10 minutes, "R" began glancing at me, and would occasionally nod his head. As he appeared to be starting to respond (very slightly at this point), I began to tie in kinesthetic experiences to my stories; e.g., "...and the little boy couldn't see any way out of his problem, which caused him to feel a very heavy feeling inside." "R" now began to stare freely at me and his body posture relaxed slightly. However, even though he was now looking in my direction, it was clear to me that he was now in an altered state. His eyes had a far-away distracted look, and his facial muscles had flattened out. Several minutes later he looked right at me, blinked several times, and interrupted me to say, "I get the picture. If I don't look for a way out of this, I'll never see things differently." He then began to talk quite freely. He said that he had been very depressed about his children leaving home, and by the "fact" that he was getting on in years (he was 62) without ever having seen himself successful. He also admitted that not only had he wanted to see me, but that he had come in prepared to be very hostile. (I discovered later that he believed that seeking help was a sign of his failure, and he didn't want to "face" that.)

N.B make sure readers remember you have to calibrate person, each time, for each situation, and make notes (mental or written) rather than buy some wall poster with the ‘eye accessing cues’ printed on it...

At this juncture, "R" was actually very friendly and talkative. His "problem" just poured out, almost always beginning with his visual system and ending in his kinesthetic. Since he was using a ton of words, I made the following assumptions as to his systems: His output system was primarily auditory, with visual being a strong second. His unconscious system was visual (very pronounced) and since he never moved his eyes to the kinesthetic or auditory, my best guess was that both his kinesthetic and auditory were out of conscious. He verified my assumptions when he told me, "I have a lot of trouble feeling close to people or showing any emotions, and my wife tells me that I don't listen to people very well." I spent several minutes discussing the processes of unconscious learning, emphasizing visual experiences. I then said, "I would like you to see for yourself how the unconscious can work separately from the conscious. I want you to hold your hand in front of your face like this." At this point I "show" him with my hand, palm toward my face. "Good. Now, as you watch your hand just like that, your unconscious will show you something you need to see... Perhaps that little boy at a time and place where he began to see himself as not good enough. [Pause] That's right...and as that picture becomes more clear, that hand will begin to bring that picture closer toward your face, while the sound of my voice makes you feel stronger." His hand begins slowly moving toward his face. "Now, as you
get the picture [using the exact phrase he had used earlier], you may find the comfort of closing your eyes [blinks several times and then his eyes close], and I really don't know just where you will see that hand coming to rest against your face, as my voice relaxes you more and more. I know it will be strange to see that picture of the little boy who feels bad while you feel comfortable even more. .now." His hand reaches his face after several minutes, and he appears to be very deep into "that state." "Now, as you continue to learn something important to you, you can continue to change the feelings into those of comfort, and I don't want that hand to move down any more quickly than...YOU HAVE LEARNED SOMETHING IMPORTANT, and that is no more quickly than you hear the voice inside telling the little boy that it will be OK, and that it never was what he thought it was." It was close to ten minutes before "R's" hand began moving down, and when it was on his lap, he opened his eyes. He began to cry softly (pretty good for a man who has trouble feeling or showing his feelings), and told me about two incidents that had really "got to him" as a child. His eyes were now moving to the kinesthetic area when he was recalling the feelings of those incidents, and several times they went briefly to his auditory. He informed me that sometimes he heard my voice, but most of the time he didn't, and that he could remember very little about what I had said.

All systems, from anxiety to depression, anorexia to obesity, will have certain set patterns or systems. I will go more out on a limb and state that the majority of people with each symptom will have the same patterns. Once you recognize the pattern and its loop, you need to help the individual break it, and form a choice of patterns.

So begin with their preferred system, to gain rapport, then use the unconscious etc etc system to offer suggestions in, bypassing conscious resistance / limiting beliefs...framing language in this way also induces form of trance and amnesia for what suggested ... so very powerful...

To determine ‘output systems’ observe if person is wordy like me, or relies more on gestures i.e body language / tone to convey meanings....MHR not sure if this that useful... To determine ‘unconscious system’ listen to TYPE of language used i.e in his case he used primarily VISUAL figures of speech (rather than auditory/ or kinesthetic) and metaphors, similes, descriptive language, analogies etc... e.g ‘You see what I mean, It looks bleak etc1.

To determine the ‘out of consciousness representation system’ i.e NOT-conscious representation system uses to ‘talk to self’ / ‘sabotage self’ MHR , in above case both the kinesthetic and auditory representation systems were pretty much neglected, based on his lack of eye accessing cues, as calibrated and observed...which were almost all visual. So these appeared ‘out of conscious’, as verified / confirmed when he later states , "I have a lot of trouble feeling close to
people or showing any emotions, and my wife tells me that I don't listen to people very well."

So lead with visual language, then move into kinesthetic and auditory, as client enters form of trance allowing you to plant suggestions directly to subconscious mind, bypassing conscious resistance, which literally cannot 'hear' your words framed in the auditory and kinesthetic language, and after planning suggestions for growth / change / improvement, return to visual language, at which client will appear to come out of the trance / reverie, with no memory of you having made those suggestions...but clearly in a more positive frame of mind, and open to more therapeutic suggestions of a conscious nature e.g feedback on ‘parenting skills’ and ‘how to make better choices’ etc i.e the more ‘rational’ and ‘reasonable’ part of therapy, once you have overcome / bypassed / replaced the irrational, emotional conditioning / implants / phobias / habitual defeatist-sabotaging self-talk and visualisations etc...

Take a child and tell him, over and over, that he will never amount to anything. Years later, every time he is about to get a promotion, he gets drunk and "forgets" to show up for work, and he amounts to nothing. This is the same pattern as post hypnotic suggestion, formed by constant repetition from an authority figure, and the suggestion being accepted / adopted.

MHR Virginia Satir and Steve Heller’s recognition David Humes T vol I observations, that we seek out patterns automatically. It is our nature. We construct patterns out of the flimsiest materials. Automatically. Habitually. This is how we construct ‘meanings’. Relating one object to another, by way of ascribed (we think observed / induced) patterns, either induced from ‘experience’, which is so indirect / distorted by expectations etc i.e previous ‘patterns’ ascribed, or from general principles i.e definitions...again the result of someone’s previous ascription / observation of a ‘pattern’ i.e constructed pattern out of impressions...we construct expectations i.e if X, then Y, or X+Y will result in Z, cause-effect idea-ology, to make predictions, and employ constructed / observed patterns to our benefit...e.g deliberately introduce X and Y together to produce Z...and assume that if we see Z, that X and Y must have been here...we ‘jump’ to so many conclusions...it is kinesthetic...an emotional need / triggered response...automatic...non-conscious in most cases and pre-rational acceptance of what told / appear to see e.g movies, t.v, teachers, parents, ...and own experience...often definitions imposed on us / ascribed even to our own motives, by others...we are powerless to reject...have no way to ‘disprove’ on our own...take as given, natural, normal...consensus reality...big and small i.e wider society, and own small family group...
We are creatures of habit / comfort of ‘known’, when in fact we cannot claim to ‘know’ anything…but the patterns we repeat become habitual and ‘known’ to us in kinesthetic sense…i.e ‘jump’ to conclusions and ‘feels right’…

Very hard to ‘kick’ a habit.

We use the term ‘concrete’ to describe ‘concrete reality’ and ‘concrete facts’, as if these exist in reality, other than in our minds.

Patterns are efficient…the quicker you can ‘define’ a whole ‘class’ of similar objects, situations etc, to ‘chunk up’ to higher levels of abstraction / generalisations, the more efficient your processing, but the less accurate / precise…e.g jump when hear sound of car backfiring…or ‘growl’ in the woods…automatic…can save your life…but make it miserable too…phobia is case of ‘chunking up’ and ‘generalising’ often from one case…but more often our conditioning is the result of repeated positive and negative reinforcement, like Pavlov’s dogs…at first require presence of ‘concrete’ stimuli to produce saliva…later mere sound of the bell they learned to ‘associate’ i.e connect i.e relate i.e assume belonged together with, the appearance of the meat…so it is with us…or the elephant first tied by a chain, at birth, learns that this ‘class’ of objects called ‘chains’ are impossible to break, and later assumes that a flimsy string belongs to the this ‘class’ of objects, and allows itself to be ‘retained’ by something it could easily break free of…by habit it has generalized…chunked up…and becomes a prisoner of this generalisation…of including string in the same class as metal chains…and so the ‘state’ need not point a gun at your head, it simply sends you a letter directing you to appear someone in a few days time to start training for war…or to pay a huge fine, or taxes, or close down your business, or give your children to ‘the state’…with not the merest hint of violence…and because you conform, no-one pays it much attention…as compared to soldiers forcibly arriving to make you do any of these things…THAT would look like a POLICE STATE…but as long as this threat remains in the background, we can pretend we live in a FREE SOCIETY…

What can be learned can be relearned. People may not realise they have alternatives, or be unable to break out of a learned cycle of behavior / patterns. Patterns that once served them well, may prove maladapted to their current / future situation. Imagine war compared to peace, and habits learned during the very dramatic / traumatic experiences of war. Or of simply growing up in a very hostile family / social environment. A child is about as powerless vis a vis their parents and family and other carers, as a soldier in a war zone, or worse, as a prisoner of war.

PAIN AS A PATTERN
Physiological pain is more than pain. It, too, is a pattern. The individual suffering pain from illness or injury responds to that pain in a patterned way. The pattern is based on their past experience with pain, their belief system as to their ability to deal with pain, as well as their future expectations. The individual whose past experience and belief system lead them to expect that they can handle it—that they've always done OK, and they "know" that they will recover quickly—becomes what is called a "reducer." As the name implies, these individuals are able not only to minimize their response to pain, they are also able to actually lower their perception of the pain itself. At the other end of the scale is what is called an "augmenter." An augmenter's belief system, and therefore their remembered history of pain, is that pain is terrible, awful, always gets worse, and they can't stand it. Their future expectation is that the pain will always get worse before it gets better. Their belief system and pattern of response is, in effect, operating as a hypnotic suggestion.

If an individual combines a belief system such as, "I can't succeed, I always fail," with a pattern of behavior that leads to self-defeat, he not only fails, but the failure itself "proves" his belief system. This leads to reinforcement of the automatic patterns of belief and behavior.

Consider the results of sudden pattern interruption. Several years ago, researchers decided to interrupt hypnotic subjects as they were performing post-hypnotic tasks. They found something quite interesting. The subject, upon being interrupted, spontaneously entered into a hypnotic state. Milton Erickson utilized this phenomenon as a method of trance induction. For example, he would give a suggestion for some post-hypnotic activity to take place at the next session. Erickson would then interrupt the pattern. The subject not only entered into the hypnotic state, in many cases the subject developed spontaneous amnesia for the events just preceding the trance state. If you, as a therapist, can discover a pattern in your patient, and lead the patient to recreate it, and interrupt it before completion, you may be surprised—You might find the individual entering into the hypnotic state.

PATTERN INTERRUPTION A woman entered my office, sat down, tightly crossed her legs, then crossed her arms over her chest, let out a deep sigh, and began spewing out words. The words were about her hopeless situation, her stupidity, her inability to do anything right, and that she probably couldn't even learn "this hypnotic stuff." At that point, my phone rang. Since was expecting an important call, I had not turned it off. The woman looked upset, so I apologized and had her wait in the reception room while I completed the call. When I asked her back in, she sat in the same chair, and recreated her initial behavior in every detail: tightly crossed her legs, then her arms, deep sigh, and then the stream of words of helplessness. Recognizing her behavior as a probable pattern, I decided to interrupt. I said sharply, "Wait, I can't hear you from there. Would you mind
moving to that other chair so I can hear you better?" She moved to the other chair, crossed her legs, then arms, then sighed, but before she could spew, I turned to my desk and began writing without a glance at her. Next, I apologized and told her that the first chair would be better and she could help me by moving back. As she sat down, I told her to please cross her legs and only then her arms. As she complied, she developed what Dr. Erickson calls "responsive attentiveness" (Erickson, Rossi 1976). The best description of this might be "staring in an almost daydreaming way."

She was then told to close her eyes and take a deep breath and let it out slowly (i.e., her sigh described differently) before we could talk. As she complied (already responding to my lead and suggestions), she was then told, "Now that you are becoming so much more relaxed, you can continue breathing slowly, relaxing that much more [leaving it to her to figure out how much is that much more], and soon you may want to uncross just your arms or just your legs first [implying there would be a second uncrossing without knowing when]." Within two minutes, a most satisfactory state had been achieved. Her pattern was interrupted, then redirected and then redirected again into a formal hypnotic state.

Gazzaneza (1967) discussed what he termed "conditional reflex, or bad habit" and the rapidity with which an individual can learn such patterns of behavior when he said:

We must remember that we are examining a half of the human brain, a system easily capable of learning from a single trial in a test. — The Split Brain in Man by Michael S. Gazzanega, August 1967, p. 372 "Progress in Psychobiology" Readings from Scientific American, W.F. Freeman & Co.

At our training seminars, I will have a volunteer hold out either their right or left arm straight ahead, making a fist with their arm very, very stiff. I then tell them I am going to give them an instruction that is impossible to carry out: I'm going to ask them to raise their arm up and move it down at the same time. Of course, it's impossible to go in two directions at the same time. I then state, "Begin." While they stare at me in disbelief, I say, "That's right, now you can BLINK." I emphasize "blink" with my voice. At that moment in time, the person will blink. You could imagine that the brain is saying, "What is this craziness? I can't raise my arm up and move it down at the same time." But when they hear, "You can blink," the brain says, "Of course, I can do that." Now, the interesting thing is how quickly that suggestion is accepted. What is even more interesting is, if you ask that person within a minute or two after their first trial to raise that arm and hold it up again, in most cases, s/he will automatically blink as s/he brings the arm up. In effect, the beginning of a pattern has been established in seconds. If s/he were to repeat this raising of the arm and blinking for four, five or ten times in a day, s/he might develop what is called a conditioned reflex, or a bad habit.
The real problem is how to interrupt the pattern of behavior that continues to reinforce the belief system, i.e. via self-fulfilling prophecies, and how to help the patient examine their own belief system, to help them acknowledge other choices that are available in the world.

If you find yourself still tied to the past, this case will help you cut that cord right at the Knot yesterday but now! (example of sleight of mouth)

PATTERNS: BELIEF SYSTEMS — CASE STUDY I was asked to see a man who was suffering with intractable pain resulting from cancer that had metastasized throughout his skeletal system. Other than his name, age and diagnosis, the only other information I had was: the pain had become so severe that he was talking about suicide; medication was becoming less and less effective; he was willing to see a hypnotist, but he doubted that hypnosis or anything would help. Based on this information, I reasoned that asking him to relax in order to become hypnotized, or to attempt to teach him to control his pain at the start, or to explain theory to him, would be the height of illogical therapy. I agreed to see the man providing that everyone concerned—except the patient—would be aware of and accept that I would use unexpected and unorthodox methods. When I arrived at his home, I was taken immediately to his den where I found him standing up, hunched over and evidencing great pain. His face was contorted, his body twisted and emaciated. As I walked toward him, his physician said, 'This is Doctor Heller, the hypnotist I told you about.' With a feeble and apparently painful movement, he put his hand out to shake mine. I pushed his hand to the side with the heel of my right hand and I hit him on the forehead with enough force to jar him. He stared at me with shock and disbelief on his face and said, "What did you do that for?" Using a harsh tone of voice I said, "Shut up unless I ask you." (Leaving what I might ask unspoken). At this point, he was standing up almost straight and his look of disbelief and shock was even more apparent. I went on in the same tone and said, 'I am now going to stomp on the top of your foot and break all the little bones.' He said in a pleading voice, 'Please don't hurt me.' I replied harshly, 'I have to hurt you,' and with that, I raised my right foot over his left. His voice which was no longer weak said, 'Don't.' I replied even more harshly, 'Shut your eyes, take a deep breath and relax... I can't hurt a man when his eyes are closed.' He closed his eyes in one split second, took a deep breath and slowly exhaled. As he exhaled, I began to talk softly, his face relaxed, then his body, and, within a moment, he was not only comfortable (he had escaped me), but somehow he had entered into a profound hypnotic state.

Since the man's present problem was intractable pain, I could assume that, at least in his present situation, he was in his kinesthetic system. As stated earlier, you must go where your patient is: that is, meet them in their world. Therefore, I knew I would not only need to begin in some kinesthetic way, but in a manner
that would supersede his kinesthetic reality. I also knew that his belief system included: he had pain; it was getting worse; nothing was going to help; everyone was trying to make me feel better, but to no avail. I could further assume that he had patterned expectations about doctors, what they do and how they act, as well as to his pain itself. The pain pattern would include putting all or most of his attention on the pain, expecting it to get worse, becoming more anxious and depressed, feeling hopeless and thereby increasing his pain perception. My behavior interrupted his patterns; his attention went from his pain to my crazy behavior; he stopped worrying about what he felt and began worrying about what I would do and what he would feel as a result. My behavior was a "shade" different from what he expected based on his Relief about doctors; everyone was trying to help him feel less pain, while I seemed to be hell-bent on causing him more. Since the human organism is designed to protect itself, the moment he was given the option to protect himself (shut your eyes, take a deep breath, etc.) he took it. As soon as he closed his eyes, several of his past beliefs had changed or were changing. By closing his eyes, he could stop something from happening instead of believing he couldn't do anything to help himself; his belief system about his pain began to change. Once he closed his eyes and began to relax, his level of pain lowered—something he hadn't believed possible. He learned he could avoid more pain, which also taught him he could have less and he could control something to do with pain. Most of his new discoveries were inferential: "shut your eyes, etc.," equaled you can do something to avoid more pain (my stomping on him). If you can feel less and avoid pain, you can control pain. Last, but not least, when I said, "Shut up unless I ask," the response was not connected to what he had asked. The words "shut up" and "unless I ask" implied he was to shut up and I would ask something of him. As a result of this "subtle" approach, the patient not only became comfortable and discovered hope, he was also able to learn self-hypnosis, to change his kinesthetic pain to visual pictures, and to disassociate from his body. (MHR again exactly what I ‘gleaned’ from all this NLP, as my own ‘method’…) 

THIS IS WHAT OTHERS SEEMED TO BE SAYING, BUT LIKE ME, HELLER ACTUALLY SAYS IT, SO YOU DON’T HAVE TO WONDER WHAT THEY WERE ‘trying’ TO SAY !!! I.E THE FOLLOWING, how to ‘anchor’ ‘trigger’ etc using NON-touch i.e unobtrusively…

Pay attention to the body positions your clients/patients assume when they are discussing problems, and compare that with their positions when they are discussing something pleasant. Next, when they get into problem areas, politely interrupt them, and help them to assume the position they use when talking about pleasant things. They, and you, may find that they have trouble getting back to the problem. Ask a few patients to talk about their problems in one specific chair and to move from that chair for all other conversations. Observe the changes as they move from one chair to another. Next, when they discuss a problem,
interrupt and have them describe a pleasant vacation or something they do well. Ask another patient to laugh and smile as he discusses a problem and observe what happens. As for the therapist, switch chairs with your patient; look away from a patient during problem talk and make eye contact during pleasant conversations; cough repeatedly during problem talk; smile during pleasant talk and nod your head. You may discover that your patient begins to understand, on an unconscious level, that feeling good, and thinking pleasant thoughts, gets your attention. Use non-sequiturs:

Doctor, I've been very depressed.

Speaking of baseball, who do you think will win the world series? And, while you are doing that, take several deep breaths before you close your eyes.

I've been very depressed.

Splendid! I'm glad you're getting it out of the way. By the way, where did you go for your high school graduation?

Begin to observe your way of relating to patients. How do you greet people? Vary it. What facial expressions do you rely on? Mix them up and practice new ones. Learn to use certain tonal and speed patterns when discussing pleasant topics. Then, when your patient is in a bad place, use your pleasant tonal pattern. Without your patient's conscious awareness, you interrupt their pain-producing pattern and they will usually cheer right up.

If asked, most people would insist that they are rational and that they would respond to reality. I would ask of them: "Which reality?" Within each of us there reside (at least) two separate, distinct, different and equal realities. One "reality" is that of the left hemisphere of the brain (LH) and the other is that of the right hemisphere (RH). Professor Betty Edwards (1978) conveys the general consensus of brain researches when she states that not only do the two hemispheres specialize, they also perceive reality in their own unique way. The left hemisphere specializes in verbal skills, numbers, analytical thinking and linear, digital reasoning. The right hemisphere specializes in spatiality, visual imagery, imagination, color, rhythm, kinesthetic experience, and creativity (Ornstein, 1973; Edwards, 1978; Buzan and Dixon, 1978). As Robert Ornstein (1972) puts it: Both the structure and function of these two "half brains" in some part underline the two modes of consciousness which simultaneously coexist within each one of us. Although each hemisphere shares the potential for many functions, and both sides participate in most activities, in the normal person the two hemispheres tend to specialize.

Dr. Roger Sperry, Joseph Bogen, Michael Gazzanizza, et al., have demonstrated this concept in their research with split brain patients
(epileptics in which the corpus callosum—the arched bridge of nervous tissue that connects the two cerebral hemispheres and allows communication between the right and left sides of the brain—has been surgically cut).

When you see someone you already know, your left hemisphere recognizes each specific feature: i.e., the nose, mouth, eyes, etc. However, if only your left hemisphere were operating, you would not be able to recognize the whole. Your right hemisphere, with its spatial and conceptual ability, takes the specific pieces and makes a whole.

SPERRY: SPLIT BRAIN RESEARCH In one of the now classical experiments by the Sperry group, split brain patients were given the task of assembling a jigsaw puzzle while they were in a situation that allowed only left-hemisphere function. Films of these experiments show the patient struggling with the pieces and then failing to put the pieces where they belong. One film shows an even more provocative phenomenon: One subject was busy trying to find where the pieces went using his right hand (left hemisphere) and suddenly, without his left-hemisphere awareness, he received help. The film shows his left hand (right hemisphere) sneaking into the picture and correcting the right hand until the experimenter forces the intruder away.

HEMISPHERIC CYCLES Psychologists at Dalhousie University have been investigating what is termed the 90-minute cycle of the brain. During their research, they have been able to verify a specific hemispheric pattern: When left-hemisphere activities are at their peak, right-hemisphere activities are at their lowest ebb. Conversely, when right-hemispheric activities are at their peak, left-hemisphere activity is at its lowest ebb. Different tasks require different hemispheric activity. "Western society has placed a greater emphasis on the scientific and analytical side of mental functioning than it has on the more colorful and imaginistic side."

I believe there is a direct correlation between over reliance on left hemisphere and instability, suicide and craziness. It is almost as if the right hemisphere, finding itself imprisoned, attempts to break out of "jail" in any way it knows how.

[The brain] can love and hate together, it can be calculating and irrational at the same time, it can value trees and enjoy the endless newsprint which is destroying them. It has a left and right hemisphere which only appears to oppose when one is used at the "expense of the other." —Buzan and Dixon 1978, p. 129

To reverse the trend toward over utilization of one hemisphere at "the expense of the other," I believe left must meet right must meet left. In discussing split brain patients, Ornstein (1972, p. 76) drew a parallel between the results of a surgical disconnection of hemispheres, and the results of a so-called emotional disconnect when he stated:
In this instance, a clear split was observed between the two independent consciousnesses that are normally in communication and collaboration. In such experiments with split brain patients, we can accurately localize the split of information in the system. A similar process, although much more difficult to localize, may underlie the classic Freudian symptoms of repression and denial, both situations in which the verbal mechanism has no access to emotional information in other parts of the system. In less pathological instances, when we perform an action "intuitively," our words often make no sense, perhaps because the action has been initiated by a part of the brain little involved in language.

While brain hemispheric research has demonstrated that both hemispheres have the raw potential of the other, MHR plasticity, in practicality, the right hemisphere has very little in the way of developed verbal skill, as indicated by stroke victims helped to speak again, through right-hemispheric training, who begin speaking at about the level of a five-year-old child.

Heller argues that the right hemisphere communicates in different ways to the right, dreams, fantasies, hunches, "gut feelings" and kinesthetic memories.

There is mounting evidence that the right hemisphere, with its built-in ability to effect and mediate autonomic nervous system processes, is responsible for the formation psychosomatic symptoms (Furia, 1973; Galin, 1974; Erickson and Rossi, 1979) and that these symptoms are a metaphoric communication of the right hemisphere (Erickson, Rossi & Rossi, 1979; Heller Meta 4 Change, in work)

Behavior, no matter how bizarre, emerged as at some point in our history we come to "believe," at some level, that the behavior was necessary to protect ourselves in the best way we knew at the time. Thus so-called irrational fears, anxieties and depressions are messages from our right-hemispheric memory bank that we are entering into "real or imagined" danger.

MHR warning to any state that would totally ‘ban’ Dionysus’ from their cities i.e remain totally ‘rational’ and ‘logical’ and never have any ‘fun’, ‘give in to their animal impulses / urges / desires’, will tend to self-destruct e.g Left and Right hemispheres, neurotic boredom leading to insane outbursts i.e emotional side retaliating at its jailor / enslaver/ master … typical of Western society … neurosis, depression, seeking oblivion via drugs/alcohol, nervous, anxious, miserable, desperate…trying to ‘control’…paranoia… MHR orthodox jews and fundamentalist Christians total ‘ban’ on Dionysus, producing their insanity, death-wish e.g ‘Armageddom’, Zionism, desire to be ‘raptured’ away from this gloom and desperation…
Difference of holistic Vs purely analytic...overemphasis on one or other typical, in our society i.e of ‘extremes’...hard to ‘balance’ sides...tendency to extremes...simpler etc T vol I

If a computer is misprogrammed, it will rapidly and perfectly arrive at the wrong answer, over and over again...i.e so much for ‘reliability’ test of ‘knowledge’...MHR i.e wrong assumptions / bugs / mistakes in BIOS etc...i.e T vol I limits of ‘logic’ i.e if assumptions wrong, logic of no help...just gives false notions of confidence...’authority’ to fatuous arguments...

Extreme leads to ‘flights of fantasy’ and ‘escapism’, using religion, or drugs/alcohol...so can ‘switch off’ the ‘rational’ side of brain...allow emotions to express themselves, without inhibitions...e.g enjoy sex, food, rage, rebellion without the usual inhibitions e.g food tastes better, sex more enjoyable, can ‘relax’ and ‘enjoy other’s company’...allow Bacchus/Dionysus free reign for a time...at very least ‘oblivion’ i.e switch off the hemisphere...escape the despair, self-judgements, self-rejection, self-criticism...i.e hopeless as cannot ‘measure up’ to this hemisphere’s demands...denying too much of our nature...punishing self for being ‘human’ and imperfect, vis a vis adopted ideals / standards i.e unrealistic...and over exaggerating our failures / faults / transgressions...and what of Edipal guilt / responsibility ...!!!

The problem of ‘overshooting’ the swing of the pendulum can reinforce the FEAR of losing control, ‘giving in to’ Bacchus/Dionysus...i.e if only way can ‘enjoy’ self is drugs / getting drunk, and while ‘inebriated’ tend to go to extremes of total uninhibited behavior, which when once more sober come to regret e.g sexual, financial, health etc consequences...then AFTER sober up, likely to become even MORE extreme...and likely to seek escape from this with MORE inebriated ‘rampages’...which gives our typical tightly wound neurotic / religious type who has no fun, hates themselves and life, and seeks Armageddon / oblivion...and tends to ‘fall off the wagon’ regularly...going to extremes...rather than being reasonable and accommodating their ‘urges’ and ‘desires’ in moderation...regularly...i.e welcoming Bacchus/Dionysus into their city to have a relatively harmless, more controlled, but not life-destroying, enjoyment...not having overly unrealistic expectations and fatuous ideas of what is ‘supposed to be’ and what is a ‘perversion’...when in reality it is the over extreme ‘controlled’ neurotic, no fun, that is the perversion of nature, and of life, joy, spirit...

Some people do the opposite, and totally reject all rational, reasonable, logical lifestyle choices i.e totally reject ‘family’, ‘home’, ‘relationships’, ‘jobs’ and simply fall into chaotic self-gratification...take any and every drug, seek out any and every pleasure, without regard for longer term consequences...with the natural result being self-destruction, losing any sense of ‘reality’, flight to
fantasy, religious extremism, mental illness / delusions i.e ‘religion’… some people regress to infantilism e.g religion, and ‘child-man’ i.e reject all responsibility for own world…

Ideal is balance i.e sometimes got to be disciplined, grown up, serious, analytic, logical, but other times spontaneous, child-like in the best sense… each have their place… we need to have the choice… flexibility… to enjoy our sensuality, even to extremes, now and then, without being irresponsible generally… i.e moderation also includes extremes… and main point MHR is that we pay our own way… we don’t enjoy some extreme benefit at the extreme expense of another sentient being/s.

In his book, The Furthest Reaches of Human Nature, Abraham Maslow described the self-actualized individual as the highest of achievements. Paraphrasing Maslow, he stated that the self-actualized individual has the ability to leave behind everyday reality in order to delve fully into his creative process, decide to return to reality, choose what can be and then plan to work to make it happen. If we translate this into the language of our discussion, it might be stated that the self-actualized individual has the ability to put aside left-hemisphere activity to explore fully right-hemisphere activity, and then utilize left hemisphere to bring right-hemisphere creativity to fruition. Ornstein (1972) has predicted that if each side of the brain is utilized, both sides will produce more than if only one side is used. As in the concept of synergy the sum of the parts will be more than the parts themselves.

As an individual enters into an altered state, his right hemisphere becomes more active, while the left hemisphere rests. The hypnotic state produces, if not a change in left-hemisphere beliefs, at least a substantial putting aside and questioning of left-hemisphere beliefs and limitations.

MHR Consider global, generalized self-defeating self-talk as an amnesia for all the successes every person has experienced by virtue of being able to walk, talk, count, read, ride a bike… the despairing, hopeless person is fixated on the negative experiences of failure / loss / grief / pain / dissatisfaction / rejection etc… and thus stranded on an island of despair… we need to build bridges back to the other positive experiences they have forgotten, or are ‘pushing out of consciousness’ by their focused, concentrated, narrow attention to the bad experiences… We need to ‘interrupt’ that record that is on ‘replay’… to give us a chance at a more balanced overview of experience… rather than perhaps some particularly traumatic / dramatic episode defining their total reality, or a succession of more recent, less dramatic, cumulative experiences of failure / rejection / incompetence / pain etc… we need to break that cycle / loop / hit the ‘pause’ button and bring their attention to the positives being blocked / censored / pushed out / elbowed out…
Left Hemisphere more about following rules / proven methods / repeating past attempts, even where these failed, and when they continue to fail, to give up…Vs Right Hemisphere ‘try and see’, take risks, experiment, curiosity, spirit of fun and adventure…Left fears losing face / looking silly while Right is curious / playful…

People may be experimental in some areas i.e Right Hemi, but Left Hemi in others. Balanced generally, but in some specific problem area, limited to one or the other i.e either L or R, so end up escaping from reality with fantasy for some particular challenge / area of life, or becoming super rational / logical / despairing…sometimes playful in one area, and limit self in other through fear of embarrassment…will take risks in finance but not romance…etc…will avoid reality and slip into fantasy world in one aspect of their life, whereas normally known for being rational / logical / scientific.

Repeating the same ‘sequence of facts and logical argument that got you stuck, will get you stuck again’, if you don’t break out of that Lefty cycle, and start accessing your Righty resources, experimenting, trying something new…ANYTHING is better than repeating the same thing, expecting a better outcome….but when you are stuck, you are stuck in the Left hemi…in the cycle…you see no way out…you despair…

So we find out where person is confident, where they have overcome the same type / sort of problems, and reframe current problem in same light…generalize the confidence from the functional area to the problem area…find what comes easy / where overcame problems, and use what learnt there as resource for problem area…you did X, you can do Y…let’s see how you did X, and transfer that approach to Y…see, you forgot what a great success you’ve been, what you’ve achieved…how competent you are…

Hypnosis results in more right-hemispheric activity while reducing the activity of the left hemisphere, and so it frees up the creative potential … shuts up the negative Left H, with it’s ‘knowledge’…long enough to prove it wrong…to get it ‘out of the box’…

Use slower speech and lower tonality to mark out parts of your utterances as separate messages intended for the Right Hemi / subconscious…while continuing in the usual tone / speed for the rest…to bypass the conscious limitation of the Left Hemi…speak to the Right Hemi…the subconscious…which has a huge untapped pool of resources…the client / you have become STUCK in the Left…MHR remember Vol I T, ‘switching’ in ‘normal’ people slowed down / stopped in ‘depressed’ and very rational / logical people…MHR use chapters of T vol I in this book…to make it more TROONATNOORY, rather than ‘just’ eclectic meta research.
"I can't see myself approaching women... I'm afraid I'll look foolish." Those statements indicated that, at least in his problem area, he was stuck in his visual system—that is, he made visual pictures (V) of some future disaster with women, probably based on some prior visual learning, and then he feels (K) in response to those pictures. In effect, his internal reality became more real than his external reality.

How do you know you're confident at tennis? i.e. what do you see, hear, feel? What movies play in your head? What self talk do you hear. What sensations do you have in your body? What happens to your posture, facial gestures, feelings, emotions?

(MHR remember that the left side of the body is controlled / connected to, the right side of the body, and vice versa!)

[Dr.'s head tilts slightly to his right, directing the next communication to the patient's left ear (RH) with slower speech and lower tonality. From this point on, emphasis and caps indicate head tilt, slower speech and lower tonality.] THAT'S RIGHT! IT'S A FEELING! Tell me more about that good solid feeling.

[Implying that the feeling is good and solid, and of course, you can get a hold of something solid.]

[Eyes move slightly up and left while he "looks" for his memory of that solid feeling; he begins to relax, and there is a noticeable change in his breathing.] I feel good... [dots indicating a pause] kinda strong... [eyes down to his right indicating a switch to his kinesthetic system, and he evidences a positive response. This helps to confirm that the source of his problem is in his visual memories and expectations.] ...There's also a sense of excitement and well-being.

How do you think you look when you...FEEL CONFIDENT? [hidden suggestion and beginning to help patient to associate good feelings with visual images.]

[Smiling] I've never looked at myself, but I guess I look sort of proud...and confident. [At this point he begins to sit up straight in the chair, squares his shoulders, and his voice takes on a strong tone, in effect showing how he looks and feels.]

THAT'S RIGHT!... Just like you do NOW! [Associating more pleasant experiences into his visual system] ...and when you've played a great set, and discuss it, how does your voice sound now! [Mixing past experiences—"played" a great set—with the present—How "does" your voice sound "now!" In addition, beginning a positive association with his speaking.]
I guess like it sounds now. [Acknowledging the experience he is now having.]

That's a GREAT FEELING...NOW...isn't it? [Dr. adds smile which will be included with tonality, head tilt, etc.]

[Head nodding, smiling] Yeah! I want that when I talk to a woman, [indicating he is connecting the experiences and is recognizing the potential.]

But you didn't...ALWAYS HAVE CONFIDENCE... [Unconscious suggestion] when you first started playing tennis, [reinforcing the connection between the two experiences: starting without confidence, working at it, and gaining confidence.]

At this point, head tilt, etc. has become an automatic cue eliciting in the patient a positive response. In effect, an unconscious suggestion.] Did you know that fear is nothing more than FOR...GETTING YOUR CONFIDENCE?

The word "forgetting" above: FOR...GETTING YOUR CONFIDENCE had been said very slowly, with a slight pause between "for" and "getting." In addition to the message the patient understood conversationally, there was also an unconscious suggestion: FEAR IS FOR GETTING CONFIDENCE; i.e., use the signal of fear as a cue to remember being confident. This uses his real life expectations and experiences to help trigger a new response.

PT: [Smiling] You mean I know how to be confident, I just forget. [Indicating he is integrating the unconscious suggestion.]

DR: THAT'S RIGHT! [Head tilt, tonality, smile] And if you've forgotten it, you must have it somewhere. You can't forget what you haven't learned. However, in the past you have been terrified when you tried to talk to a woman. [Said with a flat, almost accusing tone and using the past, implying it was in the past only.]

PT: [Body slumping, voice quavering] Yeah, it really scared me. [Indicating he is beginning to put the fear in the past: "scared" as opposed to "scares."]

DR: [head tilt, tonality, smile] BUT YOU KNOW HOW TO FEEL GOOD IN A SNAP. [Snapped fingers interrupting his pattern or response while head tilt, etc. elicits the now associated good feelings.]

PT: [Holds breath, then slowly exhales, relaxes and smiles] I don't know what you're doing, but I was feeling bad and all of a sudden I feel good again.

DR: [Head tilt, tonality, smile] THAT'S RIGHT! [head to normal position, normal tone] A part of you knows how [pause, head tilt, etc.] TO FEEL GOOD...WHENEVER...YOU WANT TO FEEL GOOD!
At this point, I discussed the game of tennis in general terms with a strong emphasis on being unsure in the beginning and then, with practice, it gets easier and easier. This theme was repeated several times while discussing the skills of tennis: learning to serve, learning to have a smooth backhand, etc. Since the patient already knew all this, it was hoped he would become bored consciously, and since he knew what he wanted—confidence in regards to women—he would take the important parts of the message—practice leads to skill and confidence—and apply it to his goal. (Erickson, Rossi and Rossi, 1979) During this seemingly repetitive conversation, I began a formal induction:

DR: One of the important skills you've learned automatically to watch the ball with interest. [Improper sentence intended—read it again.] Just as you've NOW WATCHING ME WITH INTEREST [head and tone, no smile] to respond automatically...to the ball without thought, just as you are BEGINNING WITH ME [head, tone, improper sentence] holding that racquet [stated as if he were holding a racquet: leads to disassociation] and THAT HAND [head tilt] had learned to MOVE AUTOMATICALLY as if a mind of its own [right hand makes slight motion] JUST LIKE THAT'S RIGHT [head tilt, running two sentences together] and I really don't know which hand will...BEGIN TO FLOAT UP [head tilt] to rest against your face [right hand twitches more. Long pause, 10-15 seconds] THAT'S RIGHT [head tilt, 10-15 seconds pause] IT IS...a pleasure to have that UPLIFTING EXPERIENCE [double message: it is with pause, equals it is moving, equals a pleasure, etc., equals, it is a pleasure to have that movement. Patient's hand jerks several times and slowly, with short jerking movement, begins to move up.] Your unconscious mind will decide if you will...CLOSE YOUR EYES while your HAND MOVES UP...OR AS IT TOUCHES YOUR FACE. [The above implies he has an unconscious and that it can decide, and uses the illusion of choice! His eyes will close, he has to choose when.] Consciously YOU MAY BE SURPRISED AT WHERE YOUR HAND TOUCHES YOUR FACE...or / COULD BE WRONG AND YOU WONT BE SURPRISED AT ALL! [This allows him to realize that his conscious doesn't know what his unconscious can do, and implies that he will complete the suggestion. I gave him a chance to prove me wrong. He doesn't have to be surprised at all.]

Patient's eyes blink slowly then close, he breathes deeply, facial muscles relax and he proceeds into a formal hypnotic state. His hand rises, and after several minutes touches his face and stops there.

DR: No matter how fast I want your hand to move down, I want you to fight it and do not allow it to move down any more quickly than is comfortable for you which will be no more quickly than you continue to go deeply. [Pt. hand stops against face for 3 or 4 minutes and I say softly, "That's right," two or three times in time with evidence of deepening—i.e., breathing slowly, facial muscles becoming flaccid—and then said again as hand began to move slowly down.]
The patient, through simple story form, was reminded of his acquisition of skills during his childhood: learning to ride a bike, roller skate, play sports, etc. Each story was about three minutes in length, emphasizing starting out a little afraid but wanting to learn, practicing, falling, getting up, learning, and gaining confidence. At the end of each story I said, "THAT'S RIGHT," increasing the association factor. He was told to take all the time he needed to return to conscious awareness, and that he would not return any more quickly than he needed to review one particular time of learning to be confident, and to bring those feelings with him. After nearly ten minutes, he opened his eyes.

PT: Hey, that was great. I feel good.

DR: THAT'S RIGHT! New learning is always interesting; but I have a problem [intentionally changing the thrust and interrupting his conscious processes] and I need your help.

PT: [blinks eyes and stares intently] What can I do?

DR: Well, therapists need what is known as base line data [some examples of such data was given]. Since I can't be inside of you to know what happened when you got scared IN THE PAST [head tilt, slower pace] and since we need something to judge your progress, by I have an assignment for you.

PT: OK.

DR: I want you to get a small notebook and go out and try to get rejected by five women in one week. Approach them in any acceptable way and pay close attention to your responses. [Patient begins to act a little nervous.] It's important to notice [back to visual] how you feel and see what happens to you. This will give us the information we need to help you. Of course, you can refuse, but you will look foolish asking for help and then refusing to help. [Intentionally using his fear of "looking foolish" to motivate him. In effect, a double bind. In addition, carrying out the assignment itself will require that he approach women.]

PT: Well, I don't like it, but it would be foolish to pay you and not cooperate with you.

DR: THAT'S RIGHT! [head tilt, tonality, eliciting his positive association to his new task] Now time is up. I'll see you next week, and with your base line data we can really get down to work.

SECOND SESSION

PT: [Patient appears smiling and looking excited.] Well, I didn't quite carry out my assignment. I was only able to be rejected by three women. I managed to
meet six ladies and I've been out on two dates this past week. Boy, you should have seen me LOOKING GOOD! [patient's voice is strong and he looks very pleased and his report of seeing ladies and looking good indicates his visual system is now seeing positive experiences]

At this point the patient discussed how he made his first approach, his fears which began to lessen, and his growing confidence. "It just kept getting easier." Every time he felt afraid, he remembered that being scared meant he was forgetting to be confident. He also stated, with confidence, that his problem was solved.

DR: THAT'S RIGHT! [smile, head tilt, tonality] Now you remember how that hand began to rise up last week [patient looks at right hand, which began to twitch] You know how to enjoy that same experience NOW! [Eyes close and he enters into hypnosis.]

The balance of the hypnotic experience was regarding his tennis game to overlay his skills with meeting women; e.g., DR: You are proud and confident about your serve and as you feel that, you can see yourself serving to a woman on the other side of the net, you know how to move in close to the net and handle whatever is hit your way, and just as you can move toward a woman and see yourself handling it and how off-handed you can be with your backhand.

Many stories equating tennis and meeting women were used to reinforce his goal. It was a good bet he would fill in. While no formal follow up was attempted, this patient referred several people, one of whom relayed the message that things were great and he was getting better all the time, just like his tennis game!

MHR Phobic is not responding to the particular stimulus e.g. fear of dogs, that dog here now…but to a ‘node’ of associations with ‘dog’ that go back to some particular incident / trauma / drama with a particular dog, or continued conditioning e.g. ‘dogs are dangerous, quick, be careful, watch out, don’t pet that dog’ etc…i.e the trance can be induced quickly or slowly…by a dramatic ‘imprinting’ or a gradual accumulative conditioning.

You might...NOW ASK YOURSELF...which reality is real for the phobic…the node of associated memories / imprints / conditioned reflex responses, or the actual ‘dog’ in front of them, here, now.

Religion / politics etc like Steve Heller’s ‘Magical stick…an imaginary response to an imaginary problem…first you create the imaginary monsters you fear, and demand protect from…then you create the imaginary protection e.g. hell / devil / demons / evil spirits / sin, then ‘god’, ‘religion’, ‘prayers’, rituals, papal dispensations. Seems natural tendency in many towards fear of things that don’t actually exist…so you can ‘tweak’ and ‘direct’ this towards a few ‘agreed upon’
imaginary threats, and then offer protection...or just invent the threat...illusory or real i.e rape and pillage in costume, then turn up and offer protection from yourself, the original 'protection racket'...

Reason / logic won't get you far with superstitious people...better to offer them the optimal 'solution', one that does not leave them prey to 'religion' and 'politicians' ...

MHR if hypnotic / trance state is one where imagined things are defined as real, or at least the person is playing that / pretending that / actively playing the role of hypnotized person...then it is clear that we are ALL living in different levels of trance / hypnotism, from moment to moment...as at least part of our response to the 'here and now' is really a response to ideas / definitions we constructed / were imprinted / conditioned with, in the past, by our experiences, or by conscious processes of 'authority figures' and 'institutions'...a.k.a religion, education, 'news', mass media, propaganda...so we are NOT responding to what is actually here, now, but to an assumed 'subjective reality' i.e we experience it all through tinted glasses / filters of our past conditioning / learning etc...

Doing the same thing and expecting a different outcome is based on fixed beliefs about what reality is, and how to respond to it e.g what the problem is, and how to solve it...we need to go back to our definitions / subjective reality / models / maps / interpretations of 'reality' to see how well our map corresponds to 'reality'...always very very careful to be ZEN about it...i.e stop imposing our map onto the terrain...and thus only seeing what we expected to see, what is on our maps, what is in our models, rather than what is there...the actual condition, situation, person, object that is there (as far as that can be said at all re: Humean skepticism)....n.b that the entire world can be an illusion, and the same approach is still optimal...it is about generating options / choices / new possibilities / resources, and not getting fixed, stuck, limited by our past conditioning / decisions on what is real, by our past definitions of T, ...which MUST include EVERYTHING we ever assumed to be 'right', 'truth', 'self-evident', 'incontrovertible', 'agree on', 'traditionally accepted', 'consensus', 'everyone knows', 'its obvious'...because it is RARELY 'obvious' and 'self-evident'...it is just that most people self-censor, and 'go along to get along', and repress their own authentic responses / definitions / experiences, to avoid others rejection, disapproval, abandonment, ridicule, ... especially when there are institutions with huge budgets out there reinforcing the 'norm' the 'consensual reality' with sticks and carrots, threats of violence, real violence, prison terms, huge fines, loss of income, loss of reputation, loss of career...for 'DENYING' that the Catholic Church is the only 'true' Christian institution and 'middle-man' to god, for DENYING that the particular god/s of the time and location actually exists at all...For DENYING that women are clearly irrational and could NEVER be trusted to make rational decisios, and thus CLEARLY should NEVER be given
the right to vote…For DENYING that black people are inferior to white people, and in fact unable to manage themselves, and that therefore SLAVERY is good for them, and after all GOD’S will, just read THE BIBLE…For DENYING that homosexuality is a perversion of ‘nature’ and a ‘sin’ and a crime, for which ALL people in a society will be made to pay by GOD, if YOU do not punish homosexuality with DEATH…

Raises the question….how DO you counter an irrational, mostly non-conscious RESISTANCE to logical / reasonable / demonstrable arguments? Can logic / reason / new information contradict a stubbornly held ‘belief’ i.e the continuance of some form of trance / hypnotic state, in some part of a person’s life e.g the BELIEF that ‘The Holocaust’ happened?

HYPNOTIC MONSTER A woman who suffered from severe anxiety whenever she was in a relationship with a man, sought my help. She described her reaction as a feeling of drowning, or suffocating, and claimed she actually experienced those sensations physically. She had been working on her problem for just over two years, and had, in her opinion, made good progress. She"understood" the dynamics, had insight, and felt stronger in handling the "bad" feelings. She believed that she was now ready to get rid of the problem once and for all. She acknowledged that her problem made no sense "logically." She had read extensively on the subjects of psychology, therapy, and interpersonal relationships. In spite of her efforts, she felt stuck and said, "I'm beginning to lose all hope." During her second session I helped her into the state that doesn't exist—hypnosis. I asked her to "go back" to a time when she had experienced those bad feelings and to signal me by raising the first finger of her left hand when she could actually feel the sensations. After she signaled, and was evidencing some discomfort, I told her to allow her creative mind to create a horrible monster, to see it clearly, and to feel all the fear as it was trying to destroy her. She was then asked to imagine that there was no safe path of escape. Within a few moments, there were obvious signs of discomfort: her breathing rate increased dramatically, sweat appeared on her forehead and upper lip, and she was evidencing agitation. At that point, I told her the following: "It's up to you to decide whether to knock your monster out, or to wiggle your nose and chase it away, or to flap your ears and simply fly away and leave the monster where it belongs—in the past. Now, take your time, because your unconscious mind may want to use a combination of those things, or it may have even better ways." Now, we all know that not one of those instructions makes sense logically, and yet, in spite of the nonsense, something began to happen. Within a few moments, she took a few deep breaths and exhaled very slowly; her body began to relax and then she started to giggle. Five minutes later she opened her eyes and smiled a beautiful smile. She told me that, for some reason, she knew that she didn't have to be afraid anymore, that she didn't understand it, but
somehow she had a "gut" feeling where the monster came from and how to get rid of it.

MHR the ‘feeling’ and ‘anxiety’ and ‘fear’ is the product of an illusion / imagined situation / experience in the sense that it happened IN THE PAST and is being re-created in their mind…so cannot use logic, reason, understanding to alleviate / get to the etiology of it…have to use the imagination in the realm of the imagination, to solve problems that are being imagined i.e at least once to produce the symptom, then re-produced every time that symptom is to be produced … so MUST address imaginary beliefs on their own terms, by entering the world of fantasy / imagination in which they are produced…which is how ‘The Holocaust’ has REALLY been produced. Not by any facts, documents, objective arguments. These do NOT exist. They NEVER existed. But by a process of propaganda, which created ‘The Holocaust’ IN PEOPLE’S MINDS…And so we must do the same…by making movies, etc, in which THE TRUTH is presented i.e of labor camps / work camps…and then the later ‘construction’ of ‘the holocaust’ is illustrated…to replace the imagined reality, no matter how consensual it has become, with the actual reality, IN the imagination…i.e as metaphor, as story, as narrative, as a constructed mental world…ironically we MUST make reality into fiction, to gain entrance into the subjective reality of every individual…for THAT is the REAL reality for each person…

Once upon a time, there was a young woman and a young man crawling around on their hands and knees. They seemed to be searching desperately for something. A kind and well-meaning stranger happened by and asked them, "What are you looking for?" They replied, "We are searching for some important keys that will unlock important doors in our lives." The stranger said, "That sounds important. Let me help you look." The stranger got down on his/her hands and knees and began searching for the missing keys. After a long while, the stranger stopped and said, "I can't find any keys here... Just where were you standing when you lost them?" The couple replied, "Oh, about one hundred miles from here, in an open field." The stranger said, "If you lost them in a field one hundred miles from here, what are we doing searching here?" "Well," said the couple, "the light is very good here, and we already know the territory perfectly." — Old Sufi tale, updated a little

Conscious Vs UNconsciouc Vs SUBconscious Vs ‘NONconscious…consider how when you run out of breath, from jogging or climbing stairs, or swimming, you tend to deliberately and consciously breathe deeply…whereas most of the time you pay NO attention to your breathing at all…but you are ALWAYS breathing…most of the time you are NOT conscious of it… Or consider when you LOSE your balance, or EXPECT to slip on ice…suddenly you become VERY conscious of the feelings in the soles of your feet, the muscles in your legs
and back and stomach, etc... or a typical teenage boy's bedroom... he will tend
to become not-conscious of the smells present... or a soldier during field training
who has not washed for days, working hard, sweating, stressing out, will STINK
to high heaven, but will NOT be aware of their odor until they come out of the
shower, to take their OWN clothing to be washed... only THEN do they become
CONSCIOUS of the extremely strong odor...

Consider how we are mostly not-conscious of much sensation in our genitals,
until we have 'sexual' thoughts, and suddenly we become hyper-aware i.e. hyper
-conscious of our genitals...

by flashing words on a screen at a high rate of speed—euphemistically called
"subliminally"—the subjects would evidence physiological responses without
conscious awareness of the words. One experiment included the flashing of
sexually stimulating material in the midst of a very "dry" intellectual movie,
again at a speed that prevented the subjects from being "aware" of the material.
Yet, all of the subjects gave evidence of strong "physiological arousal." The
researchers, based on the results of these and other so-called "subliminal
experiments," concluded that there is an unconscious process. They further
concluded that not only are these (unconscious) processes occurring at all times,
but we are most often unaware of not only the process, but how the process
affects us.

Dr. Milton Erickson insisted for years that there is an unconscious process.
Rather than be surprised at the evidence of there being a NOT conscious mind, he
was surprised that they still insist that there is a conscious mind!" Only when our
unconscious mind makes our conscious mind aware of something, does that
something become part of our reality.

MHR iterative?

If the two hemispheres of the brain do specialize, as seems to be the case, to some
extend, then we can work from the metaphor / assumption / model that the left, or
so-called dominant, hemisphere deals with linear, digital, analytical and logical
processes. The right hemisphere's domain is spatiality, imagery, color perception,
kinesthetic recall, and creativity; it may be called the metaphoric mind. The left
hemisphere may be conceptualized as the conscious mind, while the right
hemisphere is the home of the NOTconscious mind. It is a useful metaphor for
work with hypnosis. When engaged in so-called "conscious work," I use facts,
logic, and reason. When I move to "doing hypnosis," I use stories, imaginistic
recall, nonsense suggestions and fantasy—in short, "the language of the
unconscious."

MHR what is it not or un or sub conscious of? IT is conscious of its contents isn’t
it? And we can probably attend to much more of it than we ever do, or even
attempt to. A computer is supposedly not conscious at all its levels of operations. So we might call the ‘not-conscious’ the ‘calculator / ‘reckoner / processor / routine runner…? “

More accurate to state that both hemispheres engage in unconscious and conscious processes, and that neither hemisphere works totally independently of the other. Rather, there is a consistent interaction and interchange between the two. i.e MHR Brain plasticity and NON-localisation in general, though great DEGREE of localization in intact brain, and these dominant localized regions form different functions in the intact brain, while if you remove these, the same functions will be taken up by the non-localised areas of the brain that CAN perform the same tasks, but usually do NOT… i.e specialisation if more efficient, and ideal, when brain intact, but when not, other parts of brain will ‘take up the challenge’ and begin performing these tasks… as a second preference… like Murphy’s law and the ‘redundant’ systems built into aircraft as ‘failsafes’…”

Erickson and Freud both saw the not-conscious mind as doing its best, the best way it knows of, of protecting the organism… such as in the case of ‘blocking’ memories of traumatic events / impressions / pain / suffering that may have overwhelmed to organism at the time… i.e repression… to the ‘not-conscious’ parts of the mind… engrams etc… But also that the conscious mind ‘blocks’ the not-conscious at many levels, in many ways, and thus limits the resources available to the conscious mind… i.e limiting beliefs imprinted / conditioned, very hard to overcome / bypass… brain seems set up / or has so far served the organism well enough to allow it to survive and reproduce, to form patterns / define things / construct belief systems / models / maps, as quickly as possible i.e to ‘learn’ quickly… to look for / construct ‘patterns’ so it can predict e.g what may follow the rustling in the grass and sudden quiet of birds around them e.g approach of a lion / tiger etc… or that fire burns, that ‘strangers’ can be dangerous… to ‘obey’ your parents / authority… how to get people to approve of you, accept you, and thus support you / help you / give you food / love / shelter / work / status / prestige / privileges… This sort of automatic impulse to construct models / maps, from the scantiest of impressions, definitely has its advantages… but at some point in time also many disadvantages… seen from the individual’s point of view… though for ‘a social group’ it allows control and social order i.e fixed rules of interaction rather than having to negotiate each interaction individually… i.e the ‘police’ do not have to ‘prove’ their credentials / ability to violently attack you, every time… you KNOW they can, so you act, each time, as if they will, if you do not comply… statuses allow generalized respect and authority i.e you don’t have to convince each person, each time, that you are superior to them in some way e.g skill, intellect, training, competence, ability… if you get the ‘genius’ definition, you are ‘entitled’ to ‘the floor’ and to ‘an audience’…” best seller…” successful etc all grant you special
authority...you don’t have to convince people to listen to you, they are ‘all ears’ already, due to your ‘title’, ‘reputation’, ‘fame’, ‘rank’, ‘status’ etc...

All this I T vol. I

It is a real advantage, if every time you hear a tiger, you act as if a tiger is nearby, and a potential threat, and take precautions...if your heart rate etc climb in anticipation of the need to ‘fight or run’...but if you live in a place with a lot of things that ‘sound’ like tigers, but which aren’t, or if in reality all the tigers are tame these days, and friendly, and no threat, even wise helpers and pets, then you can quickly see how spending the entire day with an elevated heart rate, in a ‘fight or flight’ response state, is not going to be good for your health, or for getting stuff done.

Even ‘religion’ may have served some positive ends originally. To motivate people to be more honest, fair, just, etc with others. However Socrates will claim that if you educate people about WHY such behaviors are in their own best interests, then THESE ARGUMENTS will be much better motivators for good behavior / ethics / morals...and god/s become redundant, and even contra-indicated for good mental health, and a vibrant, flourishing society of equals. Not just because priests can abuse their imaginary powers to gain REAL power in ‘reality’.

The methods of the unconscious may have once been useful, or may have been the best choice available at another time, or the best "allowed" at another time. That is no guarantee that its "protection" is in the individual's present best interest! In other situations, the unconscious may have "a better method," but the belief systems of the conscious mind may deny, block or ignore the message of the unconscious.

Freud argued compellingly that the unconscious will find a way to make itself known. Symptomology (physical or emotional) are its way of communicating where the conscious mind is repressing / blocking / censoring it. See Freud in T vol I.

**Tension headaches** occur from impaired circulation and building pressure from increasing muscle tension. As if the brain is forcing you to ‘time out’ MHR i.e ‘take a break’, stop thinking, stop stressing...a communication you cannot ignore compared to simple muscle tension etc... You can't concentrate, your eyes ache, your head pounds, and you are forced to take a break—which is what your unconscious wanted in the first place. MHR or just generally you not-conscious mind is rejecting your current lifestyle / lack of fun / overwork / overstress etc...

**CASE 9: HEADACHE** A man was referred to me who had a long history of so-called tension headaches. He averaged three to four severe headaches a day. He
tended to be a compulsive individual in all of his activities, but more so when it came to "keeping on top of my work." I asked him to imagine the following: that he had a very urgent message for a friend, and that he went to his friend's house to deliver it. He knew his friend was home, so he rang the doorbell but no one answered. I asked him what he would do, assuming the message had to be delivered. He replied that he would push the doorbell and hold it, and if that didn't work, he would pound on the door and shout his friend's name. I asked him to consider that his unconscious had an important message for him, tried knocking on his "door" and, when he didn't answer, his unconscious then started to pound... HEADACHE! He was then asked to close his eyes and let his creative imagination produce a clear picture of that part of him that was sending the message, and to signal me when he had done so. He was then instructed to "ask" that part what signal would be acceptable for him to acknowledge. That part told him to respond to tension in the neck. I then suggested that he become more aware of that signal and, as soon as he felt that message, he was to stop, take several deep breaths, and then take a 10 to 15 minute break. I asked him to ask that part if that method would be acceptable, and if it was, it would be time for him to return to my office. (Somehow during these procedures, he had entered into what looked a lot like a hypnotic state.) He opened his eyes about ten minutes later and said, "It said 'yes,' but if I don't keep my promise, it reserves the right to give me a headache." This simple procedure resulted in an 80% reduction of his symptoms within two weeks. He was then helped, while in the hypnotic state, to become more aware of his kinesthetic signals in general, and to take more frequent breaks. Within six weeks he was symptom free and has remained so. In addition, he reported that his work performance improved.

MHR that was my idea... symptoms represent communications... become more forceful / loud / insistent, until finally overwhelm you i.e. migraine FORCES you to stop doing EVERYTHING... but why not allow unconscious to use a different form of communication i.e. representation system for the message 'relax', 'take a break', 'stop this' etc... MHR as long as you agree to LISTEN to the alternative communication format / representation system ... and actually RELAX and 'take time out' etc... so that the unconscious can achieve its aims WITHOUT resorting to 'Pain'... which is a kinesthetic representation of the message... with various submodalities...

CASE 10: BEE PHOBIA

A woman complained of the following problem: About six months prior to seeing me she had developed an almost phobic response to the buzzing of bees. She told me, "They're starting to drive me crazy." After establishing what is known in the "trade" as an "anchor of comfort" (anchors are explained in Chapters XVI), I had her hold on to the feeling of comfort while she "saw" a bee at a safe distance. I asked her to then hear the buzzing while she held on to the feeling of comfort,
and to listen to the sound as it changed into words; that the words would tell her what it was that her unconscious was trying to tell her. After about fifteen minutes, she opened her eyes and said, "I'm not surprised." She told me that the bee slowly turned into her husband who was always correcting her and putting her down; and that his voice was just like the sound of a bee. (Remember, this is her unconscious process, even if it was different than I had instructed.) She went on to tell me that she was very unhappy in her marriage, but she tried to "pretend everything is great." I explained to her that she could fool some of the people all the time, and all the people some of the time, but that she couldn't fool her unconscious for even a moment. She told me that she was afraid that the "buzzing" would drive her crazy. I told her to give some thought about talking to her husband about her dissatisfaction, and even to consider marriage counseling. She called me a week later to tell me that the buzzing no longer concerned her; that as soon as she had talked to her husband, she could feel the fear "fall away."

Hypnosis causes the unconscious to rise above the conscious and to become more active; while in the waking state, the conscious is at the higher level. The unconscious is always "paying attention" and "knows" everything that is going on. While a surgery patient may be "out cold," they may still record what is said in the surgery theater. Erickson has claimed that you can communicate to the unconscious separately from the conscious. His method was via stories, metaphors and talking to one ear for unconscious communication and the other ear for conscious messages. Hypnotists have held that the unconscious is the storehouse of our entire history and experience; the root of our problems as well as the source of the solutions.

The unconscious is capable of doing several thousand tasks at the same time.

Producing the hypnotic state is easier than falling off the proverbial log, each individual already "know" how to go into hypnosis, and experience that state several times each day. Trance is a normal occurrence and behavior isolated, and exaggerated for therapeutic ends.

There is no 'magic spell' that works with everyone, every time. It is a matter of attending to individual, and inducing / amplifying their normal trance states.

Hypnotists who are highly visual will tend to use visual induction methods—that is, they attempt to produce the hypnotic state via visual imagery. Those hypnotists who are highly kinesthetic will tend to rely on kinesthetic inductions; i.e., you're getting heavier and heavier, etc. Auditory hypnotists will tend to rely on "sounds" as an induction method. (find explicit example? Does he mean 'listen to the sounds of my voice?') If the individual you are working with happens to match your system, you have a very good chance of being successful. If that individual doesn't "match," you can always label the lack of results as "resistance."
VISUAL INDUCTION During one training seminar, the "hypnotist" was telling the "subject" to "feel the weight of your body, and your legs, as everything gets heavier and heavier, and you are getting more and more deeply relaxed." It sounded great—only the "subject" was not responding. The "hypnotist" said to me, "She is fighting me. Would you tell her to cooperate?" I asked her (the subject) what she thought was wrong. She replied, "I can't seem to get it. If he would show me what he means, I'll cooperate!" I asked her if she had ever gone to the beach as a child and had her legs buried in the sand. Her eyes went up left, she smiled, and looked back at me and said, "Sure." I then asked her to look across the room and see herself at the beach as a little girl. After a moment she nodded and continued to "look across the room." I then asked her to "see that little girl having her legs buried in that nice warm sand." She began staring intently and then slowly nodded her head. I said, "Good.

Now...as you see yourself floating into that picture, you can continue to remember these feelings, and then close your eyes and enjoy all of it." Within a second her eyes closed, her breathing rate slowed, and she stayed like that for several minutes. When she opened her eyes she said, "That was great! I could even smell the beach and I seem to be much more relaxed." In the above example, the woman went from "resistance" to responding by simply allowing her to use her system (V) instead of attempting to make her use the "hypnotist's" system (K).

Matching representation systems just small part of total approach. We can utilize any and all parts of the individual’s behavior to achieve the desired destination. As long as we use ZEN attending.

She was always uptight (which was evidenced by her general body posture, as well as almost constant jaw clenching). She said that the more she tried to relax, the more uptight and upset she would become. I then asked her to close her eyes, concentrate on her tension and to really feel all of it. After a short time she was instructed to really feel the tension in her arms and shoulders and, for the moment, forget the other areas, and to nod when she had done so. Within several seconds she nodded, and I said, "Now, I would like you to allow that creative part of you to give you a clear picture of what those tense muscles look like. I know that sounds strange, but that part of you can surprise you soon." When she nodded after about one minute, I asked her to keep her eyes closed while she described the picture she was seeing. (At this point, there was a noticeable reduction of her jaw clenching, and her breathing rate had slowed and deepened.)

Utilizing Utilization 137

She described the tense muscles as looking "like pink and red thick rope with big knots every few inches." I told her that she was doing great, and then asked her to allow that part of her that remembers the feelings of relaxation to give her a clear
picture of what "those" relaxed muscles would look like. After a short time she said, "They look like big pink spaghetti, only the pink is a softer color than before." She was then asked to repeat the procedure, next with her legs—forgetting the arms—then her stomach area—forgetting the other areas—and to do it all in her own mind without talking. As she carried out her instructions, her breathing rate continued to slow, and she began to evidence a degree of physical relaxation. After nearly 20 minutes, she opened her eyes (slowly, and with some effort) and said, "That was interesting. What next?" I pointed out that our time was up, which thoroughly surprised her. When she arrived for her next appointment, she was smiling, which was a considerable change from her first arrival. She told me that she "thought" that she had been less tense during the past week, and that her husband said that she had seemed calmer. While she wasn't sure if she had been less tense, she was sure that she was sleeping much better. (She also evidenced a substantial reduction in her general jaw-clenching behavior.) I asked her to close her eyes so that we could continue with what we had started. As soon as she closed her eyes, there was an almost instant slowing of her breathing. I instructed her to pick out one area of tension, to concentrate on feeling all of it, to get a picture of that area, and to see if the picture had changed. After several minutes, she opened her eyes and said, "Well, it's still ropes with knots, but the knots look looser." "Like you've been feeling," I replied. I asked her to close her eyes again, and to get the picture of the knotted rope, and to signal by raising her left hand a few inches for "yes," which she did. I then said, "You have learned to get a picture from your feelings. Now, I would like you to continue your 'learnings' by getting a feeling from a picture. Ask that part of you that remembers how to relax...NOW...to give you a clear picture of your relaxed muscles. When you've accomplished that, you know how to signal 'yes.'" When she signaled (raised her left hand a few inches) I said, "Now keep on watching while that part continues to help you get that relaxed feeling, and that part will signal 'yes' when she's ready. You may be surprised that when you signal 'yes,' that hand [at this point I brush her left hand lightly] will be so relaxed that it may want to float up toward your face. I must confess that I have no idea just where that hand will come to rest against your face. I will have to rely on that creative part of you to decide for both of us." Within a few minutes, not only did she look as if she was "in that state," but in addition, her left had begun a slow ascent to her face.

EXAMPLE I: DISCUSSION This woman presented one very well-developed skill—that of being tense. There are those who might argue that tension is not a skill. On reflection, I know that they will recognize that tension, under the appropriate circumstances, would be an appropriate response. This individual, however, had lost her ability to have choice as to when to use this skill. Rather than attempt to make her conform to my blueprint, I decided to use hers. When I made the statement, "Hey, if you knew how to relax that easily, etc." I was signaling acceptance of her blueprint, being on her side, and establishing rapport
all at the same time. Her response indicated that this had been successful. By asking her to feel the tension, I was utilizing what she was already an expert at, thereby insuring that she would be successful, and beginning the processes of indirect suggestion. By directing her as to which area to "feel" first, I was helping her to further accept my direction. Having her "see" what the tense muscles looked like was, in fact, the first step in helping her to disassociate: Tension = Kinesthetic Changing Kinesthetic to Visual = disconnecting or disassociating from the feeling (tension). Asking her to allow "that part" that "remembers" the feelings of relaxation, etc., was a series of unconscious communications (suggestions): 1) There was another part of her than the one she was used to; 2) That somewhere in time she had been relaxed; 3) She could remember that feeling. When I asked her to close her eyes at the beginning of the second session, she immediately altered her rate of breathing, which indicated that she had "made the connection" and was learning to relax. By asking her to signal by raising her left hand slowly for "yes," I was setting up ideomotor response, and structuring the beginning of a possible hand levitation. (Stroking her hand lightly equals kinesthetic reinforcement of the verbal suggestion.) Since she had evidenced her ability to generate visual experiences from kinesthetic experiences, helping her to generate kinesthetic experiences from visual experiences was simply utilizing what she "knew" how to do, but redirecting it. By utilizing her "skills," "beliefs" and "systems" (Visual—Kinesthetic—Auditory), she not only achieved what she had been unable to achieve before (the hypnotic state), she also gained the ability to "picture" away her tension. As a result, her jaw clenching "got lost" and she became a much calmer individual in general.

Most or maybe all people, can enter into or be in a hypnotic state with their eyes wide open. There are some experts in the field of hypnosis who contend that eye closure simply makes the subject's tasks (whatever they may be) easier to accomplish.

I have worked with many people who respond better with their eyes open. In some cases, eye closure actually stops the individual from processing and responding. I believe that most hypnotists require eye closure for their comfort. I have observed dozens of hypnotists become "unglued" as a result of a subject staring at them. All the signs of a satisfactory hypnotic state may be present, yet the hypnotist interrupts the subject's state because "being watched" disturbs them. I hope you will learn to accept the subject's right to enter hypnosis with open eyes, and to utilize that situation as just another choice.

I asked him to take a seat in a dental chair, which he did. I picked up a white towel, put it into his left hand and said, "OK, I'm going to help you to experience hypnosis, but first I want to test out your so-called 'control.'" I began by positioning his left arm straight out to the side of his body, horizontal to the floor. I said to him, "Now, your job is to hold that towel as tightly as you can. When
you don't expect it, I'm going to pull it away from you. I may walk behind you and then sneak up, or I may just grab it from you." His arm stiffened and he had a "death grip" on the towel as he said, "No you won't!" At this point I made several moves as if to try and grab the towel. As I did so, his intense concentration on the towel and me increased. After a few more "attempts," I stepped behind him and said, "Get ready, I'm going to stand where you can't see me and when you least expect it, I'm going to jump out and get it." At this point his left arm had been cataleptic for several minutes. To an observer trained in hypnotic phenomena, it would have been apparent that he was in "that state." However, he had not yet experienced his "proof." I reached over toward his left hand, slowly with my left hand. At the same time, I reached toward his right arm with my right hand and rested it gently on his right forearm. I then slowly lifted his right arm up, off the arm of the chair. I held his arm up, very still, for several seconds, and then I let go. His right arm remained up, without moving, and he continued to stare at the towel in his left hand. I had planned on going no further, but the group instructor had a different goal in mind. Without my knowledge, he had taken a sterile needle from a drawer. While I was continuing to make gestures at the towel "as if" I was going to grab it, the instructor inserted the needle in the subject's right hand. This was done in the fleshy part, between the thumb and first finger. (When I saw what he had done, I was so surprised that I think I went into "that state" myself.) The subject didn't move a muscle, nor acknowledge what had happened. He gave every indication of being totally unaware of "his condition." We, the attendees and instructors, all stood observing the subject while he continued to stare at the towel, without movement or comment. After three or four minutes, he looked up and said, "Well, nothing is happening. When are you going to begin?" Everyone began laughing at that statement, and he said, "What the hell is so funny?" He then began looking around at the group. He suddenly spotted the needle in his hand and exclaimed, "When the hell did that happen? I didn't even feel it!"

EXAMPLE 3: an example of utilization with the type of individual who fears "loss of control...DISCUSSION By his initial comments, the subject had indicated that not only was control a major issue for him, but that he was proud of his "control." Utilization simply required giving him something to control—the towel—and then "helping" him to worry about his control (my threat to take the towel away). As has already been stated, people often enter their own hypnotic state to avoid someone else's. Based on that, I could be sure he would enter into hypnosis to avoid my "control." It was also a good bet that, as long as I didn't point that fact out to him, he would cooperate by "controlling" everything. As for his developing spontaneous analgesia, that is not an uncommon occurrence: that is, many individuals spontaneously develop partial or complete analgesia when entering a hypnotic state. By asking him to hold the towel, I was taking his "movie" and redirecting it toward a goal. In this case, the goal was to
produce a formal altered state. Since he visualized so well, it was a good bet that he would more or less "disconnect" from his kinesthetic experiences. Therefore, he wouldn't know where I put his arm, which made it easy to produce catalepsy.

"Oppositional" or "paradoxical." Individuals in this category not only tend to do and respond exactly opposite of what you intend.

I believe that your skill of deciding for yourself is useful. The problem as I see it is that you have lost the ability to be flexible, or to have choice as to when to be stubborn.

PT: Are you saying that being stubborn is not bad, and that I don't have to get rid of it?

ME: That's right. However, a patient once told me that being grown up includes the ability to do what is in your best interest even if someone else suggests it!

PT: I don't agree. I...

ME: [Interrupting] That's good. I'm glad you don't agree. Now I would like you to continue helping me by refusing to do what I tell you.

PT: Do you mean that you want me to fight you?

ME: Yes! You will be very helpful to me by continuing not to cooperate.

PT: OK. That's easy!

ME: Wait a minute. You just agreed with me. That's not fair. That's cooperating.

PT: What? I'm confused.

ME: Good. Now you've got it. Keep on doing it just that way. Now I don't want you to raise your left arm.

PT: [Slowly raises left arm while beginning to look confused.]

ME: Don't keep your arm just like that.

PT: [Arm stays straight out, stiff.]

ME: That's fine. Now I want your right arm to get very light.
PT: [Right arm noticeably presses down.]

ME: Thank you. You're really doing a good job of helping by not helping.

[Begin to have a "glazed" look.] I'm really getting confused. I'm not sure what to do next.

ME: Well...lower your left arm.

PT: [Responds by lowering his left arm.]

ME: No! No! Now you're cooperating by doing what I'm asking. I want you to cooperate by not doing what I ask.

PT: My head is spinning. I'm not sure what to do next.

ME: Well, don't go into hypnosis...NOW...Keep on staring at me instead!

PT: What? [Stares a moment, eyes close, and a look of relief crosses his face.]

ME: Now, stop relaxing so deeply so quickly.

PT: [Stiffens, then noticeably relaxes.]

ME: Whatever you do, only drift as deeply as you decide...NOW... and don't let that arm get light and float up [not specifying which arm, so that he can both resist and comply].

Using the patient's oppositional nature, I structured a double bind (or maybe several): The patient could cooperate by not doing what I asked, or cooperate by doing what I asked. It didn't matter which method he chose. My experience has been that, after two or three sessions of the above craziness, the patient stops being oppositional in therapy. More importantly, they stop being oppositional in the real world.

ME: Now, you are here to learn something about hypnosis, and so are your colleagues, is that correct? [His head nods "yes."]] Since you don't need to have surgery to learn to perform surgery, it stands to reason that you don't have to be hypnotized to learn how to produce the hypnotic state.

"S": Yes, that makes sense also.

ME: Good, we agree. Now I'm going to ask you to simply pretend that you are a great hypnotic subject. That will allow your colleagues to learn a great deal, and of course, so will you. Is that OK?
"S": [Dr. "S" nods his head] Sure, I'd like to be of some help.

ME: Now, pretending that you're a good subject, what would your body position be if you were in hypnosis?

"S": I guess relaxed and loose.

ME: Relaxed and loose ... good ... can you show me what that would look like?

"S": [Rearranges his body position into what looks like a relaxed position.]

ME: How would your head be ... straight up like it is now, or kind of down toward your chest?

"S": I guess it would be down a little... like this [lowers his head].

ME: Eyes opened or closed... NOW?

"S": Closed, [closes his eyes]

ME: Good! Now pretending that you are going into a deep hypnotic state, I would like you to experience, within yourself, what you would experience. Later you can tell us about it.

"S": [Nods head slowly, breathing begins to noticeably slow]

ME: [Supposedly to the audience, but really directed toward Dr. "S".] Now, if he were really in hypnosis, I would ask him to take his time in discovering... NOW... where he learned to believe that he had to hold onto certain limitations, and to discover from his creative self what he needs to have at least three new choices [Pause for 3 or 4 minutes.] I would also ask him to continue to learn and ignore us, and to not return here until his unconscious mind was satisfied as to his new choices.

At this point in time, Dr. "S" appears to be "long gone" and is evidencing all the classical manifestations of trance: slow, deep breathing; immobility; total physical relaxation; and no responses to the noises or questions from the audience. Dr. "S" continued to "pretend" to be in hypnosis while I held a question and answer session. This went on for ten minutes while we all watched Dr. "S." I then said, "He can continue as long as he wants and as long as is necessary, or whichever comes first." I spent another 15 minutes answering questions, and then the meeting was adjourned. There was just one small problem. Dr. "S" was continuing to "pretend" that he was in that state. Several of the doctors came up and began to watch Dr. "S" while he sat "pretending." One of the doctors said, "When will he come out of it?" I replied, "Normally, you would let him continue
as deeply and as long as he needs to continue. However, since everyone is waiting to leave, you could say to him that he can continue learning after he returns here, and he will return here when he realizes now how full his bladder is." Within two minutes, Dr. "S" began moving in the chair, and then his eyes opened. He said, "What happened? Where is everyone? I've got to go to the bathroom in the worst way."

MHR THAT is the entire point…hypnosis IS ‘playing at being hypnotized’, IS ‘pretending’ and ‘role playing’ … but that does NOT affect the therapeutic value…it reinforces it i.e ‘free will’ of person strengthened…just need ‘excuse’, ‘context’, ‘props’, ‘facilitating environment’, ‘support’ of hypnotist ‘situation’…

EXAMPLE 6: DISCUSSION Since Dr. "S" had signed up for the program, he was, in all probability, there to learn. On the other hand, he "believed" that being hypnotized was impossible for him. The task, therefore, was to find a way to utilize those two factors in some manner that was acceptable to him. "Accepting" that his being hypnotized was impossible, by stating that to the group, utilized that aspect. Emphasizing the learning aspects of the meeting, and then asking him to "pretend" for the purpose of learning, utilized that part. By structuring the situation so he could merely "pretend," allowed him to believe it was still "impossible" and yet he could still learn by simulation. Of course, if you pretend to raise your right hand, you will, in most cases, actually raise it.

MHR in other words NOT challenge his limiting belief/s, instead, ACCEPT them, and merely ask person to ‘pretend’, consciously at first…that they are in fact entering trance state…this is the ultimate double bind that employs the FACT that trance is always SELF-induced, and always ‘pretend’ / ‘role playing’…BUT REMEMBER, ANY BELIEF IS ESSENTIALLY ROLE PLAYING/ PRETENDING TO BELIEVE…we have no way of ‘knowing’ anything, but we ‘pretend’ we do…THAT is how we operate heuristically in a world that may or may not exist at all, other than in our imaginations i.e ‘pretending’ / ‘role playing’…

MHR To ‘role play’ requires you to discover / access / remember / focus on the EXACT symptoms of ‘trance’ i.e you have to ‘enter into it’ literally…which is exactly what the therapist intends, to ELICIT those states…when we vividly imagine those states, we elicit them in the most powerful way, making them REAL for us…which is ALL trance induction is about…either by suggestion, by mirroring and leading, or in
this case, literally, explicitly, getting person to ‘pretend’ to be entering trance, by recalling / acting out all the stages from light to deep trance...by which they ‘enter into it’ i.e trance...and are effectively in trance...this is basically SELF INDUCTION...as ALL trance is...question is whether and how a person is LEAD to self-induce i.e by copying the suggestions from the voice of the speaker into their internal voice, by copying / mimicking/mirroring their gestures ... point is that attention is focused on something first, outside, and then on the feelings this produces inside, the person...

Pretending elicits memories of those aspects necessary to "pretend." I have asked individuals to pretend that they know what it would take to solve some specific problem, or to overcome a fear, etc. In the vast majority of cases, their pretended answers are important keys that unlock the right doors. In addition, the "pretend" approach is a powerful induction technique. When a subject tells you what he would experience if he were "really" in hypnosis, he has, in most cases, given you the exact map to follow. Last, but not least, Dr. "S," as a result of his "pretend" hypnotic experiences, began to experience changes in some important areas of his life. Several weeks after his experience, he took me to lunch. He told me that he and his wife had been having some difficulties, and that he had not been able to "get it on" sexually with his wife in almost a year. His wife had been claiming that he was almost always uptight, and that he seldom "let go." He said that since the training class, he had begun to loosen up, and was finding it easier to "let things happen," and that he was becoming sexually active with his wife. In addition, he informed me that for one week following the class, he had a tendency to "sort of drift away and lose track of everything, whenever I'm alone with nothing important to do." I told him that he was an excellent hypnotherapist, and that his ability to not understand was helping him to gain understanding.

MHR this is pure Buddhism...to ‘remember’ rather than ‘generate’ solutions...much easier...to act as if already know...as if already in trance...activates all the non-conscious powers of the mind and de-activates / bypasses the limits of conscious beliefs...as to what is possible, good, acceptable...

EXAMPLE 7: "B," a 38-year-old doctor, was referred to me with a "list" of presenting problems. He had made out the list very carefully. He informed me that his list was in the order of the problems' importance. "B" told me that he had taken several courses in "professional" hypnosis(I assume that other courses were
to him "unprofessional" courses), and that he attended many hypnosis workshops. He also stated that he often used self-hypnosis, but had been unable to solve his problems with that approach. Additionally, "B" had been in psychotherapy for nearly a year, and he claimed that he had made little or no progress. I asked him why he continued for a year when it wasn't, according to him, doing much good. He replied, "I like to finish what I start, and I'm a very patient man." When asked what he did for relaxation, he answered, "When I want to relax, I more or less drop out. I accomplish that by turning on some music at a very low volume. I then close my eyes and really make myself tune in to the music. I then start a process of drifting." (I wonder if you, the reader, have figured out what his preferred conscious system is?)... After gathering some additional information, I began to tell him several metaphors. The thrust of these metaphors was to "remind" him that we do many things without thinking about them in specific, step-by-step detail. I wanted him to remember that there are many areas in which we rely on our unconscious processes; that this frees our "logical" mind for other matters. (I'm sure that the reader can "see" that "B" was a very logical person: problems in a list, systematically studying hypnosis, etc. You can...NOW RECOGNIZE...that his preferred system is auditory.) As I would tell him a metaphor, with the embedded suggestions / generative – resourceful beliefs, I would lean slightly to my right, and talk softly in a monotone (remembering that soft music allowed him to ‘drift off”). When giving him so-called "factual, logical" information, I would lean to my left, and talk more rapidly and with tonal animation. After a short time, when I would lean right and switch to a monotone, "B" would sit perfectly still and stare intently. When I leaned to my left, he would "fidget" and his face was animated. Toward the end of our first session, "B" said, "I know you're doing something to me. I can feel it happening, but I can't figure it out. Aren't you going to try and hypnotize me?" I laughed and said, "I'm still trying to figure out how to get you to stop going into hypnosis so well!"

MHR Zen observation / interrogation yielded insights required to employ natural tendencies in person in therapy, to induce trance, offer suggestions in way most likely to be accepted by person...

EXAMPLE 7: SESSION 2 Our second meeting was basically a repetition of our first session. The metaphors were now more directed toward his "list." Whenever I finished a metaphor, I would stare at him without blinking for several seconds. I would then blink several times, switch to my left and give him some "logical" information. As we neared the end of the session, he again said, "Aren't you going to try and hypnotize me?" I again laughed, leaned to my right, and just stared at him. "B" immediately "froze" and stared back. I then sat straight up, and "B" blinked several times and said, "Hey, have you been hypnotizing me all along?" "That would be telling," I replied, while I nodded my head slowly "yes." "Besides, there's no such thing as hypnosis." I then leaned to my right, and moved my lips as if I was speaking. However, I wasn't making a sound. "B"
"froze" again, his eyes glazed, and his body began to slump. Very softly I said, "Not yet. Next week will be soon enough." I then sat straight up in my chair. "B" blinked several times and then said, "Wow. That was strange. I know you hypnotized me, but I don't know how." With that we ended our second session.

EXAMPLE 7: SESSION 3

"B" entered my office and sat down with an expectant look on his face. (You could say he was altering his state in preparation of having his state altered.) I asked him if anything surprising had occurred during the last week. He replied, "Yes, quite a bit. I have been laughing more and I seem to be looser in the way I move. My staff has commented about how much calmer I seem to be. The only problem is, I can't figure out why." I responded by telling him, "Good. You are a very logical person, but in the past you've been totally illogical in your attempts to solve your problems. After all, if logic were the answer, you would have logically solved the problems. Since logic has failed you, it's illogical to do more of the same." (As I was giving him that logical, illogical explanation, I slowly shifted to my right and also shifted to monotone.) I reached for his left hand, and slowly and gently lifted it up. When his hand and arm were about one foot off the arm of the chair, I held his hand still. I said to him (still in a monotone), "Now you know where your hand is because you can see it. However, even though you're a doctor, you would have difficulty naming all the muscles, in the exact logical order, that are...keeping your hand and arm exactly as it is." (Unconscious suggestion for arm catalepsy.) At this point, "B" was completely still, was staring without blinking, and was totally EnTranced with what was transpiring. I continued: "Now...as you close your eyes, you won't be able to know where your hand is by seeing it. Instead, you can be very successful by allowing yourself to experience all of the feelings of it." (Much of what is now being said is directed toward two goals: 1) trance induction; and 2) metaphoric approach to his "real" problem—being shut off as to experiencing feelings in general.) "And, as you continue to connect to all those good feelings, without action...and perhaps without understanding, then my voice will continue to be as if soft music, and you can continue to drift." At this point, "B" was given some direction toward the resolution of his problems and then told, "Your arm will probably remain stuck, just as you have been, until you discover how to become even more flexible in your personal life." Twenty minutes later, "B's" arm moved slowly down. Instead of terminating his hypnotic state, he appeared to be deepening it. I told him that his unconscious mind would decide if he was ready to return to "this time and place," or to continue with what he was doing if that was more important. "B" stayed in "that state" for another hour and fifteen minutes. I had to use one of our other offices to see my next appointments. Over the next several weeks, the changes in "B" were not only dramatic, but delightful to watch. He put it best when he said, "Everything used to seem so serious and important, life or death. Now, I'm having some fun with my life, and saving my serious side for truly
serious problems. The funny thing is that I'm accomplishing more with less effort."

EXAMPLE 7: DISCUSSION

The above example is filled with utilization. Often the induction processes and therapeutic goal processes were completely intertwined. That makes it somewhat difficult to make a clear delineation between the two. Certain factors, however, can be separated and spotlighted. "B" had been trained in traditional hypnotic techniques, and had been practicing them on himself. However, "it" wasn't working. Therefore, any use of so-called traditional approaches would no doubt meet the same fate. In other words, any overt attempt to hypnotize "B" would probably not succeed. He gave support to that interpretation when, at the end of the first session, he said, "Aren't you going to try to hypnotize me." (In this context, the word "try" implies: I know it won't be successful, but let's try.) In addition, "B" had been in formal psychotherapy for almost a year, with little or no acknowledged results. Helping him to gain more "insight" or "logical" understanding would produce a lot more of the same... NOTHING.

Utilizing Utilization

"B" had given me the information needed to help him experience an altered state. This information was conveyed when he explained what happened when he listened to music on low volume. By leaning right and talking in a slow monotone, I hoped to accomplish two things: The leaning right would itself become an unconscious suggestion to enter into hypnosis; the monotone would recreate his experience of hearing something in the background while he "drifted." His responses to these tactics indicated that they would "do the trick." He had also told me that he was a patient man. Telling him long, drawn-out
metaphors would insure he would have plenty to be patient about: Listening to me, trying to understand my point, waiting for me to "try" to hypnotize him, while drifting due to my monotone. Last, but perhaps most important: pointing out to him that he would have to feel...his arm in order to remember where it was, required him to get in touch (or pay attention, or tune in) to his internal (kinesthetic) sensations, while, at the same time, he was attempting to listen to my monotone metaphors. The combination of his "patience," "drifting when listening to something soft and low," and my pseudo-logic all combined to utilize his skills and experiences to help him move...NOW...to new experiences. I could no doubt "DO" one hundred pages on utilization. I don't want to use a sledge hammer to drive a thumb tack. While what you have read about utilization was directed primarily toward producing the hypnotic state, utilization is even more useful as a therapeutic strategy. It is beyond the scope and intent of this work to outline utilization in detail as a therapeutic approach. However, throughout this work, I have attempted to "sneak" in examples of several utilization methods.

**CREATIVE UTILIZATION** For those of you who wish to take a creative leap, the following hints may be useful for you to utilize: Utilize the compulsive personality's compulsiveness to compulsively carry out assignments that lead to new behaviors, which break up the compulsiveness; utilize the rigid person's need to be right, to have them carry out the assignment of being wrong, just right, and to enter into hypnosis in the "right" way; utilize the phobic's ability to generate feelings (Kinesthetic) from their internal pictures (Visual) to generate new feelings from new internal pictures; utilize the depressive's "skill" of holding on to feelings (depression) no matter what any one says or does, to learn to hold on to good feelings in spite of the ups and downs of life.

You can...BEGIN NOW...to look at the presenting problems as a form of unique skill. Once you do that, your task is to discover the method behind that skill, and then to redirect it. The grand master of this form of utilization was the incomparable Milton Erickson, M.D.

MHR it is very hard to achieve the symptoms, and maintain them, deliberately...and in fact they WERE intended, and successful, in achieving some ends e.g survival...though now no longer appropriate, or less optimal than alternatives...so we offer these alternatives...to replace the sub-optimal, destructive, self-defeating 'symptoms' e.g depression takes you 'out of the game' i.e avoidance is a survival strategy, as is a phobia...even the massive tension build-up and maintained in the neck / jaw / face / scalp muscles...

His new wife. He told me she was excited about the prospect of meeting a "real" hypnotist. He informed me that she was afraid that if she looked at my eyes she
would get "put under." When I arrived for the dinner party, my friend greeted me at the door. He led me in to meet his wife. As he introduced me, she reached out to shake my hand, and then her eyes caught mine. She began to stare, and then...BAM! Her eyes closed, she slumped and I had to reach out and catch her. You could say that my presence, combined with her belief system and expectations, produced an interesting phenomenon... You could say that she had hypnotized herself into being hypnotized by my eyes.

Bandler and Grinder? Coined the redundant term ‘anchor’ for ‘stimulus-response trigger’...e.g red light ‘triggers’ a whole set of complex behaviors, mostly non-consciously i.e you don’t have to think about them...you see the red light or stop sign and automatically carry out the actions required to stop your car...or a police flashing light triggers a lot of anxiety etc especially if you are ‘carrying’ or expect a fine...your rego is expired etc... the stop sign ‘elicits’ these responses...the stop sign has become a ‘node’ for a series of actions / responses...like the bell in Pavlov’s experiments triggered salivation in the dogs, who had ‘learned’ to expect meat i.e associated this ‘trigger’ / stimulus with meat...and so in NLP terms they’d say it had been ‘anchored’ to the bell...the association ‘anchored in’ the bell...but for me the term ‘associated’ is enough...and ‘trigger’ seems more apt than ‘anchor’...

Every word triggers both a denotative and a connotative set of associations e.g the dictionary definitions, determined by context i.e which of the definitions applies in this context...and a lot of individual associations e.g cats, allergy, affection, fun, predator, pet...we decode the symbol into these...if we share the symbolic language with the writer e.g English...denotation...denotative ‘meaning’ intended...but the connotative meanings may be lost on us, or different e.g how we have experienced ‘cats’ and thus our personal associations with the idea of a ‘cat’...

MHR Every impression is represented in some form, in other words encoded into that form. The word ‘cat’ first triggers the image in your head of a ‘cat’, and then all associations e.g cats purring (auditory), the wonderfully calming / soothing softness of cat fur (kinesthetic) and our personal ‘feelings’ about cats e.g love / hate / envy / fear (phobic-allergic) (kinesthetic)...the same set of responses will be triggered by an image of a cat, or hearing a cat meowing or screeching, or feeling a cats soft paws / or as it slides and pushes up against your legs...in this case the word ‘cat’ will be triggered by the kinesthetic / auditory i.e visual ‘cat’, and auditory ‘cat’, and kinesthetic ‘cat’...more precisely ‘cats’...a metaphor nodule is triggered...every association is triggered, by any of these ‘symbols’ / ‘representations’....

MHR some people flexible in their responses...able to tailor response to the particularities of the interaction e.g friendly dog Vs vicious killer dog, guard dog
doing its job Vs playful pet in park…but some people stuck in rigid ritualized reactions…unable to chose … e.g puppy terrifies as much as attacking pitbull…the ‘trigger’ sets off a ritualized chain of responses, ending in panicked terror for phobic, or consider the term ‘The Holocaust’, and all the Hollywood associations you have been conditioned to ‘call up’…or the word ‘Nazi’…

These responses were originally ‘suggested’ by some traumatic experience, or dramatic experience good or bad, or by long term repetition e.g ‘drink coca-cola’ was once EVERYWHERE, in EVERY channel of representation…same as tobacco products, and alcohol…today only ‘The Holocaust’ has the same ‘brand’ exposure, along with demonisation of ‘Hitler’ and ‘Nazis’ and ‘Islamic terrorists’.

In the same way that a hypnotist ‘suggests’ a given response to a given stimuli e.g when you hear a bell chime, you will X, ‘when I click my fingers, you will Y’…all post-hypnotic suggestions that will be ‘triggered’ AFTER the session is over, or after ‘awaking’ from the trance…

Consider a movie or television commercial, or radio commercial, as a ‘trance condition’, which you ‘awake from’ at the end…during the commercial or movie certain suggestions were implanted in your not-conscious mind…by association…it is called ‘product placement’ when the hero wears ‘Rayban’ sunglasses and drinks ‘Coca-Cola’ or ‘Jim Beam’. Of course the ‘Shoah’ movies implant malicious, mendacious, ideas about Hitler and the Nazi’s, or Islam and terrorism, or anyone who challenges these ideas as being a ‘terrorist’.

The movie may be an action film with no obvious message. Pure escapism. But the ‘product placement’ is intended to ‘sell’ a product or idea. That Hitler was the most evil man ever, and Nazi’s were vicious monsters, or that ‘Raybans’ or X brand of cigarettes are the way to become the hero of your own story, attract women, feel confident etc… These are the ‘suggestions’. The ‘post-hypnotic’, ‘Post-movie’ suggestions. So next time you feel insecure, you will reach for brand X cigarettes. When you hear the world ‘Nazi’, you will automatically activate the metaphor nodules implanted in you by the movie, and ‘remember’ Nazi’s throwing babies or crippled old men in wheelchairs out of windows, laughing in their malicious glee. And over your lifetime, you will have been exposed to thousands of such ‘programs’ i.e ‘conditioning programming’ designed explicitly to achieve this end i.e so that you will be conditioned to respond a certain way any time you see, hear, or read, the word ‘nazi’, or Hitler’, or feel like you need something to do with your hands e.g smoke.

Our ‘education’ is mostly the implanting of conditioned responses to ‘authority’, to ‘valuing the approval of authority figures and fearing their rejection / disapproval i.e abandonment by society…parents…family … e.g religious ‘education’ … the only reason one person ‘believes’ in one set of religious
beliefs and not another is clearly that they were conditioned from birth, directly or indirectly...few people ‘change’ their nominal religious beliefs / affiliations...and it is easy to ‘trigger’ a conditioned response to some ‘foreign’ religion i.e by definition it is ‘wrong’ and ‘deceptive’ and ‘dangerous’...i.e same as for fear of anything ‘foreign’...as inferior, and dangerous...

Sense of smell is perhaps the most powerful trigger...Olfactory representation...we ‘see’ some wavelengths, hear others, and smell others...different animals have wider / narrower bandwidths for each e.g do has much more sensitive differentiation and width for smells, but humans see more colors...

Placing a sleeping person’s hands in water ‘suggests’ urination to their non-conscious, sleeping mind.

A certain sound can trigger sexual thoughts.

A certain scent, associated with ‘mother’ as an infant, placed in ‘baby powder’, and later placed in adult perfumes and even washing detergents, will trigger powerful feelings of safety, security, etc...

These are all ‘triggers’, what NLP calls ‘anchors’, because they deliberately employ the ‘implanting’ of ‘triggers’ via touch, tone of voice etc, to replace one existing sets of triggers with another...so that the same stimuli now triggers more resourceful, constructive, optimal etc responses...

MHR I would use the term ‘implant’ or ‘glue’...anchor is heavy, and stops movement...

Before the subject was "counted out" (or whatever) from hypnosis, the following type of suggestion would be given: "...when I touch your forehead [shoulder, what have you] and count [backward, forward, up, down, it doesn't matter], you will re-enter into this pleasant [deep, comfortable] state." (Kroeger, 1963; Wolberg, 1964). Where this post-hypnotic suggestion "took" you would have, in effect, a one-trial learning anchor. From that point on, each time the hypnotist triggered that anchor, the subject would re-enter the so-called trance state. In some cases, any other person triggering the anchor would find the subject entering into a trance. Pavlov, with his development of classical stimulus-response conditioning, was one of the first to recognize anchors and to realize that anything could be used as a stimulus to produce a response. He discovered, in his work with dogs, that food—the unconditioned stimulus (US)—leads to an unconditioned response (UR): salivating. Pair a bell to the US, and in a short while, the bell becomes a conditioned stimulus that elicits the UR.
MHR inhibitions ‘learned’ i.e born like puppy, no fear, outgoing, confident, expect the best…then become inhibited to ‘fear’ something or be ‘wary’ and ‘anxious’ in general, by each new ‘painful’ experience…compare puppy to mature ‘feral’ street dog in demeanour, and you have the dramatic case that applies to most humans. Some remain ‘puppy-like’ or ‘boyish’ into their old age, but most become cynical, bitter, resentful, anxious, fearful etc…neurotic…

MHR none of the books ever mention David Hume. It was HE that clarified / revealed how we take totally unrelated phenomena, and form ‘cause-effect’ relationships from them…constructing ‘objects’ from discrete, unrelated impressions e.g colors, scents, tastes, textures to form ‘apples’…and connecting things that appear before and after, by some magical property called ‘cause and effect’, for which we have no justification…for which there is no’ objective’ reality…

So the danger is that we connect things that are unconnected…e.g danger to all dogs, based on something we overheard mother say, or one dog biting us…or much worse, ideas of ‘gods’ and ‘sin’ and ‘hell’ that are pure constructs, like ‘voodoo’ or ‘magical sticks’ that are ascribed massive powers, though they have zero power over us…we respond ‘as if’ they do…in other words, we were conditioned to respond with a whole ‘ritualistic’ set of responses…and can be cured or made sick by placebos and nocebos, by the good and malicious intentions of the ‘witchdoctor’, ‘priest’, ‘shaman’…

MHR as infant / child, with everyone more powerful than me, I ‘learned’ that I could NOT defend myself…that I was POWERLESS to do so…so later people who were NOT more powerful than myself, were able to bully me…I was physically incapable of defending myself, even though I could easily have defeated most of these people, and at least given the rest reason to find some other victim…most of us have been conditioned in some way…to come to similarly unjustified conclusions about our ‘self’ i.e limiting beliefs…e.g I’m not pretty, I’m stupid, I can’t learn new things, I can’t dance, I can’t write essays, I can’t talk to people, I can’t succeed, I can’t be happy…

MHR we give certain ‘words’ or other stimuli, e.g ideas, the power to make us mad, angry, depressed, anxious, fearful…they are powerless…just utterances, but they ‘trigger’ a ‘ritualistic’ response…i.e a ‘habitual’ set of feelings, physiological reactions…visualize someone biting into a big juicy lemon !…or your top sex symbol undressing … or someone pointing a gun at the head of a child…or a Hollywood ‘Nazi’…or the ‘Hollywood version’ of Hitler. See how quickly such powerful responses are triggered. As if by magic. Abracadabra indeed. The words evoke images, feelings, even smells, simply by association…a host of associations have been conditioned / implanted in your by your actual
experience, and by your viewing of mass media products, and ‘education’ materials, including religious and other propaganda works.

Conditioned reflex responses … include a chain of ‘triggered’ associations…

Erickson observed that if he asked a patient to sit just as he had the last time he experienced trance, and Erickson began talking in the same manner and/or about the same subject as the last trance experience, the patient would re-enter the trance state without any so-called induction. Erickson named this technique "recapitulation."

When a person vividly remembers or imagines employing all their representation systems e.g sights, sounds, smells, textures, feelings, (remembering is really imagining also), they spontaneously enter trance and regress to or enter that imagined/recalled situation.

If there is some physiological symptom / manifestation associated with that memory / imagined situation, then can literally ‘feel’ that pain anew / afresh, as if the ‘cause’ of it were present. Merely by imagining such ‘causes’ vividly, as Hume explained.

Just like you may loathe visiting X, or doing Y, because you associate it, consciously or not, with some nasty experience / feeling, if you evoke a certain memory or imagined scenario in a particular tone of voice, with the person in a particular state, sitting in a particular chair, or in a particular way, they can form an aversion to that tone of voice, chair, body posture, and you can use any of these ‘associational triggers’ a.k.a ‘anchors’ to evoke / elicit that state over and over…e.g to induce trance, by having them repeat the past actions, in the same tone of voice, sitting in the same chair, as that you used to induce the first trances…i.e to quickly reproduce that trance state, which initially may have taken a long time…muscle memory…associations…conditioned reflex responses can be implanted quickly…or over time…but then can be triggered quickly and easily by any stimulus the person associates with that state / situation…

The key to understanding ‘anchoring’ is that YOU do NOT need to understand / comprehend / see / know exactly WHAT it is about what you did or said, or they did or said or thought, that ‘triggers’ the trance induction…so there is no ‘formula’ or ‘recipe’ you can repeat…you just need to experiment, and observe when the person is in trance i.e HAS been induced…then repeat any of the ‘cues’ you employed…any of the changes in tone of voice, touching in a certain way, sitting in a certain place, which the person has somehow associated with the trance state…SOMEHOW…no need to know how / why…to use it to evoke
trance again… there is often no LOGICAL reason to expect trigger A to produce response B e.g trance state, or fear, or sexual arousal… it is the person who has made some association… it is NOT rational… NOT logical… WHY stimulus X e.g red shoe, should trigger response Y, sexual arousal, need not be understood… there is no LOGICAL connection… the connection however WAS formed, and does exist, and it is real, and you can utilise it… e.g to induce trance, fear, terror, joy, sexual arousal, depression, optimism…

Any association made by the person can trigger a post-trance-hypnotic suggested response… e.g the response ‘suggested’ by a small dog biting a person as a child’, or a trance state… any association the person makes will evoke / illicit that response… so you can illicit / evoke it by trigger that association, by doing what you did last time that ‘worked’, or having them do what they were doing last time… without seeking to understand WHY sitting in that chair ‘works’, or ‘remembering your first puppy dog’ ‘works’ to induce trance, or fear, or sexual arousal.

i.e you can find out what person associates with ‘being in love’ and then transplant / evoke / illicit those feelings for their current relationship… same for sexual arousal for partner… using sub-modalities of representations of experiences / imagined situations… and muscle memories / associations e.g posture, tone of voice, smells, images…

Ideally you take any triggered response that the person does not want to have, and replace it with one they desire… e.g replace fear with cautious, alert, calm… stress with relaxation… anxiety with optimism… despair with positive expectancy… e.g Help the individual to use the first subjective feelings of anxiety— i.e., tightness— to trigger a response such as relaxation?"

Conditioning is about hypnotizing people into believing X, e.g. That hypnosis doesn’t exist… and implanting the post hypnotic suggestion that when they hear someone contradict belief ‘X’, e.g. the word "hypnosis" becomes the post-hypnotic "cue" (anchor) / trigger that elicits a response of angry denial that hypnosis is real.

Ask person to recall situation ‘X’, and observe them for all signs that they have regressed to ‘x’ or are vividly experiencing ‘X’ in their imagination e.g change of rate of breathing, posture, pulse, coloring of face, muscle tension, sweat… then when appears they are fully immersed in the ‘imagined’ situation, ‘anchor’ that set of responses to the imagined situation with a touch on their shoulder, while saying, "Good. Hold on to that feeling so that you can become very familiar with how it feels inside." You may chose to use a distinctive tone of voice that in future will be associated with that set of feelings, or talk to only their left ear, or stare at them directly without blinking… anything that later will become
associated with that state, and which you can therefore trigger with that… e.g. stare, or tone of voice, or touch on the shoulder…

Then tell them that in a moment you will ask them to do something, but not to start until you direct them to. Tell them you are going to ask them to repeat the same process of imagining that supposedly past experience (all memory is distorted / imagined), or new one, in slow motion… paying close attention to how the process builds… i.e. to attend to the very first signs of it beginning to develop e.g. of the fear emerging vis a vis the phobia, the first indications e.g. tightening of muscles in stomach, dryness in mouth,… whatever the first strong physical sensations are, that are triggered by the imagined presence of the feared trigger etc… and direct them to signal in some way e.g. raise the first finger of their left hand, when they become aware of this sensation first emerging… But they are not to begin until you direct them to. Then touch them on the same spot as before, or give the same unblinking stare, or adopt the same tone of voice, speaking to the same one side of their face etc… where you ‘anchored’ the response set, and apply a little more pressure than before, and ask them to begin vividly reproducing the ‘state’, hold the pressure for a few moments, and then remove your hand.

Now they have just begun building up to the ‘state’, in the way they have been habitually doing… e.g. thinking of the ‘trigger’, and going through the process by which they become ‘terrified’ etc.

And you can now replace their traditional / habitual / learned / conditioned / induced response with something desirable, as Buddha suggested… no ‘debate’ with their conscious mind about how irrational / illogical their habitual response set is… just replace the actual response set… with a new ‘muscle memory’…

Now ask them to take several deep breaths and think of the beach or mountains or anything pleasant. The next step was to ask them to remember the most pleasant, relaxing place they have ever been—or to make one up in their imagination—and to signal when they had accomplished that.

Now touch the same spot you anchored their ‘habitual negative response set’ to, and instruct them to recall that ‘situation’ i.e. how it begins, and to signal when they feel the first reflexive response. As soon as they signal, stop touching them and say somewhat sharply, “Stop!” [A pattern interruption.] So that the release of your pressure, and ‘stop’, coincide with the very start of their usual response set.

Then immediately instruct them to ‘go to that special place’ i.e. vividly imagine that place of calm, optimism, relaxation, pleasant etc… to see yourself feeling those pleasant, pleasurable, relaxing, feelings, sensations etc…
Repeat this procedure 6 to 8 times, and then while they are in that state, instruct them as follows: "Each time you feel that first signal of "anxiety" such as [filled in with what they had reported as the first signal], you are to see yourself there, feeling those comfortable feelings. As you practice this procedure, it will become more and more automatic until soon it will happen, in all the appropriate circumstances, without thinking and without your conscious awareness of having gone to your special place."

You can anchor the 'pleasant state’ also. And ‘test’ to see if the anchors work. I.e if they trigger the unwanted, and the desired, states.

Use visualization e.g imagine you entering into the pleasing scene you imagined i.e first see yourself dissociated, then associate. Use visualisatin first, dissociated, before associating, and ‘feeling’ i.e enter into it...

Practise until the ‘anchors’ ‘trigger’ the states i.e you have ‘anchored’ the states, and can trigger them, by repeating the anchor. Observe for signs they have entered the states, as evidence of the ‘anchor’ ‘working’ i.e that you can ‘activate’ it at will.

**BASIC ANCHOR COLLAPSE**

Several years ago, or once upon a time, I was asked to give a lecture and demonstration to a psychology class at California State University at Northridge. The professor, who was a very nice man, had told me beforehand that he did not believe in hypnosis, that it did not work anyway, but he felt his class should have the opportunity of hearing about it. I guess he wanted me to be the token hypnotist. To make matters even more interesting, he was prepared with a long statement about his disbelief in hypnosis while stating he was open enough to give almost anybody a chance to speak about what they believe. It was as if he had told them I had designed the Titanic and was now going to prove that it had not sunk. I decided that to survive my glowing introduction, I would have to demonstrate something dramatic, and on the professor. I knew from a previous conversation with him that he was going through a very painful divorce and was—according to him—fighting depression whenever, "I think about it." I thanked him for his introduction and, as he sat down on a long table at the front of the lecture hall, I walked over to him and ostensibly began talking to the class. I told them that I really appreciated the Professor’s asking me here and introducing me, particularly at this time in his life when he was going through a very difficult period. His expression immediately began to change as he looked down to his right (kinesthetic), and evidenced discomfort. At that point, I squeezed his right shoulder and said, "I know that's painful, isn't it?" He nodded slowly. I then removed my hand and said sharply, "How long will it take you to remember now... [said more slowly and with a lower tone: an embedded hypnotic suggestion to remember now] a time...
before you were 20 when you experienced something that felt so good that you knew everything was going to be exciting." (Taking a risk that most of us at some time before we were 20 did something or experienced something that was exciting.) His head came up and his eyes began moving up to his left (visual recall), and his face began to relax. Slowly he smiled, and then blushed and said, very strongly, "I can remember." At this point, I had reached to his left shoulder and began to gently squeeze it. Without any explanation, I was making an effort to set up two anchors: touch on his right shoulder for the painful experience and touch on his left shoulder for the happy experience. Next I tested the work. I said to him, "That's a better feeling than the other, isn't it?" (Still squeezing his left shoulder.) He smiled and nodded vigorously. I then went on: "Much better than this uncomfortable feeling" (Here my voice became sad-sounding and my face looked sad, while I squeezed his right shoulder.) The change was dramatic! He again looked as if his world was coming to an end: eyes down right, head lowered, lips quivering. I then switched to his left shoulder while saying, "You'd rather have these feelings, wouldn't you?" (Said with happy tone and smiling face.) He immediately looked up, took a deep breath, smiled and said: "What the hell are you doing to me?" I replied, "Confusion is new learning." and then I squeezed both shoulders at the same time. His eyes glazed while he appeared to stare straight ahead, and he looked confused. I then instructed him as follows: "You can close your eyes and it will all clear up comfortably" (said slowly, in a low tone). He sat very still, breathing deeply for about three minutes, and then opened his eyes and asked what was going on. I reached over to squeeze his right shoulder to make sure the anchor was cancelled. He showed no response except, perhaps, a questioning one, but no "depression." I asked him to think about that painful situation, and to share with us what was different in his internal response. He turned his eyes up left (visual recall) and then down left (auditory) and then down right (kinesthetic) for one split second, and looked up at me and said, "It doesn't affect me like it did, and somehow I feel stronger and know it will be OK! What the hell did you do?" I replied, "Nothing. There's no such thing as hypnosis so you must be hallucinating." (I guess what happened helped him to alter his belief system. He attended two of my seminars, Clinical Hypnosis: Innovative Techniques®, and became a booster and utilizer of hypnosis and Unconscious Restructuring®.)

In one classic experiment, experimental animals were conditioned to go to one side of a cage at the sound of a bell, and the other side at the sound of a buzzer. Almost like squeezing the left shoulder for one feeling and the right shoulder for another. When both stimuli were set off at the same time, the animals would appear to be confused and disoriented, and would then not respond to either stimuli. (Almost like what happened when I squeezed both of his shoulders at the same time...it does make you wonder now about the implications.) Most individuals who are put through the above procedure report what comes very close to being cognitive dissonance; and some researchers claim that new
learning does not take place without cognitive dissonance. i.e confusion, two things you believe are inconsistent...so one must be modified or rejected to accommodate the other...discomforting...MHR most people 'resolve' this state via dismissing / denying the NEW re: Virginia Satir would expect this i.e to maintain the status quo comfort...WE need to break through to a NEW comfort zone that incorporates the NEW and more valid / justified / demonstrable / generative / productive / constructive information / data / beliefs.

However, I want to caution you: as powerful as this technique can be, it isn't a panacea or a cure. All it does is to help an individual have "lowered emotionality" to a stressful situation, produce a calming effect and give the individual hope about solving their problem when they can experience such a marked change within several minutes. But, it's not a cure. It only accomplishes in five to ten minutes what three to eight traditional sessions might accomplish.

EXAMPLE: A client stated, "I'm beginning to lose hope. I'm in therapy and yet I'm still depressed almost all the time." While he described his depression verbally, he also "described" it physically: body posture slumped, eyes down right, voice sad and flat. As he talked about how "heavy" his depression was, and continued to evidence it physically, I reached over, gently touched his left knee, and said in a voice that mimicked his, "That's a heavy, awful feeling, isn't it?" He shook his head slowly. I then snapped my fingers (pattern interruption) and said, "Before your problem began, what did you really enjoy doing?" His head moved up slowly, he looked at me for a moment, and then his eyes went up left, and he said, "Baseball. I love the game! I'm a pitcher on the University team." I asked him if he ever had a really good day pitching. He smiled and said "Oh yeah! I once pitched a three hitter and struck out the last five batters in a row." At this point, he had straightened up in the chair, and his voice was stronger and melodious. I replied, "You're kidding. Really?" He leaned forward, smiled, and said, "Yeah, honestly." At that moment, I reached over and gently touched his right knee and said, "That's great! I bet you really felt good!" He was now smiling and looked much better. To reinforce his plus (+) anchor, I asked him to describe how he felt inside after striking out the last five batters, and as he described the good feeling, I again touched his right knee. I repeated this procedure as he described, in response to my questions, how he looked and how he sounded. All of the above took less than ten minutes, and the young man was much more relaxed and he was smiling. Next, I used the same procedure as on the professor described above. When he had "neutralized" out, I asked him to "Try Hard" (implying it would be very difficult) to remember the depressed feeling. He looked straight ahead for a few moments, then looked down right for a split second, brought his eyes back up level and said, "Hey, I'm having a hard time getting it back...anyhow I don't want it back. That's amazing. You mean there's hope for me after all?" As I nodded my head yes, I said, "What do you think?" He nodded his head and said, "Yeah, I'm going to beat it." He was
referred back to his therapist who, several weeks later, reported that the young man was doing fine, was back in school and beginning to make some decisions about the situations that had led to his depression.

ANCHOR COLLAPSE: BASIC PROCEDURE

If possible, you first want to establish a pleasant (+) anchor. While anchors can be set with visual, auditory and/or kinesthetic cues, I am going to recommend you begin with kinesthetic cues (physical touches) as they are the easiest to learn and use, even though beginning with kinesthetics might cause you to miss with a few individuals. However, if your client/patient is already in a bad place—e.g., depressed—don't work like mad to get them in a better place in order to set a + anchor and then throw them back into their bad place for the unpleasant (-) anchor. In that case, start by anchoring that feeling (- anchor). I recommend that you sit directly in front of the individual, close enough to be able to touch their knees. Let's assume the individual's presenting complaint is being depressed whenever they are alone, but as they talk to you they appear to be pretty level. Ask them to remember a time they really felt good about something they accomplished while being alone; e.g. "Can you remember a time you took a ride by yourself and really enjoyed the scenery or a time you were working on your hobby and felt pleased." (Use your imagination.) When they say, "Yes," watch them carefully. Some people will begin to smile and show pleasure just from being asked. If they show a pleasurable response, gently, but firmly, press on one knee (doesn't matter which) and suggest, with a cheerful voice and a smile, something to the effect, "That's a nice feeling, isn't it?" (You are establishing the + anchor.) If the individual merely says "yes," but doesn't evidence the "pleasure" in their expression, you must go further. (Systems become more important here; assume a visual person for this example.) Ask them to see that pleasurable situation, or to see how they looked in that pleasurable situation, or to "show me what you look like when you feel good." Next, ask them to remember the sounds of that experience, or how they sounded when they were feeling good. Next, ask them to describe what they feel when they feel good. As soon as they "show" the good feeling in their experience, establish the + anchor: that is, gently press on one knee (let's say the left) and say in a cheerful way, "That's a nice feeling," or "That feels good" or... Be creative but not incongruent. (At my training seminars, I have observed people saying, "That's a nice feeling, isn't it" while frowning and talking with a voice that would make an optimist sad.) After you have established the + anchor, repeat the procedure to establish the - anchor; i.e., "Now, Mr. Smith, you told me you have been feeling depressed." Observe his facial expression, and, if it changes to one of sadness or depression, gently touch his other knee. If the facial expression doesn't change, use systems again: "How do you see yourself when you are depressed?" (Remember we are assuming a visual person for this example.) As soon as you observe the facial change, install the anchor.
TESTING At this point, in all probability, you will have established a + and a anchor. You now want to test your work. This is either a simple procedure or a very easy one depending on your attitude: Touch the + anchor (left knee in our example) and, with a cheerful voice and face, say something like, "I'll bet you like this feeling better don't you?" Watch carefully to make sure that their general expression and demeanor matches the + anchor. If so, let go of the + anchor; touch the - anchor and say something like, "It's much better than the depressed feeling, isn't it?" (Be congruent; use a sad tone and facial expression.) Check to see that their expression, etc. matches the - anchor. If so, you have a take. (If not, go back and reinstall the + and - anchors, taking time to get the response you want.) After testing the - anchor, it is always a good choice to retire (retry?) the + anchor; i.e., "Bet you really like this good feeling better," while touching the + anchor.

The touch on the left leg has become a hypnotic cue that helps the individual to respond to the "suggested" good feeling, while a touch on the right leg is a hypnotic (non-verbal) "suggestion" to respond with the "depressed" feeling. In other words forms of MHR post-hypnotic suggestions for 'triggers' of state X and Y.

While inserting and testing + and - anchors, you will see many individuals evidencing pupil dilation, altered breathing rates, flaccidity of the facial muscles and an almost trance-like state of attention. Accept your bonus with good grace! An altered state without a so-called induction.) MHR because trance is focus / attention / concentration on a narrow locus … like taking a general, wide awareness / consciousness of lots of things happening inside your head, and outside, and concentrating it into a laser beam focused on one thing / state / idea…this opens a Bardot of opportunity…in this case the locus is the emotional/kinesthetic state e.g happy state and sad state, to the exclusion of all else…which is WHAT trance / hypnotic induction IS..directing the general / wide consciousness into a narrow laser beam and thus powerful vis a vis normal light ‘waves’… in formal / traditional hypnosis it was a flickering flame, swinging pendulum, the hypnotists eyes, or their voice, that became the focus, and concentrated the ‘waves’ of consciousness into a single beam, and ‘induced’ the state of suggestibility / focus…the mind / consciousness was FREE of all other distractions / the mental chatter silenced / a ‘bardot’ of opportunity opened up for the ‘operator’ to suggest such and such would be a good idea / implant post-hypnotic suggestions…allow person to focus muscle and mind e.g to achieve physical acts their ‘limiting beliefs’ and ‘scatter of focus/powers’ would normally preclude them from achieving, though physically possible…so ‘appearing’ to be super natural etc…

COLLAPSING: COMPLETED
At this point you have completed the major work for basic anchoring. You have "polarized," (that is, separated) and established two distinct states in the individual: a + anchor and a - anchor. Next is Anchors Away, which enables the individual to substantially reduce his painful response—in our example, the feelings of depression when alone. Anchors Away is accomplished by simply pressing on the + (left knee) anchor and - (right knee) anchor simultaneously, and holding both until the individual "neutralizes" out. "Neutralizes" out simply means that, when you first touch both anchors, the individual will look confused, often spaced-out, with either staring or darting eyes. After a few seconds, the confused, spaced-out look will disappear and the individual will look...well...neutral. Next, you test your work by touching the - anchor and waiting. If the individual remains neutral—that is, does not go back to the "depressed" state when you touch the anchor—you have then accomplished your basic anchor away or anchor collapse. If the individual collapses back into the - anchor, reinstall a new + anchor and repeat until the - anchor fails to elicit any negative response. My experience, both personally and by having observed several hundred people at my training seminars, leads me to conclude that in only about 20% of the cases will you need to reinstall a second or third + anchor in order to collapse the - anchor.

COLLAPSING: SUBTLETIES

Before we move onto the next step of anchors away, I would like to offer some subtleties for you to be aware of. If the individual's negative state—e.g., depression—is extreme, you may need to establish a somewhat equally powerful + anchor—that is, a powerful + experience—or two, or three + anchors; or you may need to collapse and reinstall a new + anchor, recollapse both anchors, and repeat that procedure until the anchor is neutralized. Next, please be aware that not all people will respond in the same way. Some people will respond with full facial and body expression, while others may only clench their jaw or smile slightly. It doesn't matter as long as you can see the change. Some individuals smile immediately when their + anchor is touched, while others may take 10 to 15 seconds to respond. Always give the individual time to respond and watch for their way of responding, not your version of how they should respond. You may find the following examples helpful.

At another seminar, a woman told me she couldn't get her subject to respond to a + anchor, but only a - anchor, and that the subject insisted he couldn't get a good feeling. I happened to know that he had just completed a divorce and, according to him, had lost everything. I walked over and said, "John, how would you like to find out that you just came into $250,000 after taxes?" He looked up, smiled and said, "Would I!?" At that point, I squeezed his arm and said cheerfully, "I knew you could remember how to feel good." I asked the woman to complete the exercise and it went without a hitch. In short, be creative. Treat each person as an
individual. If you don't get the desired outcome the first time, use a different approach.

Last, but not least, always test the - anchor after you have pressed both to make sure it is collapsed, and only then ask the subject to think about what was making him/her "depressed" and to tell you what is different. The general responses will be: 'It seems different' or 'It's farther away,' or 'It seems less important,' etc. The reason for not asking until the last is that there are times when the individual is so far behind their unconscious process, that they don't realize the change until you have tested and "shown" them.

BUILDING A NEW RESPONSE to the old trigger/s

We need to offer the person new response sets / states to be triggered by the real world (or imagined?) stimuli...the situations etc that previously triggered the phobic response, the despair, the fear, the self-sabotaging thoughts, the disempowering feelings / emotions, the incapacitating fear/anger/aversion...and/or the physical symptoms associated with that triggered state e.g stress/frustration/irritation/ anger producing muscle tension, high blood pressure, increased rate of breathing etc and then migraine / back spasms etc.

Direct person to recall / imagine a time / condition / situation where they felt great, powerful, calm, alert, e.g some victory / success they experienced. When they’ve ‘entered into it’ i.e observe for signs you’d associate with such a positive experience i.e physical and mental state e.g change in posture, facial gestures, breathing, and tone of voice, ‘anchor’ that state with an appropriate touch, so that re-touching them in this way will ‘trigger’ this vivid state they are currently experiencing in full...’anchor’ it in every representation system e.g ‘Picture in your mind how you LOOKED when you had this experience’, then re-touch...then’ How did your VOICE sound, and what other sounds were you hearing during this success?, and re-touch...’How did you FEEL, what emotions did you experience during this successs...giving them time to’enter into it’ i.e ‘recall’ or ‘vividly imagine’ (both are imagination), observing for the indicators that they are ‘in it’, and then re-touch. So now you have ‘anchored’ these new responses to that touch. And they can be ‘triggered’ at any time, simply by repeating that touch, in the same place, with the same pressure, gently pressing in the same spot.

When you get more advanced you can set more subtle, unobtrusive ‘anchors’ such as specific tone of voice, a direct stare, a looking at one eye, or talking at one ear, ‘anchors’...which have the advantage of being ‘undetectable’ and ‘covert’ and ‘unobtrusive’ and ‘sneaky’, so that a very talented operator could ‘anchor’ any particular state they manage to lead you into e.g anger, fear, desire, TO these subtle behaviors of yours, allowing you to trigger them, simply by speaking in that way to them. They won’t have any idea why they suddenly feel a
certain way….the ‘anchor’ was set so unobtrusively, and is being ‘triggered’ by nothing more than you talking to their left ear in a lower pitched, slower voice….this is the sort of power Richard Bandler and other famous ‘NLP’ operators, and ‘mesmerizers’ of the past deliberately, or intuitively, employed.

Now we ALL know HOW these principles operate.

My ambition is that you decide to approach each and every one of your beliefs with the suspicion that you may have been ‘tricked’ into believing something, ‘seduced’ or ‘conditioned’ into accepting something as ‘real’ and ‘true’, that is in fact false, and a lie. The people who ‘implanted’ these ‘lies’ may define them as ‘noble’, ‘in your own interests’, or ‘in the interests of the state’, or some other imaginary entity, like their ‘gods’. Some of these people have convinced themselves, or were themselves ‘tricked’ into believing these lies, and have no idea they are in fact lies. Others know they are lies, and employ them for their own perceived self benefit. Either they fear the consequences that the truth would have on them and theirs. Or they recognise the material benefits these lies bring them and theirs. In terms of wealth, power, status, prestige, and all the privileges these bring. Of course the original ‘profession’ was not prostitution, but the ‘priesthood’. And of the two professions, one is honest, providing a service. The other is more like ‘crypto-prostitution’ i.e faking love to snare a man or woman. The priests often pretend to ‘love’ you, but are only using you. That said, many of the priests really believe they are helping you. They are either unaware that they are selling lies. Or they consider these lies to be ‘noble’. And in any case, once you have devoted decades of your life to a priestly education and training, you are unlikely to ‘come out’ and admit it is all a sham. You have invested too much. How will you feed your family? Why would your wife stick around once you could no longer provide her with the life she had, as a wife or concubine of a priest, grown accustomed to. After all, in EVERY religion, the priest class was the highest class, even above the royals. Doesn’t the Bible explicitly direct ‘Jews’ to ‘Give the best of the best to the Levites’?

The current Jew World Order learned all they tricks in Babylon, where they wrote their ‘Talmud’, which includes explicit instructions on gaining total domination by ‘lending to the nations, and never borrowing’, and describes all non-Jews as mere cattle, that can be raped, deceived, enslaved, or killed, by the Jews, as they see fit, without any need to feel guilt or shame. For it is ‘good’ to do these things, as long as you don’t get caught, at least not until the ‘Jew World Order’ is finally accomplished, and these things can all be done openly, with zero fear of retaliation from the victims. Almost the state we have today. It is very close, their ‘jew world order’.

After pressing the anchor for the kinesthetic response, the visual response, and/or the auditory response, I proceed as follows: "Now, I want you to see yourself alone, but this time I want you to experience a change in the way you feel [here I
press the + anchor] and see yourself looking good as you feel a certain strong feeling." (Still holding the + anchor) "Now, let's take another situation where you are alone and again notice a growing feeling of strength" (again holding the + anchor). "Next, I want you to see yourself [holding + anchor] in one of those alone situations, but see yourself looking comfortable and feeling comfortable and nod your head when you have accomplished that." Lastly, stop pressing the + anchor and ask the subject to think about one of those situations that "in the past" caused those "old" feelings, and to see what happens now. I observe to "see" that they remain calm and comfortable. If so, it's time to call it a day. If not, I go and find another positive experience, preferably one that matches the problem situation: e.g., "Can you remember a time you were working on a project alone, and you felt relieved no one was disturbing you?" I repeat the last described anchor experience until the individual evidences comfort while "seeing" the problem area.

Words, visual stimuli, kinesthetic experience, olfactory and gustatory experience are all potential anchors.

Many individuals will automatically enter into a trance state, with zero formal hypnosis, as you utilize anchoring. MHR many of the great therapists of past and present were employing such altered states, inducing them intuitively, or unwittingly, in their clients, who reaped the rewards. The therapist gained a reputation for being ‘talented’, without really knowing what that talent was.

**CASE STUDIES clearly explaining the method**

After she had seated herself in my office, I asked her to tell me about her problem. She immediately looked up to her right (visual). At this point (I could not tell if she was making future or constructive pictures, or if she was left-handed or cross-brained and, therefore, having past visual recall), her hands grasped the arms of the chair, tightened, and she held her breath. Then, in a tight voice, she said, "I am terrified of flying, and I don't think anything can help." At this point, I knew the source of her response: she, upon thinking, speaking or hearing about flying (which would be the trigger) made visual images and responded to those "pictures" with physical feelings and emotions that matched her pictures. While she continued looking up right and stayed tight, I reached over and squeezed her left wrist and said, "That's a bad feeling, isn't it?" (Installing the - anchor.) She nodded. I then asked her who her favorite grade school teacher was. This was done to both break her pattern and to discover where she would look for past recall. Her eyes went up left and she relaxed substantially. I now knew that her "phobia" response was from constructing future pictures, probably of a plane crashing, and then responding kinesthetically. After several minutes of making disjointed small talk, jumping from one subject to another (to continue interrupting her pattern and keep her away from her
"phobic response"), I asked her what she really liked to do, and did well. She looked up left, smiled, looked down left (auditory), smiled, her face and body relaxed, and she said, "Golf. I really love golf!" I asked her what about golf sounded best (remember her auditory eye movement). She said the crisp sound of a well-hit ball; with that, she smiled and her whole body relaxed. I touched her left knee (installing + anchor) and said, "That's a feeling you really enjoy." Next, I asked her to remember a time she played an outstanding round of golf or made a really great shot. (Eyes up left (V) down left (A) and to a big smile while I pressed her left knee again and her left forearm, installing a second + anchor.)

At this juncture, we have accomplished the following: Discovered the internal source of her problem; her - anchor; her system for pleasant memories; installed the - anchor and two + anchors. All of this was accomplished within 15 minutes from the time she first sat down. Next came testing the work. I reached over, squeezed her left wrist and said, "Your fear of flying really concerns you, doesn't it?" Immediately her eyes went up right, body tight, etc. Before she could say anything, I let go of her wrist, touched her left knee and said, "But you also know how to feel good." She relaxed, eyes flickered briefly up left, down left, and then she looked at me, smiled, and made some comment on how fast her feelings changed. I repeated the test again, mainly to "show" her, on a non-verbal, unconscious level, how much control she really had over her feelings. My next step was to touch her left knee and squeeze her left wrist at the same time, thereby collapsing the anchors. After she "neutralized," I asked her to think about flying. She looked straight ahead (indicating an unconscious change or restructure), evidenced some tension, and said, "It still upsets me, but it's not nearly so bad."

When an individual presents him/herself at your office, I believe that they are saying in effect: "My belief system is preventing me from exercising new choices." If their belief system was effective in the problem area, they would have solved the problem and would not need you. If you accept their belief system as being true in reality, then you not only have been hypnotized by them, you also run the risk of perpetuating and becoming part of that problem. Therefore, your first task is to help them expand and/or challenge the belief system that is keeping them stuck. Next, you must consider that a form of self-hypnosis is keeping their belief system going. That individual is somehow hallucinating to stay stuck; for example: "not seeing" times they have been "liked" while finding evidence they are disliked— which in traditional hypnotist circles would be recognized as positive and negative hallucinations. When you
argue with a person who is "seeing" or "not seeing" an hypnotic hallucination, they entrench and become more "positive" of what they "see" or "don't see." So, whether you use hypnosis formally or not, I believe you must be aware of the hypnotic factor involved in maintaining the individual's painful state. You either use this awareness, or end up being a hypnotic subject yourself.

REVIEW: representation SYSTEMS I further contend that a person who is functioning well, either in all areas or some area, is utilizing all systems (V—K—A) in a synergistic manner, while the more that individual relies on one system to the exclusion of one or more of the other systems, the less choice they have available, and the more stuck and in pain they become. Within every system is stored experiences, knowledge and the skills that can lead to new choices, behaviors and responses. If a person "sees" himself failing, you may help them to remember a time they "felt" successful, and that feeling may help them build a picture of being successful. The new picture will itself lead to a challenge of the old belief system. If an individual has always been "told" they shouldn't speak up, you can help them recall visually times they saw people speak up; that visual memory can help them change their belief that they shouldn't speak up. It is therefore incumbent upon the therapist to help the individual expand and balance his systems. Where therapists continue to use the same system as the individual, and accept the individual's belief system, then the client/patient is doing an exquisite job of causing the therapist to "see" or "hear" or "feel" the same way the patient does. Of course, we must keep in mind there's no such thing as hypnosis. By recognizing the individual's limited use of systems and their self-defeating belief systems, the therapist immediately becomes equipped with a multitude of choices as to how to proceed to help the individual.

If someone is lost in the wilderness, it is foolish to build a base station and wait for them to find you. You have to go where they are and lead them out. To sum up the point, we could say that the individual has been hypnotized into believing that certain things are a certain way and will always be that way. Through circumstances, the individual in his problem area at least, begins to develop reliance on a particular system—whether kinesthetic, visual or auditory—for attempting to deal with the problem. Through these processes, the person begins to "distort" reality, and by so doing, they continue to "see," "hear" and "feel" the same thing over and over. In effect, they keep themselves in a hypnotic state during which their belief system takes precedence over so-called "consensual" reality. I believe that if you use the same mechanism that produces the problem—hypnosis—you can help them to quickly break patterns, develop new skills and respond with new choices. If a person already is skilled at using a hammer, help them to use the hammer differently while showing them how to use a screwdriver. Don't demand they fly a plane instead. (You will have to think about that.)
REVIEW: PATTERN INTERRUPTION

I would like you to consider that human beings are energy conserving (some would say lazy). We build machines to do our work, and then machines to run our machines, and then use computers to supervise. This is said to point out that people naturally streamline their behavior into patterns: patterns that are repetitive and energy conserving. Where these patterns are effective and lead to successful outcomes, we have a good system. However, where an individual continues to repeat painful patterns—e.g., becomes "depressed" every weekend, or when they are alone, etc.—it then becomes an "absolute must" to interrupt those (painful) patterns and help them to develop more effective patterns of response. As we pointed out earlier, where a pattern is interrupted, an individual will often go into a hypnotic state. This gives you a golden opportunity to help them to install a new and more efficacious response. Since we all have long and successful histories of learning, unlearning and changing patterns, it is already built into the system to change patterns. However, no human being develops a pattern unless, at some point in their history, that pattern "seemed" necessary. That is not to say it was necessary, only that it seemed so. Therefore, part of the individual's belief system is that the pattern is needed. Helping them to break patterns also may help them to challenge belief systems without ever discussing belief systems. I've said it before, and I want to say it again: "Therapy, any therapy, succeeds where, by hook or by crook, on purpose or by accident, the therapist has helped the individual to break a pattern and substitute a new pattern in its place." After working with hundreds of individuals in my clinical practice and giving dozens of training seminars, I have become convinced of the following: People respond in their problem areas (and, perhaps, in their successful areas) as an hypnotic subject would to so-called post-hypnotic suggestion. They will tell you that, "Every time s/he looks or talks or...that way, I get depressed or angry or [fill in]," or "Every time I think of...I become..." If you compare these phenomena and the individual's consistency of response with the literature on post-hypnotic suggestion, I believe that you, too, will be struck by the similarity. If you accept this thesis, then it stands to reason that hypnotic techniques are the antidote to hypnotically produced and continued problems and limitations.

REVIEW: ANCHORING

Consider anchoring as a different way of producing post-hypnotic suggestions. Or, you may want to consider post-hypnotic suggestion as a different way of producing anchors. I will leave that up to you. Either way, you can have a powerful understanding of what produces and continues limitations and problems. In my office, I have imitated a tone of voice or a facial expression that a person says upsets them; I have observed them cry, get angry and, in one case, attempt to "punch me out." It was as if they were "automatons," responding without choice or awareness. Helping them to "collapse" (MHR de-activate / de-potentiate / neutralize / de-fuse) those anchors helped them to have choices.
Since I believe that no one wants to suffer, helping them to have choice leads them to find more satisfying and pleasurable ways of dealing with the world. If you are not aware of anchors (post-hypnotic suggestions), you run the risk of reinforcing them and triggering them. That's OK if you have a reason and a goal and intend to break the pattern and collapse the painful response. Since, with hypnotic techniques such as anchoring, you can cause an individual to respond to a pencil with anxiety or to a facial expression with happiness, it would seem very important for you to stop trying to make sense out of nonsense. If logic and left-hemispheric thought could have resolved the problems, the problems would have been resolved. Instead, if you will consider all presenting problems as some form of anchor or anchors produced by a form of hypnosis, your tasks will be simplified. All you will need to do is develop the techniques to help the person respond in more useful ways. This will be accomplished by recognizing (not analyzing) their belief system; which system (V—K—A) they need to develop; how to break the pattern; and what anchors (post-hypnotic suggestion) you need to neutralize; and what new patterns you need to install and reinforce.

I do not believe that any book, even (or perhaps moreso) this one, can replace getting in there and trying new things. So many of us are afraid that we might make a mistake, or our patient/client might not like us. In truth, we're not getting paid to be liked, and our clients don't know what is going to work and what is not. I invite you, no I implore you, to attempt what you have read and more. Each day do something unexpected in your practice (and your life); change chairs, change clothes, change!! Use a new technique. You will probably become more effective. I know it will keep you challenged, excited and.

symbols and cues and triggers and anchors are powerful things.

a powerful mechanism for real change. Real Change. The scientific research is there. Change at the level of the limbic system. (See, for example, The Psychobiology of Mind-Body Healing: New Concepts of Therapeutic Hypnosis by Ernest L. Rossi, Ph.D., W.W. Norton Co., Inc., New York, 1986.) Steve's methods work. Just by "telling stories

Dr. Heller ‘The Wizard’, was a lecturer and "trainer of the trainers," in the Ericksonian method, as well as his own method, Unconscious Restructuring® which he once used as the sole anesthesia during a mastectomy. The patient was free of pain during the procedure, and required no postoperative medication. She was discharged 36 hours post surgery. Dr. Heller got a Ph.D. in clinical psychology, his main area of study being hypnosis. He went on to practise clinical hypnosis since 1969. He died in 1997 aged 57. He made the "magic" behind Ericksonian techniques and Neuro-Linguistic Programming accessible to anyone willing to learn. He, like me, was always frustrated with ‘teachers’ who
explained some things in great detail, but then appeared to totally miss, skip, gloss over, the actual METHOD...and left feeling either stupid, or that he’d missed something...but that something, an explanation, a clear cut step by step procedure, was never there. I always had the same experience watching or reading books by Erickson, or their derivatives, such as Bandler. Like me, Heller was a frustrated student, which lead him, like it lead me, to seeking ways to actually explain, step by step, in a way that anyone could replicate, reproduce, and integrate into their own behavior / practice. Real understanding. Concrete steps. Nothing ‘glossed over’. Most ‘teachers’ seem to assume that what they have expressed contains the contents of their mind. As if we can ‘read their mind’, what they ‘intended to say’, in what they wrote. But they didn’t. They missed too many steps that for them were ‘self-evident’ or ‘intuitive’. Things that came natural to them never seemed to need explicit communication. So they never realised what they had only thought, and had failed to communicate. All the stuff they found implicit in their descriptions, but was never made explicit. As any good teaching materials MUST do, to be useful to ANY reader, and not just the ones who happen to be just like the writer / teacher, and already ‘get’ things, and ‘get’ what is ‘implicit’ to THEM...but NOT to most readers / students...we have to always TEST what we have written with a range of people...and encourage them to admit what they don’t ‘grok’...rather than, like most students in classrooms, pretend they ‘got’ it, for fear of looking stupid, compared to everyone else, who CLEARLY did grok it (most of whom were acting in the same way, assuming everyone else, who was pretending, actually got it, and not wanting to appear stupid, pretended also...a typical case of ‘collective ignorance’ as described in my T vol I.

Heller admitted to readers of his great book that he found ‘doing’ what he does much easier than ‘explaining’ ‘how’ he does it. I believe him when he described the process as a terrible ordeal of ‘blood, sweat, and tears’, even with the help of his co-writer, Ms. Steele. I myself have done everything I have ever done without the help, even encouragement, of a single person. Heller explains the things he explains better than any other NLP writer I have read. And that is a whole lotta NLP writers. Half of his book seems to be taken from my own ‘TROONATNOOR vol I and vol II. He makes Ericksonian therapy, and the use of ‘anchors’ comprehensible, in ways Bandler never did. So he gets a special mention. Of course Bandler’s huge contribution is his ‘quick phobia cures’ and ‘swish’ methods. Once you learn the source of most of NLP, you can become a little irritated at Bandler and Grinder’s ‘acquisition’ of it for themselves, like L Ron Hubbard, dressing up existing methods and concepts in new NLP terminology, seems to me like stealing credit for other people’s work. But Bandler is, after all, Jewish! A magician perhaps with direct descendancy from the original practitioners of all this ‘magic’, the Babylonian Jews, who stole THEIR magic from the Babylonians themselves.
Heller admits, in his ‘Ramblings’ Ch. XVIII, just how frustrating trying to explain his methods was. Most other writers became too impatient, and just had transcripts of their lectures printed, or videos of training seminars made. They didn’t ‘hunker down’ and do the ‘hard yards’ like Heller. It became clear the moment I began reading his book ‘Monsters and Magical Sticks—There’s No Such Thing as Hypnosis’. He didn’t ‘cop out’ like Bandler. He did his best to recollect exactly WHAT he did, and HOW...as far as he could...paying attention to the details, and then explicitly documenting / describing them for us. So that the most easily frustrated / irritated / impatient students like myself, who would never ‘pretend’ to understand for fear of looking stupid, compared to everyone else who was pretending, and maybe passed, where I got High Distinctions, could ‘grok’ what he had done, did, and comprehend how it works, and why, so that we could emulate the method in our own ways...I was so sad to read he had left us. But he left us so much the wiser. Thankyou Dr Heller! He could have done the lazy thing like Bandler and others, and gave a half-assed attempt to explain ‘anchoring’ etc...and kept most of his real secrets for himself...to bask in the aura of ‘Wizardry’ and ‘magic’, when most people, those for whom the process was not intuitive, consciously or non-consciously, could not replicate his results...attributing it to some ‘talent’ in the ‘master NLP practitioner-magician...rather than the FAILURE on the part of Bandler et al to do the hard, laborious, painstaking, work of working out how to explain what they did...by first recollecting / observing what they did...then working out how to explain it...make it easy for others to understand and use themselves...which is ironic, given he was first a ‘modeller’.
The biological basis of trance / hypnotic suggestion vis a vis MHR the brain as a computer...blood Vs electricity ... brain centers vis a vis computer chip circuits

Dr. Hart explains hypnotic phenomena thus: If the brain or any part of it be deprived of the circulation of blood through it, or be rendered partially bloodless, or if it be excessively congested and overloaded with blood, or if it be subjected to local pressure, the part of the brain so acted upon ceases to be capable of exercising its functions.

If we press upon the carotid arteries which pass up through the neck to form the arterial circle of Willis, at the base of the brain, within the skull--of which I have already spoken, and which supplies the brain with blood--we quickly, as every one knows, produce insensibility. Thought is abolished, consciousness lost. And if we continue the pressure, all those automatic actions of the body, such as the beating of the heart, the breathing motions of the lungs, which maintain life and are controlled by the lower brain centers of ganglia, are quickly stopped and death ensues.

"We know by observation in cases where portions of the skull have been removed, either in men or in animals, that during natural sleep the upper part of the brain--its convoluted surface, which in health and in the waking state is faintly pink, like a blushing cheek, from the color of the blood circulating through the network of capillary arteries--becomes white and almost bloodless. It is in these upper convolutions of the brain, as we also know, that the will and the directing power are resident; so that in sleep the will is abolished and consciousness fades gradually away, as the blood is pressed out by the contraction of the
arteries. So, also, the consciousness and the directing will may be abolished by altering the quality of the blood passing through the convolutions of the brain. We may introduce a volatile substance, such as chloroform, and its first effect will be to abolish consciousness and induce profound slumber and a blessed insensibility to pain. The like effects will follow more slowly upon the absorption of a drug, such as opium; or we may induce hallucinations by introducing into the blood other toxic substances, such as Indian hemp or stramonium. We are not conscious of the mechanism producing the arterial contraction and the bloodlessness of those convolutions related to natural sleep. But we are not altogether without control over them. We can, we know, help to compose ourselves to sleep, as we say in ordinary language. We retire into a darkened room, we relieve ourselves from the stimulus of the special senses, we free ourselves from the influence of noises, of strong light, of powerful colors, or of tactile impressions. We lie down and endeavor to soothe brain activity by driving away disturbing thoughts, or, as people sometimes say, 'try to think of nothing.' And, happily, we generally succeed more or less well. Some people possess an even more marked control over this mechanism of sleep. I can generally succeed in putting myself to sleep at any hour of the day, either in the library chair or in the brougham. This is, so to speak, a process of self-hypnotization, and I have often practiced it when going from house to house, when in the midst of a busy practice, and I sometimes have amused my friends and family by exercising this faculty, which I do not think it very difficult to acquire. (We also know that many persons can wake at a fixed hour in the morning by setting their minds upon it just before going to sleep.) Now, there is something here which deserves a little further examination, but which it would take too much time to develop fully at present. Most people know something of what is meant by reflex action. The nerves which pass from the various organs to the brain convey with, great rapidity messages to its various parts, which are answered by reflected waves of impulse. If the soles of the feet be tickled, contraction of the toes, or involuntary laughter, will be excited, or perhaps only a shuddering and skin contraction, known as goose-skin. The irritation of the nerve-end in the skin has carried a message to the involuntary or voluntary ganglia of the brain which has responded by reflecting back again nerve impulses which have contracted the muscles of the feet or skin muscles, or have given rise to associated ideas and explosion of laughter. In the same way, if during sleep heat be applied to the soles of the feet, dreams of walking over hot surfaces--Vesuvius or Fusiyama, or still hotter places--may be produced, or dreams of adventure on frozen surfaces or in arctic regions may be created by applying ice to
the feet of the sleeper. "Here, then, it is seen that we have a mechanism in the body, known to physiologists as the ideo-motor, or sensory motor system of nerves, which can produce, without the consciousness of the individual and automatically, a series of muscular contractions. And remember that the coats of the arteries are muscular and contractile under the influence of external stimuli, acting without the help of the consciousness, or when the consciousness is in abeyance. I will give another example of this, which completes the chain of phenomena in the natural brain and the natural body I wish to bring under notice in explanation of the true as distinguished from the false, or falsely interpreted, phenomena of hypnotism, mesmerism and electro-biology. I will take the excellent illustration quoted by Dr. B. W. Carpenter in his old-time, but valuable, book on 'The Physiology of the Brain.' When a hungry man sees food, or when, let us say, a hungry boy looks into a cookshop, he becomes aware of a watering of the mouth and a gnawing sensation at the stomach. What does this mean? It means that the mental impression made upon him by the welcome and appetizing spectacle has caused a secretion of saliva and of gastric juice; that is to say, the brain has, through the ideo-motor set of nerves, sent a message which has dilated the vessels around the salivary and gastric glands, increased the flow of blood through them and quickened their secretion. Here we have, then, a purely subjective mental activity acting through a mechanism of which the boy is quite ignorant, and which he is unable to control, and producing that action on the vessels of dilation or contraction which, as we have seen, is the essential condition of brain activity and the evolution of thought, and is related to the quickening or the abolition of consciousness, and to the activity or abeyance of function in the will centers and upper convolutions of the brain, as in its other centers of localization.

So we see how ideas arising in the mind of the subject are sufficient to influence the circulation in the brain of the person operated on, and such variations of the blood supply of the brain as are adequate to produce sleep in the natural state, or artificial slumber, either by total deprivation or by excessive increase or local aberration in the quantity or quality of blood. In a like manner it is possible to produce coma and prolonged insensitivity by pressure of the thumbs on the carotid; or hallucination, dreams and visions by drugs, or by external stimulation of the nerves. Here again the consciousness may be only partially affected, and the person in whom sleep, coma or hallucination is produced, whether by physical means or by the influence of suggestion, may remain subject to the will of others and incapable of exercising his own volition."
Blushing and turning pale are known to be due to the opening and closing of the blood-vessels. We may say that the subject is induced by some means to shut the blood out of certain portions of the brain, and keep it out until he is told to let it in again.

Consider how quickly a person can blush, or turn deathly pale, at the mere thought, suggestion, idea of something, even while reading a book, watching a movie, or listening to someone describing something. This is produced by dilation or constriction of the blood vessels to the head and face. Exactly as the Dr describes in relation to the brain. This makes it easy to imagine how blood flow to specific parts of the brain can be increased, or decreased, by mere suggestion, but mere imagination, by thinking something, hearing something, seeing something... in specific, the areas of the brain responsible for conscious volition, and the blocking / repressing of subconscious desires / fears / impulses MHR...where limiting beliefs reside...thus short-circuiting the 'false friends' we have learned...the bad habits ... the internal voices that prevent therapeutic change...the 'you can'ts and you shouldn'ts and you mustn'ts...etc...

MHR use this together with the computer analogy...like bypassing different circuits by reducing / increasing/ eliminating power to them...basically how ALL computation occurs i.e power on, power off, blood in, no blood in, as the blood contains the 'power', the oxygen and calories...the equivalent of electricity circulating through a set of computer chips, blood circulating, or not, through the brain...turning different circuits on and off...just as in a computer...0 no electricity, 1, electricity, 0 no blood, 1 blood ...constricting and dilating is like on/off switches miniturised into todays micro-chip circuits...but which originally were huge vacuum tube circuits taking up entire floors of buildings...

Zen is about 'interrupting' the circuits habitual patterns of firing...to open a 'Bardot' of opportunity for introducing new firing patterns...new circuits...new habits of thought / behavior / emotions...

Diverting blood flows through the brain may facilitate accessing brain functions rarely exercised / employed...it may increase flow to just the right places, while inhibiting flow to just the right places e.g the limiting / rational / conditioned mind Vs the intuitive / 'lizard' brain etc...freeing capacities not usually accessible, due to the inhibition of other brain functions / restriction of available blood flows...this may account for the heightening of one sense when another has been diminished e.g blind
people hear better, or stoned person’s sense of taste, smell, sexual response etc…sensitive to impressions otherwise overwhelmed by other impressions, or simply the mental chatter / worries etc of the conscious mind…e.g E.S.P, telekinesis, mind reading, etc… often it takes time for an impression to reach our conscious mind e.g we see something, while concentrating on something else, then when I mind is free, we suddenly realise we saw something…

unconscious facial expressions can often be ‘read’ by people in trance i.e become very sensitive to impressions we usually overlook / are not aware of / do not perceive. Persons in hypnotic trance appear to be expert muscle readers. One ‘mind reading trick’ is to hold a word in your mind, then go through the alphabet, stopping at the letter that word starts with…you will unconsciously give some ‘cue’ e.g muscle contraction in your hand, or face.

MHR if the world is an illusion we construct, then it makes sense we would need at least 2 distinct forms of consciousness, the conscious, rational part to play along with the rules of the game, to solve ‘problems’ i.e to become enganged, curious, playful, striving…and the subjective part open to suggestion, i.e the suggestion of ‘TROONATNOOR’ i.e all the things we experienced must be ‘suggested’ and suggestable…so that our conscious / rational mind has impressions to play with / work with / construct reality from…at least two levels…one for constructing the illusion of reality, and another for interacting with it, as if it is real, and limited…i.e to produce the ‘limits’ within which the game becomes possible / interesting / fun / challenging / engaging…so we are both constructing our reality, then denying this i.e a ‘wall’ between the two operations…to prevent transparency…realisation it is all a dream, all illusion…lucid dreaming is an exception where we start consciously constructing our dream world…maybe this is why it is so irregular, so hard to achieve and maintain…it challenges the transparency / wall … risks bringing the whole illusion down…but why do we need determinism? Why not live in lucid dreamscapes? Has someone trapped us in one of theirs? What is lucid dreaming, if we cannot chose it at will, every night? Some sort of breakdown in the control grid that keeps us running around like rats in some experiment, killing, slaving, sweating, toiling, suffering…when it could all be just like in a lucid dream…where we could ‘be cause’…and produce any experience we wanted, at no cost…???
MHR in trance the ‘clairvoyant’ is suggestible i.e if you ask a question, she will act as if answering it…’is that George?’, yes, hello dear…etc…i.e wants to please, as that was the basis of the entire interaction from the start…she knows what expected / desired of her, and gives it…re: spiritualism / channeling the spirits / dead… If we regard mediums as persons who have the power of hypnotizing themselves and then of doing what we know persons who have been hypnotized by others sometimes do, we have an explanation that covers the whole case perfectly.

http://www.gutenberg.org

Vittoz methods: basically Zen practice i.e bring self into here / now, by focusing on some routine thing in detail...focus attention on it...own body...sensations...that usually fail to attend to...sort of biofeedback training, sensitivity training...Sight

Your eyes receive waves. Let the waves simply penetrate your consciousness. Instead of focusing your gaze and moving from one point to another, embrace the totality of an object, with all its nuances and colors. Then close your eyes.

Visualize the image in your mind, but without thinking about it. Recall just the image, the visual impression it made on your retina. Then start again.

Look at a detail, a fragment of the object. Then close your eyes and visualize it, this time making it grow larger and larger, as if you were looking at it through a magnifying glass.

Practice developing instantaneous and total perception of images, in all their detail, like a still camera as it snaps a picture instead of like a video camera which pans across the scene, centering on one point after another.

Hearing

Clink a glass (crystal if possible) or ring a chime or a bell. Instead of listening with your thoughts, let the sound waves pass through your body without stopping them. Vibrate in unison with the sound.

Perceive the sound as it continues, until it becomes almost imperceptible.
Listen to other sounds, like the ticking of a clock or the regular purring of a motor. Try to perceive all the nuances of sound, without anticipating them (as if you were hearing them for the first time).

Instead of tensing up and feeling your muscles quiver whenever an unpleasant or sudden sound reaches your eardrums, accept it. Welcome it, as you perceive each vibration. Suppress all inner dialogue as you listen to the sounds around you.

Touch

Find someone to assist you, and ask them to place an object in your right hand, while you keep your eyes closed. Keep them closed throughout the exercise, in order to concentrate on your sense of touch.

Perceive the whole range of sensations you experience through touching: first, hot or cold, hard or soft, moist or dry; then the texture of the material - smooth, rough, soft, etc. Don’t try to attach words to what you feel. Don’t try to determine what the object is.

- Next, do the same exercise using your left hand.

- Become aware of everything you touch and everything that touches you while sitting on your couch: all the points of contact between your body and the chair, the texture of the materials touching you, all the objects (jewelry, glasses etc.) or articles of clothing that you’re wearing.

- Next, become aware of your own body. Concentrate on perceiving your body from head to foot. Feel the vibrations, the pulsing in each part of your body, radiating from the surface of your skin.

Taste

You may have heard the story about the two writers who were able to procure a can of sardines for themselves during the second world war, an occurrence which was extremely rare at the time. They opened it, began feasting on the fish, and started talking excitedly.

Suddenly, one of them cried, “My God! I swallowed without tasting it!” Caught up in the discussion, he had swallowed his portion without even feeling what he was doing.
This is exactly what you should not do.

Take some food that is salty or sweet, bitter or acidic, and savor it without trying to transform your sensations into words.

Smell

Do the same thing with various perfumes, or foods that give off a strong odor.

Control of movement and perceptions

- Instead of thinking about something else while brushing your teeth, feel the effect of the bristles as they brush over your gums and teeth.

- When you take a shower, concentrate on the water pouring down, on its temperature, how the droplets feel as they hit your skin, the sensation of soap sliding over your body, and so on.

- When you open a door, feel the cold metal of the doorknob, the resistance of the spring or hinges, the way the lock clicks open and shut, the way the handle turns the lock, and so on.

- When you shake someone’s hand, feel the contact - is the grasp firm or gentle, the skin dry or moist, rough or smooth, warm or cold? Feel the energy flowing from hand to hand, be aware of the duration of the handshake, the rapidity or slowness with which your hands separate...

- When you drive your car, be aware of all your movements: how you hold the wheel, how you shift gears, how you sit in your seat... You will quickly become aware of any useless tension in your body. The aim of Dr. Vittoz’s method is economy and simplicity of movement - both of which help you conserve your energy.

- As you eat, feel the weight of the food on your fork, the muscles you bring into play to carry the food to your mouth, the movement of your jaws, the consistency of the food you’re eating...

- When you engage in some sport, like tennis for example, feel the movements of your body, the contact of the racket as it hits the ball, the way it vibrates, and so on.
- When you apply the Vittoz method as you are making love, you will experience a reawakening of your sensitivity, which has been weakened by habit and by being too “emissive.” Each caress, each gesture, each movement is an occasion for conscious feeling. Even your emotions - the love you feel for the other person, the love s/he feels for you, your pleasure and the intensity of your orgasm, can be heightened by being conscious and relaxed. Many people claim to have been cured of frigidity or impotence by practicing the Vittoz method.

- Every one of your daily actions can be an occasion to practice the Vittoz method of conscious movement: opening a letter, picking up a telephone, talking, holding a pen, washing something, cooking, cleaning, doing repairs, or even reading.

One exercise merits special attention. Although it is very complex, you can do it frequently. The exercise we’re talking about is conscious walking.

**Conscious walking:** Start the exercise by concentrating on your right foot, the way it touches the ground, the sensation you feel as it supports your weight. Then do the same with your left foot. Become aware of your ankles, your knees, your thighs, your hips, the way your spine moves, the way your arms swing and balance, the way you hold your head. Feel your entire body in perfect balance and control. Feel the amazing mechanism that is your body as it moves in perfect harmony, on a simple command from your brain. As you concentrate on your walking, you will be so flooded with sensations that it will be impossible for your mind to wander. This is an extraordinary exercise for calming yourself down, regaining a sense of harmony, and getting rid of fatigue. Compare your mental state before doing the exercise, and after a few minutes of conscious walking. You will be sure to feel the difference.

**Conscious breathing**

Whenever you feel stressed or start thinking negative thoughts, your respiratory rhythm changes; you take shorter breaths, leaving some of the tainted air in your lungs, thus providing your body with less oxygen, which in turn makes you even more tense. As you can see, the effect is very much a vicious circle. By becoming conscious of your breathing, you can control your respiration and free yourself from this harmful cycle, so that your lungs expand more fully and remain more flexible. Concentrate
and feel the air flowing up through your nostrils to the back of your throat, then down your trachea and into your lungs. Feel the cool fresh air entering your body and regenerating you. Synchronize your rate of respiration with the conscious walking exercise (one deep breathe - inhaling and exhaling - per step). You can also do a few minutes of conscious breathing at a predetermined rhythm. Dr. Vittoz recommends the following sequence: INHALE for 10 seconds: HOLD for 5 seconds: EXHALE for 10 seconds and start again.
Framing refers to context e.g. of the utterance … the context determines which of the many possible meanings were intended…whether as a joke or serious…as an insult or compliment…sarcastic or genuine…most words have many denotative meanings e.g. dictionary meanings, and many more connotative meanings unique to each individual i.e. what train of thought / trance / memory / idea / experience / feelings they trigger in each person by association etc…

Bandler and Grinder investigated, Family Systems Therapy, Gestalt Therapy, and Ericksonian Hypnosis, General Semantics, Transformational Grammar, Cybernetics, and Cognitive Behavioral psychology, then borrowed the term ‘Neuro-Linguistics’ which Alfred Korzybski introduced in 1936, years after his classic work, ‘Science and Sanity’, in which he demonstrated how what we do "mentally" and "linguistically" activates neurological processes. We exist as ‘mind-body’ beings. What is thought, and verbalized, impacts the organism.

One minute prior to the NLP phobia cure, people could make their neurology go into an absolutely freaked-out state of total panic and autonomic nervous system arousal by just thinking about something. And then, a few minutes later, they could think about the same object and remain calm and cool.

Somehow they had programmed the phobic stimulus-response…or something had…some process had…Bandler and Grinder asked them how they did it…then reversed the process, using the mechanisms they had discovered, and ‘modelled’ as their phobia cure.

To commune is to be one with e.g. commune with nature…communion in religion is becoming one with god, via ‘transubstantiation’ and ‘sympathetic and homeopathic magic i.e. imagined union with god by the imaginary eating of his flesh and eating of his blood, on the imagined understanding that doing so, via homeopathic magic, makes us one with god…
The neurology of our body transforms information received from our nerve cells on the skin, our retinas, our ear drums, etc, into nerve impulses and chemical "messages" that move along neuro-pathways. From there that information experiences more transformations as it activates cells and cells assemblages in the cortex, which then pass that information on to appropriate "parts," whether the central nervous system, the autonomic nervous system, the immune system, etc.

"I returned and saw under the sun that the race is not to the swift, nor the battle to the strong, neither yet bread to men of understanding, nor yet favor to men of skill; but time and chance happens to them all." (Ecclesiastes 9:11)

Meta (Greek) refers to anything "above," "beyond," or "about" something else. To go meta refers to moving up to a higher level.

Without the ability to distinguish between descriptive and evaluative language, you will never become truly professional or elegant in language use. So begin here. Begin at learning the power and simplicity of see-hear-feel language (sensory-based language). It provides the magic of clarity, the magic of p-cision, and the magic that deframes. Deframes? Yes, it pulls apart old constructions. It pulls apart abstractions that confuse.

Without the ability to distinguish between descriptive (sensory-see-hear-feel-experiential, value-free, non-judgemental, non-evaluative, open-ended) and evaluative (abstract, judgemental, value laden, critical, evaluative, conclusions) language, you will never become truly professional or elegant in language use. Learn the power and simplicity of see-hear-feel language (sensory-based language). It provides clarity, precision, and de-frames i.e lowers level of abstraction…avoids value judgements, loaded terms etc…

Reframing transforms meanings i.e takes same sensory information, but ascribes different meaning e.g lazy Vs relaxed, malicious Vs accidental, i.e interpret the same data differently …‘spin-doctoring’…’public relations massaging of the facts… Can chose a definition that is most productive, generative, helpful, positive, constructive…

Levels of self-fulfilling prophecy, moving up levels of abstraction i.e concrete experiences as child produce feelings of being unlovable, failure, reject, loser etc…which produce self-fulfilling outcomes e.g doesn’t try, gives up, avoids etc…which produces self-fulfilling GLOBAL definition of ‘there is no point trying, just accept it, adapt to it…so you frame GLOBALLY…highest level of abstraction, and thus produce despair / depression…things are NEVER going to
change, so why bother living? … Reinforce and deepen distresses. Provide "proof" about the validity and accuracy of those limiting beliefs. Then would draw another and even higher meta-level frame of reference, "I'll never change. This is the way life is going to be. No need to get my hopes up that things will turn around. I'm just a loser and always will be."

That neuro-semantic state, as a state-about-a-state (hence a meta-state), will then multiply psychological pain and create even more of a self-fulfilling prophecy. All of this operates as a form of black magic. It sets a high level frame-of-reference typically outside of consciousness that governs perception, behavior, communication, expectation, etc. so that it actually seeks out and invites more of the same. Further, with that belief working at a meta meta-level, reframing at the first meta-level will not have much effect or any long term effect. After all, it doesn't get to the meta-frame. Suppose we offer a reframe, 'It's not that you won't amount to anything, actually you can decide to become anything that you want to if you just put the past behind you.' That reframe probably won't work. At least, it will have little effect because at a higher logical level, another frame engulfs it and discounts it.

MHR the higher level of abstraction belief i.e the GLOBAL or GENERALISED belief, always overrides any lower level, even concrete ‘contradiction’ of that globalized belief...e.g achievement / someone DOES love you / You DO succeed at something, will all be dismissed / minimized as ‘the exception that defines the rule’...and overlooked / have no power to affect the Global / General...MHR similar in all impringing / conditioning with propaganda e.g ‘The Holocaust’...people ‘know what they know’, and no matter what facts you present, they will dismiss them as ??? because they KNOW at a higher level of abstraction that leaves no room for these ‘facts’ i.e simply shouts them down / ignores them...

So we have Audio, Visual, Kinesthetic representations of ‘I'm a failure / unloveable’ i.e concrete experiences, at the lowest level of abstraction...then the meta-level frames, them the meta-meta level frames, then the meta-meta-meta-level i.e GLOBAL i.e Highest level of abstraction frames...

Joseph O'Connor believes you can implant a HIGHER level of abstraction FRAME that encloses EVERYTHING below it

Frames (as in frames-of-reference) refer to the references (conceptual, abstract, beliefs, etc.) that we use and connect MHR relate, to things, events, words, etc

Reality begins not with the world as such, but with our thoughts about the world. Apart from our associations, nothing means anything. Apart from our thoughts, events occur. Things happen. Sights, sounds, sensations, etc. stimulate our sense receptors.
Change ‘frame’, change the meaning i.e what it denotes, connotes, what states it triggers (it is a trigger for / anchors)…

MHR ‘belief’ is merely an expectation based on an ascribed / assumed ‘pattern’ e.g X+Y produce Z … I ‘believe’ something means I think it exists, that this ‘pattern’ or ‘set of relationships’ is ‘real’…that given X and Y, I can expect Z…and to produce Z, I need X and Y, combined in the relationship defined by ‘addition’… all T vol I stuff…

All ‘meaning’ relates to pleasure, pain, and relief, so we always related any ‘definition’ or ‘pattern’ or ‘thing’ to whether, and to what extent, it brings pleasure, pain, or relief, and thus every ‘thing’ and ‘situation’ and ‘conditoin’ etc have another level of meaning e.g I like / love / hate / loathe / despise / want / fear / welcome it…so it ‘triggers’ these states e.g of antipathy or desire, rejection or approval etc…

The highest level is being aware of this relationship. The assumption / belief that an ‘I’ exists that can feel pleasure / pain / relief, and that these ‘external objects / conditions / phenomena exist that can produce (‘cause’) me to feel these desired and undesired / feared sensations … I get the ‘impression’ that this is so by association in the case of induction e.g fire burns from being burnt, or from induction, e.g someone with authority / I usually believe because others appear to, told me that fire burns, that burns hurt / kill… but in both cased Hume demonstrated the assumption of ‘Humean uniformity’ e.g that X+Y ALWAYS add to give Z…that fire always burns, and burns always hurt…

We also ‘think about thoughts’…which is what I do all day…asking myself ‘why do I think that?’…’do I really have justification for believing that?’ … why does X believe something I KNOW is not possibly true…why does X believe what I tell them couldn’t possibly be true…the safest bet is to move from mere deduction e.g someone told me / it’s in a book / movie / the government said so, to induction e.g they said X, is X possible, let’s check and see..now if X had occurred, Y would be present, is it? Could it have been removed? Could someone be lying about X, given that Y is not present, and by all scientific known facts, should be? Etc…

Spin doctors always defeat truth by moving from induction e.g testing bricks in supposed gas chambers for traces of ‘Prussian Blue’ residue from Zyklon B, to ‘this is the most documented case of genocide ever’…using a generalized, highly abstract statement, which you feel unable to counter, it being so confidently announced, that you forget that this ‘spin’ is just distracting you from the fact that you asked a concrete question and they evaded answering it. Why? Because once you move down the level of abstraction, from ‘general claims’, it becomes much easier to refute / disprove a statement. Simply by testing its concrete claims. Which is why ‘Holocaust’ promoters NEVER debate a person on the facts that
CAN be established, and in fact put the scientists who measured/recorded these facts in prison, and Jewish thugs beat them up.

Pre-framing is simply implanting an expectation in someone, by implanting a definition of a future object/situation in their mind e.g gypsies will steal your stuff, so watch out, or ‘dogs are dangerous’, or ‘everyone is out to get you’, or ‘all non-jews want to kill Jews because they are envious of their god-given superiority’…This is what propaganda does. This is how Israeli children are mind-controlled to fear and hate non-jews, to prepare them for the coming third world war in which most ‘Jews’ will be offered as a burnt offering to the Babylonian Jew world order…

Post-framing is taking an experience and defining it for the participants…telling them what happened, who did what, when, why, and what it means…not allowing them to induce all these themselves from their own experience and reason, but immediately imposing/imprinting an ‘official’ definition of reality, of that reality just ‘experienced’, in a way that determines the way it is encoded, that determines what beliefs and definitions the person/actors will bring away from that experience…in a way that distorts and filters the experience in particular ways…like all the mass media reports on 911, with their ‘Oh no, a second plane has hit’…so that everyone ASSUMES there was a ‘first plane’, though there never WAS one…there is not a SINGLE image of a ‘first plane’ hitting anything…and the ‘second plane’ (missile) was simply ‘doctored’ to appear to be a commercial passenger jet, as long as you don’t look closely…and why would you? You’ve had the entire experience encoded/imprinted…you KNOW you saw a first plane, a second plane, and you KNOW it was a hijacked…etc…It is very hard to compete with such ORIGINAL imprints…they tend to be the most powerful…so whoever gets to you first, as a child, usually gets to define reality for you…e.g which religion etc…

Pre-framing, framing, and post-framing all operate like post-hypnotic suggestions…any belief is really a post-hypnotic suggestion…something suggests it, while you are in an impressionable state, and from then on, you act as if it were true…and a host of emotions like denial, anger, mistrust, etc are ‘triggered’ when anyone challenges that ‘reality’, the one you are now ‘comfortable’ with…it takes a lot to ‘shake an early impression’, they even say ‘First impressions are the most powerful…it is true for meeting someone, as it is for any other belief or definition you form of ‘reality’…

All of this is about ‘learning’. We ‘learn’ something quickly, and once it is ‘learned’, it is very hard to ‘unlearn’ it. We are set up with a preference for quick learning, and ‘jumping to conclusions’ and ‘accepting what we are told by someone we trust/an authority’. And undoing any damage our first ‘teachers’ do is very hard. We were all ‘taught’ an official version of 911. Thousands of people
have proven it to be completely unrelated to reality. Completely at odds with what is physically possible. But the original ‘imprint’ is the strongest. Like the chick freshly hatched, that latches onto a snake, believing it to be its mother. We are all like that chick. We assumed our parents knew, that our teachers knew, that the mass media knew, the truth, and were sharing it with us. So their lies were imprinted, almost chiseled in stone, in our minds.

Those of use who care about ‘truth’, whether or not any ‘truth’ can be said to exist, all face the challenge of how to ‘de-program’ people. How to ‘throw out the trash’ that their minds have been filled with. A challenge made harder as the people we seek to ‘clear’ will resent it, resist it, and hate us for trying to do it. We will be making them feel ‘uncomfortable’.

Reframing is simply changing the way you think about something. Changing the way you think about something, changes the way you feel about it. And thus changing the way you think, changes the way you feel, and changes your ‘subjective reality’. You now have access to far more choices than before. Your ‘limiting beliefs’ were preventing you from seeking out alternative options in everything to do with life. Now you are free to explore. Playfully. Like a child again. Like a puppy. Like a ZEN practitioner.

To reframe, you first need to be willing and able to ‘suspend judgement’ and ‘suspend disbelief’. To become a Humean Skeptic, for the duration of your reframing. To behave like a ZEN practitioner, for the duration of your reframing.

Do not be alarmed that you may ‘lose’ something. Reframing merely offers you MORE alternatives / choices / options. It will never deprive you of any options. Unlike DOGMA, which literally deprives you of ALL other options. It limits you to just ONE single frame of reference. The one you have been ‘sold’, ‘indoctrinated into’, ‘conditioned to accept’, ‘imprinted on you’. Dogma is the post-hypnotic suggestion that precludes ALL OTHER OPTIONS. Dogma carries the maximum opportunity cost of all belief systems. It says JUST this, and NEVER anything else. THAT is a prison. THAT is idolatry. THAT is turning a living thing into an object, a nominalisation a ‘Dogma, a thing of stone and wood. Whether it is expressed as ‘THIS’ and NOTHING ELSE, or the worshipping of idols of stone and wood, the state is the same. Whether it is a supposedly ‘scientific’ dogma, or a ‘traditional’ one, or pure propaganda imagined by some group, and imposed upon everyone else, the STATE is the same.

We have to apply the scientific method, which itself seems to run counter to human nature. Scientific method seems alien to most people. They do not behave scientifically automatically. They must force themselves to employ scientific method. To discipline their natural inclinations to superstition, jumping to conclusions, accepting what they are told by some convincing / persuasive
speaker, ‘going along to get along’ with whatever everyone else seems to believe, etc.

Most scientists, when working in fields outside of their own, let alone in their daily lives, do NOT behave scientifically. They do NOT formulate and test their hypothesis, seeking to disprove them. They behave like anyone else. They have their ‘pet’ beliefs, or inherited ‘dogmas’ that they never submit to anything like rigorous scrutiny, let alone apply the rules of scientific method to them. They find their beliefs ‘compelling’ for all the typical reasons. And NOT for the ones outlined in TROONANTOOR vol I. Outside their own fields of specialisation they are not more ‘intelligent’ and ‘objective’ and ‘scientific’ than the general public. And even in their own fields of specialisation, they need to be constantly ‘peer reviewed’ so that their natural tendencies are ‘held in check’ and ‘checked’. And even then, few ‘scientists’ are really scientific, as I demonstrated in my TROONATNOOR vol I, and as David Hume demonstrated centuries ago.

To bypass all the resistance of existing beliefs and dogmas, the ones that say NO, I’m right, I’m not listening, I can’t see you, lah lah lah … That MUST be wrong because it is not consistent with stuff I KNOW already…hah hah…we use stories, metaphors, narratives to bypass this conscious, smug, complacent, know it all consciousness, and access the subconscious directly, speaking to it…bypassing the censorship, bypassing the framing, bypassing the dogma, to have a chance at reaching the ‘child-mind’ that is open to new ideas, curious, and that wants the best for us. The people who brainwashed us may have had good intentions, but they were being used by others with malicious intentions. So no matter how well intended our ‘teachers’ were, they were doing us harm. Limiting us. Turning the living mind into a zombie. Turning living ideas into idols of stone and wood, and which is the same thing, dogma. THAT is the true meaning of idolatry.

Power is the power to define. Once you have this power, you determine how a person thinks, feels, and acts. We need to take back this power. Otherwise our happiness, motivation, pleasure, pain, relief, will all be controlled by others. And these others tend to use that power to their own perceived benefits, rather than to improve YOUR life. That is human nature, sadly. People of course convince THEMSELVES that their lies are true, or at least noble. But look at the world around you. Then ask yourself if it the world you would chose for yourself and those people and other animals you care about.

One huge frustration is that, like the supposed ‘scientists’, most people apply one set of rules in one area of their lives, and totally submit to the dominant rules in others. They may be vegan, but happy to see ‘Holocaust deniers’ put in prison for 10 years for voicing an informed opinion, or scientific finding, that contradicts the ‘official fiction’. Or they may care about animals, but not the children who
worked in the sweat shops to make their Nike’s or Smart phone. They may appear VERY flexible and open minded on many subjects, but then you will hit a ‘nerve’ and find them totally inflexible, rigid, fixed, defiant, defensive, aggressive, about other subjects, e.g religion, politics, history.

Bandler’s ‘sleight of mouth’ tricks are modelled on the things people do to avoid changing their states / minds / ideas / beliefs. How they deflected, denied, side-stepped transformational change. How they got themselves stuck in their rigidly defined models / maps of the world. So he took the ‘problem’ and turned it into the solution. It’s how people maintain their fatuous, absurd, patently erroneous beliefs, despite the best efforts of philosophers and therapists who want to help them escape their current mind prisons. Not to convince them of anything. Just to open them up to seeking out, and evaluating, alternatives, choices, other ways of framing the world, other ways of defining things, other alternative worlds that we could be producing right now, if only we changed the way we thought about something. E.g The holocaust, or man-made global climate tipping point (two patent lies for anyone with the slightest scientific of minds / intentions / approaches to life. These lies / beliefs are at the heart of the Jew world order conspiracy to enslave us all. So you might want to reconsider your ‘beliefs’ vis a vis both of them. For starters. That will probably lead you to question other beliefs e.g ‘religion’ and ‘peace through war’ and ‘peace through injustice’ and ‘censorships’ and ‘propaganda’.

Robert Dilts and Todd Epstein codified Bandler’s language patterns and came up with the 17 NLP "Sleight of Mouth" patterns. These 17 formats gave one the ability to eloquently reframe anything.

In a sleight of hand move, a magician distracts those watching. He or she will do one thing that captures the attention of the audience while simultaneously doing something else. A similar thing happens with the "Sleight of Mouth patterns. We distract an auditor by leading his or her consciousness one way while making a conceptual move of some sort which in turn creates a whole new perception. Then, all of a sudden, a new belief (or frame-of-reference) comes into view, and the auditor doesn’t really know where it came from, or how. I have tried reason, and any time this worked, my interlocutor accused me of ‘tricking’ them...they don’t trust reason...it is NOT one of their main representation forms...it does not contribute / figure much in any of the sub-modalities...it does not carry the ‘convincing’ element that ‘this FEELS right’ does, i.e the way they represent ‘knowledge’ and ‘truth’ is very alien the ways a ‘rational’ person represents them. So we need ‘tricks’ like ‘sleight of hand’ and metaphors / stories to bypass their censors, and offer the subconscious, which is much more open minded, new options. New data. New definitions. New ways of interpreting and seeing. And being. The sub-conscious then produces new options for the person, which seem to appear ‘out of the blue’, but are the result of our therapeutic / philosophical
methods. But first we need to bypass the conscious, resistant, fixed, immobile, stubborn, sometimes terrified, conscious mind.

I have tried to overcome the obstacles with reason. It rarely works, as most people don’t work on ‘compelling argument’, logic, reason, facts, scientific method…they work on ‘irrational’ non-arguments, specious sophistry, dogma, ‘trust of authority’ etc…and fear of being ‘the odd one out’.

The art of ‘mis-direction’ is to get someone to attend to / focus on / look at / be engaged by / be distracted by / ‘captivated’ by, one thing, so that they don’t notice the ‘other’ things you are doing, right in front of them, before their very eyes. So they don’t actually ‘see’ what you’ve done, and by the time their attention returns to you, you have done what you needed to do, and they have no memory / knowledge of your having done it…so that to them there is a ‘break’ in the action, during which you did something they didn’t notice…this ‘break’ is a blank to them…so they see X then Z, but fail to see the +Y. It is as if you went from X to Z. Once anyone pays attention to the Y, all the mystery evaporates. They see how the trick was set up. They see what it is necessary to MISS, in order for it to appear ‘magical’, that is, as if the magician went from state X, directly to State Y. ‘Spoilers’ show you what it is you ‘missed’, what the magician ensured you did NOT attend to…

When a card illusionist does sleight of hand movements, he or she performs one set of actions that so captivates the interest of his viewers, that they really don’t see what else he does that actually changes things. Consider what happens to the attention of those watching. It gets shifted, and captivated, so that it preoccupies itself at a place where they think and anticipate the action will occur. Then, on another place, the more significant action occurs. When this happens, sleight of hand creates for the viewer an illusion, and this illusion frequently results in a shock to consciousness. "How did he do that?" "Hey, I saw her move it over there, so this can't be!"

In general life every belief is based on assumptions at lower levels of abstraction, and assumptions at the same levels of abstraction, which seem to support the contention / belief. The trick of ‘misdirection’ is to avoid you EVER questioning any of these assumptions…they want you to reflexively compare assumptions that re-inforce and support each other…when all are lies…but they are consistent…the moment someone breaks out of their spell, and challenges any assumption, the whole thing falls apart…that is why it is so necessary to torture anyone who dares this, and their family, to kill them, ruin them, imprison them, etc, to make sure NO-one challenges even the slightest assumption e.g proves there are NO traces of Zyklon B in supposed ‘gas chambers’, or that ‘god’ has been recycled and re-invented for millennia, rather than having ‘exposed’ himself...
to one particular prophet at one particular time, the ‘last prophet’ with the ‘final word of god’ ‘carved in stone’ and never to be questioned…

No matter how fast or skilled a person's seeing, if they send their "mind" off to pay attention to irrelevant factors, the illusionist will get them every time! A similar process occurs with verbal behavior when we deliver a really good mind-line. This happens all the time in human interactions anyway. Sometimes it occurs in interactions that we engage in just for fun and enjoyment. Sometimes it occurs when we interact and negotiate with someone to create win-win situations. Then again, sometimes it occurs when someone intentionally seeks to pull the wool over someone else's eyes in order to take advantage of them.

MHR same goes with ‘arguments’…if you fail to see what was assumed in an argument, and instead take all the ‘facts’ and ‘definitions’ for granted, then logic will trip you up every time…no matter how long and hard your attempt to use logic to prove what you sense if right, that the arguments are wrong, you won't get anywhere. Until you challenge the assumptions. Realise all the assumptions that are NOT stated, but implicit, in the stated assumptions or ‘data’ you are working with. All T vol I. stuff.

Just invite another human being into a discussion about content and you can do all kinds of things (and I'm not kidding about this!) in altering, changing, and transforming the context. And when you do, most people will never notice. Conscious minds seem to have this thing for content. Feed them a little gossip, some details, the specifics of this or that person, in this or that situation, tell them a story, or even better—a secret, and presto ... and you can shift the person's frames and contexts without them ever suspecting.

In negative manipulation we "handle" ourselves in relation to others in a WinILose way wherein we seek to benefit at another's cost. And conversely, in positive manipulation we relate to others from a WinWin attitude so that everybody benefits. This underscores the importance of the WinMIin perspective in personal relationships and communicating, does it not?

Beliefs involve a wide range of conceptual ideas. "Shoulds" that we put upon ourselves as moral imperatives. Our assumptions about causation—what causes or leads to what. And our assumptions of meaning—what equals ("is") what, what associates with what. These semantic constructions describe MHR part of, our mental filters which we rarely question.

MHR Our first ‘frame’ is the fact that we are human. We have human limitation e.g bandwidths of E M spectrum we perceive / encode … we are limited to generating our ‘meanings’ and ‘definitions’ from the impressions of sight, sound, touch, taste, smell. We should remain sober and humble, and keep this in mind any time anyone says ‘I know X’ or ‘I know X is not’. Any time we use a
technology to ‘extend’ our perception, it always involves some artefacts and
interpretation i.e encoding and decoding, e.g even with ‘photos’ of ‘planet earth’
as sphere. They are all doctored, constructed, rather than simply ‘photographs’,
i.e NOT what human would see from space…

When we translate the Meta- Model into a conversational model for reframing
(for transforming meaning), we incorporate a lot of powerful verbalizations.

Our senses filter out most of the infinite complexity and diversity of ‘objective
reality’, if such exists outside of our mind, making it more manageable. People
who move from quite rural life to city life are often overwhelmed as they are
used to noticing everything, saying hello to everyone, looking everyone in the
eye…then suddenly there are thousands of them rushing by, it is impossible..have
to learn to ‘attend to’ different things i.e ‘ignore’ most of what is happening…our
interests narrow our focus e.g music, fashion, women, cars, scenery, so that we
tend to filter our most of the potential ‘impressions’, like listening to someone
speaking in a crowded room, we do not ‘hear’ everyone else, though we feasibly
could ‘listen to’ any number of them…but if we didn’t ‘focus’ on one voice, we
might hear too many voices at once, and this would just become ‘noise’.

Consider ‘unicorns’ and ‘pegasus’ and ‘gods’…all things never seen by anyone
‘out there’, but billions of people believe in them…they ‘see’ them, inside their
heads, in their imagination. So arguing ‘are they real’ is absurd. But it is a fact
that they DO exist, IN PEOPLE’S MINDS…it just proves how powerful words
can be…that utterances can produce beliefs, that produce emotions, that produce
motivations, that lead to people investing heavily in such beliefs, and even
fighting, and murdering children because of them.

The Jewish cautionary tale of ‘The Golem’ is a metaphor for ALL such ‘neuro-
linguistic-programming’ i.e you put things in people’s heads using mere
words….on paper as in the case of the Golem, or verbally, and people ACT on
them…ACT as if they were REALITY…let these words dictate their
actions…command them…as if they were magic,…as if they were mere robots
acting on instructions / programs…

The "Sleight of Mouth" patterns do not, in themselves, comprise "therapy," and
yet they do open up space where personal transformations can occur. As
psychotherapists, we have used these mind-lines to loosen up (or deframe) a
client’s beliefs, so the person can make the changes he or she desires.

We work covertly. We deliver the reframe them in our everyday talk. We speak
the conversational reframe, redirect consciousness, speak the line, and then watch
someone suddenly develop a more resourceful frame of reference. It is an easy
and quick way to redirect a brain to a new point of view.
Induce someone into a state where they feel attacked, inadequate, or vulnerable— and you can count on their defense mechanisms going up. People will fight tooth and nail if they feel attacked.

Track a person back to the experience or experiences out of which the learnings (beliefs) arose. When the person gets there, he or she then has an opportunity to remap—to create a new and better mental map

We identify MHR confuse, our maps (thoughts, beliefs, decisions, etc.) with reality. MHR identification means we think we ARE our beliefs, actions, thoughts !!!! And this means challenging them is very global…if they are wrong, then WE are WRONG…i.e self-preservation…if self identifies with / AS these, then will defend them to the death…literally…

As a neuro-semantic class of life, whenever our internal representations shift, so does our experience, our neurology, our identity, etc. This describes where "the magic" occurs.

Korzybski (1933-1994) noted the unsanity that results from the neuro-linguistic forms of the old Aristotelian languaging. As an engineer, he sought to remedy the situation by creating a new more systemic and Non-Aristotelian way of thinking. His efforts resulted in General Semantics and Neuro-Linguistic Training. Both men recognized that we need a new use of language—a relanguaging to cure the bewitchment. Bandler and Grinder (1975, 1976) created such a re-languaging model (the Meta-Model) by utilizing many of the Korzybskian map/territory distinctions. They relied upon the foundational work of Bateson et al. regarding refmning. From this came the "Sleight of Mouth" model

"Words and magic were in the beginning one and the same thing, and even today words retain much of their magical power. By words one of us can give another the greatest happiness or bring about utter despair; by words the teacher imparts his knowledge to his students; by words the orator sweeps his audience with him and determines its judgments and decisions. Words call forth emotions and are universally the means by which we influence our fellow creature." (Sigmund Freud, 1939, pages 21-22)
MHR Hearing is ‘representing’ 20-20kHz frequencies as ‘sounds’. Seeing is ‘representing’ to wavelengths as ‘sights’. ‘Touching’ is representing frequencies between and as ‘solids’. We associate a set of sights, sounds, touches, smells, tastes into imaginary things called ‘objects’, as Hume demonstrated. We associate X and Y and Z. X+Y appears before Z, so we assume Y to be ‘caused’ by X+Y. etc

We ascribe relationships to assumed ‘objects’, based on when they occur in time, relative to each other, and how they appear to interact, and appear to produce (cause) other things, how they affect other things, what their relationships to other things are…and to our own pleasure, pain, and relief.

A man sees a white flag on a ship and throws himself down the cliff to his death…the power of symbols…then we find out that someone raised that white flag knowing what it would mean to the man, but that in fact it does NOT mean what he thought it meant e.g that they’d lost a war, his wife was dead, etc…the power of symbols and words…meanings…

Someone says ‘you look ugly in that’ and you feel ugly. Suddenly your total posture and appearance changes. In response to those words. Isn’t that magic? Abracadabra.

Fighters and their friends ‘psyche each other out’ until one of them can’t bring himself to strike the other, out of fear for the consequences…and will even submit to an inferior opponent, just because of a few choice words and sentences uttered by their friends…this happened for real to me…isn’t that magic? Abracadabra.

Someone says ‘ it says here you have to go fight and die, and kill women and children, for your country’, and so you ‘obey’. You kill hundreds of women and children, maybe thousands, because of a few words…you assumed you ‘HAD’ to cos it ‘said so’, or ‘someone ordered me to’…Abracadabra

Everyone kept talking about the ‘SECOND’ plane, so there MUST have been a FIRST plane, right? Of course. Though no-one has EVER shown you a photo or footage of it. But it MUST have been there. Because the SECOND plane was real. Wasn’t it? Doesn’t the second plane prove the first plane prove the second?

A very old Chinese Taoist story describes a farmer in a poor country village. His neighbors considered him very well-to-do. He owned a horse which he used for plowing and for transportation. One day his horse ran away. All his neighbors exclaimed how terrible this was, but the farmer i simply said "Maybe, " A few days later the horse returned and brought two wild horses with it. The neighbors all rejoiced at his good fortune, but the farmer just said "Maybe. " The next day the farmer's son tried to ride one of the wild horses. The horse threw him and the
son broke his leg. The neighbors all offered their sympathy for his misfortune, but the farmer again said "Maybe. " The next week conscription officers came to the village to take young men for the army. They rejected the farmer's son because of his broken leg. When the neighbors told him how lucky he was, the farmer replied "Maybe.

MHR The point is that the context is the ‘frame’ that determines the meaning e.g the meaning of a broken leg in one context is bad, but in another context, it is good. It is bad to suffer a broken leg, but if this means avoiding dying in a war, then it is ALSO good…you can take your pick. As they say ‘It is an ill wind that blows no good’ i.e usually everything has a plus and minus, and you can focus on the one you chose, and feel fortunate, or unlucky, and thus feel happy, or unhappy.

Some patterns will work more effectively with some beliefs than others. Frequently, we need to "keep firing off" different magical lines until we find one that makes the desired change. So as a magician, it serves us well to keep our eyes open while we perform our magic! In NLP, we call this process of keeping our eyes, ears, and senses open "sensory acuity," Doing so provides us feedback about the effect of our reframing.

Aim also to layer the reframing patterns. We make our mind-lines much more effective when we deliver several one after another. So feel free to pack them as tightly as you can if you want to pack in magic upon magic.

You do not have to understand this chapter to become fully skilled and elegant in conversational reframing patterns. The only thing you really need to get from this chapter boils down to the formula.

**Deframing reframing patterns:** How to Wipe out a belief system with "just a word"

By asking for specificity, precision, and clarity, the Meta-Model questions coach a speaker to go back to the experience out of which he or she created the mental map in the first place.

Be gentle--it can feel abrasive to people not used to too much clarity or reality.

MHR, I have often been accused of being ‘abrasive’…natural born interrogator!

As a technology of de-construction, the Meta-Model empowers us to de-abstract our abstractions. With it we can de-nominalize nominalizations.
Beliefs have a basic formula that you can destroy, and thus implode / collapse the belief itself.

Most beliefs lack specificity, existing as generalisation MHR higher levels of abstraction in many beliefs. Forcing us to be specific e.g what, who, where, when etc, often dissolves / vanishes the belief. MHR go down to lowest / concrete levels of abstraction e.g so cannot avoid ‘facts’ by glossing over with ‘vague generalisations no-one can challenge, as they are so vague and global’. We cannot let our enemies remain ‘up there’ … where they are invulnerable…they took the high ground because they got there first i.e highest levels of abstraction with ‘known, proven, document, holocaust’ so we can’t fight on that level, have to lure them down into the gulleys, out of their tall towers, where they are vulnerable to the ‘facts’ that cannot be simply ‘dismissed’ because they are clear, precise, unavoidable, and provable i.e not mere ‘spin’ and ‘clever words’ and ‘mind games’ but actual concrete, demonstrable facts…

To elicit this conversational reframing pattern, use the elicitation questions that move a person down the scale of abstraction1 specificity: "How specifically?" "What specifically?" "When specifically?" "With whom specifically?" "At what place specifically?"

Consider the "strategy" below the formula, "When she looks at me and narrows her eyes, I feel judged and put down." suppose a guy uses this as his way to feel depressed. It could happen. The EB=IS might go: "Eyes narrowing = feeling judged and put down." His strategy that creates this experience might go: external visual awareness (V) of her facial expression with special focus on her eyes, represented image in color, close, three- dimensional, then a rehearsing of the words (A,), "She's judging me and criticizing me," then more words (Adm), now words of self-evaluation, "I don't measure up to her expectations," then feeling tension in stomach (K-), an ache in back of the neck and head, remembering other times of criticism, etc. Of course, strategies occur at lightning fast speed so that most of it does not occur in consciousness-just the final kinesthetic feeling and emotion: depression. And as strategies streamline (which they all do), this process becomes so quick, so automatic, so immediate, that she only has to do one thing to evoke it: narrow her eyes (EB) and his meaning equation fires. Almost immediately he feels depressed, so he then really "knows" that it "causes" him to feel depressed (his limited belief). Here we have a neuro-semantic "program". Finding this strategy for a person's "reality" (hence, a person's "Reality Strategy") offers us a conversational reframing pattern whereby we can pull off some neat "Sleight of Mouth" patterns. We discover how a person constructs the limiting belief program. As a planter of doubt and skepticism, Realify Strategy Chunk Down deframes by the very process of asking a person to pull the program apart so that, together, we can examine it.
Every constructionist knows that this messes their reality program up!

It is human nature to form connections on spurious grounds, to accept what we’ve been told, to believe rubbish, junk, toxic, poisonous lies, offered to us by ‘caring’ and ‘sincere’ and ‘respected’ priests, teachers, mass media personalities…

Do you make a picture of it, do you say words, what words, with what tonality, in what order re: how did you come to that belief?

How do you represent stress? Do you do that in your mind with pictures, or do you say something to yourself, or do you have some kinesthetic sensation somewhere in your body? Where? To what degree? Then how does your motor program activate your feet to go looking for chocolate and your hands to start ripping off wrappings and cramming chocolate down your throat?

To elicit this reframing pattern, use the strategy elicitation questions: "How do you represent that belief?" "How will you know if and when it does not hold true?" "What comes first? What comes next? How do you have each piece coded representationally?"

We can take back the power, and behave consciously, rather than habitually, based on inherited / learned / conditioned programs…being more specific, and precise, with words, with thoughts…challenging our habitual responses…are they valid? Necessary? Cause-effect? Do things really have any power to make us mad, angry, sad, despairing, depressed, etc? Or have we just gotten into certain bad habits, of interpreting ‘that’ look in such a way, then automatically letting our programmed responses kick in until we find ourselves stuck in a hole of despair, of our own making…when we could just say, hey, she isn’t interested in me, lets move on to the next opportunity, sooner or later one will ‘bite’…

MHR all about debunking assumptions, making them explicit, interrogating them…seeing how we ourselves go from X +Y to Z, when it is NOT necessary / of necessity i.e causal…WE do it…go from ‘that’ look to ‘abject despair’…we could do many different things in response to ‘that’ look, or ‘that’ experience…we habitually take one route, when it is just one of many, and often the worst option…

MHR there are ‘impressions’ made by our senses, constructed out of ‘whatever it is out there’ e.g E M soup…they are constructed actively by our encoding and decoding of E M vibrations / frequencies…these ‘impressions’ generate ‘meanings’ in the context of all other impressions and ‘meanings’ e.g in relation to pleasure and pain and relief (ultimately), and these ‘meaning’s generate internal states e.g happiness, or despair, hope or fear…So we can change our impressions by ZEN observation and choosing what to see, hear, and ‘know’, then
challenge our ‘meanings’ i.e. the true relationship of these impressions to our pleasure / relief / or pain...and thus change our internal states, e.g. happiness vs sadness...at each step we have opportunities to ‘reframe’ and ‘revise’ and open up the ‘bardot’ of now, here, to re-define, re-calibrate, look again, take a fresh look at things, reveal implicit assumptions we had NOT noticed, and check their validity against sensory perceptions / impressions i.e. ‘concrete’ fact checking, and asking ourselves ‘why we think that?’ ‘how do we KNOW’ that? Who told us? Did we learn it first hand? Could we have learned something different from the same impressions / experience? Did we let our preconceptions / prejudices color / distort / filter our impressions? What happens when we lower our level of abstraction?

Unless you WANT to feel horrible (let’s find out why / how you got that desire / belief) you can always ask yourself...‘how could I reframe this experience to feel good about it, and the future, and feel invigorated and motivated to do what needs to be done for me to get where I want to go? Which assumptions were necessary? Which were valid? What OTHER choices do I have re: how to interpret situation, how to respond to it? What beliefs are available for me to chose from? Which would leave me happier and more energized?

MHR I am using all this self-defeating, self-sabotaging, critical, hopeless self talk. I can chose to start using positive self talk, and make this a new habit. Why do I feel a need to self-sabotage? Where did I get THAT idea from? That I NEED to? That I SHOULD?

MHR ‘Is this how I would speak to another person I cared about and wanted the best for? E.g a small child, or partner? Why would I be so hard on myself? What would I say to another person to encourage them?

What are the different ways other people might interpret / define etc this, and what alternative meanings might they come up with, for the same behavior / situation?

MHR we distinguish between intention and action...so before acting, ask yourself what your intentin is, and if this is the best way to achieve it e.g to express your anger...through physical violence, or a temper tantrum, or rage, or ??? Allow yourself choices / options ... generate them...

MHR question notion that all intentions are good, positive, desire some positive outcome e.g. that physically assaulting someone to gain ‘revenge’ is about seeking the positive of ‘justice for all people’...like rapist claiming it is an act of class warfare, to make the privileged female feel the pain of the masses, and want justice...though karma may be that...i.e produce identification with victims, by being victimized...
pre-frames our thinking-feeling about the external behavior as "seeking to accomplish something positive and of value." Then we set about to explore what specific positive intent we can find. "What positive intention does this person have in saying or doing this?" "What could a person seek to accomplish of value here?" "What secondary gain may one seek to obtain or not lose?" As we orient ourselves to guessing in the direction of positive intentions, we begin to habitually formulate positive intentions and attribute such to people. Now consider for a moment the positive effect this will also have on your own attitude. By shifting attention from the negative behaviors to the positive intent behind it, we thereby open up a new space for ourselves as well as for them. Into this new and more solution-oriented space we can then invite the other person. Doing this sets a more positive direction for conversing. Doing this facilitates communication and accessing the person's respect and appreciation. All of this, in turn, builds hope. Ultimately, this appreciation attitude creates the basis for even new and more positive behaviors. Such reframing can actually turn around a negative cycle and create a positive one. (C) "When you arrive late that means you don't care. "I can understand how you say that my being late means I don't care. Apparently you really do want to know that I truly care for you, don't you?" In this statement we assume that their EB of "criticism" intends to find out if we really care and to get us to show our care. So, instead of taking offense, and arguing with the person about the EB that he or she dislikes (showing up late), we empathically affirm that we do care. How much nicer, don't you think? Setting this positive frame about criticism then enables us to talk about solutions rather than blame about the problem. (D) "Stress causes me to eat chocolate." "So what you really want to do is to reduce your stress, a most admirable choice, and you have gotten into the habit of doing so by eating chocolate. And I wonder if eating chocolate really does reduce your stress? If not, perhaps we could explore other ways you could fulfill your objective of de-stressing." (E) "I can't really make a difference because management doesn't walk their talk." "It certainly strikes me that you really do want to make a difference and perhaps even help management walk their talk. I bet this strong desire to make a positive difference will cause you to persevere until you can find a way to make a difference. What do you think?" "If your true desire in saying that involves trying to motivate yourself to hold back so that you don't get your hopes up and then feel crushed if things don't change, I wonder what other ways you could reach that goal without pouring so much cold water on your motivation?" (F) "I can't buy your product because it costs too much." I'm glad you brought that up because it seems that you really do care about getting the proper value out of your purchases, and I'm wondering if this attitude really accomplishes that for you?" As mentioned, the eliciting questions for this pattern involve exploring
intentions, the 'why' question which drives a person's motivation, secondary gains, etc.

"Sorry that I'm late, with all the traffic on the road, an accident occurred and wouldn't you know it-right in my lane." (When you deliver a mind-line like this, make sure you have rapport enough that the other will listen to your explanations.) But we have a problem with that. It sounds like an excuse, doesn't it? So we don't have much of a reframe in it so far. Just the mere relating of facts. So lets spice it up-with some magic (you know, words that set a positive frame.) "Sorry that I'm late. I had looked forward to this meeting with you all week and really wanted to meet with you. Repeatedly throughout the day I have thought about the possibilities of working together with you. So I do apologize for getting here late. I should have considered the traffic at this hour and the possibility of an accident-which of course happened. I guess I was thinking more of you then those details." In this conversational reframe, we have put heavier emphasis on that cause, rather than to the accidental causational factors. This allows the person to swish his or her mind to two contributing factors-one accidental and one intentional.

"Saying mean things makes you a bad person." "If hatefulness or ugliness caused me to say those things you consider mean, then I would agree with you and immediately change. But I cut you short because I had a terrible day at work, feel unresourceful, and just didn't think about your feelings as I usually do, and as I want to."

In making this reframe, we assert that the behavior does not arise from a negative cause, but that other reasons, causes, and factors play a role.

To elicit this pattern, simply explore about other possible Positive Prior Causes that cause or contribute to the response or belief statement. "What could be a possible cause for this limiting belief or hurtful behavior?" "What else could explain this that also opens up space for changing?"

"I can't buy your product because it costs too much." "It really seems like a big deal today ... and maybe that's the problem. Just for the fun of it, imagine yourself having come to the end of your sojourn, and ready to leave this world, and look back to this day when you had this opportunity to make this purchase ... and how expensive does it seem when you view it from that larger point of view?" To elicit this pattem, use the elicitation question of eternity: "When I get to the end of my life, how will this EB look?" "From the perspective of eternity, how will I perceive this?"

"In my mind I went out to my future, and then to the end of my time-line. From there I then looked back on the decision point of this day when I was attempting to make a decision/
The four questions from Cartesian logic. "What would happen if you do?" "What would happen if you don't?" "What would not happen if you do?" "What would not happen if you don't?"

"So, you think [not "know"] that my being late means I don't care." Or, "You think that my being late means I don't care." Bringing an embedded message or messages to bear upon a person's belief statement can provide a message outside of conscious awareness that the person would not receive otherwise.

Apply the higher criterion or value to the limiting belief. "Does this belief allow you to act with love, kindness, assertiveness, respect, etc."? Check out how this works via our playground. (C) "Your being late means you don't care about me." "Actually, arriving late, while important, doesn't seem near as important as respecting you and our relationship and planning to spend quality time with you when we do get together." "I think you say that because of how really important you feel it to know whether or not I care. So caring holds a higher value than timeliness."

OUT framing uses Universal Quantifiers to bring in more sober, dissociated, fair, etc reflection...e.g self-punishing behavior your wouldn't force your kids or stranger to endure thus becomes absurd...or self-serving nature of supposed 'justice' and 'ethics' becomes obvious, and forces a re-think / re-evaluation...at least a BARDOT of opportunity for your subconscious to rearrange itself, and produce more options / choices. Words like 'all, always, everybody, nobody, all the time,' etc. In the field of Transactional Analysis, we call these words "parent words." As parents often use them. Words that make a universal generalization with no referential index. These terms imply and/or state an absolute condition, law, top level abstraction FRAME including EVERYONE AND EVERYTHING EVERYWHERE, with ZERO specificity of WHO in fact, WHERE in particular, WHEN in fact, etc e.g '6 million Jews', and 'All Nazi's', and 'All Alt. Right ...

Kant's question ' Would this action be a good UNIVERSAL role model for EVERYONE else, in all situations, at all times? i.e a Categorical imperative' ... which is implicit in my 'Optimal Ethics Generator' i.e moving a persons frame of reference from self, things like the self, way out to 'all sentient beings'...as YOU might just be ANY one of them in any one of your next lives... use this 'OUT framing'... will their beliefs 'cohere', or be as 'solid' and 'desirable' and 'self-serving' when they do that? ... include ever sentient being in their 'ethics' i.e 'belief system about what is desirable , acceptable, ideal, in terms of 'justice' and 'who deserves it?'...

That guy who wrote 'Eternity' all over Sydney, which was then the theme for one New Years Eve Harbor Bridge massive fireworks display...intended to get people thinking about the value of things they were seeking, striving for, in this temporal world, compared to the nature of eternity, and 'eternal rewards' of
spiritual balance / karma / future selves / the life of the spirit…sort of smoothe
out any bliss or dejection about things which soon will ‘pass’…and direct
attention to things of the spirit e.g ethics…

BUT ‘What if everyone thought / felt like that?’ leads to X replying ‘Well then
I’d be an idiot to think / feel otherwise’ i.e re: everyone for themselves, everyone
selfish, everyone greedy etc…

If the belief represents a good, ecological, and balanced generalization, it should
apply across the board at all times and places. If not, then we need to qualify,
contextualize, and index it. So as we move to a meta-level and frame the belief
with allness, we exaggerate it, we push it to its limit. In other words, we take it to
its threshold to see if it will still work, if it will still cohere as a reasonable belief.
Or, will we discover that it begins to fall apart? If it doesn't cohere--then the shift
will deframe the belief. It will fall apart as an inadequate generalization that
doesn't hold universally.

"Saying mean things makes you a bad person." "Since everyone has at sometime
said something mean, the only kind of people that we have on the planet are bad
people!" "How enhancing do you think this idea about 'mean words creating bad
people' serves the human race? Would this encourage honesty, authenticity,
genuineness, and the like?" ( 

"Cancer causes death." "If all of the doctors and researchers working on cancer
believed that, we'd never have any hope of finding a cure for cancer." "Would
you recommend that everybody who gets any form of cancer immediately think
that it will cause them to die?" "Would you recommend that everybody who gets
any form of cancer immediately think that it will cause them to die?"

When you put this larger frame over and around the belief, % do pay attention to
the effect of the sensory-based representations within the magical formula that
defines the belief. As it embeds the belief, what happens to the belief’s coding in
terms of modalities and submodalities? Typically, because a larger frame adds
information in the same picture at the lower logical level, the modalities and their
qualities at the larger level will dominate and temper the lower level
representations. Moving up and altering the frame size reality tests " for how
well-formed we had our belief formatted. (C) "Your being late means you don't
care about me." "So I show up late once, and that means I don't care at all about
you?" "Since everybody arrives late at some time or another in their life, then the
only kind of people on the planet are those who don't care about anybody?" In
this response, we have changed the frame ... we have moved it from focusing on
a specific behavior that occurred (showing up late) to a larger level meaning. We
have essentially asked, "Once means forever!?!" Interesting enough, when a
person doesn't take into account the larger levels of awareness (i.e., that the
person did show up!), then the person lives in a state of discounting, complaining,
gripping, fussing, badmouthing, feeling bad, feeling unloved, etc. How unproductive! And yet, when considered from the larger level frame—the person did indeed care enough to show up. Will the person focus on the message of care or on the message of "lack of care?" In all context reframing, we leave the content the same (the belief in the box), and only alter the frame around it. And yet, as the frame changes, so do the specific meanings embedded within it. "Do all people who show up late not care?" "Would you consider everybody who shows up late as suffering from a lack of care regardless of circumstances?"

MHR point is to de-potentiate a complaint someone has against you…and

**People LANGUAGE themselves** into particular ways of being and seeing and doing. Particular ‘modus operandi’ that affect the way they think, and behave. THAT is pure neuro-linguistic programming MHR

When people talk and think using modal operators of necessity like "have to, must, should, ought, got to," etc. they model a world of force, pressure, law, and compulsion. This leads to them developing a Modus Operandi, a way of thinking and living, in which the feeling of necessity dominates. "I have to go to work." "I must clean this house." "I ought to write her a note."

Compare this to people who tend to use modal operators of possibilify or desire like "I get to do this task." "I want to clean the commode." "I desire to write the letter." People who talk this way, and language themselves and others using these kinds of terms, live in a reality that is set up for generating, and seeking out, opportunities, possibilities, desires, and resources for themselves and others.

MHR this is pure Abracadabra…Language as a VERB…an action…the language we use to ourselves, in our own heads, and then use with others, has a huge impact on HOW we think, WHAT we focus on e.g opportunities Vs limits, and our ever action e.g motivated = tries = gets up when fails=ultimately succeeds in some way Vs despairing=gives up=self-fulfilling spiral down …

Moving through the world differently, you will ‘attend to’ different things e.g possibilities Vs restrictions, opportunities Vs limits, the good Vs the bad, and you will take more risks and work harder and likely achieve more … self-fulfilling modes of ‘languaging’ then thinking then acting…it starts with an idea, always…and most of us are very verbal in our thinking i.e we ‘talk to ourselves in our mnds to ‘rehearse’ ideas / formulate ideas etc…though De Bono used images to the same effect, perhaps intuitively and implicitly hoping to bypass the verbal limits / censors / limiting beliefs of conscious, verbalized, language, thought patterns / habits / beliefs.
The model operators of impossibility show up primarily in one term: can't. "I can't do this job." "I can't stand criticism." "You can't say those kinds of things to people, they'll think you're nuts!" In the Meta-Model, the question that challenges modal operators invites a person to step outside his or her model of the world and explore the territory beyond the modus operandi. "What would happen if you did?" "What would it feel like (look like, sound like) if you did?" "What stops you?"

"Stress causes me to eat chocolate." "Does stress have to make you eat chocolate? Could stress lead you to other behaviors? What stops you from experiencing stress as leading you to exercise or deep breathing rather than eating?" (E) "I can't really make a difference because management doesn't walk their talk." "What stops you from going ahead and making a big difference at work in spite of the incongruency of management?" "What would it feel like for you to not feel compelled to let the incongruency of management control how you respond?"

Challenge the modal operators that you hear people use. Namely, "What would it look, sound, and feel like to experience this opposite thing?" "What stops you from not letting the thing operate as a constraint against you?" i.e challenge their meta-model ‘can’ts’.

MHR e.g you have some physical imperfection you allow to stop you from attempting something, from some sport, to dating … is anything stopping you from NOT letting it stop you trying?...what is stopping you from NOT letting this ‘handicap’ etc get in the way of what you want?

In the Meta-Model, the question that challenges modal operators invites a person to step outside his or her model of the world and explore the territory beyond the modus operandi. "What would happen if you did?" "What would it feel like (look like, sound like) if you did?" "What stops you?"

MHR Our languaging produces ideas which produce beliefs, which produce actions, which produce the subjective world we, AND OTHERS live in. We also live in these worlds that OTHERS have generated / produced, from THEIR languaging and ideas and beliefs and actions. Change our own, and others, languaging, ideas, beliefs, and therefore actions, and we change our world. For better or worse.

All is flux. Change. Process. You are not the same now as you were a moment ago. I always revolted against the idea that 1+1=2, when speaking of objects, as each object is different. You get more ‘appleness’ from one set of 2 apples, or less, than any other set of 2 apples. So 1+1 is merely abstract theoretical maths. In reality, unless the two 1’s are identical, at every level of abstraction, it is just an artefact of our level of abstraction to say they are ‘the same’, ‘identical’, rather than a property of either ‘1’. We ascribe ‘sameness’ by rising in levels of
abstraction e.g ‘all Europeans look alike’ to an African who only focusses on the differences between ‘blacks’ and ‘whites’, namely, general skin color…in fact there are thousands of shades of white and black. So to refer to ‘blacks’ or ‘whites’ is an artefact of languaging, of adopting a particular level of abstraction.

Two apples might be considered ‘the same’ i.e ‘they are BOTH apples’, if you take some particular qualities of ‘apples’ and apply them to both. But looking closely you will find that no two apples are the same. The ‘sameness’ is a product of the level of abstraction, the level of composition, you adopt. Under an electron microscope there is NO appleness at all, just a bunch of vibrating energy matter strings. Maybe THESE are all the same. And it is how they are combined that gives the apple its ‘appleness’, its qualities. As it gives light, smells, sounds etc THEIR properties.

TROONATNOOR vol I goes into details on all this.

We allow our emotions to act as if sound / sight / feel / smell / taste / impression / experience / condition / situation / object / person X always MUST produce emotion Y in us…ALWAYS…when in fact every person, situation, sight etc is unique. The ‘dog’ that bit us is NOT the same dog/s we encounter later. The MAN who hurt us is NOT the same as all the men we encounter later. Realising this frees us to make more specific decisions / definitions / plans / beliefs…it gives us more options vis a vis responses to each unique individual experience / object / person / dog we encounter…

When we ‘generalise’, it is efficient, but limiting. When we generalise ‘all rustling in the forest MUST be a predator’, we end up living in fear, at a heightened state of preparedness for fight or flight, every moment of every day, and end up destroying our immune and nervous systems, overloading them, so they destroy our nerves, our cells, totally disrupt our healthy balance…We tend to ‘jump to conclusions’, it is our nature…and serves us well, in many cases…but if we don’t take the opportunity to stop and re-frame / re-define / interrogate our ‘beliefs’, we get stuck with a lot of generalisations and erroneous beliefs that limit our enjoyment of life, our health, our ability to satisfy our innate desires for peace, love, sex, relationships etc.

"I can't really make a difference because management doesn't walk their talk." "So your identity as someone who can get things done, make a difference, and contribute significantly in the world depends entirely on the inner congruity of management? Their integrity or lack of it forces you into this kind of person?"

Identity does not exist in the world, but only at best in human minds, and if identification represents a form of unsanity bordering on insanity, then it becomes useful to learn to dis-identify ourselves from limiting self-definitions. Here again we find it most useful to E-prime our language of the "to be" verbs. I
(MH) have found it useful for years to ask people to describe themselves without using the "to be" verbs. "Tell me about yourself, what you like, value, feel, think, experience, etc., but don't use any of the 'is' verbs-'is, am, are,' etc." General Semanticists have used this technique for years. Journalism classes have had students write a biography without using the "to be" verbs. Most people find this very challenging. In the end, it helps us to overcome the limitations of identification and over-identification.

If there is no fixed 'YOU', no limited 'identity', no 'personality', just options / alternatives / the thousand flowers of the soul, then using 'I am' languaging is inappropriate...sure, maybe, right this moment you ARE X and Y and Z, but this moment is already HISTORY BABY...What you want to do / and get others to do, to break out of their limiting beliefs / habitual patterns of languaging – ideation-feeling-acting, is to use 'I am BECOMING slimmer, healthier, smarter, kinder, more open-minded, more flexible, happier, .... VS I am fat, unhealthy, stupid, closed-minded, inflexible, sad...because that OLD you just disappeared into the past...you don’t want to be living in the past, do you? You want to be living in real-time, now, here, don’t you?

In the Meta-States Model, we recognize this infinity of choices when we note that for whatever thought-emotion we experience, we can always then generate a thought-emotion about it.

"I can't really make a difference because management doesn't walk their talk." "So what management does, management's congruency or incongruency, plays the most determinative role in how you think, feel, and act as you move through the world? I just didn't know that management had that much power over your responses. Sony to hear that you have given your power away." (  

"Stress causes me to eat chocolate." "It sounds like unpleasant and negative emotions [an abstraction from 'stress'] cause you to do things you don't want to do [abstracted from 'eating chocolate']. So experiencing negative emotions really makes you a victim to your emotions?" [An even higher abstract concept on the entire statement.]  

"I can't buy your product because it costs too much." "Well, we do often get what we pay for. And, if you really don't want the best product available, I can understand how you would let the price tag totally control your decisions."  

Person bogged down in specifics, which limit their choices e.g the price is higher than I am comfortable paying, loses the opportunity to enjoy that opportunity ... so need to move to higher level abstraction values / priorities e.g ‘satisfaction’...it is a shame that some people let their extreme focus on price deny them of so much of the good things life has to offer, and happiness...MHR!
I.E we give away all our power of choice to ‘price’ considerations...we let this one criteria dominate our lives, and exclude so many other great things from our experience...a fixation...idol...dogma...leaves part of us ‘dead’ and ‘immobile’ ‘fixed’ ‘in wood and stone’ figuratively speaking...the ‘law’ brings death, the gospel brings life i.e good news i.e living beliefs...based on here and now...e.g war is fought for future peace...that ‘justifies’ it...but if you focus on killing in the here and now, there is NO way to ‘justify’ it... ‘security’ is a future state, as you are living in constructed fear of ‘terrorism’ or ‘evil enemies’ ‘axis of evil’, ‘red terror’, ‘nazi brutality’...fixation on ‘future peace’ prevents you from seeing that right here and now what you are doing is totally avoidable, and totally reprehensible...you wouldn’t do it if not for the future fixation, propaganda etc...

The old ‘the means justifies the ends’ is the general way of thinking that leads to war, terrorism, exploitation, murder, ... the acts involved are criminal and horrific and no-one would sanction them in and of themselves...but frame them as ‘means to some glorious ends’, ‘means to some necessary ends’, ‘the means to salvation from some impending doom’, and suddenly their meaning is transformed from ‘crimes’ to ‘means’...

"I can't really make a difference because management doesn't walk their talk."
"That really doesn't sound like a way of thinking about things that does you very well. It sounds like it shuts down your creativity, perseverance, interferes with your good judgment, and heaven knows what other negative effects it has on your mind and body."

"Coming in late means that you don't care about me!" "What an interesting idea ... but then again, has this idea ever caused you to argue with people, especially loved ones, about time and schedules so that you spent your time with them arguing, rather than enjoying their presence?"

The last two are ‘ecological framing’ i.e relating the belief / idea to the whole of what they want for themselves and their life...

"I can't buy your product because it costs too much." "Thinking about purchasing solely in terms of cost probably gives you eyes that sort exclusively for price tags. Does this enable you to purchase or enjoy the things that you want to in life without money grubbing about everything?"

When we ‘out-frame’ i.e establish the highest priorities, values, ideas, emotions, beliefs, values, states, attitudes, etc. we bring new resources to bear on our belief systems. i.e will THIS produce THIS, ultimately? Have we become fixated on X, and it is ruining our ENTIRE ecology e.g happiness, joy, satisfaction, relationships...e.g letting something that 'bugs' us destroy our chances at attaining our HIGER priorities ... does it REALLY matter that it costs X, that they were late, that management are incompetent? Will you let THAT destroy
your agenda / goals / objectives i.e overall, holistic, TOP priorities for your life? Thus we can conversationally reframe with gentleness.

MHR the real secret of magic is that our emotions are NOT determined by anything ‘out there’, but by our own thoughts...how we ‘define’ our experiences of ‘out there’, and ‘out there’ itself. Nothing can CAUSE us to FEEL a certain way...we have control of our feelings...e.g pain does NOT force you to suffer...failure does not FORCE you to feel ‘like a failure’, and ‘depressed’. THAT's all YOU...nothing can make you quit...you CHOSE to quit...or continue struggling / perservering... vividly imagined things are as real as anything supposedly ‘objective’, as ALL things are constructed and experienced ‘in your mind’...NOT ‘out there’, if any ‘out there’ really exists, is totally speculative...we have NO way to know if there IS any ‘out there’, or if it is ALL ‘in our minds’. THIS is the most empowering fact. It is also the way OTHERS have gained CONTROL and POWER over YOU...in fact they have NO control over you. They have NO power over you. They can DO X and Y, withhold X and Y, offer X and Y, but YOU chose whether you care about X and Y, and whether you will desire or fear X and Y, or simply pay it no attention, ignore it, and go YOUR way, FREE.

Bateson (1972, 1979) called it abduction. This refers to thinking "on the side," or laterally, so to speak. Here we think of one thing by using another thing as a symbol. Here story, metaphor, analogy, proverb, poem, koans, riddles, jokes, etc. provide us formats for thinking, reasoning, and talking. Let us give you a taste of Bateson (1979).

Metaphor, dream, parable, allegory, the whole of art, the whole of science, the whole of religion, the whole of poetry, totemism.

The word "metaphor" comes from ancient Greek (meta and pherein) and literally means "to carry over." When we use a metaphor, we "carry over" (or transfer) a message to another person's mind in terms of something else (i.e., a story, other referent, myth, etc.). The listener then takes the framework or structure of the metaphor and interprets them in the framework of his or her own experiences... "a figure of speech in which something is spoken of as if it were another

A metaphor therefore involves anything (story, narrative, joke, drama, movie, personal referent, mythology, quote, etc.) whereby we think about one thing in terms of another thing. Metaphoring thus represents a meta-stating process. We frame one thing in terms of another. We "carry" up and above, and then apply to the Previous thought, idea, representation, etc. some other idea, concept, representation, etc. (the basic meta-stating process). Yet because we put the message in the frame of an unrelated story that unrelated story (or terms) typ~cally bypasses the conscious mind. And in doing it, it thereby allows the sub-conscious mind to receive it.
An efficacious, well-designed metaphor, to conversationally change beliefs, needs to be ‘isomorphic’, i.e share a similar structure with the person's experience. This similarity invites the subconscious mind to interpret it in relation to its own needs, story, narrative, experience.

As a communication device, story, metaphor, and narratives also present a far less threatening style than does direct instruction, statement, and advice. What explains this? It occurs, in part, because we veil our intended message in the metaphor.

We can use story to communicate on numerous levels at the same time. Milton Erickson's genius reveled in this very thing. Via metaphors he would communicate with both the conscious and unconscious facets of mind simultaneously. In this way, he provided the conscious mind a fun and entertaining message [he distracted them with content] while simultaneously he would address deeper concerns via the structure of the story. The surface story primarily keeps the conscious mind occupied. The deeper (or higher) structural message then "carries over" to the unconscious mind through the story's similarities.

The challenge is to ‘suspend judgement / disbelief’ for the entirety of an argument / suggestion vis a vis ‘what is real’ ‘what is possible’ ‘what is desirable’ etc…the story / tale / narrative is a format which most people readily do this in / for i.e when people listen to a story / watch a film / read a book, they willingly and automatically ‘suspend disbelief’ for the duration of the novel or film or story. They allow themselves flights of fancy, opening their minds and constructing vivid experiences, in their mind’s eye etc, in their imagination, from the words… it is a ‘human’ behavior we can adapt to our needs…and most writers with a message have taken to writing novels, plays, and film scripts, in order to attempt this ‘communication’ i.e ‘sharing’ of ideas…trying directly to ‘suggest’ such and such might be a reasonable alternative belief, a better belief, or that belief X is very dangerous, toxic, absurd, i.e to directly challenge existing beliefs, or offer new beliefs inconsistent with the existing beliefs, is usually doomed to failure by human nature…so we are using metaphor and story to use one element of human nature to overcome another element of human nature…

My favorite ‘story’ is Hermann Hesse’s short story in ‘Der Steppenwolf” which perfectly communicates the essential ‘argument’ of Buddha.

The story ‘situation’ ‘condition’ ‘state’ is basically a form of trance induction. Reading is the western form of meditation. We ‘agree’ to enter into this state when we open a book, or put on a film, or listen to a story. The ‘story’ state is one where our minds are open. We do not ‘believe’ the story, but we ‘make-believe’ it is true, for the duration. We turn off our usual ‘censors’ to enjoy the
‘escapism’ from our habitual frames of reference and experiences. This is a cultural or ‘human’ response to the ‘story’ situation.

You are much more likely to get someone to attend to an argument if it is embedded in a ‘story’ or ‘metaphor’, and if that story is to some degree ‘isomorphic’ i.e the person can ‘relate’ to it, and ‘enter into it’, because it matches, to some degree, their own aspirations, or life experience, definitions, etc.

So the story has more chance if it at least begins in a situation the person feels comfortable in, as approximating their own life, beliefs, definitions. Then you get rapport, with characters, and open-ness to being led away from the initial beliefs, along with the characters…in fact a character can say things to readers/listeners/viewers, that they would immediately reject/deny/switch off from, defend themselves against, if the same things were said to them in ‘real’ life by a real person.

At the very least you gain the readers/listeners/viewers ‘attention’. If you’ve made the characters accessible, likeable, so the reader develops rapport with them, and ‘enters into them’ and adopts their tone, rhythm etc, it is no different to a therapist gaining rapport, mirroring/pacing, and then leading them, and making suggestions to them, in the trance state, which may then be ‘triggered’ as ‘post hypnotic suggestions’ during ‘waking’ ‘lucid’ states i.e after they put the book down, leave the theatre, etc.

For the duration of the story, people willingly act ‘as if’ it were true, and thus subconsciously and consciously ‘experiment’ with the ideas suggested, with the ‘ways of being and seeing and acting’ of the characters in the story.

Of course if the characters and ideas are too ‘way out there’ for the listener/reader/viewer, they may ‘switch off’ and close their mind, rejecting the story as ‘stupid’ and ‘impossible’ and ‘unbelievable’ and even as ‘propaganda’ or ‘mind control’. But the story, the metaphor, is still THE best option available to have a chance at influencing most people’s belief systems.

To avoid such ‘defensiveness’ and ‘rejection’ of the metaphor and story, hypnosis is often first induced…so that the listener is more ‘receptive’ and ‘open-minded’ i.e less critical, analytical, defensive, censoring, resistant to challenges to its current belief systems…

Language operates at a higher level of abstraction then the internal representation to which it refers. So for language to "work" it must elicit and evoke sensory-based representations in us. We experience the "meaningfulness" of language when the words (as symbols) trigger us to see, hear, feel, smell, taste, touch, etc. the referents on the "screen of our mind."
What does the word "car" evoke in terms of sensory-based representations for you? Does it evoke a black Pontiac as it does for me (BB)? Probably not. That reference arose from my TDS. Where did your TDS take you? A blue Toyota, of course (MH)! What does the word "dog" evoke? Where does your TDS take you? I (BB) have an internal representation of a black Cocker Spaniel. What kind of dog did you find in your library of references? In this way we all make sense of language. We understand things by searching through our internalized and stored experiences for visual, auditory, kinesthetic, olfactory and/or gustatory sensations that correspond to the language symbols we use and hear. This explains how language (all language) operates metaphorically. Now we call this process of associating the language we hear with our own internal representation(s) a "transderivational search" (TDS).

When we go from the surface structure language of a metaphor to the deep structure, we make our internal search. We go to our personal "library of references." So when we listen to a story or metaphor, our brain and nervous system makes an unconscious TDS to connect the metaphor with our model of the world. Count on metaphors doing this. Count on stories activating listeners to search their "memory banks" to make sense of things via their model of the world.

Shifting Referential Indices So working with story, narrative, and metaphor involves symbolism. A symbol refers to any object, situation, or character that becomes an anchor for certain responses. Many everyday metaphors take the form of, "I once knew a person who ..." The symbolic link here? The word "person." Further links will arise from the similarities within the story. Such symbolic links exemplify the concept of "displacement of referential indices."

This means that whenever someone talks about his or her experience with enough vagueness that we as listeners can shift / displace the referential index from the characters in it, to US, and from their situations / conditions / experiences to OURS. We ‘relate’ to the story, and ‘enter into it’, into the characters experiences and feelings / responses, and into the narrative / plot. We ‘sympathize’ with the characters. This is always a pre-requisite to creating a ‘powerful’ character and story. The viewer / listener / reader has to be lead into identifying with the characters, plot, narrative, so that the plot / storyling / charcters ‘speak to us’ i.e resonate with our own feelings / experience…making it REAL…vivid…accessible…on conscious and subconscious levels. We distort our sensory representations, we switch the referential index, we enter into the story, and the story casts its spell. So much tat in the olden days, they talked about stories as 'spells!' MHR as in ‘THE Go-spels’ a.k.a ‘good news’ a.k.a ‘New Testament’ …
When we ‘identify’ with ANYONE or ANY ANIMAL, we ‘enter into it’…like a shape shifter…we empathise with it, feel with it, share its fears, hopes, pleasure, pain, relief. THAT is why we read novels. To lose ourselves in another world / identity…to escape this world…for a time…Vegan identify with animals, non-racists identify with all humans, Jews identify only with Jews…THAT is the problem…this identification is carefully nurtured by the Zionist state, the Jew world order…which also does the opposite for the rest of us, dividing and conquering us with implanted / imagined ‘differences’ that prevent us identifying with each other, and especially from identifying with ‘Nazis’ and ‘Hitler’ and any Alternate Right people and their beliefs / views / arguments / narratives…P.R and advertising all work to produce an identification with a product, or idea, or person, or political party, or company…so that you CARE about it…’Love’ it…and will defend it, pay for it, support it, value it, fight for it, kill for it, die for it…something you otherwise would never have dreamed of doing…but this is the thing…they GET you to DREAM of doing it…they get you en-tranced…so that you follow the post-hypnotic suggestion of ‘sign up today to defend the American way of life’, or ‘pay taxes even though the IRS has no legal authority to demand them of you, let alone confiscate your property and imprison you,…etc etc…

Storying, narrating, metaphoring, etc. encourages the switching of referential indices. This invites the "as if" quality of stories which then begins to work in our minds and bodies. And when it does- suddenly we feel transported to another time, another place, in another body, etc. The spell has entranced us. We lose track of time, place, self, environment, etc. as we go zooming off into new and different worlds and realities. Then, once inside the story, an animal, another person, even inanimate objects transform and take on special meanings. They frequently take on powerful symbolic representations for us. And in the story, we become storied. Themes, plots, sub-plots, dramas, comedies, tragedies, victories, heroic journey, etc. define, describe, limit, and/or free us.

The power of any ‘story’ lies in its ‘isomorphism’ i.e we will relate to it, it will resonate with us, if it is, at least at first, close enough to our own experience / perceived reality / beliefs i.e it mirrors our own current model / map of the world…once it has gained this ‘rapport’ and ‘trust’, it can lead us off into ‘science fiction’ futures or ‘fantasy’ worlds…in the same way mirroring / pacing and leading do in ‘persuasion’ techniques.

An ‘isomorphic’ map / model is where the map/model correspond to reality. But in reality we can never know if our maps / models are isomorphic or not. Or whether there is any ‘terrain’ or ‘reality’ to model / map i.e the map / model may make up a ‘virtual’ reality that our own beliefs actually program / construct.
In terms of story and metaphor, this isomorphism relates to our subjective reality, to our own maps and models, rather than assuming any ‘objective’ reality ‘out there’, other than some ‘strings of electro-magnetic potential’ that form an ‘Electromagnetic soup’ which we use as the ‘raw materials’ for constructing this ‘experience engine’ we call ‘the world’.

So the isomorphism the story / metaphor requires is to be as close to the readers/viewers/listeners SUBJECTIVE experience (Doesn’t everyone see themselves as the victim? No matter how fortunate they are? Or as misunderstood? Or as a princess accidentally raised by the wrong family? Or as a prince that has been turned into a frog? Secretly someone else, more powerful, more talented, with more rights and privileges?)… to their own definitions of their ‘self’ and their world, that they can ‘enter into’ the story and characters and plot, readily, easily, subconsciously…and thus enter a trance reality, the one described in the book / film / story…

If you want to ‘reach’ people, you have to use stories and characters they can relate to, whether or not their own ‘view’ of themselves is at all accurate…if they FEEL / define themselves as ‘victim’, then your protagonist must be a victim, misunderstood, even if the reader/listener/viewer is a nasty sort, they imagine they are great people, merely misunderstood, so your characters better reflect THAT definition of them…that ‘subjective reality’, that ‘false image’ they have of themselves…and THEN you can ‘hook’ them…draw them in…so they begin emphatically resonating with your narrative and characters, and THEN you can start changing frequencies, to ‘carry them’ up higher and higher, to be better people…to teach them the lessons the characters are learning, have learned…

Who does NOT identify with being ‘the chosen people’ with a ‘god – given right to the best of the best’…a god-given rights others have stolen from them, and that they are now demanding back…the god-given right to have everyone else serve them as ‘gods’…? Who doesn’t identify with such ideas? That they belong to a ‘master race’…that they are innately ‘superior’ simply by belonging to some ethnic or religious group? That this superiority grants them privileges and benefits over and above anything they ‘earn’ through their own effort, sacrifice, risk?

Storying, narrating, metaphoring, etc. encourages the switching of referential indices. This invites the "as if" quality of stories which then begins to work in our minds and bodies. And when it does- suddenly we feel transported to another time, another place, in another body, etc. The spell has entranced us. We lose track of time, place, self, environment, etc. as we go zooming off into new and different worlds and realities. Then, once inside the story, an animal, another person, even inanimate objects transform and take on special meanings. They frequently take on powerful symbolic representations for us. And in the story, we
become storied. Themes, plots, sub-plots, dramas, comedies, tragedies, victories, heroic journey, etc. define, describe, limit, and/or free us.

Thus those people who control the ‘narratives’ and ‘storys’ a.k.a our shared and personal ‘histories’ have the ultimate power of ‘leading’ us. Leading us to believe we should ‘submit’ and ‘follow’ THEM and their representatives. To accept THEIR definitions of reality, in which WE are limited by THEIR will to DO their will.

Isomorphism allows the story-teller to ‘reframe’ our subjective experience...lead us from taking on our own points of view, into taking on the points of view, of experiencing something, from the points of view of OTHER persons and animals. To empathise with them. To see things as they see them. Experience them as they subjectively experience them. Which is the basis of my ‘Optimal Ethics Generator’. And Rawls’ ‘Veil of Ignorance’...as explicitly explained, and then, in the intuitive tradition of most writers, ‘novelised’ in my books.

"A friend of mine always complained about her husband being late. But then after he died, she often thought about him and wished that he would just be late ..." 4. "I once had a friend who always complained about the high cost of clothes for his teenage daughter. He complained and complained. Then, one day his daughter died in an auto accident. Now when he thinks about spending money on clothes for her- he wishes he had that opportunity

"Have you ever noticed that a wound up rubber band gets loose in hot water?"

The water held captive behind a dam yearns for the sea, not really caring about the dam, but only about feeling true to itself to flow ... ever flow, graciously, gently, yet inevitably down, down, down... toward the sea... And it does so, regardless of what the dam wants."

In Narrative Therapy, we use externalization as a central eliciting process. This refers to externalizing a problem, situation, theme, idea, emotion, etc. By separating person from behavior (and all other functions and production—specially thoughts and emotions) we underscore another central theme in Narrative, namely, "The person is not the problem; The problem is the problem."

"What tactics have you found that Wimping-Out uses to trick you into giving up? How have you stood up to Wimping-Out?"

MHR we can target a belief directly, and encounter resistance/defensiveness/aggression etc, or simply go above that belief, or below it MHR and reframe it ...no-one but ME speaks about going BELOW something ... it is all META reframing...but the REAL secret is to go BELOW a belief...challenge its assumptions...undermine the massively thick defensive walls of the citadel...be
a ‘sapper’, and then dig a deep hole under the foundations, by clearly identifying, unobtrusively, as if you were just chatting, the assumptions, the foundations, the entire belief / system is based on / built upon... then the entire impenetrable castle implodes into itself, falls in upon itself, destroys itself... the walls fall down... and the people who thought the walls had been protecting them, realise the walls had been imprisoning them, and they are now free to see ‘outside’ their little box, their little castle, their fortress, their belief system, their noetic structure, with its dogmas etc... and enjoy more choices, more freedoms, more opportunities, OUTSIDE the limits of their previous fortress / castle / belief systems... / dogmas / idols of stone...

MHR to escape the languaging / programming we have picked up ourselves, or had imposed upon us, and any combination / iteration of the two, we need to become ZEN practitioners. To let ‘the world’ speak directly to us, bypassing all the ‘languaging’ e.g definitions, distortions, deletions, identifications, meanings, labels, frames, tinted lenses, audio filters, mis-directions, statuses, ‘priveleges’ e.g some things are ‘priveleged in our perceptions e.g we ‘see’ them, and NOT others... we focus on them, attend to them, and ignore others... so that we let the actual thing, here, now, speak to us directly, and tell US what it is... observe it... attend to it... in all its uniqueness... free from prejudices, preconceptions, etc... and when we do we suddenly SEE and HEAR and FEEL the thing, AS IT IS, for the very first time... for up to this point we have overlayed layers of distorting filters, frames, definitions, assumptions all over it... and we saw THROUGH this distorting prism... we heard THROUGH these audio filters... we MISSED most of what WAS ACTUALLY THERE... while ascribing, adding, super-imposing UPON the thing, things that ARE NOT THERE....

We see the unique creature before us, purring, soft furred, padded-footed, affectionate, charming, friendly, warm, large eyed... rather than ‘oh, it’s just another ‘cat’... and registering some symbolic ‘cat’ in our consciousness... rather than seeing the actual ‘cat’ before us... this is the VIOLENCE of language, and languaging. A violence we do to everything we experience in such limited, LANGUAGED, ways. To the cat, and to ourselves. We turn real humans into caricatures, either ‘demons’ or ‘angels’. So ‘Hitler’ and the Nazi’s are demonised, and ‘jews’ defined as innocent angels, victims. We react emotionally, rather than rationally, to the ‘trigger’ words ‘Nazi’ or ‘Hitler’ or ‘Jew’... as evil monsters, or victims. We don’t see the actual authentic people. Just the stereotype. The archetype. The caricature. The cartoon figure. The simplification. The ‘languaged’ definition. ‘A cat is...’. ‘Hitler / Nazis were...’. Prejudged. Preconceived. Prepackaged. Neat and tidy. But doing NO justice to the referents. Bearing very little resemblance to the unique, complex, authentic referent.
We take a living thing, and idolize it. Turn it into a dead thing of stone and wood. Or a dogma. It ceases to be a living entity. It loses most of its REALITY.

Imagine being denied 95% of what you ARE. And having people respond to 5%. Putting you in a ‘box’. A ‘category’. A ‘type’. ‘Oh, X is ‘blonde’. ‘Y is on the Alt Right’. ‘She’s a lawyer’. And having your entire ‘self’ limited to a ‘slogan’ or ‘meta-tag’. ‘Nazi’. ‘Victim’. Sure it might work for you, on some levels, if it means you get ‘privileges’ for being a ‘Victim’. But being a ‘Goy’ is going to cost you heavily. And even being a ‘Jew’ is going to. You wait and see.

Calling an animal ‘beef’ or ‘chicken’. Calling a cow ‘a milk machine’. Calling a dark skinned person ‘a member of an inferior race’ is all to limit the unique individual to some pre-packaged slogan and set of definitions which limit how YOU will relate to them, and thus limit THEIR freedoms, rights, privileges etc…

These definition determine our perceptions, our thinking, how we feel, and thus how we act, towards these ‘classes’ of ‘objects’ and ‘subjects’. THAT is the true ABRACADABRA power of Languaging.

If we allow ourselves to be limited to the abstract levels of languaging e.g prejudices, conditioned expectatations, learned definitions, anything beyond actual here, now, sensory perceptions, undistorted, complete, unfiltered, then we will end up living in ‘subjective realities’ that do NOT correspond to anything like ‘objective’ reality. We end up following maps that do NOT correspond to the terrain, and thus walk off cliffs, into waterless deserts, drowning in rivers, etc

If we limit ourselves to the existing definitions / beliefs / models/ maps we either wrote in a very rash manner long before we knew much about the world, or simply took ‘on faith’ from other people, people who claimed ‘transferred authority’ from other people, and never even had any claim to being good arbiters of ‘reality’ and ‘knowledge’, then we limit our choices. We limit our options. We ‘take it for granted’ that where the map shows ‘the end of the earth’, we cannot proceed further, or where it shows ‘dragons be here’, we dare not step foot on that terrain…

The ‘Gods’ people have language into ‘social reality’ cannot help or harm you, themselves. But YOUR or OTHERS belief that they exist, and said such and such, and directed us to such and such, and granted so and so certain powers, authorities, and privileges, can easily kill you, and much worse. Fates worse than death were invented as the ultimate threat, by priests. For they could not only torture you in this life, but for eternity. Illusions are the most powerful weapons in this world. They reduce to mere languaging, but upon this languaging the worlds most powerful institutions and individuals have built their worldly power, and control grids. Invisible control and power. The most powerful of all forms of power.
Our challenge, the challenge of all philosophers and ‘social reality reformers’, a.k.a ‘social reality revisionists’, is to relanguage our neuro-linguistic reality, and to MHR open up / unlock / unfix / de-idolise / de-program / un-dogmatise / re-animate our paradigms / models / maps / definitions, and turn us all into Humean Skeptics. Seekers who never assume to ‘know’ anything, and are always open to new opportunities / ways of defining and being and seeing and living… so you get 'stuck' in any attitude, viewpoint, interpretation, meaning, emotion, reality, or interpretation. You don’t become a zombie. An ‘idol’. A nominalisation a.k.a ‘YOU’ as others and you have come to define ‘YOU”, as a fixed value, a fixed personality, a fixed / limited / ‘known’ quantity…fixed within LIMITS you have accepted without challenging, and others have forced upon you, and won’t let you break free of, because they serve THEIR perceived vested interests. THEY are happy to see YOU limited, so that THEY can pursue THEIR Unlimited goals re: Unlimited power, privilege, benefits, influence, wealth, status, resources…

MHR biggest problem is our emotional investment in our models / maps / assumptions i.e associated with loved ones, statuses, privileges, benefits…hopes…and fears…and fear of losing face … admitting ‘wrong’…and the constant reinforcement of our inherited social reality models / maps / definitions from our culture, and the mass media programming…so many things work against our ever WANTING to re-consider…to OPENING UP the debate once more…why would we bother when our own beliefs are so ‘self-evident’ and ‘everyone’ believes the same thing? … especially when ‘going outside the box’ has negative repercussions for us e.g loss of status, ridicule, rejection, disapproval, abandonment, prison, fines, unemployment, censorship…the people who put the ‘social reality’ in place, the hegemons of the hegemonic social reality, aren’t going to allow YOU to challenge the social reality that brings THEM so many benefits…are they?

The current ‘tagging’ of ‘Alt Right’ and ‘Constitutionalists’ and ‘Tea party’ and ‘Gun lobby’ is an example of rigidly ‘sticking’ labels, and ‘frames’ onto people, using the mass media, legal system, and education system. So that people see no reason to ‘listen to’ these alternatives…to pay them any attention…to consider what they have to say, what choices they offer, what ‘Bardots’ of opportunity they represent…

The Ptolemaic paradigm conceives the earth as flat, the center of the universe, and the sun as circling it. This was consistent with ‘The Bible’. We laugh at people who today claim he was right, and few people open their minds up to accept the compelling arguments in favor of this model. There is no need to ‘accept’ ANY truth / definition / model / map. In fact we should NEVER assume we have stumbled upon THE correct map / model / definition that corresponds to some ‘reality’. THAT is NOT the scientific method. THAT goes against Humean
Skepticism. THAT means we need to be humble in ‘truth’ statements we make. Always keeping our minds open to new, compelling, data, interpretations etc…

When we accept the power of a voodoo priest stabbing a voodoo pin into a representative doll as a true and inescapable curse that hexes and guarantees death-so it becomes. Autopsies on "voodoo" deaths in Haiti consistently reveal no "natural" cause of death. Somehow, in some way, the person's autonomic nervous system just shuts down. MHR it is possible poisons are also used?

Bandler (Jewish) and Grinder (1975) originally developed their NLP meta-model using another Jew, Noam Chomsky’s (1956) Transformational Grammar to understand how language works in the transformation of meaning and how to enrich a person's model of the world.

What we say suffers from deletion, generalization, distortion, and nominalization.

We assume things e.g experiences / situations / conditions / people / objects are ‘the same’ as those in our ‘memory banks’, and immediately ascribe them the same meanings…when in fact they may be very different…and in any case much more data rich i.e more diverse / full of information / ‘different’ than our ‘boxes’ allow … but we force them into the ‘dog’ box or the ‘blonde’ box, suffering a lot of detail rich information to be simply dismissed / filtered out…and the remaining data is then passed through ‘filters’ so that it ‘looks like, sounds like, feels like’ the data e.g the category ‘blondes’, already in our memory banks…our stimulus response ‘triggers’ / ‘anchors’…

Nominalisation is ‘reification’ e.g of sets of relationships reified as ‘institution X’, sets of tastes, colors, textures, smells, sounds reified as ‘object Y’, processes reified as states and objects … idolatry…’killing a process dead, and naming the ‘dead’ thing Z’, already in our memory banks…our stimulus response ‘triggers’ / ‘anchors’…

The linguistic distinctions of the Meta-Model provide a way to move from the surface sentences back down to the deep structures. Doing this moves us to the fuller representation. And there we can examine the meanings attributed and attached to things in our first mapmaking. This process sends us back to the experiences out of which we made our maps and paradigms.

Bandler and Grinder use developed their meta-model by studying and then modelling gifted therapists such as Fritz Perls, Virginia Satir, and Milton Erickson, as they effected powerful and effective therapeutic changes.

Thus a ‘META MODEL’ is a model / method / approach / process / way to CHANGE A PERSON’S MODEL… people produce models in some way, or have them imprinted…the meta-model allows us to find our how / what way this happened, so we can give them the chance to ‘re-imprint’ more resourceful
beliefs / patterns / habits … it is a model for giving people a chance to change their own models… for the therapist to suggest such changes to their subconscious mind… to open the locks, re-suscitate and re-animate the ‘idols of stone and wood’ as Jesus put it… to breathe life back into the spirit… for the ‘fixed’ word is dead… it cannot bring life… it is a dead idol… mere dogma… not appropriate for living beings… we can meta-model the paradigm / model (work out how it was constructed, based on what assumptions, deletions, distortions) to clear up the parts that lack clarity or precision. We can then fill in missing or deleted pieces, clear up distortions, and specify generalizations more precisely, de-potentiating them / invalidating them / under-mining them MHR.

We want a person’s own languaging to trigger resourceful, efficacious, generative, positive self-fulfilling prophecy responses. Where it doesn’t, we need to work on it until it does. To replace erroneous, misleading, self-defeating, fatalistic, etc assumptions / beliefs with valid, generative, positive, constructive, motivating ones.

We lose or distort important information during codification of experience into language, often adding errors, misinformation, misunderstandings etc. The Meta-Model assists us in decoding the old formations and getting back to the original experience. From that experience we can then create a more productive map. We learned things too fast, originally, or too unconsciously, for them to be the optimal / best maps / models / assumptions / beliefs possible. But now that we survived to a state where we have the luxury of time and security, to go back to them, we can re-visit the process, re-start it, re-investigate the ‘cold case’, open up the locked doors and windows, open up the investigations, revisit the ‘evidence’, chase down new tips and clues, re-interrogate suspects, and do all this at a leisurely pace, with no sense of urgency, no dire threat to our survival, with a huge amount of new resources not available to us at the time, including information, and an understanding of how we code and decode, and ‘jump to conclusions’ and can be ‘misdirected’ and ‘misinformed’ and ‘mislead’ and ‘tricked’ and ‘deceived’ and ‘conned’ and become the victim of ‘noble’ lies, propaganda, social conditioning, marketing, advertising, education, etc… This is all very Freudian and Humean …

Ironically Chomsky himself rejected his own theory of Transformational Grammar, which supposedly inspired Bandler.

We listen and observe to discover the cause-effect relationships people ascribe, the meanings they ascribe particular things / conditions / relationships / experiences, what associations they have built / ascribed between things i.e. ‘meanings’ constructed, their values and priorities, how they define themselves i.e. which of their experiences etc they ‘identify’ with as being their ‘defining characteristics / properties’, the assumptions implicit in their beliefs which they
may not realise are assumptions, and the assumptions they have simply taken for

ganted as being ‘true’, nominalisations they have made i.e processes that are

really open but which they treat as ‘closed cases’ e.g failing at something,

defined as a complete / finished/ fait accompli /beyond recovery-change-revision

‘failure’, and the way they operate in the world, their ‘modus operandi’, as

indicated by the modal operators they use, i.e indicating necessity, possibility,
impossibility, choice etc, and listen / observe for ‘deletions’ and ‘distortions’ in

the attributions made, and what has been said and left unsaid, assumed rather

than demonstrated…

MHR if we can bring a person to see how they have constructed their models,

and that they ARE models, and NOT reality, that we cannot ‘know’ ‘reality’ per

se, but we can attempt closer correspondences to it by avoiding assumptions,

remaining at the lowest levels of abstraction, ensuring our data sets are complete

and free of unjustified assumptions / beliefs, we can free them to generate better

models…that serve THEIR happiness better…which is T vol I. and II and III.

If someone says, "I'm really depressed!" we can meta-model, "How specifically
do you know that you feel depressed?" Typically, the person will access their
reference experience and give us the pictures, words, sounds, and sensations.
This brings up the pre-paradigm data of the map. As we "go back to the
experience” out of which we mapped our reality, the Meta-Model questions
trigger transderivational searches (TDS). We "go inside" to find (or re-
experience) the fuller structur-the original experience as we remember it. A.k.a a
transderivational search.

MHR…the ‘meta-model is basically my ‘interrogation’ of beliefs…in T vol. I

MHR NLP assumes that every person has access to many more resources than
they are accessing…they are simply failing to recognise these
resources…including their own past experiences of successfully coping etc…all
the positive feedback the world has actually given them but they ignored / missed/
overlooked / dismissed / rationalized away etc…they can use the same
processes they employ to get the symptoms they don’t want, to get the things
they do want…the symptoms are an expression of their personal power,
misplaced / misdirected … glitches and bugs in their programming…that can be
corrected…so the power now producing unwanted symptoms is directed towards
producing / generating desired outcomes etc… the world has everything they
need…they are competent and have everything they need…their representations
are simply faulty / erroneous … they are inputting erroneous data into sound
programs, or correct data into corrupted programs…i.e ‘dis-ease’… Socrates
assumes that if people know ‘the good’, they will behave ethically…so all you
need do is show them ‘the good’… we have become conditioned into limited
responses i.e limiting beliefs reduce our options…the balanced, resourceful
person has more choices of response, including more constructive / generative / productive / positive / positively self-fulfilling responses...Vs the phobic, rigid, fixed, limited responses e.g compulsive responses...leaving no options...e.g terror Vs calm, alert, caution allowing for reasonable / logical / rational / appropriate / constructive / optimal / proportionate responses...how to respond to setbacks / rejection / objections etc...rather than ‘knee-jerk’ despair, giving up, terror, incapacity etc...

MHR question is ‘which ‘impressions’ originate in the world, and which originate in someone’s mind...ours, or another’s...which beliefs are ultimately founded in some ‘sense perception’ or ‘sense impression’ i.e induced by a person, self or other, and which are abstractions i.e exist only in someone’s mind ... ours or other’s minds...and which are deductions from some previous inductions? ... and which are mere deductions from assumptions...i.e if we assume X, then Y follows, is logical, but won’t produce ‘knowledge’ or any close correspondence with ‘reality’, unless the assumptions are correct...and unless they are first person induced from sense perceptions, which are validated by others, at different times and places, then these assumptions are no basis for forming sound beliefs about the world...Hume showed etc....

A FRAME is a context...and in physical terms it would be not just the frame around a painting that a person has painted, but a series of filters layed over the painting itself...that distort, delete, and blur out the paintings details...it is our job to remove these layers, to reveal those details...and find out how the person actually PAINTED it in the first place...what that painting is based on...some experience...did they paint it realistically? Is it a full depiction of what is depicted? Did they exclude certain elements of the thing they were painting? etc

The frame represents the PROCESS by which an experience / meaning is encoded into language, then expressed. This process can introduce all sorts of artefacts, distortions, deletions, nominalisations etc...we need to reconstruct the process, by reverse-engineering it, based on what we expect a full complete representation should contain, and what is actually present in the person’s expressions ... to deconstruct the process...from what is and what is not present in the output...what the person says...the PROCESS of encoding from experience and conditioning into ‘meaning’ i.e representing that experience and meanings as symbols, language, images, sounds, etc...is rarely perfect...we need to go back and do some ‘forensics’ on their utterances...what are they saying, what not saying, is what they saying likely the complete representation etc...

We PROCESS impressions / information etc to encode it into language and other symbolic systems. Faulty processing can corrupt even the best data. But often the data itself is faulty, and so the perfect processing still produces garbage a-la GIGO...
Looking at the same thing from different points of view will produce different outcomes in terms of ‘what this MEANS’…hindsight is the perfect example, where the ‘meaning’ of things changes with the benefit of hindsight i.e. fuller information, perspective of experience / age etc…and thus, in hindsight, we say ‘I would have behaved / responded differently’, with the benefit of additional information, insights, etc…

All this proves the potential for ‘framing’ to be abused by those in power, to ‘frame’ all our understandings, meanings, and thus control and manipulate our emotions, feelings, impressions, and ultimately the actions these feelings, impressions etc motivate us to perform…e.g fight wars, pay taxes to criminal organisations i.e protection money to priests / IRS / governments…

"Meaning" does not exist in the world. Meaning only, and exclusively, exists in a human mind. It does because it arises as a function of abstracting (i.e., thinking, evaluating, explaining, attributing, believing, interpreting, … the basis of neuro-semantics and NLP…

We can take back control of our framing…interrogate our conditioned / learned habitual / patterned framing behaviors…chose frames that serve US better, and replace them with these…freeing us from the hegemons and the frames they have hegemonically placed upon us, as ‘impression engineers’, ‘belief imprinters’, ‘opinion manipulators’, public relations experts, advertisers, lobbyists, spin doctors, politicians, conception managers, deceivers, ‘noble’ liars…from Plato to the New Con-men, the NEO-CON men…

The frame-of-reference we put around a stimulus totally determines the meaning it has for us in how we experience it. By reframing, we attach new meaning to the same sensory stimuli to generate new responses in us. In reframing then, we do not change the world, we change our meanings that we attribute to the world.

Symbols, words, and language can turn life into a living hell, full of monstrous fears, dreads, hates, etc. or into a living paradise of delight, love, wonder, growth, appreciation, and never-ending learning.

N.B at least one author of this book is Jewish, and learned Hebrew WTF !!!

Run the "problem" through these reframing patterns. We play with the idea, tearing it to pieces (deframing), giving it new meanings (content reframing), and then outframing it every which way but loose! Frequently, when we started, we both had a stunned sense of feeling both stuck and hopeless. "What in the world can you say to that?!" But in every single case, by the time we finished zapping the line with our magic--we felt a certain touch of ferociousness, "Give me another one! Bring it on! Let me have at it!!"
MHR Re: conflict aversion, copy ‘The problem is, there are no problems’ as motive to confront problems while small, manageable, encourage etc…N.B I have a lot of material in T vol.I for management / win friends and influence people etc…and this stuff on social reality etc…

The transformation of meaning via &Onversational reframing.

Consider ‘framing’ in the context of context…open a dictionary, look for the meaning of a ‘word’…you will soon find that in different contexts, even a simple word has different meanings…the meaning of the word is ‘framed’ by the context it is being used in… And that is just the DENOTATIVE meaning. These denotative meanings will be shared by speakers of the same language, who comprehend the context i.e are thinking of it in the same context, and also know the meaning of the word IN that context. But what about CONNOTATIVE meanings? The personal associations each person has with each word, and the thing it denotes. All in T vol. I.

"Do you know the frame out of which you operate?" "Does the frame serve you well?" "Who set the frame?" "Do you want to set a different frame?"

We associate various stimuli with some response and thus the "stimulus" "means" or equals or leads to that "response" in our nervous system.

In one of the big earthquakes that shook southern California in the 1980s-just prior to the quake, a mother became upset with her little 5 year old for slamming a door in the house. Just as she began a new rebuke and stating that "something really bad will happen if you keep doing this," the little boy slammed the door and then the whole house shook and trembled, dishes crashed to the floor, lamps came tumbling down, etc. This absolutely terrified the little boy -who in his nervous system-connected "slamming the door" with causing an Earthquake. He also connected, "arguing with mom" as leading to an Earthquake. This illustrates that the "logic" inside the human nervous system doesn't have to be "logical" in a formal way, reflecting the best of mature human thinking. The psycho-logic inside the nervous +System can, and does, connect all kinds of irrational things together. "Yet once it links something with something else--the brain, nervous System, and all connecting human tissue (which means all the Somatic, physical, body stuff inside you!) "knows" at a neurological bel that "sassing mom creates devastating effects!" This creates ri%. "intuitive" knowledge.

Korzybski's work in General Semantics; Cause -> Effect statements (C-E): This X leads to this Y. Complex Equivalences (Ceq): This X means this Y. Identification (Id): This X means this Y about me.

E.B. > = I.S.
The EB in the formula stands for "This external behavior that I can see, hear, feel, smell, taste, etc.," and the \( \geq \) stands for "leads to, equals or equates with,", and the IS stands for some "internal significance, feeling, state, etc."

In This Way We Create The "Magical Meaning Box" This happens because "saying" and thinking that something equals something else makes it so—at least, it makes it so in human neurology. "When she looks at me with that expression, I feel discounted." "When he talks to me in that tone of voice, I know he is angry with me." In this way, we actually and literally speak "reality" (i.e. our internal, subjective reality) into being. Once we do, it then begins to run our neurology (e.g. emotions, behaviors, responses). Further, this magic meaning box functions like a "black box" inside of us. What does this phrase refer to? It suggests that most of the time we don't have the slightest idea of how we have constructed our meanings, or what meanings operate within us as our "programs."

Meaning primarily operates at un-conscious levels inside us. They operate as our meta-frames of references, and so like the canopy of the sky that provides our atmosphere, meaning exists as a conceptual canopy that we seldom notice. And yet we breathe and live and move within it, and it determines most of our experiences, emotions, states, etc. After all, it governs the weather of our mind-and-emotions. Finally, these language equations that connect things generate our "meanings." This makes them central to our experiences, skills, abilities, emotions, etc. To change we have to change these equations. And when we do change the equations (the neuro-linguistic equations)—magic happens. Everything becomes transformed. New realities pop into existence.

We also think about our thinking. We have feelings about our feelings. Our brains can have thoughts about thoughts, and then more thoughts about those thoughts. We refer to this kind of neurological functioning of the brain as "reflexivity." This means that the processing feeds back into itself so that as a cybernetic system, our brain processes its own previous products.

MHR migraines / overload / anxiety…imagine a computer program that is programmed to ‘record’ its own output …setting up a feedback loop…it is told ‘watch out for the boogey man’ (terrorist, car accidents, unemployment, corrupt police, bullies, mobbing, hell, the devil, disapproval, rejection, abandonment, poverty, war, nukes, criminals, con-men, ‘men’, ‘women’) and inputs this, and becomes a little anxious … or it is ‘beaten’ (the equivalent of a really strong ‘command’ line) and is suddenly imprinted with a great fear…a ‘one shot / one command ‘learning’).…and it then reflects on this anxiety, thinking about its sources / causes, maybe identifying even more potential ‘causes’ of the same anxiety, and becoming more anxious, and expressing this, then recording its own expressions, and ‘thinking about anxiety and all the things that make it anxious’, and each time the amplitude increasing, as the same signals are being outputted,
re-recorded and re-outputted, over and over, like standing waves of audio, or like deeper grooves in an etching, or more vivid colors being layered, becoming more intense, more vivid, each time, until the computer is in a constant state of worrying about all the ‘boogey men’ and also worrying about why it worries so much, getting anxious about all of this, and sooner or later ‘feeling’ that ‘life just is not worth it’, falling into despair, and thoughts about the ‘reasons’ for this, and thoughts about despair, and the utter hopelessness of life, with all these boogeymen, all this anxiety, all these worries…

Reflexivity refers to the fact that the ‘meaning’ a thing has IS its relationship to all other ‘things’, and the meanings THEY have, is their relationship to THIS individual thing. Mobbing and bullying occur among the ‘meanings’, so that groups of meanings (noetic structures / belief systems / models/ maps / dogmas / ‘first imprints’ / association-nodes / metaphoric systems ) tend to ‘push around’ the individual meanings, and force them to conform to THEM i.e force THEM to SUPPORT them, in the usual ‘human’ ways, and most individual items then do adapt themselves / conform / change / submit to this tyranny…so the individual ‘meanings’ corrupt themselves / censor themselves…and comply…pretend they are something else, so as to ‘go along to get along’…and so the ‘bully’ meanings become hegemonic…and end up ‘framing’ EVERY OTHER MEANING in the system…i.e EVERY OTHER MEANING is distorted / twisted / spun / deleted / squashed etc until it appears to REINFORCE the hegemonic meanings … in effect we end up ‘not believing our eyes, ears, nose, taste, hands’ and instead ‘believing’ the hegemonic definitions / meanings ascribed to things. So sex is bad, being kind is weak, beauty is ‘unfair’, intelligence is a threat, freedom is evil, … all the ‘perverse’ meanings that arise when meanings interact, and the most ‘powerful’ are given hegemonic rule over the individual impressions / meanings…even the ‘sense impressions’, the ‘sights, sounds, touches, tastes, smells’, which ideally would have an ‘override’ feature, and be given the highest priority as ‘data’ and ‘information’ for the cybernetic systems, are ignored, pushed to the background, distorted, filtered, deleted, to avoid making the hegemons ‘uncomfortable’ and challenging their hegemony, their ‘truth value’, their ‘power’ over the entire system. As above, so below. AS in our personal cybernetic systems, so within our social systems.

MHR complex equivalences e.g that being kind is equivalent to being weak, a failure…that being Alt. right is equivalent to being a Hollywood Nazi in a ‘death’ camp, murdering 6 million people against all the rules of physics and chemistry…not being assertive is being ‘safe’ and ‘good’ and won’t anger ‘father’ or ‘mother’ i.e won’t threaten your approval / acceptance…and by association, these ‘rules’ being generalized to ‘go along to get along’, ‘don’t rock the boat’, questioning authority is bad, the government is good, war is necessary, consume, obey, reproduce, endure…
Whatever meaning we have imprinted / learn / induce / deduce becomes neurologically "real" to us. It puts us into "state." It governs our neuro-linguistic states of consciousness. It can then modulate both our central and autonomic nervous systems.

MHR The term "meta" means ‘above, beyond, about…beliefs about beliefs, feelings about feelings, concerns about concerns, worrying about worrying, anxiety regarding anxiety, so that we produce feedback loops i.e the output becomes an input, and amplifies it…or places it within a frame / context which modifies the original ‘meaning’ to produce a new meaning…for better or worse i.e can take a good meaning like ‘noble’ and attach it to ‘lie’ so have ‘noble’ lies…take a good ‘ends’ and attach it to an evil ‘means’ a.k.a ‘the means justifies the ends’ i.e we have ‘spun’ evil into good, by ‘framing’ it in the context of ‘good’ ends…so now every evil is ‘good’, as long as we can ‘associate’ it with some ‘good’ ends…and so we fire bomb 100,000 women and children in one night, as the ‘means’ to the ‘good ends’ of ‘ending the war’ i.e bombing of women and children…

The Jew World Order Neo-CON men have ‘framed’ total theft of YOUR constitutional rights and liberties as ‘for YOUR protection’, in YOU interests, to ‘DEFEND’ YOUR LIBERTIES AND FREEDOMS ! Now how is THAT for spin / framing?

When we ‘process’ meanings in these ways i.e outputting them and re-inputting them, we do the same thing a music mixer does when mixing tracks for a recording…adding ‘filters’ and ‘distortion’ and ‘editing out’ bits until the ‘whole’ ‘feels’ right…even if most of the inputs are now ‘fake’ i.e NOT real i.e bear little resemblance to the original inputs i.e recorded tracks…most of the original inputs have been edited out, distorted, and filtered…to produce a ‘coherent’ and ‘pleasing’ final set of tracks…in the same way our minds operate with ‘beliefs’ and ‘sensory inputs’, inductions, and deductions, definitions, etc…our minds seek this ‘pleasing’ ‘coherence’…at the expense of authenticity, genuineness, correspondence with ‘reality’… of course when the band perform the same song ‘live’, we get to hear the ‘reality’…and understand why the producer and engineer, the ‘impression engineers’ and ‘social reality producers’ went to some much trouble to ‘sweeten’ this ‘reality’.

The same ‘impression managers’ and ‘public relations’ experts who ‘touch up’ and ‘paintshop’ models in magazines and movies, and prepare ‘stars’ for public appearances, also ‘touch up’ images claiming to show a ‘blue green spherical planet floating in space’ a.k.a NASA’s totally fake ‘photos’ of earth from space…and they also continually, with multi-billion dollar budgets (yes folks, your ‘government’ spend Billions annually producing a fake image of themselves, one that suits THEIR ends, flattering themselves, making wars seem
good, or at least necessary, making THEM i.e government, and military etc seem necessary…even their trampling all over your rights appear as ‘good’ or at lease necessary…they need to pain huge, scary ‘threats’, so that the ‘ends’ of countering these / protecting you from them, seem to justify ANY means ‘necessary’…so you give up all your rights to protect them…from whom? … the ‘enemies’ your government spent billions of your dollars manufacturing…as real threats, or imaginary ones, in your mind…through all this huge budget, hegemonic, all encompassing Hollywood production called ‘social reality’.

MHR note that our ‘pattern’ seeking mind constructs possible cause-effect relationships from the flimsiest of suggestions i.e either suggested by proximity and before-after as in Hume, but at least based on induction from direct sensory impressions i.e sight, sound, touch, smell, taste, or much worse, at far remove from such sensory integrity / authority / authenticity / correspondence, at much higher levels of abstraction, by our mass media hypnotists as post-hypnotic suggestions, which of course also abuse images etc in the form of vivid advertising, PR campaigns, movies, etc…

The value of a higher level abstraction is that it applies to more things, than a lower level, concrete, sensor impression based one…e.g knowledge about how this particular person will react to X, is great to have if you only have to deal with this person and X … but we want ‘universal’ meanings / patterns / laws, so we can predict how ALL people will react to X, and Y, and Z…so GENERALISATIONS have a superior value … and we naturally seek them out…construct them, from the flimsiest of deductions from usually unreliable inductions at best, but worse, from OTHER highly abstract deductions… so we tell stories about stories, argue about characters in our narrative as if they were real, when all we end up doing is arguing in circles about illusions and imaginary characters, plots etc…’how many angels can dance on the head of a pin’ and ‘when is it O.K to torture a person or other animal’, or simply kill them?

Most of most people’s times are literally spent thinking about people that don’t really exist i.e we only see a projection of them, what they chose to show, what we noticed etc…and worse, mere characters in a drama set up for us e.g ‘terrorists’ are mostly actors, false flags are us killing ourselves etc…we are thinking about ‘them’, when ‘they’ are just fabrications / constructions / the products of the minds of the social engineers and the professionals they hire to ‘write the scripts’ and ‘play the roles’, and ‘set the scene’ and ‘produce the ‘film’ called ‘social reality’…

So the greatest potential asset, a ‘generalisation’, becomes our worst enemy, at times. Generalisations like ‘as you do unto other sentient beings, so shall be done unto you’ are great. But who can turn THAT generalisation to their personal, narrow, material profit? Can you use THAT generalisation to get people into
wars, buying your military products, giving you power to order them about, like slaves, even to the point they will kill each other, and babies in their mothers arms?

So the generalisations that get the most financial backing are those that can be used to centralise power, wealth, privilege, resources, in the fewest hands. War does that. ‘Noble’ lies do that. The idea that ‘the ends justify the means’ will do that. Just keep the ends vivid and desirable, but just out of reach, just one more war away, just one more mass murder genocide of women and children away…so close the people can almost taste it, so that they are sure ‘this will be the last time people will be killing women and children, this will be the end of history, just win this one last war, as horrific as it is, and we will have our heaven on earth, our utopia…keep that vision vivid, but vague enough so that everyone can project their own version of the perfect world for THEM, onto this broad canvas, so everyone will kill and die for THEIR version of it…

And so we are constantly fighting the new ‘war to end all wars’, and giving up our constitutional rights / freedoms / liberties, in a ‘war to end all slavery’, and sacrificing all our economic resources in a ‘war to end need’…submitting to the most horrific forms of injustice in ‘a war to end injustice’ … but all we get is endless war…because war is NOT the means to an end, but an end in itself. War is used to justify murder, rape, theft, genocide, slavery, injustice, etc…and THESE are the REAL ends of the hegemons…eternal war…

These ENDS do NOT justify ANY means, for any reasonable, rational, VICTIM of the hegemons. They merely serve the perceived interests of the hegemons themselves. Those who use ‘government’ as a means to their OWN ends. And use YOU as a mere means to their ends.

So the power of generalisations usually ends up being used in ways that HARM you and yours. Sadly.

So we need to go back to the source of all our beliefs. Find out how we constructed them. How others influenced us in their construction. How we made mistakes. How others manipulated us into making mistakes. Which constructions we simply ‘accepted’ as complete, whole models e.g ‘religions’ and ‘ideologies’. So that we can start from the beginning, from ‘sense perceptions’ made all the wiser by Humean skepticism, the ‘thoughts about thoughts’, and ‘beliefs about beliefs’, the ‘observations’ of the limits of observation, a.k.a what we can know, to what level of certainty, and what we can NOT know, and how we should thus proceed, Heuristically, to build models, draw maps, construct patterns, generate ‘meanings’, ‘relate’ things to each other…

These ‘beliefs’ and ‘meanings’ and ‘definitions’ and ‘models’ become neurologically "real" to us. They place us in particular ‘states’. Of mind, of
emotion, of motivation. And then in physiological states, and material states e.g. family, war, work, slavery. Beliefs determine our neuro-linguistic states of consciousness, which modulates our central and autonomic nervous systems.

MHR the hard work, sweat, sacrifice, and risks involved in building your dream home for yourself and your loved ones has an entirely different MEANING to the same sacrifice, risk, effort, and sweat invested in building your own prison, your own work camp, your own torture chambers, your own extermination facility. But imagine if you could trick the workers into building thinking they are building the first, when they are actually building the latter?

MHR the mass media/government use distractions of positive and negative variety to keep you from paying attention to things that require real focus/attention/concentration e.g. working out what is really going on…like the loud music next door makes it hard to focus on what you are reading here, sending your mind off on tangents, getting irritated, frustrated, angry at the neighbor, trying to be ‘tolerant’, but getting your blood pressure up at their lack of consideration…your mind wanders to lots of things, and though you’ve been ‘reading’ for the last few minutes, you have NOT idea what you’ve ‘read’…any sort of distraction, worry about nukes, terrorists, debts, viruses, health care, unemployment, ‘not being beautiful enough’, ‘appearing racist’…or porn, escapist romance-porn, utopian illusions, …stardom, fame, fortune, pay rises, holidays, new cars, new clothing, …

A RESOURCEFUL frame of reference/definitions/belief system is one that recognises you will need to work at something, but that you can overcome objections/obstacles…and at the very least end up with something worth the effort…if not the actual original goal…one that harms no sentient being…that does NOT generate a benefit for one person at a cost to another…that motivates effort, concentration, discipline, investment…but balances these…so that the means become the ends, the process becomes the objective, the actions become the object i.e. life itself worth living, now, rewarding, satisfying, Vs suffering now, and now, and now, and most of your life, for some ‘future’ happiness/reward…that balances Apollo and Dionysus…abandonment to pleasure and discipline…balance between future preference and present preference…etc…

Would now represent a good time to do this? Describe this person's current state. What things has this person had to deal with that might significantly effect their receptivity to our offer of an alternate belief/definition/frame?

Disorientation/confusion/dislocation all represent opportunities i.e. Bardots of opportunity to ‘break a habit’, ‘break a pattern’, ‘stop re-producing a pattern’, press ‘pause’ on the mental chatter/self-talk/noise…be in the present, now…free from the ‘movies’ running in our mind relating to past and future…here, now…present…potentially able to attend to reality…to something
NEW… to considering ALTERNATIVE beliefs / definitions / ways of being and seeing and defining…

Adopt a playful and deliberate mindfulness, and bring it to bear upon the process of learning to produce a presence of mind while communicating that the Zen ‘Sensai’ and the best therapists of all time, have enjoyed, and reap the same positive results they achieved with their students / clients.

We have to be in the optimal state to achieve the optimal results…conversational reframing… or formal therapy… or formal trance induction… all require the optimal state in the practitioner / leader / inducer / therapist / trainer / teacher… you have to resonate what you want to manifest… personally…

MHR include T vol I chapters on communication, social reality, cognitive dissonance, free will, conflict management… nature of meaning, …

There are non ‘failures’, only feedback… never identify with a non-success… or allow others to… i.e go from ‘I didn’t succeed exactly as I wanted to here, so that means I am a total failure, or can’t do this, etc’… say ‘I learned something that I can use to continue towards my goals… so go from being scared of ‘failure’ to curious, interrogative, calm, alert, playful, i.e ZERO EMOTIONAL INVESTMENT in ‘failure’… neutral, factual, interesting, FEEDBACK… use it to redefine / reconsider our / other’s models… use as model building information… dissociate from it emotionally so it never ‘harms’ you or reduces your motivation… let the feedback apply to what you are doing, not what you ARE as a person… about your behavior, not your ‘self’… get clients to do this… reframe as feedback… which is only ever good, because it provides information for more accurate model building, more optimal process generation / construction / designing / implementing…

No-one can mind read, or ‘put’ a meaning in someone else’s head… though they can INTEND harm or good… never assume your utterance has been interpreted as you intended i.e that you have ‘shared’ what is in your own mind, with another mind a.k.a ‘communication’… check to see if what you encoded, and transmitted, was decoded, as intended… so you are sharing your map / model… use direct verbal questions, and observe non-verbal cues… if transmitted news expected to evoke / elicit a particular response, observe for it… how the person processes it… did you ‘miss’ this time? How can you encode in future, and transmit, to ensure greater correspondence between what is in your mind, your intended meaning you want to communicate / share with others, and what your interlocutors appear to be ‘receiving’ / decoding / getting… is what they ‘grok’ from your total communication i.e verbal and non-verbal, what you intended them to ‘grok’? Did you achieve an isomorphic, one to one, re-mapping / reproduction / replication / communication? Do you now both share the intended meanings? Is what is in your mind, now in their mind?
You can never know what your interlocutor ‘understood’…what meanings your utterances and gestures produced in their minds…their own process of decoding your transmissions are a ‘black box’…never assume anything…check for correspondence…for consistency between their responses and what you communicated…between their verbal and non-verbal responses…expect misunderstandings, seek them out..

If a person is offended, becomes angry, etc, that is THEIR process…if you didn’t intend it, don’t ‘own’ it…get them to ‘own’ it…but be brutally honest with yourself re: your motives…take responsibility for what you have response-Ability for i.e your OWN intentions and actions…

I "am" so much more than all of my thoughts, feelings, speech, and behavior! I shall not reduce either myself or others by labeling, name-calling, insulting, or contempting…focus on the process…not the person…assume they want good things…and help each other get them…

‘Interrupt’ someone’s process a.k.a zen whacking stick, with a joke, non-sequitur…people often don’t listen…just wait for a chance to say what they are formulating while others are speaking…if you interrupt this, they start attending / listening…you open a bardot of opportunity …

Work towards playful rather than combative, competitive, defensive, aggressive states…constructive / productive / generative / flexible states and processes…assume nothing is ‘fixed’ and beyond doubt…Humean skepticism is the ideal ‘state’ … see T vol I.

Reframe confusion, discomfort, feeling stupid, feeling lost, etc as a step in the right direction i.e indicators that you are undergoing a process that is going to be great for you…that you are on the way to learning something powerful and valuable for you and yours…don’t fear this feeling…embrace it as something wonderful and positive…confusion is the step before learning, and new understanding, new skills, new information…many people avoid learning something new because of this initial step of discomfort / confusion / feeling inadequate, feeling ‘at a loss’…it is easy to step back and avoid this feeling, but you miss out on what the new learning has to offer…take it in your stride…those who think they know are the fools…those who pretend to ‘understand’ are foolish…those who accept that they do NOT know, and do NOT understand YET, are the ones who go on to great achievements…they work through the discomfort…feeling foolish and incompetent…knowing this is all part of the process towards accomplishment…gaining those new skills and understandings…

Accept not-knowing and become curious about what you don’t know and what you can know, rather than become stupid by pretending you know…remember
people throwing papers at me in lectures when I asked questions, wanting to understand, and admitting I didn’t, when they wanted to just rush on? Who got the H.Ds etc? Sadly most people attend ‘courses’ just to get ‘qualifications’ and jobs / money /status…not really caring whether they understand or not…so most ‘professionals’ don’t really understand what they could … if they had a better attitude…

To be a real magician you need to learn ‘meaning shifting’… just like ‘shape-shifting’ is where you ‘enter into’ being a different animal…we need to become playful with ‘meaning’…it is OUR construct… it is the product of our own minds…ideally…though usually the produce of someone else’s mind…and do you think THEY care more about you than YOU do? … do you want to give up that power to define reality…to decide what something MEANS to YOU? Remember, killing and dicing means omething different to YOU, than they do to the Generals, the politicians, the priests, the banksters, and all the other people who BENEFIT from you killing and dicing. Do YOU benefit from your own death? Or from murdering women and children in a foreign nation? Or even your own?

Pleasure, pain, relief, … those are the REAL things in the world…nothing else exists…so it is time to define for yourself what processes, behaviors, definitions, etc will best ensure YOUR pleasure and relief, and avoid YOUR pain. Do you really trust OTHERS to do this decision making on your behalf? Are they going to get YOU the best basket of pleasure, relief, and pain possible? Or are they going to use YOU as a means to THEIR ends? Be honest with how YOU treat other sentient beings, such as cows, pigs, chickens, that YOU have power over…do you consider THEIR best interests? Why should those with power over YOU treat you any different?

The BEST thing is that as the only REAL things are pleasure, pain, and relief, and that THESE are all constructed in our OWN minds…we have the power to BE CAUSE…we have the ultimate, only meaningful power..to determine whether we will respond to some unknowable stimulus by feeling pain, pleasure, or relief, and all the other emotions and feelings associated with, deriving from these…THAT is power…don’t give away your power to just anyone who claims they ‘know’ better, that some ‘god’ told them, that you should submit to THEIR definitions of reality, and become THEIR slaves…

A phobia is the clearest demonstration of how we simply ‘learn’ to connect some stimuli with a whole set of responses…allowing it to ‘trigger’ these automatically / habitually…as if X can cause Y in us…cause fear, terror, anxiety, confusion, pain, horror, aversion, distract us totally from any rational thought…the ‘trigger’ object / situation activates ‘nodes’ of meanings, ‘connotations’, ‘associations’, which trigger emotional, mental, and physiological states…the phobia may
appear absurd, fatuous, beyond contempt, stupid, silly, ignorant, superstitious, ridiculous to anyone who does not share it...the responses totally disproportional to the ‘threat’ or ‘risk’...sometimes there is no apparent, obvious, rational risk or threat at all...but as we make fun of other’s weird fears, we are really overlooking how we ourselves, in so many ways, behave just as ridiculously, in our daily lives...we need to take the obvious and learn from it...it is so extreme, we can’t fail to notice the incongruencies, irrationalities, etc in the ‘meanings’ people have ascribed to harmless situations and objects...what we need to do is move backwards from these most extreme, obvious cases, to our own daily processes of meaning construction...things we fear, that are really silly...like terrorist attacks, when the odds of one (even given that our own governments carry them out as false flags) harming you are less than the odds of injury or death from slipping on a wet bathroom floor...

Our responses / interpretations of any ‘objective reality’ become emotions, feelings, behaviors, actions, institutions (the response institutionalized as a habit / phobia / state / organisation e.g. church / state / school / education system / military etc) and ‘objective’ objects like buildings, guns, bombs, roads, cars, guitars, music, art,...

Every ‘decision’ we make, or is made for us, is a product of someone’s ‘meanings’, ‘emotions’, responses, interpretations, definitions...the very same process we’ve been describing...produces the world we live in...the social reality...the rules and laws...the collective insanity or utopia...we endure or enjoy...and pass onto our children, or inflict on them, and all the other sentient beings we share this world with...so we need to start ATTENDING to it...becoming conscious of it...interrogating the process...deciding if the assumptions implicit and unstated, that underly all our meanings, and thus actions, and decisions, are sound, valid, reasonable, justified...or simply ‘given’, ‘assumed’, ‘ascribed’, ‘imposed’ upon us by others, and at very least the products of our own, faulty, erroneous, corrupted, poisoned, polluted, managed, misinformed, misdirected, manipulated, processes of meaning construction, or ‘reality’ construction.

We need to become meaning MAKERS rather than mere meaning CONSUMERS...that is, take responsibility for constructing our own meanings, rather than allowing others, through the mass media, religion, education, propaganda, advertising, public relations, etc, to impose meanings on us of THEIR choosing...meanings that serve THEIR perceived vested interests, rather than our own, and our shared, REAL interests as humans, and sentient beings.

We have to lay bare and transparent to processes by which we define reality, and thus how others define it, and how others define it for us. We have to recognise our own folly, mistakes, errors, and then those others are making, and have made.
We have to realise the power of ‘impression engineering’ and ‘spin doctoring’ to manufacture social realities, to impose meanings, to prevent us seeing and hearing / bypassing other people’s filters…the filters of social reality…of the hegemonic social reality…

The simplest way to ‘divide and conquer’ is to ensure groups defined by some arbitrary factor like geography, ethnicity, nationality, etc are all given different ‘social realities’, so that they always feel in conflict with each others ‘values’ and ‘beliefs’, and will never share a common social reality, and thus never live in peace…this is what the Jew world order have done over the last few thousand years…with religions, and ideologies…which offer different groups different definitions, meanings, and thus methods of achieving their ‘utopias’ either here or in some after life…

Until YOU are willing to see the folly of your beliefs, how can you expect others to see the folly in theirs? Why should THEY be the first ones to admit they’ve been duped, tricked, conned? What makes you so sure YOUR definitions are so ‘self-evident’ that you can afford to laugh at others beliefs? Start with your own beliefs…then worry about others beliefs…THAT is the solution…and once you have modelled how you were tricked / deceived / muddled / distracted / misdirected etc, you will know how to help others free themselves from their mind prisons.

Add stuff on ‘operationalising’ / ‘operationalisation’ of meanings i.e in practice, what X means…how do you ‘work with’ X in daily life, in the ‘real’ world, vs the ideal concept of it…allowing us to be more specific, and blow away generalisations and abstractions that have no real basis in ‘reality’ i.e sensory perceptions, or actual ‘real life’ decisions making …

Specifying enables us to index the specific referents: who, when, where, how, in what way, to what degree, which, which is basically the process of operationalizing our terms, specifying, specifically, in concrete sensory / empirical / behavioral terms a.k.a what we see, hear, feel, smell, and taste terms, and actually DO, precisely what we mean by a specific idea, concept, belief, meaning, definition. This is what TRULY defines our utterance / idea. How it is expressed in the real world. Not in some idealized, highly abstract, utopian idea that exists only in our heads, or the interlocutors heads. Often the interlocutor has no useful definition / real idea / concrete idea of what they themselves ‘mean’…often they are bluffing, or employing ‘noble’ lies…i.e they don’t believe X will bring Y, but they want X, so they lie, and pretend that it is certain that X will bring Y, e.g mass genocidal revolution will bring peace, prosperity, an ideal state, a ‘utopia’ that will ‘end history’ and be enjoyed for all time, in security. They are often disingenuous at worst. And at best never really interrogated the assumptions they are merely reproducing i.e transmitting, after
being ‘persuaded’ by someone else e.g the ‘true believers’ often don’t really understand what they really believe…their ‘certainty’ and ‘faith’ is just bluff…unquestioned….they pretend to themselves they ‘know’…but really do NOT understand what it is they claim to know…and become the more violent in their means, the less sure they REALLY are…feeling the necessity of censoring any criticism / challenges / interrogations, for fear that their ‘beliefs’ will shatter, fall apart, crumble, evaporate, if in any way challenged / operationalized/ made more specific…the devil is in the details…so they operate by slogans, vague utopian visions, highest level abstractions…for fear of being ‘outed’ as ‘frauds’…

We need to identify, what was the initial stimulus…what is it that the person produced their meanings / definitions from? An experience? A long term repeated conditioning? Something someone told them or they read? What are they REALLY responding to? Something concrete in ‘reality’ i.e sensory perception of vision, hearing, touch, smell, taste? Or some highly abstract idea they have ‘taken on faith’ and simply ‘accepted’ as a ‘suggestion’ of some authority?

Then we need to identify what internal state has become ‘paired’ or ‘anchored’ to this stimulus. What emotions, feelings, physiological reactions e.g stress, muscle tension etc, the stimulus ‘triggers’ in the person. To analyse and break down the process by which they get from ‘The trigger is present’ to ‘I’m in a total state of irrational panic and terror’. How do they go from being a free person to being under the control of a priest or government authority? We cannot ‘enter into them’ but we can ‘read’ all the ‘cues’ and ‘signs’ available to us, as ZEN observers, with NLP insights…such as eye accessing cues, posture changes, flushing of skin etc…and ask directly ‘how do you construct this state of terror? What process do you go through? What do you see, hear, smell, feel? Is the visual bright, large, distant, close, animated or still-images? Etc…

Then we can ‘model’ their process…i.e how they get from ‘I see a cat’ to their state of terror…what they say to themselves, what images they form in their minds, what they imagine, how they FIRST did this i.e the initial experience, or was it long term programming / conditioning e.g repeated rejection / disapproval of parents etc lead to low self-esteem…education system that forced them to fail and fail again, to feel ‘a failure’…

And so we work out the method / process by which a person constructs their beliefs…particular beliefs in particular…i.e how their beliefs are ‘represented’ in all their ‘sub-modality’ details…their particular qualities, distinctions,…specifics…equivalent of concrete sensory inputs to their process…

MHR note that the process will be iterative…from lower to higher levels of abstraction…with each level informing the other, but often with higher levels of
abstraction acting as filters and distorters and deleters of lower level abstraction sensory data...so that we ‘see what we expect to see’, based on the higher level abstractions e.g ‘pigs can’t fly’, so we will never ‘see’ a pig, if it is flying...our belief precludes it...and so even if a pig flew by, we wouldn’t let it conflict with our ‘model’...like any good economist, we won’t let reality ruin a pristine, perfect, clean, tidy, manageable, easy to work with, THEORY / model.

MHR you could chose to represent ‘rejection’ as ‘freedom’ to try something / someone new...we represent external phenomena as ‘guilt’ ‘shame’ ‘fear’ ‘love’ ‘success’ ‘happiness’ ‘good fortune’...you could chose to represent failure as ‘joy’ and rejection as ‘bliss’...because it is INTERNAL...whatever ‘happens’ ‘out there’ is just the strings vibrating / resonating at different frequencies...we can chose the frequencies our mind resonates at e.g bliss or despair...though we might not survive long if we ‘represent’ ‘our skin burning’ as ‘pleasure’...it is insane to represent / attach too much meaning, to things that are essential harmless e.g one girl rejects you, you fail to achieve one goal, you fail once, you didn’t get exactly what you wanted...

We process ‘phenomena’ into ‘experience’ with ‘meaning’ in chains of representations e.g optical nerves produce visual representations, ear drum nerves produce audio representations e.g of ‘the phenomena’...and our mind produces ‘emotions / feelings’, that are represented as ‘pleasurable’ and ‘painful’, ‘exciting’ or ‘boring’...from the stimuli that have been processed by eyes and ears and nerve endings in the skin, nose, and tongue...so the most significant EVENTS occur IN our minds...not OUTSIDE...i.e they are SUBJECTIVE and NOT objective...we have control...if we chose to take it...like the Buddhist monk on fire, experiencing pure meditative calm, even as his skin melts off...these are proven facts...demonstrated throughout history...and to think you let something like a school grade, or ‘rejection’ by some stranger, or the opinions of people you’ll never meet, or care about, influence your moods, emotions, and overall self-definition? You’ll accept living in fear of public speaking, or dogs, or authority figures...or Worry about what people think about you...people who have NO influence over your fate...

WE determine what ‘experience’ i.e definition / meaning / interpretation and thus mental, emotional, and physiological responses we have...even to which external phenomena we pay attention to...actually ‘notice’ and respond to...we can chose to ignore the entire world as ‘just a dream’, and enter deep meditation, in which we can ‘lucid dream’ any reality we chose, even as our bodies melt around our bones...we can chose to respond with more determination, or give up, to reject rejection or be destroyed by it, to get up when we fall down, or stay down and complain it...the solutions are often so easy and quick that we have a
hard time accepting them as real…we’ve been conditioned to think ‘life wasn’t meant to be easy’, nothing good comes easy, etc…

NLP breaks down the process by which we go from ‘there is a dog’ to ‘abject terror’, or ‘I haven’t had a sale in some time now’ to ‘I’m a total failure and should kill myself’…into the steps we unconsciously / habitually / automatically etc tend to start on, at the appearance of the ‘trigger’ thought, idea, person, situation etc…then we can stop the process as soon as it begins, and replace it with a more constructive / generative process that offers alternative responses, ones that bring about positive change, and avoid the previous typical negative spiral, self-fulfilling prophecies, and undesirable internal states and behaviors / emotions / feelings etc…

MHR note how the Jewish Bandler and OConnor use examples that demonise Saddam Hussein before the Iraq invasion by the U.S…not just ‘chance’…interesting that they teach NLP…

Change a definition at any point in the process, and you get a different outcome. It is that simple. Like an equation. Change the value of one variable, and the value of the product of the equation changes totally. Often exponentially.

By changing our priorities, and meta-beliefs, we can free our less abstract priorities and values from the filters that were previously imposed on them…now we can ‘see’ and ‘hear’ more of what is ‘really there’…something that any human, with the biological constraints / filters of its basic sense organs, can agree upon…it may not exist, or be very different from what a human perceives of it, but it will be at least a common denominator for making individual and collective decisions that are SANE.

If people insist ‘the holocaust happened’ and accept the Nuremberg show trials ‘findings’ as ‘reality’, then the concrete FACT of there being ZERO evidence to support these findings will have no impact on their beliefs…they will simply ‘dismiss it as irrelevant’, ‘spin it’, fill in any gaps with specious sophistry, deny the facts, etc…because the more abstract belief has more power over the sensory channels…to the point that even though the optical nerves produce particular stimuli where they are normally encoded by the brain, the mind does not ‘register’ them…does not ‘see’ them…like the father of the princess in ‘Eric the Viking’.

Thus ‘the writing may be on the wall’, but on the philosopher-prophet can ‘read’ it…most people just see ‘scribbles’ and pay them no attention…and when the prophet reads what is clearly there, they look at him in amusement, as some charlottan, some prankster, and if he insists, and what he says makes the interlocutors uncomfortable, they will rather feed him to the lions, than waste a moment in introspection about what he said…
Reporters ‘embedded’ in the military, are not going to report on any war crimes they witness…they will literally ‘look the other way’…to avoid seeing them…they will accept any fable told them to ‘explain away’ apparent atrocities committed by their own troops etc… in the same way, all our sensory impressions and lower level assumptions are EMBEDDED in our higher level assumptions … and so if you have assumed, at a higher level of abstraction that ‘The Holocaust’ happened, anything you ‘experience’ that contradicts that presupposition / assumption / model / world view, will be ‘overlooked’ and ‘dismissed’ by your mind as ‘self-evidently untrue’…how could X be true if Y is accepted as true by EVERYONE (as far as you know, and apart from a few crazy Hollywood nazi types) … if the two are inconsistent, the first imprint, the one at the higher level of abstraction, that FRAMES all the lower levels of abstraction, MUST be right and the new, lower level of abstraction ‘impression’ MUST be faulty…and anyway, they’ll put you in prison if you even ENTERTAIN the idea, so who would see any point in doing so? The ‘context’ is not just the belief system, but the social system i.e the rewards and punishments associated with ‘agreeing’ with social reality, the hegemons programming / conditioning, and those associated with dissenting, challenging it, even just openly discussing it in critical / curious manner.

MHR idea of ‘sameness’ key to understanding ‘jumping to conclusions’ and ‘patternning’ … a pattern requires that the things observed now, be ‘the same’ in some way, to some degree, as those witnessed / observed / learned about, previously…so when we assume, ‘this situation is the same’, ‘this object is the same’, we are using patternning…and a phobia can only be triggered by the perception of ‘sameness’ e.g this puppy is in some way ‘the same’ as the vicious dog that bit me’, or this situation is similar to the one in which I nearly died…etc… this relates to ‘complex equivalence’ / sameness/ matching …

MHR Plato’s idea that every dog was an expression of some archetypal ‘dog’ form…is a nominalisation of all the unique dogs into the idea of a ‘dogness’ and then idolatrty i.e fixing this as the ‘ideal’ dog from which all other dogs are imperfect / inferior examples of …once you reframe out, you see canines as just one species of mammals which evolved from sea plankton…no such ‘construction’ necessary e.g ‘creationism’ i.e dogs were created ‘whole’ as ‘dogs’, rather than evolving particular qualities we define as ‘doggy’, doglike, dog-ness.

Original formulations of Korzybski, the models and technologies of NLP, Cognitive Neuro-science, Systems Theory, and Bateson's Meta-Levels

Experiment now with making the picture bigger and then smaller. When you make it smaller, do your feelings decrease? And when you make it larger, do
your feelings increase? If so, then running the pictures (sounds, feelings) in your awareness in this way functions as it does for most people.

Do your feelings intensify when you move the picture closer? Do your feelings decrease when you move the picture farther away? Most people find this true for the way their consciousness/neurology works.

As you change the mental representation in your mind of the experience, your feelings change.

If your pictures have color, make them black-and-white, and vice versa if you have them coded as black-and-white. ... When you changed the color, did your feelings change?

Do you see an image of yourself in the picture or do you experience the scene as if looking out of your own eyes? What about the quality of your images: in three dimensional (3D) form or flat (2D)? Does it have a frame around it or do you experience it as panoramic? Experiment by changing how you represent the experience. Change the location of the picture. If you have it coded as on your right, then move it to your left.

We can change our feelings by changing how we internally represent an experience. NLP glories in these very kinds of processes of the mind since it works preeminently with mental processes rather than with content.

If we make all our unpleasant pictures big, bright and up close and all our pleasant experiences small, dim, and far away, we become expert at feeling depressed, miserable and unresourceful!

The Meta-Model

(1) **Unspecified nouns** (deletions) refer to statements which lack a referential index regarding the performer or subject of the action. Unspecified verbs refer to the action or process representation that lacks specificity. (2) **Unspecified adjectives and adverbs** refer to the qualifiers of nouns and verbs which lack specificity. (3) **Unspecified relations** (comparative deletions) refer to those comparative statements that lack the standard by which the comparison arises. "She is better than him;" "he is smarter than his brother." (4) **Generalized Referential Index**: words with a generalized referent so that the words do not immediately make the specific reference clear. (5) **Universal Quantifiers** refer to those words that create representations of allness: all, every, never, everyone, no one, etc. (6) **Modal Operators** refer to the modes wherein people tend to operate. This indicates the kind of "world" out of which they operate. Modal operators of necessity presuppose a
world of laws and rules: hence, "should, must, have to, need to," etc. Modal operators of possibility presuppose a world of choice and options: hence "can, may, will, might possible, etc. Modal operators of impossibility presuppose a world of limitations, hence, "can't, impossible, etc. (7) **Lost Performatives** refer to those phrases and sentences which indicate a value judgment given without specifying who made the evaluation. (8) **Nominalizations** refer to noun-like words and phrases that hide or smother a verb within it. Here someone has turned a process word (a verb) into a noun and treated it like a thing. This reification of a process or event accordingly masquerades the verb within and prevents the reader from recognizing it. Thus, relating becomes relationship, motive and motivating becomes motivation, leading becomes leadership, etc. De-nominalizing nominalizations serves as the meta-model process for challenging nominalizations and turning the nouns back into the verbs from which they came. (9) **Mind-Reading** involves claiming to know someone's internal state, thought, emotions, etc. without specifying how you attained that information. "You don't like me." (10) **Cause-Effect** involves the making of causation statements which contain illogical formulations. "She makes me angry." (11) **Complex Equivalences** involve connecting two experiences linguistically so that one equates and treats them as synonymous. "I know he doesn't like me when he uses that tone of voice." (12) **Presuppositions** involve the unspoken assumptions, beliefs, understandings and ideations necessary for a statement to "make sense."

**Korzybski noted that we ultimately reason circularly, defining our terms by the very terms that we use in our definition.**

We construct metaphors when we assert that one item "is" or has a "likeness" to another. Such language enables us to map a facet of some phenomenon in terms of a similarity of structure, function, purpose, etc. of another phenomenon.

We over-rely upon verbal, dictionary definitions. Doing so, Korzybski noted, leads to unsanity since it leads us to move further and further away from the sensory based, empirical world and more into a world of words and mere verbal definitions.

MHR equivalence really just ‘definition’ i.e x is y…not calling every day means you don’t love me…i.e ‘means’…is equivalent to...

MHR trance as existing in a reality of high level generalized, vague, abstractions e.g as compared to ‘lucidity’ which is existing in the here and now, in the world of specific concrete sense perceptions…touch, taste, smell, sight, sound…
Passive verbs such as is, am, are, was, were, be, being, all related / define living processes as if they were dead. Finished. Done. Beyond change. Fixed. Idols. Dogma. MHR nominalisation, idolatry, reification, are all subjects I’ve dealt with in my T books…to treat a process, life, as a ‘finised’ ‘completed’ ‘dead idol of wood and stone’, or as Jesus put it, ‘the word gives life, the law is dead’ referring to the Jews huge number of ‘fixed’ ‘dogmatic’ laws e.g which direction to face when defecating, vs the ‘good news’ he was sharing, one free of money lenders and priests…or as the Old Testament Prophets put it ‘worshiping dead idols of stone and wood’ as compared to ‘the living god’… things are are ‘living’ are ‘processes’ and ‘actions’…Hobbes ‘the movements of atoms’ in the human ‘computational mind’… so some people will avoid them altogether, to avoid reifying processes e.g reifying the ongoing processes of interaction that produce ‘institutions’, and treating an ‘institution’ as a thing itself…as if it has a separate, independent existence from the actions / interactions of its membership…this is a case of idolatry…and usual dogma…e.g ‘The Catholic Church’ or ‘Islam’ re: ‘final prophets’ or Marx ‘himself the final prophet bringing his ‘end of history’ i.e the the dictatorship OF the proletariat, and genocide of any people’s who will not submit to this ‘historical determinism’ a.k.a ‘scientific socialism’ a.k.a ‘historical dialectic’…all of which … yes all these judeo – Christian-islam-marxism-global climate crisis tipping point ‘dogmas’ being parts of the Jew World Order plan since Babylon.

Reality is ‘plastic’. All is flux. All is process. All is change. Fixing something ‘once and for all’ is like trying to freeze a river’s flow…damming it up may last some time, but it will break its banks, overflow the dam walls, burst through suddenly, or gradually, but it will break…today the Jew World Order is censoring your expression, and thus your thoughts…your speech will be walled in…until the pressure is too much, and it breaks out violently…with no peaceful way to ‘express’ itself, nowhere to flow peacefully, it will violently break the dam walls…civil war…violent revolution…

Any belief system, like the one Jesus criticized and was murdered for criticising, and offering an alternative to, one that was ‘living’ and ‘suitable to the needs of the living’, that claims to be ‘the final word’, or ‘the last word’, of ‘the last prophet’ or ‘end of history’ or ‘end of the debate’ or ‘truth’ or ‘fact’ or ‘undeniable’, or ‘unquestionable’ or ‘beyond doubt’ or inviolable, or fixed in stone, or ‘carved in stone’, or ‘fixed’ in any way, as an unalterable law of nature or man, is a lie. It is unnatural. It will fall. And it will COST a lot in terms of suffering, waste, conflict, war...as people fight over whose ‘truth’ is ‘true’, whose ‘word’ should be final’, whose prophet the last, … but the real skeptic is free of these…free of dogma, free of ‘truth’, free of ‘reification…the skeptic is always attending to the here and now, like the Zen practitioner…letting reality, which is constantly evolving, changing,
emerging, being born and dying, from moment to moment...patterns are heuristically useful, but they are mere Humean uniformities, that we must be free to abandon the moment they prove no longer applicable, as reality has moved on, changed, innovated, or we find patterns that are better at predicting what we can observer, and thus more reliable indicators of what to expect...and plan for...and build into our systems and processes and machines...technology etc...

If you think ‘I am this’, then you are giving up the 999 other ‘flowers of the soul’ as the writer Hesse put it. You limit yourself to ‘this’. When you are infinite awareness having an experience of begin ‘this’, at this moment, and at any moment you can become that, and that, and that...you are NOT your actions, your past, what people have told you you are...what you have defined yourself as, and have been defined as...and the world is not limited to what people say about it...but given these maps, your pretend to be that limited self, and you only interact with the things on your maps, and miss most of ‘the real world’ that is not indicated on it...or at least not accurately and precisely...you are not ‘a loser’ or ‘a fat person’, you may be someone who has not succeed at X, but obviously HAS succeed at many other things...you may be a person who has been eating too much (exercise really can’t burn that many calories from exercise, maybe two or three times more than just sitting reading a book) , and thus is maintaining and increasing an undesired excess of fat on their bodies...saying ‘I am a fatty’ fixes you forever as a fat person. Globalising a few lack of successes in a few areas of your life as ‘I am a failure’, turns you into an idol of stone or wood...reifies you as a ‘thing’ that is ‘fixed for all time. But you are NOT the same person you were when you started reading this sentence. Let alone who you were a decade ago. And in a few years you will be a totally different being. Maybe not even a human at all.

The character Moses hears a burning bush say to him ‘I am that I am, and while some element of you may endure, and be eternal, some ‘monad’ that ‘IS’, was , and forever will be, the alpha and the omega, it is the ‘coat hanger’ on which we hang ‘appearance’, ‘personality’, identity, etc...the clothes, etc, are not the person...the hanger has ‘all qualities’, it is ‘the no thing from which all things emerge’...the ‘uncarved block’ which can be formed and shaped, true to its true ‘plastic’ nature, into all kinds of ‘experience engines’, like the one reading this, and the one writing this...please read my T books :D

When WE define others, and other things, we limit them to some very narrow, limited, fixed, definition...it is an act of violence...to see only ‘some dumb animal’ or ‘that angry right winger’...these are acts of true violence
which usually lead to, or are used to nominally ‘justify’, acts of violence from verbal abuse to genocide.

A definition is a projection…like a net of filters we throw over something, so we don’t see IT as it is, in all its unique complexity. We see only the ‘label’ we have thrown over it…’cow’, ‘right winger’, worker, arab…it is a perceptual prison we put the person / object / animal in. And usually that being suffers as a result. And we suffer also, for ‘as you do unto others, so shall be done unto you’ Obadiah.

A person is NOT the job they do, their appearance, their ideology, their religion, their nationality, their status, their net worth. An object is NOT the function we perform with it e.g means we use it as. An animals is NOT a mere means to our own ends. Nor is any person. Defining them as such is an act of violence that always leads to physical violence, and often world war, genocide, and slavery.

Nothing ‘IS’, except the primerty. The ‘strings’ of vibrating / resonating energy-matter that interact to produce every level of complexity in existence, and yet to be.

All other things should be spoken of as ‘processes’. As ‘interactions. As fluid conditions and states. As plastic. As OPEN to discussion / debate / investigation.

Anyone who opposes this valid, scientific skepticism, probably is scared of losing some benefit that their ‘noble ‘lies’ and ‘fixed ‘ ideas, ‘protected’ truths, provide them, or that they at least imagine provides them…

Saying / thinking I am, S/he is, They are, It is … are acts of violence that ‘freeze’ a thing, person, set of interactions at a point in time, in a particular state…this is what we do ANY time we define something… we then ‘dismiss’ it from our mind…it is just THIS…and no more…no longer an object of our curiosity…we have ‘frozen’ it, reified it, nominalized it, taken a living ‘god’ and turned it into an idol of stone and wood…taken the ‘living word of god’ and etched it into tables of stone, fixing it forever…this is death, as Jesus rightly pointed out…this is not natural…nothing in nature is fixed, even the mountains…everything is ‘in flux’…to live means to be undergoing a process…the ‘strings’ that make up everything are resonating / vibrating at every imaginable frequency…constantly in motion…anything that ‘stops’ processing is ‘dead’…its soul has moved onto new experience engines…

So we need to think carefully about how we ‘language’ living things into dead things…complex things deserving of our wonder and respect into
‘simple’ ‘abstract’ ‘standard’ ‘limited’ ‘boring’ etc things…open processes into closed loops … evolving situations / conditions / interactions into ‘institutions’ and ‘laws’… for once we do this, we put these things out of mind…we frame them as ‘no longer worthy of further consideration / investigation… we imprison them in ‘definitions’, in ‘boxes’, in ‘categories’ as ‘mere examples of a particular ‘class’ of objects… we pour concrete around their feet…we ‘arrest’ their development…we kill the 1000 flowers of their soul…we live them impoverished…a mere ‘snapshot’ in their development, fixed for eternity…THIS is the greatest violence you can do anything…THIS is murder…THIS is torture…THIS is fate’s WORSE than death…and if YOU allow yourself to be tricked into defining yourself as OTHERS have defined you, and ‘internalise’ the limits imposed on you, then YOU have been done the ultimate injustice, … are the victim of the ultimate crime…and when YOU do this to others, you are the ultimate criminal and slaver … WAKE UP…break out of the confines of your mental prison…start languaging in ways that open up all the opportunities available to us…that re-open every ‘closed case’, from ‘god’ to ‘what am I’, to ‘what could WE become…

There is NO ‘being’…there is only BECOMING…what do YOU want to become ? There are NOT Limits, apart from those you impose on yourself, usually limits others have ‘suggested’, and you have ‘accepted’, and identified with…

I am NOT markus heinrich rehbach and YOU are NOT the identity you have adopted / have had imposed / imprinted on you…BECOME anything you want…but remember, ‘As you do unto all other sentient beings, so shall be done unto you’…The golden rule applies. And NEVER assume ANYTHING…

Stop DEFINING … start observing…open your mind…challenge EVERY assumption…the ones you realise are assumptions, and the ones you never attended to…the assumptions you took for granted as self-evident…most of these are assumptions…mere speculation…assumed by someone at some time and then accepted as ‘truth’…with no basis…usually as a tool….as a means to enslave others…please read my T books…

The "is" implies that these things exist independent of the speaker’s experience. Not so. Our descriptions speak primarily about our internal experience, judgments, and values. More accurately we would say, "I evaluate as good this or that," "I see that flower as red," "I think of him as suffering from stupidity!" "Is" statements falsely distract, confuse logical levels, and subtly lead us to think that such value judgments exist outside our skin in the world "objectively." Wrong again. The evaluations (good, red,
stupid) function as definitions and interpretations in the speaker's mind. The 'Yo be" verbs dangerously presuppose that "things" (actually events or processes) stay the same. These verbs invite us to create mental representations of fixedness so that we begin to set the world in concrete and to live in "a frozen universe." These verbs code the dynamic nature of processes statically. "Life is tough." "I am no good at math." These statements sound definitive and absolute.

NEVER take anything on ‘authority’…especially ‘transferred authority’ e.g ‘I speak for god’, or ‘I speak as an expert’. Or I am a nobel prize winner for X, so what I say about Y must also be believed…dogma cannot be true, for it fixes something as static, final, the end of history, the last word, the last prophet, the final word, the ‘law’…FACT…no facts exist…you cannot correspond with reality if reality is constantly changing, or a mere ‘Humean uniformity’ that will hold true for some time, but never forever…correspondence … patterns only APPEAR to be reliable…there is actually NO basis for ANY cause-effect arguments…or that any OBJECTS actually exist, as we imagine them…all these things are constructs of our mind…they limit us…we need to get back to David Hume, and start from THERE…

MHR note how Hindu’s / from India, speaking English, or Tamils etc, will say ‘It is being hot today’, She is being unhappy about this, He is being tall…which is much more precise than She IS, He is, It IS…because NOTHING IS, everything IS being / becoming … THAT is also the wisdom of Daoism…and Buddhism…our WESTERN mindset seems very ‘Semitic’…can you guess why? What did the Semitic people learn in Babylon? Did the people of Is-Ra-El (ISIS, RA, El) learn their current mind control tricks thousands of years ago, and combined with ‘usury’, used them to gain total hegemony of the entire world…simply using languaging tricks? You bet they did. And will continue to, unless YOU wake up and wake up those around you.

David Hume demonstrated that redness exists in our minds, as do all other qualities. We construct redness from the resonating / vibrating ‘strings’ of energy matter that make up the EM soup of ‘becoming reality’…there is NO ‘fixed’ anything…nothing IS…for the moment it took to write and read and think ‘IS’ is over…it WAS for a brief moment, theoretically…but in ‘reality’ time is infinitely divisible…there is no ‘now’…just change…just process…fluidity…’now’ is just a concept, in your mind…not ‘out there’…you can take a photo of ‘now’, of the position of photons at the moment you hit the ‘record’ button, but it has no TRUTH anymore…it is a photo of something that does NOT exist, any more…but we explain this in detail in the T stuff on David Hume. Please read it.
Glossary of Terms

As-If Frame: Pretending; acting "as if" something was true, had occurred; a creative problem-solving process. Association: Mentally seeing, hearing, and feeling from inside an experience; in contrast with dissociated; emotionally experiencing and feeling a thought, memory, imagination, etc. Auditory: The sense of hearing; one of the RS WAK). Belief: A thought about a thought; a representation validated at a meta-level; generalizations about higher level concepts (i.e., causality, meaning, self, others, behaviors, identity, etc.). Calibration: Tuning in to another's state via reading non-verbal signals previously observed and calibrated (i.e. breathing, posture, eye movements, etc.); sensory awareness skill. Chunking: Moving up or down the levels of abstraction; computer term about the size of information; chunking up refers to going up a level (inducing up, induction) and leads to higher abstractions; chunking down refers to going down a level (deducing, deduction) and leads to more specific examples or cases. Complex Equivalence: A Meta-Model linguistic distinction; equating two representations which usually refer to different dimensions, e.g. "He is late; he doesn't love me." Content: The specifics details of an event; answers what, and why; in contrast with process or structure. Context: The setting, frame, or process in which events occur and provide meaning for content. Deletion: A modeling process; the missing portion of an experience. Digital: Varying between two states (i.e. a light switch, either on or off); a digital submodality (color or black-and-white; in contrast with an analogue submodality. Dissociation: Experiencing an event non-emotionally; seeing or hearing as if from a spectator's point of view; in contrast to association. Distortion: A modeling process; inaccurately representing something by changing form or structure. Ecology: Concerning the overall relationship between things; relation between an idea, skill, response and a larger environment or system; a question about how well something serves you. Elicitation: Evoking a state by a word, behavior, gesture or any stimuli; gathering information by direct observation of non-verbal signals or by asking meta-model questions. Empowerment: Process of adding vitality, energy, and new resources to a person; enabling someone to take effective action. Epistemology: The study of how we know what we know. First Position: Perceiving the world from one's own point of view; associated position; one of the perceptual positions. Frame: A context, environment, meta-level, a way of perceiving something. Generalization: A modeling process; taking a specific experience and generalizing to higher abstraction, class, or category. Gestalt: An overall configuration of individual elements. Internal Representations (IR): Thoughts; how we code and represent information in the mind; the VAK (sights, sounds, sensations, smells, tastes). Kinesthetic: Sensations, feelings, tactile sensations on surface of skin, proprioceptive sensations inside the body, include vestibular system or sense of balance; one representational system. Logical Level: A higher
level, a level about a lower level, a meta-level that driies and modulates the
lower level. Loops: A circle, cycle, a story, metaphor, or representation that
goes back to its beginning; looping back (as in feedback); an open loop
refers to an unfinished story or representation versus a closed loop. Map of
Reality: Model of the world, a unique representation of the world built in
each person's brain by abstracting from experiences, comprised of a
neurological and a linguistic map, one's IR. Matching: Adopting facets of
another's outputs (i.e., behavior, words, posture, breathing, etc.) to create
rapport. Meta: Above, beyond, about; at a higher level; a logical level higher.
Meta-Model: 12 linguistic distinctions that identifies language patterns that
obscure meaning in a communication via distortion, deletion and
generalization. 12 specific challenges or questions by which to clarify
imprecise language (ill-formedness) to reconnect it to sensory experience and
the deep structure. Meta-modeling brings a person out of trance; developed
by Richard Bandler and John Grinder (1975); the basis of all other
discoveries in NLP. Meta-Programs: The mental/perceptual programs for
sorting and paying attention to stimuli; perceptual filters that govern
attention. Meta-States: A state about a state; bringing a state of mind-body
(fear, anger, joy, learning) to bear upon another state from a higher logical
level, generates a meta-state; developed by Michael Hall (1994). Modal
Operators: Meta-Model linguistic distinction that indicate the "mode" by
which a person "operates" 6.e. necessity, impossibility, desire, possibility,
etc.; the predicates (can, can't, possible, impossible, have to, must, etc.) we
utilize for motivation. Model: A description of how something works; a
generalized, deleted or distorted copy of the original. Modeling: A process
for observing and replicating effective behaviors by detecting the sequence of
IR that enable a person to achieve new levels of competency. Model of the
World: A mental map of reality, a representation via abstraction from
experiences, one's personal operating principles.

Multiple Description: Describing something from different viewpoints.
Nominalization: A Meta-Model linguistic distinction that describes the result
of a verb or process turned into a noun; a process frozen in time. Pacing:
Joining someone's model of the world by matching the person's language,
beliefs, values, breathing, posture, etc.; crucial to building rapport. Perceptual
Filters: The ideas, beliefs, values, decisions, memories, language, etc. that
shape and color one's perceptions; the Meta-Programs. Predicates: Words
indicating an assertion about something; the sensory based words indicating a
particular RS (visual predicates, auditory, kinesthetic, unspecified).
Presuppositions: Ideas that we take for granted in order for a communication
to make sense; assumptions; that which "holds" (position) "up" (sup) a
statement "ahead of time" (pre). Reframing: Altering a frame-of-reference;
presenting an event or idea from a different point of view thereby eliciting
different meanings; a change pattern. Representation: An idea, thought,
presentation of sensory-based or evaluative based information (the VAK representations). Representation System (RS): The sensory systems (VAK) by which we code our internal thoughts. Resourceful State: A mental-emotional state wherein one feels resourceful or at his or her best. Second Position: Perceiving things from another's point of view. Sensory Acuity: Awareness of the outside world, of the senses, making finer distinctions about the sensory information we get from the world. Sensory-Based Description: Information directly observable and verifiable by the senses, see-hear-feel language that we can test empirically, in contrast to evaluative descriptions. State: A holistic phenomenon of mind-body-emotions; mood; emotional condition; sum total of all neurological and physical processes within an individual at any moment in time. Submodality: The distinctions, features, and qualities of each RS. Third Position: Perceiving world from the viewpoint of an observer; one of the three perceptual positions; the meta-position. Time-line: A metaphor describing how we store the sights, sounds, and sensations (VAK) of memories and imaginations; a way to code and process "time" as a concept. Unconscious: Whatever we do not have in conscious awareness. Universal Quantifiers: A Meta-Model linguistic distinction indicating "allness" (i.e., every, all, never, none, etc.); a distinction admitting no exceptions. Unspecified Nouns: Meta-Model distinction; nouns that do not specify to whom or to what they refer. Unspecified Verbs: Meta-Model distinction; verbs that have the adverb deleted, delete specifics of the action. Upfime: A state wherein attention and senses get directed outward to immediate environment, all sensory channels open and alert; sensory awareness.
Persuasion engineering TM…Bandler and La Valle

Richard Bandler...'layer' sub-modalities of 'successful' experience into one new experience you can 'trigger' at any time, to 'activate' that level of positive energy / expectation i.e be 'ferocious' when doing therapy with client... have client project to 3 future times when they will 'backslide' e.g break diet, fall off wagon, fear something etc, and each time 'get back on wagon' etc i.e continue diet...so programming assumption that each time they do ultimately 'slip up', they will have returned to 'program'... i.e one week, reverting back to original...then 2 weeks, and revert back...then month ahead and revert back to X.... i.e the 'right way' / 'resourceful way'...i.e program to fall off diet 3 times embeds presupposition that they returned back to 'program'...so when in future 'fail' this will actually re-inforce expectation of success ... presupposes that if 3 failures spread apart, they must have been succeeding all the rest of that time !!! i.e programming success...then later increase gap between 'failures'... also makes failure not important e.g zen practitioner ... vs master... client won't understand consciously this strategy, and can't sabotage it...in order to 'fail' have to get back onto right track...so whatever sort of client will work with...don't explain, just insist firmly that this will work...and insist they do that... Don't tell client' when you open your eyes, the audience will have dissappeared', but ask question that presupposes they have already dissappeared e.g' Is it O.K for you and I to discuss this alone, together, in private' etc ... so not fighting with conscious mind, actually got it's permission to 'dissappear' everyone in audience...it has implicitly agreed they are not to be noticed...i.e presuppositions/implicit assumptions/ 'loaded' requests/questions which presuppose the condition / situation you really want them to hallucinate / negatively-hallucinate...

Attend to person, so can respond to...feedback for mirroring and leading...and to actually ‘hear’ what they say, and ‘see’ what they do / how they respond...be able to pounce on opportunity to ‘sell’ something...always selling a feeling...how to facilitate them getting that feeling...what is it about what you are selling that can provide that feeling?
The mind likes similarities i.e. confirmation, validation of what already ‘believes’ i.e instills greater confidence in worldview, that it has a ‘grip’ on reality...satisfying... but it LEARNS from being challenged / contradicted i.e. success reinforces, and failure challenges beliefs...if consciously open to...or bypass conscious mind and appeal to subconscious ...

Rapport developed via ‘sameness’ i.e. mirroring, pacing, mitlaufenge, agreeableness...’speaking to a rhythm’ lets you access this rapport, then break it at choice points to embed another structure, before returning to this baseline rhythm of agreeableness...

Matching postures, body matching, mirroring, is visual, and not necessarily the most effective representation system to use...as many people are using the technique, it is hard to say who is mirroring and then leading whom...

Often more effective to use vocal mirroring of interlocutors voice tone, tempo, rhythm, inflections. If trying to influence X, then speak to others present, while mirroring X, without directly addressing X. To check for rapport with X, after a minute or so, touch your cheek etc, and see if X touches theirs i.e. are no insynch – mirroring you...for the entire time you are talking you don’t even need to look at them, or mirror anything else...when you touch your cheek etc, observe X out of your peripheral vision, so they don’t even realise you are ‘auditing’ them...

The vocal mirroring, like the posture mirroring, breathing rate mirroring, and all other forms of ‘agreeableness’ all influence the process of influencing people...of leading people...of motivating people...of gaining rapport / trust / confidence of people...

Attend to the representational system being used by the interlocutor...attend, attend, attend...very zen...don’t prepare a plan...plan, but then go with whatever you attentively observe...use what they say, their body language...actually listen...as they change, pay attention...use the changes...go with the changes...

If people say ‘I’m looking for a new X, to change my X, at getting X, and going to X, use visual language, and ‘show’ them stuff...get visual...point out visual stuff...show them products, or brochures, stuff they can SEE...LOOK at...ironic when people buying ‘stereos’ and they want to ‘see’ some new stereos, and say, ‘come over and take a ‘look’ at my new stereo’...so sell to THAT...don’t try to use your own preferred / logical / rational representation system...e.g. stats on a house Vs how it ‘feels’, how stereo ‘looks’ rather than ‘sounds’...’this looks good’, ‘this feels right’...go with THEIR representation system...adapt to fit their way of ‘knowing this is the right product / house / idea / plan for THEM’...take YOUR cue from THEIR cues...
So car sellers add ‘new car smells’ and home sellers add ‘freshly baked bread / freshly roasted coffee’ smells, even though you’d think OTHER things were more important to car and home buyers…

We get stuck in our own representation systems…our own favored way of experiencing / representing/ and communicating…we have to learn to listen and observe for other people’s ways of seeing and being, and take our cues from them, adapting to them…to gain rapport, and access to their decision making / judgement processes…

MHR me and the 1000 Ohm guitar interface, while every youtube etc marketing has all the ‘stunning visuals’ etc…or ‘she has a great personality’ when you are shopping for a sex doll…

‘How does THAT sound’? ‘How does THAT strike/ grab you?’ ‘Try THAT on for size’. ‘Does THAT feel right / sound right / look right / seem right to YOU? Observe eye accessing cues AFTER you have offered information / ideas … to work out how they are processing what you’ve offered…what they are doing with it…visualizing it?…in the future? Comparing to a past experience?

Watch someone’s accessing cues when they are thinking of something they are certain about / convinced wholeheartedly about, and compare that to something they don’t believe, something they are not sure about, etc…where is the information stored e.g to the front and down to the left? … remembering is eyes up to left, usually. Compared to constructing mental images etc…

Compare two instances where you were certain you wanted to buy something, but didn’t, and where you weren’t sure, but did, and compare where the images are located in your mind, and the associated submodalities of each experience…e.g color, size, location, movie Vs still, audio qualities, close Vs far, intense/vivid Vs vague / dull etc…

Get interlocutor to move the ideas / things so that what YOU want to be certain / confident / desired inhabits the appropriate position and sub-modalities…then ‘anchor’ it subtly by some touch, or change of tone of voice etc…

Need to get people into a state of answering yes, with every fiber of their being, by asking things they are bound to enthusiastically agree with, from the weather, to sport, to … to agreeing to buy your product / idea…keep them saying yes…yes set…make it agreeable…keep them positive and having fun…create a positive state in yourself that becomes infectious…

You are ‘selling’ good feelings…not products or ideas or services…
Your aim is to induce a feeling … feeling good…about X, Y, Z … about a product, about you, about action, about deciding, about a service, about an idea, about changing etc…so you first have to convince YOURSELF…’get excited about X’…wake up and think of all the positive experiences you can have today…mentally start the day with positive self-fulfilling prophecies…

Change your behavior until the person literally lights up with enthusiasm for X…for you…for Y…

Ask person to think of a time they were really convinced, certain, happy, thrilled etc…in a congruent voice, with congruent body language i.e to induce that state, you need to be expressing in all representation systems…like a real actor…resonating that desired state on all levels so that you infect the person with it, and they sympathetically resonate with you…that is induction…

Before fall asleep, imagine waking up energized, refreshed, optimistic, looking forward to the day to come…and as soon as wake up, think of a bunch of great things to look forward to…etc…

Kinesthetic anchor is ‘touching’ someone literally. But can ‘anchor’ in other ways.

‘Sliding anchor’ can be done with your hand in the air, or touching someone, at precise moment.

If people really convinced, certain, confident, they won’t fear you being able to make them uncertain / unsure etc… MHR which is why ‘holocaust hoax deniers’ NEVER respond with arguments / facts…they KNOW their whole story is shoddy work…

Build powerful internal state before approaching someone i.e ‘cold calling stranger’…

‘I want you to remember a time you were X ‘… e.g excited, depressed, certain, committed, optimistic, happy…Now wait until you can see they have accessed that feeling / state to the maximum, and then anchor that feeling / state with a touch, a sound, a gesture, or word. Then ask them to recall something else. Observe the differences in their state. Then ‘fire off the anchor’ you set. Watch the same state / response re-emerge. The idea of sales is to have such anchors triggered by the product. To attach those great feelings / states to the product.

‘You, like me, want the best for yourself” … n.b the conflation of ‘you like me’ with the agreeable ‘you want the best for yourself”… accepting one means accepting the other, so you have them subconsciously agreeing with your
intended feeling ‘You like me’. This is a typical Bandler language pattern for imprinting suggestions.

The state with the greatest motivation i.e where no hesitation is felt ... e.g when you looked down and saw a 100 dollar bill, and you did not hesitate to grab it ... zero doubt ... zero need to consider ... THAT is the state you want to imprint in yourself and then others ...

Access your own most ‘ferocious’ state ... intense ... when you had fun doing something you never thought you’d do ... And a time you had a great sense of humor, as humor is about seeing the world differently / from an unusual perspective ...

You can induce these states in others with questions, and layer each upon the previous, by anchoring them with the same trigger e.g touch on the shoulder ... so that THEY can later trigger the same layered set of responses / states / feelings / emotions ... get them to recall in as many representation systems, sub-modalities, and with as great intensity / vividness as possible ...

Always take the picture of what you want that is in your head, and make it more vivid, alive, colorful, detailed, closer, moving image, full of sub-modality details, and so you make it more real ... more likely to manifest it ...

Take your good feelings, amplify them, make them more vivid, real, and constantly relive them ... like you habitually do with your bad memories / regrets / fears / negative expectations ...

People tend to speak at the same speed at which they are processing / can process information ... so never speak faster than someone, at least not during the mirroring / pacing stage ... that said, you can speak very fast to their subconscious ... but this can be unnerving for them i.e their subconscious and conscious will be out of sync ...

Listen to their predicates i.e visual, auditory, kinesthetic i.e looks good, sounds like a great idea, that feels right etc ... matching their predicates builds rapport subconsciously ... a good ‘feeling’ ... it is agreeable to be matched ...

For many people, doubt is down to the right i.e you can read ‘doubt’ by this accessing cue, people looking down to the right ... literally ‘that’s down right ...’ And the problem is you tend to put contracts down on a table, to their right, for them to sign ... and thus trigger this association ... the muscle memory triggers the feeling of doubt ... and suddenly they go from being keen to sign, to having doubts ... So first ask them to think back to a time they were totally satisfied with a purchase ... and observe where their eyes move ... to calibrate / benchmark their ‘satisfaction / confidence’ accessing cues ...
If someone starts shaking their head ‘no’, mirror them first, then lead into nodding…

Mirror their breathing, then you start nodding, before you start asking questions you want a ‘yes’ to…

Ask person to recall a time they saw something, they wanted it, and they knew it, for sure, without doubt or reservation or objections…they bought it and they were happy…this is the state you want to induce in clients / customers … Vs a time they experienced ‘buyer’s remorse’ after a purchase…

To induce / manifest a state in others / in the world,, you must first be resonating that state authentically and vividly … like the depictions of holy mean / magicians … physically manifest the states by vividly imagining them…total congruence between the states you want to manifest, and the state you are imagining / feeling / hearing / seeing / being / tasting / smelling … so YOU need to vividly construct / recall, in you mind, and thus in your every molecule, the state of excitement / love / arousal / desire / compassion / confidence / certainty / commitment / faith / belief …

In the case of marketing it is ‘closing’ that is the key…overcoming objections then closing the deal / sale / conversion (of belief) … so you need to be in / resonate / manifest, all the qualities of someone who is certain about making a decision…”this is a no brainer”…’of ‘commitment’, of being a ‘true believer’… without doubts, hesitations, worries, concerns…

So you need to recall an experience of this in your own life…when something was very easy to say ‘YES’ to, without any hesitations / doubts … Nietzsche’s YES, Jim Morrisson’s ‘a totally positive song’…that feeling of certainty that you want this, you are ready to sign immediately, keen to ensure you get this now, this opportunity, like shoppers outside a U.S chainstore on the morning of a super sale…rearing to get in and make that purchase…something you could ‘taste’ you wanted…that was beyond doubt…so easy to sign for…to say YES to…

Once YOU are resonating with this YES, NOW, state, you want to infect others with it, to induce them to resonating with it, to manifest the same state in THEM…

It has to be something you actually DID decide on, and ‘sign’, and ‘buy’, and ‘agree to’. Something YOU ‘closed’ on. And felt totally ‘right’ about doing so. You wanted it, you KNEW you wanted it. It was perfectly, exactly what you wanted. You could say YES with every molecule of your being. You KNEW it was the right decision. Zero doubts. Zero hesitation. ‘Where can I sign’. ‘Quick, let me have it, right now, what do I have to do to secure it?'
It has to be a decision made with opportunity costs. In other words a situation where you had to decide between different options, and were sure, certain, definite about the one you chose, and were overjoyed at having made that decision. Zero buyer’s remorse. You felt fortunate and privileged to have been able to buy it / sign it / do it. And this feeling endured. You never regretted the decision. You felt, long afterwards, that it was a a great decision. Not just the best from a bunch of bad options, but a great outcome.

Compare this vividly recalled situation with another one, where you experienced doubts, buyers remorse, uncertainty whether you are happy with your choices, your decisions. What are the differences in the two images / recollections, in the different representation systems and sub-modalities? What makes one decision ‘feel’, ‘look’, etc like a good decision, and the other a dubious, doubtful, bad, uncomfortable, regrettable decision?

Most ethical and best long term business proposition is to ensure that what you offer meets the clients actual needs, budget, etc, so that they can say YES, and also not end up regretting the decision. Then YOU will be part of their YES, and they will come back for more, and spread the word of their satisfaction, and YOUR great service / integrity / ethics / professionalism / competence.

Bandler assures us many famous people paid other people to pretend to be them, attend lectures, write papers, sit exams, and even write their thesis. That many supposed ‘research papers’ were produced by computer programs like the ones he wrote, to write history papers, to sell to other students at Stanford.

You can manipulate people’s ‘internal images’ corresponding to how they ‘feel’ about a decision i.e make it bigger, smaller, closer, further away etc and in this way take an ‘unable to decide’ picture full of doubts and uncertainty, and manipulate it so it now inhabits the position and has the qualities of an ‘easy’ YES … i.e bringing it closer, making it larger etc…moving it from left to right, depending on how the person ‘represents’ ‘confident YES, please, let me sign right now’ that leads to ‘closing’ the deal / convergence of beliefs etc…

You can get behind an image and push it closer to them. Move the image to where they represent ‘YES’, … the delightful YES…Please…

Lead into your suggestion with Yes sets e.g ‘You want to be happier / richer / healthier / freer / more attractive…questions they are going to answer with YES…

Move the current decision into the previous decision, and see if it ‘sticks’…e.g does THIS decision feel as good as that one did / does?
Replace their currently expressed desire, if it conflicts with what you want to sell them on, with something equally compelling e.g. large backyard? Vs you want to spend all weekend on yard work? Why not buy a small property bordering on a public park or school, and let someone ELSE do that yard work, and pay the property taxes…

Try to replace their current YES to e.g. station wagon, fuel efficient car, big backyard, things you are NOT selling, to what you CAN offer, and show how THIS can produce even BETTER feelings i.e. a bigger YES…consider the potential benefits of YOUR offer compared to what they are comparing it against… Then ask ‘Do you want to be happy-ER’…i.e you have a BETTER solution offering greater relief, satisfaction, benefits…

‘Do you want to feel good’… ‘Let’s take a look at this’, as if the two are related i.e conjoin them in their mind…subconsciously…introduce expectation of connection between feeling good, like almost ALL advertising, and the product/service/idea you are selling… It is your own congruence that is the ‘glue’ that will connect/join/conjoin/confabulate the two things… the ‘feel’ of an advertisement does this…high energy, beautiful perfectly desirable images, with no relation to the product in reality, but which are conjoined to the product in the viewer’s subconscious…no RATIONAL connection…just habit…like Hume’s cause and effect… people see X and Y in proximity, and Y AFTER X, so assume, subconsciously, with NO real rational, scientific basis, that X leads to / produces/causes Y…we do this with ALL our ‘cause and effect’ notions…we even construct objects out of discrete qualities e.g. redness + mass + taste+scent = apple…when all that exists are the discrete properties…WE put them together in our minds, habitually, and construct ‘apples’, and ALL cause-effect relationships…heuristically many prove useful…but many are in fact destructive, worthless etc…

Placebo effect works off Hume’s cause-effect confabulation…self-fulfilling prophecy…

Bandler got his understanding of Humean critical thinking via ‘junko logic’ of George Paulu.

Test Bandler’s theory. Take a decision you felt great about, compare it to one you regretted, move the images so they change positions, and see if you now feel differently about each of those decisions...remember there is no reality ‘out there’...just a representation of one of many possible realities / quantum states / probable states that you’ve collapsed, via a certain process of representing that thing in a certain way, into the subjective reality you experience…you can totally rewrite your experience in your mind, totally deconstruct and reconstruct your entire history, and thus your ‘trajectory’...take the momentum that was pushing you down, where you didn’t want to go, in undesirable, destructive directions,
and re-direct it…you are the accumulation of all your past representations, what you call ‘experiences’, and that accumulated mass x velocity represents the force pushing you either where you don’t want to go, or where you do want to be…it is a momentum…you can take it and change the direction of the trajectory / vector … you can remove the momentum of a bad engram / experience / representation and add momentum to other vectors…imagine that no vector is ‘real’ and manifests until it collapses into a particular state…your ‘personality’ is that collapse…so open up the book again…rewrite your history…go back to the quantum states of indeterminacy, and chose a better reality, better experiences, a more desirable trajectory, and then collapse THAT trajectory, THAT history, THAT momentum…you will then realise the full potential of your holistic inheritance…you cannot change everything….but you will be making the best of the holistic inheritance you have…you might be stuck in a war, in a repressive regime, with bad people, in bad situations, but you will make the most possible of whatever opportunities are available…achieve things you otherwise never would have…and surprise people around you by doing things THEY consider impossible…because of THEIR states…and maybe you will resonate powerfully enough to manifest these same positive states in others…what would be a REAL evolution, rather than a mere revolution, the revolving door of replacing one group of violent slave masters with another, who at first pretend to be your friend, so you will help them in THEIR objectives of gaining power, simply to use, like the last group, to enslave YOU…

To get people to ‘revise’ their position / feelings, simply change the representations and sub-modalities, moving them to where ‘good’ feelings usually are represented…people do this all the time with ‘falling in love’, ‘faith’, and then ‘demonisation’ after the relationship falls apart, they ‘lose faith’…they have simply shifted their representations of the person / thing / situation from one position / set of representations and sub-modalities, to another…from the ‘love’ to the ‘hate’ ways of representing things …. i.e changing the size, location, closeness, distance, vividness, movie Vs still image etc…

You can manipulate the images in their minds with words e.g ‘Take a closer look at this. Can you feel it is a good idea’, as most ‘good ideas’ appear closer i.e are represented as closer.

I represent things linguistically i.e consciously break down into verbal descriptions, to be able to represent complex thing in smaller steps, and so be able to ‘map’ things, and then follow that map…because too hard to keep entire process in conscious mind i.e 5 to 9 things limit…when have 250 things, or a million in the case of TROONATNOOR…And conscious understanding VS intuitive means you can SHARE that understanding using words…VS intuition requires person to ‘enter into it’ with you… too many ‘teachers’ too intuitive, which is why so good at what they do, but so bad at teaching it…replicating it in
others...manifesting their own intuition in others...translating the awareness/understanding...how to transmit, encode, and store it? ... that requires words and pictures, and ideally videos...so include all representation systems, and also break down steps in optimal place, optimal chunk, most meaningful chunks, and then analyzing/representing/modelling what occurring in that chunk/step, and how it connects to next...e.g what chunks to break down 'little wing' into? If too little, you lose the 'feel', though sheet music supposed to be able to represent that, even by showing individual notes...in reality easier to follow if break down into 'licks' and 'chops', then re-joining these...so need first the notes/chords, the discrete 'licks' and 'chops' and 'progressions' they form...then how they relate to each other i.e put together a few licks and chops, then put these chunks together into verses, etc, until end up with entire song...VS intuitive guitar player can just play the entire song from start to end...and when tries to teach individual notes, student struggles...as does not share this intuition...and the teacher is not actually sharing it...has no way to share it...just 'knows' it and 'feels' it...Vs someone like me who doesn't 'grawk' it and needs to break it down and build it back up, to see what Hendrix is doing, and how he puts it all together...so I do this...work out the optimal 'chunks' to learn/teach...etc...so ANYONE can end up learning, if patient, disciplined enough...no need for the 'intuition' of the 'born natural'...which usually turns out to be, like Mozart, the result of years of hard work, during which subconsciously the musician recognised and internalized a whole lot of rules, licks, chops, progressions, musical theory, practical skills...etc which then manifest as apparent 'natural ability', 'gifts', 'talents'...in reality a mix of both...with the 'great musician' having the benefit of both talents, and luck of having it nurtured/facilitated/encouraged...

Modal operators can be employed to achieve ends...e.g compare how saying, to yourself 'I'd like to...I want to...I need to...I have to...I must...I can...I will' and focusing on how each statement makes you FEEL...chose any X e.g I want to ask Y for a date...Vs I will ask Y for a date...go through the whole range of options and compare all them to 'I am GOING TO...'. Stop and go inside and focus on how thinking 'want to' Vs 'will' changes how you feel about that act. How likely is it you will do it. How 'real' does it appear i.e any associated representations such as images, where do they appear, and how large, vivid, etc are they? Is the representation a movie or a still photo? How vivid is it? Color vs black and white? How real does it feel to you? Is it distant or close?

The 'best' decision strategies people make are movies, with the following elements, and even a particular quality in the internal voice describing these elements: and particular modal operators:

What you need to do is use active verbs in the present tense. The only time that really exists is the present. Things can only occur in the present. In the NOW. You can imagine things have happened, or will happen, but they can only
actually happen in a present time. The time they happen in. So ALWAYS use the present tense with any decision / desire / induction / resonation in order to manifest it in yourself, others, the world.

So try ‘I’m ASKING HER OUT’ i.e I’m ‘taking the day off / I’m losing weight / I’m starting my exercise plan / ‘I’m standing up for myself / ‘I’m asserting myself / I AM X’ing…(compared to I will X, am going to X…as these are lame, meaningless, in the context of action…you can only do something in a NOW, in the present tense)…

Using this present tense changes a still image into a movie, adds color, vividness, detail, makes the internal impression / representation more real, compelling, and so it resonates with greater power to manifest … the movie will run to the end i.e to the achievement of the desired outcome, and leave you planning around this inevitability i.e as if it is real, and happening right now, so you will see yourself asking her out, discussing where you will go and what you will do with her, and even seeing yourself on that date having a great time…

If you or another person has trouble visualizing i.e constructing images i.e imagining things visually, simply get them to recall something memorable from their past, and suddenly they will be recreating THAT memory in their mind, which is the same as constructing something in their mind…ask them to describe some detail e.g color of their pet cat, first car, bedroom etc…

If you don’t get the response you want ,change what you are doing (vs insane person who keeps repeating expecting / hoping for different outcome ‘this time’)…

Ask ‘What are you buying today’ Vs ‘what are you looking for’ … sets up expectation of actual closing / buying … similar to ‘I am excercising today’ Vs ‘I will try to exercise today’… i.e make assumption / presupposition of action / doing/ achieving / succeeding…’trying’ is a loaded term, implying merely attempting, and worse, raising doubts / objections … ‘ tried to…usually means failed’…, tacitly, implicitly…

Observe how people move their hands…it often indicates where they ‘position’ their representations…listen to the words they use as they move their hands…visual words are associated with what hand position / movement ? Their hands can be literally ‘drawing a map’ of their representation systems as they speak…

Bandler claims that paraphrasing people’s words back to them, to show you are listening and understand them, is undesirable. It implies you can read their mind, which you cannot. This is NOT the best way to build YES sets…the terms you choose to paraphrase their words will have different meanings, which will be
represented in different positions on their internal maps / representations systems…so do what did in the study I quoted on getting the highest tips…repeat back the most important things they say VERBATIM…do NOT paraphrase…repeat the key elements exactly, precisely, even to point of mirroring how they said it, body language etc…repeating their words / validating them / listening to them / observing them, is powerful…

Redraw the map the person just described, in front of them, so they can visualize it again…listen to what they say they want, need, would like etc, then repeat…yes I see, you NEED, you WANT…etc…re-draw the map…making it more vivid…that builds rapport … you make it real for them, what they just described…you understand them…a powerful feeling for anyone…to be UNDERSTOOD…to have someone actually LISTEN and UNDERSTAND…simply by repeating back to them, in their exact own words, the key points they just expressed…

Prove you know ‘what they are looking for’ by repeating what they just said…they now trust you with their needs…and finish with ‘You will be thrilled with X (what we were talking about)… be careful about introducing objections yourself i.e new information / questions which could lead out of the YES set…don’t risk the YES set…customer has to ‘feel right’ about the decision…THAT is what you are selling…that feeling…

Wait until they are finished before repeating their words back to them…don’t repeat each sentence just after they finish it…collect 6 or so bits of information, or wait until they are finished, before parroting back all the key points they expressed…literally…precisely…using THEIR own words and gestures…

Virginia Satir believed that survival is NOT the most basic instinct…it is in fact the instinct / tendency / habit to do what is FAMILIAR …

Practise adopting different representation systems to your habitual i.e try to express anything you ‘know’ visually, acoustically, kinestheticly, to others…like others do to you…i.e so you can ‘enter into’ their way of representing…use their ‘figures of speech’ and ways of defining / seeing / being / experiencing…how they encode the ‘external’ world into subjective experiences…so you can relate to them…communicate with them using their own language…

Pattern interuptions are the equivalent of the Zen practitioner whacking his student with a stick…to break the internal dialogue…shock them into attending to the here and now…attending…being here now…Bandler calls is ‘confusing people’, which is apt. A Zen Koan is often considered as a ‘confusing’ riddle…even nonsense i.e no solution, but in fact usually DO have solutions…but solutions that require the person to think differently, outside the box, to escape
their own habits of thinking / defining…to see things differently…thus experience the world / represent it, differently…and that is part of the NLP process / experience…

Confusion is a state of openness to something new…Vs certainty of habitual ways of being / defining / experiencing i.e in the box…it is an opportunity…

People often merely pretend to be listening / attending to you…really holding mental image / internal dialogue, and waiting for you to be quiet so they can continue it…which is why ‘shock’ and ‘confusion’ required to REALLY break the habitual internal dialogue / representations/ mental images etc…

Observe for ‘cues’ that they really HAVE stopped their internal dialege / movie screening…

Asking answers that should provoke ‘yes’ responses better than ones they can Umm and Ahh in response to. So they have to really attend to your questions. Often only after having said ‘yes’ to something odd, do they suddenly, startled, start paying attention…’what?’…use rhetorical questions, to keep them actively engaged with you…

Tone conveys more than the words. Need to have intended meanings resonate in the listener. Tone does that.

To produce resonance in your voice, and become more compelling, place two fingers lightly just below your sternum (solar plexus? Bottom of chest? Just top of stomach?) and change your voice tone until you can feel your words resonating here, through your finger tips. This is the voice you will want to use, to be compelling. (basically totally relaxed throat / jaw / tongue i.e singing voice)... i.e opposite of ‘nasal’ ‘irritating’ ‘whiney’ voice.

Need good posture to get resonating chest voice working i.e stand tall / erect…need to project it from your chest towards the person, to bathe them in it…

If someone says, ‘I’m just looking’…finish their sentence for them ‘at your future car / kitchen / school / training course’…to set the subconscious process going…

Don’t ask ‘Can I help you’, ask, ‘Are you looking to make a great decision that you will always be glad you made?’…something they can only say YES to, consciously and subconsciously…

Elicit all the sub-modalities that go with / make up / are associated with / underscore / produce a ‘powerful belief’…e.g do you believe the sun will rise tomorrow?… and observe their accessing cues i.e where their eyes move…if their
eyes don’t move, ask them ‘do you see a picture in your head of tomorrow morning?...to get them visualizing ... Ask them ‘does a voice in your head say yes or no?’ Once you’ve located the image i.e where it is , ask them how big it is. Ask them to walk behind that image...now take a representation that says ‘selling is fun’ and replace the image of the sun with this image...

Altering states really about going from one trance state to another...one illusion to another...one dream to another...one frame of reference to another...like concept of ‘perversion’ ... people assert one state is ‘awake’ and another is ‘trance’...one state is ‘normal / natural / functional / god-given’ and another is abnormal, deviant, dysfunctionally, unnatural / a sin’ ... the dominant illusion / definition usually is imposed in a duality of ‘right and wrong’, ‘good and bad’, good and evil etc...when in reality all positions subjective...

Can alter states with elegant language formulations e.g Erickson using ambiguity, double entendre, connotation, rhetoric questions...

26 letters of alphabet represents magicians arsenal...

Many ambiguities are purely phonological i.e only occur when spoken, by native speaker...the context supplies the missing information in the verbal expression e.g right Vs write...

Dental receptionist always states ‘we need a check from you before your next appointment’ i.e to pay for this one...client just enjoying relief, and satisfied, most likely to be in best mood to pay right then...she holds our her hand, palm up, as if receiving the check already, and most clients take the cue and write a check and immediately make their next appointment...great for cash flow and business !!! The point is that she is NOT literally asking for payment or for them to book their next appointment, immediately, but the association with the hand gesture, and their goodwill at that moment of relief, result in the person volunteering both !!!

A literal example is ‘I caught an elephant in my pyjamas’ etc...or ‘I sold a car to a woman in red high heels’...all produce moment of surprise / shock / break pattern / break internal dialog / like Zen ‘whacking stick’...The idea is to deliberately introduce these into the dialog...to work out how you can say something reasonable / normal / prosaic, in ways that can produce the ‘ambiguity’ and desired ‘whacking stick’ result...We will tend to find them humorous, if we consciously pick up on them...’what was the elephant doing in your pyjamas? ‘Do you often where high heels to work?’...You can use the dual meanings like Erickson, to slip past the conscious resistance to suggestions...the conscious mind hears the ‘harmless’ meaning, and the subconscious reacts to the intended, other meaning e.g sexual innuendo implicit which the conscious mind
will ignore as it makes it uncomfortable ‘He couldn’t be meaning THAT now, could he!’…

You can even create ambiguity using punctuation, as Erickson does, in his verbal suggestions and stories…by moving a comma you can change the meaning …

By changing the inflection you change the meaning also e.g I like racing cars Vs I like racing cars … one refers to a thing, the other to an action…

Persuasion is about helping people make the right decision? One they won’t regret. So get loyal customer.

Altering rhythm, inflection, tone, pitch, etc makes your voice more engaging / agreeable, and can introduce deliberate changes to stress parts of an otherwise ‘harmless’ utterance so it has the desired effect i.e consciously overlooked, but the subconscious picks up on it…it is much more sensitive once you ‘interrupt the internal dialog’ …

Make a decision Vs making a decision… I will help you make a decision…Vs I am going to help you make a decision Vs I will help you in making a decision…Make much more decisive / effective a suggestion.

I can help you with a decision is a nominalisation of something that IS definitely going to occur, but just hasn’t occurred YET…also more decisive / effective a suggestion.

In the more effective suggestion the implicit assumption is that they have decided, and it is only a matter of acting on the decision. So you make the desired decision a fait accompli, simply by how you express your suggestion …

I’m going to make a decision…you add ‘happen’ to the end of their statement, to manifest it…

What location / sub-modalities does ‘going to do’ Vs ‘am doing’ have for you / interlocutor? Ask them to locate and describe each…is one bigger, brighter, closer, more animated, more vivid, to the left of the other?…get them to locate it on their time line e.g where is ‘in 2 weeks’ on their timeline? …of course we tend to put off decisions…sometimes forever…we ‘make’ them but never ‘implement’ them…when we locate it on our timeline, it is usually ‘just out of reach’…which means forever…So to get the decision implemented…to get the action the decision has be ‘made’ about to happen i.e go from deciding to do, to actually doing, need to move it on their timeline…

Procrastination revealed when ask person to move to tomorrow, on their timeline, and then locate the decision…it will move…always remaining out of reach…
People literally ‘put things off’ their actual timeline…

We need to get the person to move along their timeline to a point AFTER that decision has been made, so they can look back on it, as a fait accompli…a successful execution of that decision…like Buddha’s ‘remembering’ something as if it has already occurred…this relaxes the conscious mind, leaving the work to the more powerful subconscious to realise the ‘memory’…think how much easier it is to remember the solution to a problem compared to working it out for the first time !!!...

MHR Einsteins space time like my Zen hard disc…Einsteins thought experiment was to take a film strip and cut the frames, and instead of playing them left to right, in time, layering them on top of each other…so what would visualization of timeline as vertical do for person? Why hasn’t ANYONE in any of their books EVER considered a VERTICAL timeline???

Bandler…using a rising question intonation at the same time as a falling command intonation…

Temporal predicates all located somewhere on your / their timeline…so consider where a word is located to decide which to use…

Fine line between elicitation and installation…when asking questions…when eliciting, attend to them 100%, pure zen…observe everything they do and listen to what they say…to find opportunities to overcome objections, offer solutions, to mirror them…

Design well formed questions that will elicit the info / data / responses you need…be specific e.g what repayments could they afford Vs vague ‘how are your finances?’…write down the specific info you want, then reformulate it as a specific question…this speeds up the process…makes it easier for client to decide…

We need to learn to really open our eyes, i.e look, and really listen, like a cat prowling at night…every sense awake, zen…waiting, looking, listening…totally attending outwardly…for any sound, sight, smell…any opportunity…note hunter looking for opportunities…not so much worried about threats…but sensitive to all inputs, therefore will detect them…

When you get home to your partner put everything out of your mind and recall, as vividly, vibrantly, fully, with as many details and sub-modalities, the very best time you had with them, the greatest passion you felt for them, the best feelings you had for them / with them…and amplify these…make the images animated / moving, closer, brighter, bigger, more compelling, more real…crank up the
intensity of that feeling…THAT is how to keep a relationship / passion / romance etc alive…

During the day start actively attending more to sounds, sights, smells…stop and focus…what can I hear…give it time for your mind to focus, until you can start making out noises you were previously consciously unaware of…do the same for sights, while waiting in a queue, or on the phone, actively search out interesting things to look at, from the ground to the sky, to details in architecture, people’s clothing, faces…do the same with smells…heighten all your senses…sensitivity training is not just about accessing cues, but about using all your senses more actively, opening them up, making them more sensitive, becoming more aware of every second, everything happening around you…

MHR juggling 4 balls seems to require a real change from using front vision, to peripheral vision i.e like Carlos Castaneda … you need to look straight ahead, rather than focus on either L or R side balls / hands … use your peripheral vision, etc…it is quite challenging…otherwise cannot throw two balls at same time…like breaststroke, where we first tend to use our legs a-synchronously, kicking first one then the other…after time we learn to synchronise so we move both in the same way, at the same time…it takes initial conscious effort…

Negotiation / mediation is about helping people make better decisions…find better solutions for everyone…sales is about helping people make better decisions (ideally)…i.e persuasion engineering…Vs ‘social engineering’ in ‘con-man’ context …

Need to program self before night, so imagine self waking up energized, enthusiastically looking forward to opportunities MHR like dogs that we see wandering for kilometers, every day, always hopeful of finding something tasty to eat, though probably rarely do, which is how we live our lives too, if we are honest…i.e very few rewards, but if we want to have a chance at whatever IS available, we have to be like that dog…focusing on what MIGHT be there…maybe remembering an experience where we FOUND something ‘tasty’ to keep us motivated…what is alternative? Death! Or worse, a living death, like a dog that has given up, and just lays down to die…Moscow subway…

Have to treat day as ‘fun’…i.e cold calling, sales etc…

Modern corporations in creative, e.g high tech industries, work on notion that if people are having fun at work, look forward each morning to going to work, they are more creative and productive…

Consider speaking with a kranky, depressed, negative person compared with a happy, excited, positive person…even on the phone… the tone carries all this…it is a pleasure to interact with one, and the other you’ll avoid…
Hesitation at trying something new is a huge limit to how many new things you will try, and better things you will find as a result…MHR evolution and sex…

Once have someone thinking how you want say ‘Now hold onto that thought’…and if want to dismiss a question say ‘Now never mind about that’…

Appropriate temporal predicates change the position of decisions e.g costs / objections overcome, to the past…You want to move things to the past, as fait accomplis, in people’s minds i.e a decision that has already been made…so when they say ‘Wow, that’s expensive’ you reply ‘Yes that was expensive, wasn’t it?’ as a rhetorical question…puts their mind in the future on their timeline, looking back to the great decision they have already made, in the past, and so this ‘objection’ has already been overcome, and they get to enjoy the great product / experience they paid so much for…the cost is in the past, the pleasure in the present and future…

To prove you can sell anything to anyone open your wardrobe, kitchen cabinets, walk into your garage, and look at all the ‘junk’ you bought, and never, rarely etc used / use…or worse, if you have a ‘storage unit’!! Often you have more than one of the same item, you forgot you had one already, you’d never used it / last used it so long ago..

The first step to persuading someone is to get their FULL complete attention…100%…it’s O.K to let someone stare at something and wait, until you have their attention…without their 100% attention, you can’t persuade them consciously or subconsciously…that is Zen ‘whacking stick’ point…they need to be attending to YOU…the Koan surprises them / jolts them out of their internal reveries, so they are here, now, with you…like the whacking stick…saying something odd / shocking / surprising…using a sexual double entendre that gets their attention…

Xerox once had a monopoly, and was the largest selling product in U.S history at the time…though took inventor 15 years to find someone willing to market the device…when patent expired everyone started making them…

Bandler tells story of how one guy, in crowd of 17 copy machine salesman, took off his shirt and pants, and walked up to him … to get his attention…it worked…

Once you have their attention, you need to build rapport / trust.

If you’ve lost them, get up, point to your empty chair as if you have joined THEM, criticizing YOU, saying ‘Now that is exactly how other sales joints are going to treat you, sucks doesn’t it’…so now you have spun it around to being on THEIR team, together, with a shared enemy, rather than letting the negative experience they clearly had with you, just then, stick to you…it slips off, you’ve
got them back on your side again…rapport…and can start again / on a new
tack…and start associating with something else i.e try again…

BANDLER IS JEWISH…!!!

Decision engineer is positive anchor Vs salesman, which for many people has
negative connotation / is a negative anchor…

Ask them about the difference between good decisions and bad decisions…your
aim it to help them make sound / good decisions they will be glad to have made
in the future…mirror their breathing rate…their tone of voice, tempo, rhythm,
intonation, and representation system e.g visual words, audio words, kinesthetic
words…then shift your speaking rate to the rate they are breathing…and if YOU
are in a positive, enthusiastic, fun, happy, pleasant, wonderful state, you will
infect them, they will begin resonating with it, because you will now be
LEADING them…but key to leading is YOU being in the state you want THEM
to end up in…they will begin feeling as you do, and if your state is enjoyable,
they will want to keep feeling that way…people WANT to be influenced /
sexed…they just need to justify it to themselves / /FEEL right about being
sexed…then they will automatically seek to find some way of rationalizing
their ‘decision’…which is ultimately an EMOTIONAL one i.e emotions /
feelings of pleasure and relief, fear and hope, drive our decisions…we rationalize
them afterwards…post-retrospective rationalisation…

Your voice tone will reflect your state…you can HEAR the state reflected in your
voice…so make sure you are transmitting / manifesting a positive state…by first
working yourself up into that state…

Milton Erickson’s ‘Hand shake interrupt’ technique for trance induction, lead to
Bandler’s ‘contract interrupt’ technique. Bandler gets client to sign the contract
first, then starts to rip it up the carbon stuff around the edge, while convincing
them that they want it. This way they can see, immediately, if they are likely to
experience ‘buyer’s remorse’ AFTER signing the contract for real.

Faking heart attack to get someone’s attention?

Experiment deliberately disciplining yourself to ask things right off the top of
your head, without first rehearsing them…ask rhetorical questions to which the
person is bound to agree…”You want to be healthy, happy, wealthy, independent,
free, have fun, great sex …all while carefully mirroring their breathing rate /
pattern…and then audit if you have rapport by ‘leading’ e.g scratch your nose,
see if their hand moves towards their face, involuntarily, non-
consciously…change your stance, see if they follow, or at least begin to follow,
smile, and see if they smile, nod, see if they nod…etc…all the while consciously,
deliberately, going into pleasant states yourself, so that this pleasant feeling will
resonate from you, and manifest in them…so they will be feeling good…then amp up your pleasant state, by recalling a state / time you were really feeling great…and watch as they begin resonating along with you…manifesting the same great feelings…start with ‘pleasant’, or even mirror their current state when you begin, then gradually lead towards the desired state, manifesting it in yourself, resonating it out to them, and seeing it manifest in them…this is mirroring and leading…match the tempo of your voice to their breathing tempo … gradually…until it matches…mirrors…to do this watch their chest rising and falling, and NOT their mouth, as inhalations and exhalations are not colored gasses!...be sure to attend to their language / use of predicates and mirror them, using the same figurative language … reflecting verbal, visual, kinesthetic representation systems they are using…and if they are not breathing much, get them excited, so they do…take a deep breath yourself and if you have rapport, they probably will too…

When you audit, e.g make a gesture like scratching your nose, you can add other representation systems to the gesture, which is kinesthetic, to re-inforce it, by uttering words such as ‘lifting’ and ‘handy’, anything that can sound natural in the context, but which reinforces the IDEATION, the idea, of moving their hand up to their face…observe for any twitch, or other indications of the impulse having been transmitted / received, that it is resonating with them, and has been manifest in some way, from a slight twitch, to a full-blown nose-scratch etc…

Use good tonality, speak at the same rate of your interlocutors, to build rapport…even if just bank teller…the bare minimum…and to be pleasant, and smile at customers…basically to be nice, inviting, friendly, helpful, positive. Bandler claims one bank invested 3.5 million in such basic training with his company, and increased its profits by 1 Billion in less than a year…

Even Bandler noticing that banks already behaving as if he was NOT living in a free society, re: limits on cash withdrawals from ATMs

Prospect for clients anywhere, especially where people use the stuff…e.g sell jewellery at the opera, where people wear it…

On the phone you should be able to hear people breathing, in person watch their chest, and listen for pauses when they stop talking to breathe…match their inhalations and exhalations, until you get into the same rhythm / pattern / tempo as them…

Bandler realises people process language by the phrase, with commas, colons, periods etc representing pauses, emphasis, and this produces the meaning as much as syntax i.e pure word order…

**Intonation** a.k.a **changes in pitch** a.k.a **flat, rising, or falling intonation**, changes ‘Hello’ from a neutral statement, rising in pitch to a question, and falling in pitch to a command…think of giving a dog commands…”si-iiit” pitches down…falling in pitch…falling ‘intonation’… in English anyway…other languages use pitch changes much more, like Chinese, or instead have actual discrete, different words, like Vietnamese, for each form e.g questioning, stating, commanding…

Warn people about ‘future preference’ as a trap … you end up sacrificing everything you could have right now, until you are too old to enjoy any of it, and then ungrateful / undeserving kids, governments (taxes), etc get to enjoy it…spend it before THEY do…because they WILL…before it is too late…we see it all the time…

Constantly test for ‘close’…people may have been ready to ‘close’, to buy, to sign, to agree, and you rattled on, and introduced doubts, and end up ‘un-selling’ what you had already sold, if only you had attended to the signs, and ‘tested’ to see if they were already ready… test using ‘embedded questions’ e.g ‘I don’t know whether you’re read or not to…..’ And look for non-verbal answers / responses / cues as to whether they are ready or not…

Avoid objections before they arise…rather than trying to ‘overcome’ them…if you see it coming, get to it ahead of time…

Need to overcome your own limiting beliefs about what it is possible to do … to sell…to persuade…to influence… we need to ‘recalibrate’ our belief systems…to remove the garbage / limiting beliefs…open up our true potentials…realise them…overcome inhibitions imprinted / conditioned from birth…

Limiting beliefs are the same as phobias…they stop you doing things that actually work…will work…will improve your sales…your performance…your life…

While you are talking to yourself, planning your response etc, you are NOT listening to your interlocutor…you are NOT attending to them…you are missing cues, communications, opportunities…

Keep your eyes and ears, all your senses, open, very ZEN…attend to reality…to your interlocutor…to all the subtle gestures, accessing cues, hints, verbal and non-verbal signals, expressions…

Think of all the times you wanted to do something, were sure you should do it, but something held you back…go into yourself and feel again what it was that stopped you…limited your action…that gut feeling…feel it intensely…amplify it…attend to it…make it vividly and compellingly real again…really feel it as
you have never felt it before…the ‘thing’, the ‘feeling’, the ‘inhibition’, that stops you doing things for fear of ‘embarrassment’ or ‘looking foolish / silly’ or ‘making a fool of yourself’ etc… Do this so that you can localize where in your head / gut, that feeling / voice comes from…turn up the volume, tighten the knot of fear in your stomach…until you feel ‘enough is enough’…then run the memory backwards from where you felt this, and hear the voice associated with the experience playing backwards, and see yourself and everything else in the memory moving backwards…like playing a movie in reverse…continue until way back before the experience began, the actual incident / situation arose…then hear yourself beginning to laugh inside your head…feeling a tingling all over your body…and a compelling compulsion to do the thing you couldn’t do, while you let the film run forwards again…feel yourself walking through it, listen to yourself…let your subconscious learn…”Not this, THIS”…first you rewind what you don’t want, and let it fade away… then let your mind run the scenarios you WANT to experience…repeat this over and over, trying out different speech variations i.e tempo, tonality, rate…adjust the scenario until it plays out just as you want it to…until it makes you laugh…feeling good all over… In this way you are conditioning your subconscious to want to try different variations / experiment / try and see, because experimentation is fun, pleasant, pleasurable…you are producing a new history of successfully innovating / improvising / experimenting, and feeling good about it, rather than fearful / anxious / with expectations of failure/feeling bad/feeling stupid/feeling embarrassed…thus you are replacing the old imprinting with new imprints, new conditioning…conditioning for a fun, playful approach to life, to sales, to persuasion…

Be sure to focus on the resonance of your voice in all the scenarios you play out…you need to condition your mind to automatically use the most ‘chest’ voice, the most resonant, attractive, persuasive, powerful voice you have … consider the different impact when someone has a deep, chesty, resonant voice, and a falling intonation, when they ‘order’ you to do something, or even calm you, or suggest something…this is a voice congruent with command, trust, strength, confidence etc…it resonates with confidence and is thus more compelling…the hearer automatically resonates with it, and so the speaker manifests their will in the hearer…

Speak each word clearly and discretely, leaving a pause between each individual word so each word is distinct, and you could easily ‘edit’ it…try to pace this tempo to your listeners breathing tempo…use a falling intonation…people respond to this more readily…it is an innate response…a resonant, relaxed, calm, powerful voice sounds certain, confident, compelling. To have this voice use my ‘vocal training guide’ exercises….
Use embedded commands, rather than questions i.e falling intonations…subconsciously people tend to respond to these as subconscious commands…

‘Keep it in mind’!!! Bandler has a black belt in Gestalt therapy…

Don’t speak fast. Listen to see when you’ve got a sale, when they are ready to buy / sign / agree. Rather than raving on and on, and ending up un-selling / un-convincing them…once you have agreement, close the deal / sign the papers…

Your aim is to induce a compelling desire in your interlocutor…so you first need to build up your own excitement / pleasure / belief in the product to a point of intensity that infects everything you say, your every non-verbal communication, and begins to resonate through your entire being, so that they begin resonating sympathetically, and manifest the state you want, the state of ‘yes, where can I sign’, ‘yes, I want one now’, Yes, where can I get this?’… You need to experience, and share, a very passionate, intensely pleasurable state vis a vis what you are ‘selling’…so that they want to feel that way too…and do end up manifesting it…

The word ‘Now’ can link things, in your interlocutor’s mind, that are not connected…

Use words onomatopoetically e.g if you say ‘smooth’ ride…say ‘smoooooth riïde’…

Use NLP every day on YOURSELF…use anchors to fire yourself up each morning, like those days you remember where you just couldn’t wait to get out of bed and start the day…so full of promise…positive expectations…so looking forward to the pleasure you could already taste it…like a puppy…full of life…the joy of living…as a WONNNN-der-ful opportunity…thrilled to be alive…feeling so lucky and fortunate to have this chance of living…

Get all your ducks lined up in a row…exude pleasure / passion / joy / belief / confidence … speak with falling intonation, and a resonant, chesty voice…bathe them in confident resonances…in powerful tonality…so they actively desire what it is you are offering…so they feel what you are making yourself feel…then crank it up…

The decision has to FEEL right to the person…logically, rationally, and EMOTIONALLY…in every way, to avoid buyer’s remorse, and returns…and so they will bring more clients in, generate more business for you by word of mouth etc…
Line up people’s priorities e.g. large car in fuel crisis safer, cheaper parts, costs nothing when not moving, luxurious…etc

Embedded questions elicit responses without verbal answers…e.g. I don’t know if you understood that that was an embedded question’, is an embedded question. I don’t know if you realise how important they can be. That was also an embedded question. You are building up ‘response potential’ like water behind a dam wall. Now, I don’t know if you realise how important this can be. It’s not just that you can build it up with embedded questions, isn’t it? It’s that you can use tag questions, can’t you (¿) to do the same thing.

‘Let’s go by the X 4 bedroom home’…good implant of ‘buy’ using phonological ambiguity’, so when they consciously agree to what they consciously attended to, they have also subconsciously been primed to ‘buy’ it.

‘Innoculate’ clients against future objections which may come up by attending to the key values the person is looking to realise … so that when they stumble upon something they do NOT like, you can override this consideration / objection with reference to the thing you KNOW they LOVE…elicit this information…keep it handy for when it is needed…but don’t let it feel like an interrogation, for every question you ask, offer something yourself to reciprocate…You want to get more details on the things they say they NEED and the product / service / solution MUST have…to elicit further information, take the last word or phrase and reformulated it back as a question e.g. They talk about an extra room as they need an office. So you reply ‘Office?’ with upward intonation, to elicit details e.g. ‘Oh, yes, we do a lot of work from home’…so now you have more info…it can be used later to overcome objections to the price or number of bathrooms e.g. ‘Yes, it does have only 2 bathrooms, but that extra room would make a great office, wouldn’t it? …And if the elicited ‘Office’? lead to a lot of details, about what sort of business they do from home, all this is valuable information for later…to respond to / counter / override any objections that come up…

Listening to the client’s comments prepares you for your next clients’ objections, and positive things about what you are selling that may not have occurred to you to mention, you may not have realised…always take notes (MHR prepare a smart pad with boxes you can check, comments you can add etc…people will reveal all sorts of valuable insights on what people are interested in, value most, object to most, so you can be prepared, and offer these positives to your next clients…things that may never have occurred to you that are of value to the buyers…they are offering you valuable market research data…what motives do different people have for wanting to buy, or what worries do they have? Is there any pattern? What are the pros and cons for these people? Is there a market situation? A consensus opinion? Rumor? Gossip? What are their expectations? Problems? So you can address these in the most favorable way i.e put things in
the most favorable light, overcome objections they don’t actually voice before they even voice them, bring things up they might not have considered that are a positive for you vis a vis selling to them … avoid any ambiguity…avoid them harboring objections that are not valid, by addressing them by the by, as part of your pitch…observing trends in buying behavior, lifestyle choices…why people are interested in particular areas, types of dwellings…what they are really looking for…

You want to find out what is important to THEM…and limit yourself to what THEY want / need … so you’ll avoid ‘un-selling’ something accidentally, and wasting time with explanations and questions that are never going to lead to a sale / closing…’quit while you’re ahead’…

The internal voice saying ‘I want this’ is usually located behind you…so to mimic this internal voice, stand behind the person you want to persuade the ‘you want this, don’t you’… this is easy if you get them to sit down in a chair…you simply walk behind them… as an embedded question, it would be ‘Now I don’t know if you are ready to just buy this and drive it home’…if they nod yes, shut up…don’t ruin it…don’t end up talking them out of it accidentally, by introducing doubts, objections that were not there before you stumbled and bumbled your way, and them, into them…any time they are ready to sign / buy / agree, you should stop … forget what you had planned…the ‘sales process’…the planning is everything, the plan is nothing…

After a sale, suggest they bring friends / tell others about you, using embedded questions like ‘No I don’t know if you will want to tell your friends about me / the great deal you got / our great product / service / etc’…

Often it is another person’s voice saying ‘You don’t deserve this’, ‘You can’t have this’, ‘It is too expensive’ etc…

The most common error is speaking too fast … pitching the product or service too fast and too early in the spiel…What you want to do is generate / manifest a great positive feeling, resonate it, immerse them in it…and then by association they will feel good about your product or service…

MHR this has been Madison Avenues marketing strategy for EVERY product and EVERY service they have EVER marketed…they use vivid, compelling, attractive images, audio, packaging, people, to grant the product / service a ‘transferred attractiveness / appeal / desirability’…they are buying this feeling, but paying for the service / product…subconsciously doing one thing, consciously rationalizing it with the ‘propaganda’ they are offered at the same time e.g ‘this is a quality product/ great value / very desirable’ … but really buying sex appeal, success, status, positive feelings, etc…
Make your presence / attitude / resonance so addictive people will want to be around you…recommend you to their friends…make yourself the ‘commodity’, the ‘drug’…so they WANT to talk to you on the phone, invite you over, visit you at the office…

Speaking from your diaphragm / chest resonates…place your fingers lightly on your nose while you talk, make sure it is NOT resonating, then on your throat, and then totally relax so that these resonances fall lower, into your chest and diaphragm, from your stomach…use my ‘vocal training guide’ to achieve the optimal resonance, breathing, posture for success…

Now do you want to feel good / happy / successful / empowered / confident…is an embedded question…ask lots of such rhetorical questions i.e they don’t require an answer, as the answer is self-evident e.g ‘if everyone was jumping off the harbor bridge would you?’, though that is a negative one…we want YES responses, to set up a ‘yes set’…that will carry along your product / service in its momentum…YES sets are agreeable / feel good / you want to continue feeling good, and the way to do this is to say YES to the product / service…then using a falling intonation, you can embed / implant / imprint subtle subconscious commands …

You like me want the best for yourself…consider the subconscious message even when you say You, like me, want the best for yourself…

Writing notes helps, even if you don’t remember to bring, e.g, your shopping list with you…

Instead of trying to overcome objections, inoculate them before they emerge / come up on the radar, so they are powerless…predict objections…note client’s objections…build up an inventory of likely objections, and de-fuse them before they appear…rather than trying to ‘overcome’ them i.e resistance strengthens them…but avoiding them like Jujitsu lets you use them to your advantage…nip them in the bud…

Bandler would show car buyers two cars that they absolutely would hate, that were totally wrong for them, then show the third car which he always intended selling them…

Install a ‘propulsion’ machine in you that will work at all times…that will push you and pull you towards an objective…

Get their attention, observe to discover their representation systems so you are ‘talking the same language’, so you can package your product / service so it will get through their decision making process, and you can MHR ‘defuse’ objections before they emerge (Bandler uses the term ‘inoculate’)...
Sensitivity training i.e Zen, here, now, sensitive to the slightest expressions / communications / verbal and non, of ‘YES’ and ‘NO’… so you can perceive the objectives before they are consciously expressed…

People consciously or otherwise will play a decision back and forth to see if it ‘fits’ i.e if they can commit to it…decide…i.e X BUT Y…

They say ‘Oh no, I’m just looking’ and you go ‘But you feel that your really want it’ and they go ‘yeh, but it looks really expensive … you have gotten the kinesthetic on your side i.e the emotions / feelings…and they are the most powerful representation system in decision making … (MHR even the kinesthetic of regret i.e of having to part with money, is an emotion i.e the desire to NOT spend is emotion driven … which is why diets fail…people ‘know’ it is bad / high in calories but they WANT it…the pleasure of eating it…overcomes any other representative system unless you have MHR alternate sources of pleasure…to replace it with…or gain pleasure from NOT eating i.e you are attractive, men will ‘pay’ you for it…

MHR Rehearse possible scenarios and the objections that come up…so that when you meet a client you can suggest them, and observe them … listen and watch…for verbal and non-verbal responses, to discover which objections are latently strongest for each person…often people won’t honestly respond…will deny objections e.g ‘I’m not tight / parsimonious / a scrooge’ so will deny the price is the objection…etc…

The peripheral part of your vision notices movement, the phobic part is what you see with…

Use temporal predicates to move any objection to the past…

Robert Dilts was Richard Bandler’s graduate student when Bandler was a Professor…

37 American Legion members died in same hotel…from bacteria that thrive only in air conditioning…Legionnaires disease…

Placebo effect and NLP positive outcomes defined as ‘spontaneous remission’…but placebos for most things almost as effective as the actual products they are tested against…

The word ‘phonetic’ isn’t even fonetic !!!

N.B Bandler Jewish, attacks Saddam Hussein…’we should go back and finish it’ i.e after first Iraq invasion
Even joked about Germans vis a vis ‘Master-card’…

MHR list useful phrases, words, sentences, with multiple meanings, and list the way they could be used e.g to suggest, to connect to repressed sexual impulses, etc…the way Milton uses phrases / words i.e embedded questions, tense shifting as if speaking of fait accompli already finished-now looking back at…etc…make it really clear…most of this ‘research’ has been to clarify the ‘hints’ given…i.e supposedly explained but takes 20 books to work out what the supposed ‘explanation’ was meant to have meant to the utterer / writer…

Practise making voice more varied i.e tonality i.e up and down pitch shifting, like reading a story to kids, more expressive range…using resonant chest / diaphragm voice…vary tempo…be conscious of how you could have changed syntax / punctuation in something someone said / you just said / you plan to say, in a way that can give it the subconscious meaning suitable to your aims…learn how to modify utterances so they become embedded questions / rhetorical questions that are sure to receive a subconscious agreement, to build ‘yes sets’, consciously and subconsciously… then practice different ways of anchoring a state…like Milton, use different pitches to rest of your utterances to anchor the state to that pitch, i.e active different levels e.g subconscious levels Vs merely conscious levels, so communicating, when using that particular pitch, with the subconscious, and activating the desired state, via the subconscious…observe for accessing cues i.e are they imagining what you just suggested?, then immediately ‘anchor’ it … still not clear EXACTLY what this means / meant to mean / how to do it…this is why I have all these notes, to work exactly that out…

Visualise, and feel, the metaphor ‘untwisting the knots in your gut’…

Accessing cues are muscle memory triggers, and indicate which representational systems people are using to think, decide, access memories, construct ideas…eye movements, body posture, gestures, breathing patterns, are all indicators you can ‘read’ with practice…have to calibrate to individual rather than assume they are a ‘type’…this is key…Zen observation…the motive of reading accessing cues is like sorting apples by size and for imperfections…it may not itself be significant…but it trains you to switch off your internal dialogs / musings / assumptions / prejudices / trains of thoughts / automatic spiels / strategies / plans / presumptions etc and actually pay attention to the person…listen…attend to them 100% … and THIS will open your eyes and ears…yield insights into THEIR motivations / needs / wants / ways of being / seeing etc…and allow you to tailor your spiel to them…not force them to endure your ‘one size fits all’ or ‘I guess you are a type Z so I will use spiel Y’…

Anchoring is another word for stimulus response conditioning, it seems…NLP like to act all new and innovative, so made up terms to avoid revealing the source of their inspirations…not quite as bad as Scientology demonizing Freud…it is
about triggering responses…if the trigger is external, it is something you can control i.e. YOU determine the trigger e.g. ring a bell, higher pitch of voice, touch on the shoulder, faster rate of breathing, a particular memory / image / word / tone of voice…like Pavlov and his dogs…the aim is to ‘trigger’ it easily and quickly, and often covertly, i.e. without them knowing you have implanted / imprinted / conditioned a particular response, the activation of some internal mental / emotional state, with a particular trigger e.g. a subtle touch on the shoulder, speaking to them from behind (if they are sitting for example this is easy), a higher pitch of voice, … so they do not realise you have ‘anchored’ anything to this trigger…it is subconscious…their subconscious responds to it, while their conscious mind is unaware that they are being triggered e.g. manipulated … though can implant / condition triggers yourself…i.e. remove old associations and implant new ones…so you are constantly triggered to be more positive, enthusiastic, etc about your goals, aims, and no longer triggered by past emotional traumatic associations to behave in sub-optimal ways e.g. anger management, depression, over eating, excessive alcohol or other drug use, smoking etc…so same old stimulus now triggers a healthy, positive, productive response…and can find new triggers for states you WANT to access / experience e.g. love, security, acceptance, approval, self-esteem, confidence, courage…

We need to be flexible, and have many options, and always innovating, to find ways to elicit states / responses from people which we want / desire / need e.g in persuasion, sales, education, training, therapy etc…

Cycles often occur in closed groups e.g. families, or work groups, or among friends, in which one person’s behavior triggers a response, which triggers a response i.e observe to see what triggers are in play, and what response they are eliciting…e.g. how each is interpreting the other, in a patterned way…‘he always leaves his socks laying around’ interpreted as meaning ‘he does not respect / love / appreciate / listen to me’…‘nagging’ is a typical case…one person seeking to communicate, but other experiences it as ‘nagging’…just triggers cycles of reaction between the interlocutors…need to ‘step out of the loop’ and give participants insights into their own non-conscious behaviors, subconscious triggers, assumptions (often wrong), and conscious reasoning / interpretation…can usually observe an interaction ‘blow up’ in a typical pattern…’He always…She just can’t NOT…’ that prevent constructive, generative interactions i.e. solutions…just lead to conflict / argument / bad feelings / get nowhere / breakdowns in communication / relationships…destructive interactions … do more damage than good…people start avoiding interactions…and triggered more and more easily…until nothing good left…just automatic cycles of ‘switching off’ to ‘nagging’ and resentment / ill-will / association of other people with negative feelings, avoidance of them / interaction…if power involved the weaker may just pretend to go along to keep the more powerful ‘off their back’, while looking for a better job / partner / way
out / exit plan…if cannot defy openly, can sabotage, perform to lowest level, passive aggression, sarcasm, and often escalates to violence when pushed too far…most homicides are people who know each other, and ‘escalations’ from relatively minor conflicts…i.e triggers ‘blow up’ the interaction, amplify the emotions, in negative cycle of increasing hostility / bitterness / aggression / fear / hatred / malice until hit breaking point and explode in physical violence, often murder…from simple ‘argument’…‘see red’…‘blinded by anger’…MHR mostly because people won’t admit when they are wrong…were wrong…think they can just deny it…and move on…but it is a submerged iceberg waiting for the hull of their ship, just when they think things are going smoothly, and they have ‘gotten away with’ whatever they are denying…can be very simple…the need to ‘validation’ of ‘reality’ is very great…

Chunking another NLP re-write of ‘levels of abstraction’, where you take people from more concrete levels of examples, to more abstract levels, and back and forth, iterating between the two, until there is shared comprehension vs some vague notions…too concrete is limited to specific examples / cases, and thus less useful…too general is too vague and hard to apply…the ideal is a universal, abstract e.g ‘truth, justice, and beauty’, but danger is everyone has their own ideas about what these terms mean e.g exclusivism of Mosaic / Judaic / Semitic ethics Vs what Buddha meant, and what most ‘Buddhists’ actually do…so concrete examples necessary at all times, referring to a universal general abstract…i.e constant re-iteration… ‘chunking laterally’ means finding more cases of the same level of abstraction e.g more concrete examples, more universal principles…the concrete is specific, and would lead to huge numbers of laws, but these often required in people of little intellectual ability…ideal is universal abstract concept, but so few will actually agree on the meaning of it, and it is so easy for e.g the Democratic people’s republics of North Korea, the former East Germany etc…to call any system anything you like e.g ADL calling historical correctionists ‘revisionists’ and ‘hate criminals’ and ‘deniers’, when it is the ADL that is spreading the defamation, lies, hate speech, and denying reality…

Congruence is the most important factor in all this…you cannot just repeat a mantra and have it manifest…you cannot visualize yourself thin, and have this manifest…you cannot cure your illness if, on subconscious levels, this illness is performing some desired function e.g an excuse to avoid something, including life itself…a great actor is believable in any role they can ‘pull off’, because they believe they ARE that person, like Tom Cruise believes he IS Tom Cruise, though he can only PLAY Tom Cruise, the one character…real actors immerse themselves in their ‘back-story’ and truly believe they have had those experiences that made the character what they are, in the story, and thus project that character on every level, with every wood, gesture, posture, etc…reinforcing what is ideally a well written script, and with all the appropriate props e.g other actors responses as if THEY believed it…the scenery, special effects etc…with
lots of editing of anything ‘NOT congruent’ … like editing a song to make the performer appear to be a much more talented / able musician / singer than they are…like editing your facebook posts to appear much more successful and happy than you are…editing your resume…etc… everything has to line up to appear ‘congruent’…your / their beliefs, strategies, tactics, assumptions, visualisations, REAL desires / aspirations / values and finally behavior e.g striving, discipline, working at it, sacrificing for it, working through problems, overcoming obstacles…all these have to be congruent to be ‘happy’ or ‘self-realised’…most ‘successful’ people are NOT happy or self-realised…for they are successful at something their heart is not really invested in…so sabotage their success…even commit suicide at the height of their apparent success…if being fat is a solution to another problem, you will end up ‘succeeding’ at remaining fat, and therefore at solving THAT problem, and appear to ‘fail’ at losing weight / keeping your weight under control…if you don’t really WANT to be married, you will end up cheating, being a bad partner, and SUCCEEDING at your REAL desire of being single again…OR if you simply value casual sex more than a long term relationship, you will ‘succeed’ at ‘failing’ at marriage, and blaming either your partner, or yourself…when in reality you SUCCEEDED at your REAL and higher priority motivation / objective / aim… OR if you eat for pleasure, and don’t find a form of pleasure and comfort that contains no calories, to replace eating with, you will either end up miserable and slim, or fall back to food for pleasure and comfort, and most likely ‘yo-yo’ oscillate between the two…and if you value your ‘problem’ e.g obesity / illness / symptom as a great way to distract you from even WORSE problems, as a way to make your problems / your world, shrink down to a more manageable size, then you will never find a ‘cure’, because that would represent FAILURE i.e you would then maybe find yourself very attractive, but having to face an entire universe of OTHER problems you have NO way of dealing with…focus on your particular symptom/problem is a great way to feel ‘in control’…and lets you focus on a blessed future where you are slim, and all your problems are over…but once you ARE slim, you realise there are an overwhelming number of OTHER problems you are POWERLESS to do anything about…they are outside your control, compared to simply controlling your eating…many people simply fear having nothing else to do…they have organised their lives around their ‘problem’…it gives them places to go (AA meetings, weight loss meetings), things to talk about (everyone loves to complain about their own problems, and without these topics, what would most people talk about?), manageable solutions / problems / future successes to focus on…like a hobby…a locus of social activity…Religion itself is such a ‘problem’ e.g ‘avoiding eternal damnation’, and ‘sin’, offers ‘problems’ to focus on, a future ‘solution’ to look forward to, a social locus, a meeting place every week… MHR we need alternatives to bars, discos, churches, AA, sports groups i.e a reason people can get dressed up, and hang out together, in groups, to get out of the house, and socialize, without the need to first become an alcoholic, have a problem, succumb to dogma etc…but what would be the ‘motive’ i.e
‘payoff’…e.g bars is alcohol / oblivion and hope for sex, religion is ‘salvation and redemption’, …

So congruence requires self-knowledge, insights, honesty with self about what you REALLY want from life…rather than meeting other people’s expectations / assumptions about what SHOULD make you happy…lots of people with everything we are told SHOULD make them happy are miserable…despressed…despairing…so we are shocked when THEY commit suicide and assume they must have had some disease…some brain malfunction…some brain chemistry imbalance…and many people are happy to pretend this is true, to sell them chemicals that they promise will ‘correct’ this imbalance or ‘cure’ this disease…when the fact is that people are miserable for reasons…often real, concrete ones, and many times illusory ones e.g the idea that they MUST do X, and be Y, and it is BAD to want Z, and be Q, that they are ‘guilty of sin’, that they are ‘unworthy of happiness’, that they ‘must serve someone else’s agenda e.g Vatican, Military, Parents, partners, friends, peers…and of course ‘successful’ people end up with that greatest threat to contentment and happiness ‘leisure time’ to worry, compare their successes to someone they know has MORE whatever, and to sit and think on the absurdity of life…while the ‘poor’ person is too busy surviving to be able to ‘afford’ becoming depressed, and worry about things out of their control…they have clear objectives, of paying the bills, getting work…though I would never suggest ‘busy therapy’ i.e the traditional Protestant work ethic…the ‘work makes free’…Germanic ethic…the ‘just keep busy and take your mind off the bigger problems’ that ‘work addicts’ are the best example of…

Congruence is integrity…another word for it…the reason why a poor philosopher is so envied by the rich and powerful, ‘success’…why Alexander would say ‘If I were not Alexander, I would be Diogenes’. You can live in a barrel, masturbate, and own nothing, and still be the envy of the world’s youngest, most successful person. Go figure! There is a reason why vagrants and hobos have often been brutally victimized by police, and in the U.S put to forced labor, often for many years, simply for being ‘cheerful, free, and happy’, while owning nothing, living rough, and being, in the eyes of the world ‘total failures’…

The reason MOST people will NOT manifest what they seek to manifest, is that they lack congruence. They do not REALLY want it that bad, so bad that they are willing to sacrifice for it, work hard for it, take risks for it, and sacrifice other things for it…and it is NOT really what they want…and it is really beyond their ability to attain, in this life…though, that said, one in a thousand WILL achieve it…the ‘problem’ being that, if you average out the ‘benefits’ this one in a thousand achieved, over the 1000 who strove for it, sacrificed for it, gave up everything for it, risked everything for it, and died without ever realising it, you
would have less than the ‘average’ benefits the ‘average’, lazy, undisciplined, relaxed, present-preference person enjoyed…

You can only truly RESONATE when you have integrity. When you have CONGRUENCE. Consider a pitch key for tuning musical instruments. If you added just a little alloy to the metal, or changed the shape just enough, so that it no longer maintained its original integrity, whole-ness, congruence, it would no longer ‘ring true’ to the pitch desired.

Empathetic resonance, where car engines explode and bridges self-destruct, occurs because they have too much congruence i.e the engine is made of the same materials throughout, and the bridge the same...so that once you start one part of it resonating to a particular frequency, e.g from vibration of operation, or in the case of the bridge, the oscillations of the wind, the entire structure begins vibrating / oscillating / resonating at the same frequency, and at this point, any CHANGE in the vibration / frequency will totally dis-integrate the structure...it will fall apart...literally...throwing bits and pieces all over the place...and even a maintenance of that frequency will build up standing waves...upperpartials/harmonics, that will dis-integrate the structure...returning it to the ‘parts’ it was constructed of, often instantaneously, and with great destructive force...MHR which is it? Standing waves or like my novel, the change???

Future pacing is another NLP re-write for ‘rehearsal’ or ‘self-fulfilling prophecy visualisation’ of a desired, future, behavior / situation / state / condition / interaction... typical psycho-cybernetic training...rehearse the desired state mentally, so vividly it produces muscle memory ...basis of most sports applications of positive visualization,...

Installation is NLP’s way of referring to actually having a new set of behaviors / thoughts / beliefs become natural, normal, habitual...’installing’ new habits, ways of being and seeing...over-writing former imprints / conditioning / brain washing / stimulus-response programming etc...

Kinesthetic refers to all body sensations, feelings, emotional and phsycial, tactile impressions e.g touch...

Meta Model is just Grinder and Bandler’s way of observing implicit assumptions people are making, but not expressing. What they do NOT say can be made explicit, using logical deductions, based on what the full and complete expression would be, if they expressed it...so bringing implicit / tacit / non-conscious assumptions out in the open where they can be challenged...e.g deletions, generalisations, distortions...

Everything is metaphor to the Zen practitioner...the early inspiration for NLP came from the use of stories, parables, and analogies by Milton Erickson, to great
effect i.e he had a real talent for speaking to a person’s sub-conscious via such metaphors...and of course anyone who has ever written a ‘moral tale’ has consciously decided to sneak a meaningful, significant, educational, ethical, moral teaching into the general public by wrapping it in a story...thus attempting to persuade people indirectly, who either would never read the philosophy if presented as philosophy, or who would consciously object, and refuse the message, if given explicitly...Consider all the great novels and the insights and lessons they seek to communicate, from Jesus to Hesse, to my own novels.

Pacing is the NLP term for mirroring / matching to avoid references to the source of the concept, namely psycho-cybernetics...like re-naming the god-man Jesus, to avoid the fact that the entire content of the Christian religion is ‘borrowed’ from earlier religions, the most contemporaneous link being the Mithraic religion, with its god-man Mithra. You mirror / match / pace to gain rapport, so that you can then begin to subtly ‘lead’ them into states / beliefs / etc of your choosing...e.g from anger to calm, from bored to excited, from disbelief to belief, to overcoming objections etc...

Predicates are simply descriptive words, used to describe a subject, object, or its actions...simply adjectives describing things e.g bright, colorful...adverbs describing actions e.g fast, slow...and the actions (verbs) themselves i.e what is happening, what something / someone is doing... NLP observes that people tend to have a favored / habitual way of representing their impressions / thoughts / ideas, and for making decisions e.g visual, auditory, kinesthetic, lists of criteria, feelings, emotions... how people process the incoming data / information / impressions and use this incoming stream to form beliefs, come to decisions, make judgements, and ‘experience’ the world around them, including their own processing of this stream of impressions...

Secondary gain is a generic term for benefits that an otherwise dysfunctional/destructive / problematic etc behavior provide, and which thus may be motivating that behavior, or at least preventing that behavior from being managed / changed / eliminated / controlled. E.g smoking to control appetite / weight, and ‘look successful, cool, in control etc...

Surface structure is simply what people say. Deep structure refers to all the unsaid things implicit / unsaid in what they did say.

NLP uses the term Synesthesia in its own way, to refer to images / sounds / smells / etc evoking / triggering emotions, recollections, memories, trance states etc i.e one representation system producing a stimulus-response in another...smell is very powerful in evoking memories of past states / experiences...very powerful in terms of choice of romantic / sex partners for this reason...often subliminal / sub-conscious, and beyond rational interrogation / reason...and retrospectively post rationalized on other grounds i.e some
‘explanation’ given with ‘rational’ content i.e ‘reasons’ given which in reality bore no influence on the decision… because the conscious mind is unaware of the true motive for the action / decision / motivation / behavior…

Transderivational search is simply interrogation of explicit utterance for its implicit, real, deeper meanings i.e deep structure vs surface structure…

Ecology in NLP refers to wholistic integrity i.e congruence of parts with each other… secondary gains one example of lack of ecological congruence / integrity i.e conflicts of interest / objectives / desires / aims / strategies / tactics / short and long term / reason and feeling…

Well-formedness Conditions in NLP refers to an outcome stated in positives i.e what desired, that is chosen by, and acted upon, by the individual, is sensory based i.e can be tested objectively, and is ecologically congruent with the person’s noetic structure …MHR

MHR NLP goes so far to sound ‘new’ that it uses terms like ‘presuppositions’ instead of ‘assumptions’…
Addenda vii of Persuasion Engineering

When you write a computer program, you have to be very specific. VERY specific. And very careful that what you have written is EXACTLY what you want to happen. Even before the programmer can start programing, other people have to work out the basic definitions for every possible input from a keyboard, and so on. You have to start at a very basic level and define everything as a particular number in binary e.g assign the letter ‘A’ on a keyboard the number 0110010, etc. Everything at this level is ‘written’ in ‘machine code’. Just a bunch of zero’s and ones. This machine code is the language of the computer. Few people speak it. Instead they interface / interact with it using programming languages that use a specific type of English. A ‘programming language’ like C++, for example. Other people have written the ‘translation’ software that translates C++ and so on into the machine code, the true language of zeros and ones, that the computer ‘speaks’, ‘reads’, and ‘understands’, to speak very loosely.

For here is the rub. The computer ‘understands’ nothing. It merely ‘computes’. It just ‘does’ what it is ‘told’. It doesn’t even really hear or see. It just ‘reacts’ like a stimulus response machine, to the inputted zeros and ones.

This is probably the best analogy for the sub-conscious part of our mental operations. What people call the ‘sub-conscious’ mind. It computes. It does not ‘think’ rationally, reasonably, and reflectively.

If you program your subconscious to define killing yourself for some vague thing called ‘honor’ or ‘your nation’, it will accept this definition without wondering if it is ‘logical’ or ‘rational’, or ‘reasonable’. Once it has had this definition ‘implanted’, ‘coded’, ‘written’, it will carry out the action. It will actually set about generating the conditions, situations, motivations, emotions, etc, required to realise the act of ‘dieing for honor / the nation’.

When you go to program a computer, you have to be very precise. Vague, ambiguous, unclear commands can ‘crash’ your computer, interfere with its operations, conflict with other operations, and so on.
A computer programmer would never write a line of code instructing the computer to ‘try’ to do something.

Imagine that. What would it do to the computer program? You are telling it to ‘try’ to do something. Not to DO it. In other words you are programming it to deliberately FAIL to do something. That is implicit. Tacit. Unwritten. There is no ‘binary situation’ for ‘trying’. You either do, 1, or don’t, 0. You are telling it to both DO and DON’T DO, at the same time. Simultaneously. That might work at some quantum levels of indeterminacy, but at the working level of the world you either DO or DO NOT. You cannot both do and do not. Or can you?

In fact THAT is exactly what most of us do, with our minds. We program contradictory, incompatible objectives. Do and Do Not. We Sabotage all our own desires, our own success at acheiving the objectives and states and situations and conditions we desire at some level, because at some other level we have been pre-programmed, or ambiently concurrently programmed, to desire the opposite, or something incompatible.

If you say to yourself ‘I will try to stop smoking / exercise more / eat healthier / stop taking other drugs like alcohol or crack / spend more time with my kids / show my partner that I love them more often etc…you are writing ‘buggy code’. Your system will crash. You will have sabotaged your supposed objective.

What your computer / sub-conscious hears is ‘try’ means ‘fail to succeed’. You can Do. You can Not Do. ‘Try’ means Not Do, in the binary world of computing, and your sub-conscious.

First we may have to convince you that most of the things you do are done subconsciously, without deliberate, conscious, effort. Like breathing. You do most of it without deliberate thought, though you can also take control, and consciously breathe, deeply, slowly, consciously. Same goes for walking. You can end up ‘square gaiting’ because you ‘think too hard about walking’. Everything you do you can do more or less consciously. You can eat watching television, without paying attention to what you are doing. Often without tasting the food. Losing all contact with the feedback your stomach is sending saying ‘enough, enough’.

You have to start thinking in Binary. Yes No. Either Or. What do I REALLY want? What are my priorities? Compromise is a meaningless concept in the binary world. What you can do, though, is optimalise. Break down global desires into actual concrete chunks of experiences. So instead of having to say Yes or No to some huge, wieldly option, and thus facing the HUGE opportunity costs i.e saying Yes to X means losing all of Y, you can chose Yes or No from a large number of sub-parts that made up X and Y. So when you now say ‘No’ to that drink at the bar, the opportunity cost is not ‘Never being able to drink every
again’, but simply ‘no’ to that particular drink. Or ‘No’ to that handbag, and Yes to financial independence. Not ‘I will never spend another cent on anything I want but do not strictly need, and live like scrooge, so your inheritors can enjoy the fruits of your hard work, sacrifice, risk, and self-denial. THAT opportunity cost is what leads to so many ‘binary people’. i.e the extremes of behavior we see around us. People seem either to become spendthrift credit card addicts overburdened with debts, or scrooges. They either become alcoholics or tea totallers. They either become party animals, or live sterile lives with no fun at all. They adopt either / or for a a HUGE GLOBAL objective…whereas if you can break down that objective into smaller units, you can say Yes and No, with very small opportunity costs…you can buy THAT handbag, but not THOSE shoes…rather than end up either in debt, or living a sterile life not really worth working for…

But more simply, you cannot program a computer with ‘try’. You either do or do not. 0 or 1. Current or no current.

That said, maybe the brain operates at quantum levels which allow for ‘try’.

But experience shows that people who just ‘try’ to do something implicitly are not ‘doing’ it. People who ‘just do it’, as the Buddhist saying goes, actually are doing it.

So stop ‘trying’ to lose weight, etc, and start ‘doing’ it. Stop ‘trying’ to stop smoking. And simply start NOT DOING it. etc

Consider language the programming tool that it is. Muscle memory and association are other programming tools. We can program consciously, practicing carefully the optimal ‘way’ to do something, after having modelled someone with that skill or ability or competence. That is the best way. But most of us, until the advent of the uncensored internet (which is now being heavily censored to deprive you of the best intellectual role models), have / had a very limited population of potential ‘models’, and maybe access to a few badly conceived and even worse realised training materials, like books and videos. So we learned how to play soccer from the local volunteer coach or friends at school, we learned our religion from our parents and local priests, we learned a bunch of limiting beliefs deliberately imprinted on us by educators and television propaganda, and accidentally by peers, colleagues, friends, family etc…if you were working class you learned that it is evil to be ambitious to succeed at anything other than sports, and even worse, to succeed at anything other than sports, and make other ‘failures’ feel bad about themselves and their lesser good
fortune a.k.a Marxism / class conflict / envy / post-code envy etc…We learn to fail, or to hide our light under a bushel, to avoid ‘harming’ others, or making them feel bad about not having tried as hard as us…the ‘thing’ to do is go out drinking, watch sport on t.v, give up, and complain about how unfair life is, and put all the blame on our ‘betters’ for ‘rigging the system’ against us…and validating the only ‘just’ means of wealth, namely lotto wins, and sports glory.

We forget the many months it took us to learn the basic co-ordination required to pick up an object, to feed ourselves, to walk. During these months complex pathways were being formed in the brain, as nerve impulses were co-ordinated, feedback loops imprinted, and so on. We did a lot of the work consciously. Like when learning to drive. But once we have it ‘down’, we can do these things almost without conscious thought. And in fact none of us can ‘consciously’ alter our brain chemistry, our neural pathways, our nervous system. Not DIRECTLY. We interface with our body via the sub-conscious. The sub-conscious performs the tasks of digestion, as much as it allows us to perform complex physical actions required for sports, music, gymnastics etc.

**But we can take control of our sub-conscious, once we learn how to program it. And how it has been programmed with limiting beliefs, propaganda, ‘noble’ lies, malicious lies, accidental errors, and deliberate errors.**

One of the ‘problems’ becomes apparent when you view the subconscious as a tool. As a computer. One that has some ‘hard-wired’ values such as ‘hunger bad’, ‘pain bad’, ‘food good’, ‘survival good’, ‘sex good’, but otherwise is a ‘blank slate’ that is just waiting to be written on. Greedily seeking and absorbing definitions, protocols, programs, as if you computer WANTED to work, to learn, to experience.

So it is vulnerable to being badly programmed with lots of ‘junk’ programs, viruses, Trojan horses, etc, just like your own computer. If you just download any and everything, as a child does, without discrimination, you end up with a real mess. The mess we all get mired it over the first decades of our lives, and which very few find a way out of. Most don’t ever even consider that TROONATNOOR might be anything other than the mess of often conflicting, inconsistent ‘beliefs’ and ‘ideas’ and ‘knowledge’, a.k.a programs and definitions, that they have absorbed. The most important are the earliest, when the mind is the most keen and desperate for ‘understanding’ of how to survive and prosper. Few people change much after age 5, in terms of their ‘core’ beliefs. Then comes all the other propaganda from religion, government, schools, mass media. Depending on your circumstances you will ‘inherit’ different programs e.g ‘sense of entitlement’ if you were fortunate, or a sense of ‘guilt’ and ‘unworthiness’ if you are typical working poor, working class, etc…If you think
it is random, and mere coincidental, its time to start thinking ‘out of the box’ you have become packaged in.

The worst thing is just how easy it is to ‘fool’ anyone. To program their subconscious, their computer, with lies. With errors. With faulty, buggy programs. With inferior scripts. So you can take a healthy, happy, thriving, creative person, and ‘teach’ them, ‘imprint’ on them, that they are doomed to sickness, ill health, dissatisfaction, unhappiness, dullness, boredom, failure, servitude. That the best they can hope for is to find a more considerate master to use them as means to THEIR ends, and thus avoid too much suffering, and if lucky, die in their sleep. They may then be released from this purgatory called ‘life’ to enjoy some future, vague, less violent, less painful existence with whatever ‘gods’ they have been programmed to believe in.

The great thing is that we can RE-program the subconscious mind just like the computer it is. We can undo all the damage done deliberately, maliciously, and with the best intentions, by parents, life, family, peers, teachers, education systems, institutions, religions, and re-write our entire ‘life scripts’. We can re-program our sub-conscious computer.

Compare a compute to the sub-conscious, and the conscious to the programmers.

The computer, as it is now, has no intentions that have not been hard-programmed by the B.I.O.S, or the programs that are added to the bios. The Operating System. Then the various programs like the one I am using to write this. The programs used to decode various data into movies, music, and so on.

Few of us know how to program a computer. Even fewer of us know the simple techniques required to program your mind. Luckily it is much easier to program your mind. It is much more user friendly. Almost as if some annunaki (they who came from the heavens) had designed it to be that way. Or as if our pre-selves designed these ‘experience engines’ to be satisfying, enjoyable, fun, easy to operate etc.

If our minds didn’t come with a user guide, then this book can be seen as the user guide of all user guides. Based on every user guide to the mind ever written.

The advantage a computer programmer has over me is that the machines he works with have no ‘affects’. No emotions. They do not ‘resist’ updates. Updated definitions of TROONATNOOR. Whereas humans fight tooth and nail to keep the most unproductive, erroneous, maliciously inspired, counter-productive, etc definitions, as they are emotionally invested in them.

This EMOTIONAL INVESTMENT is the HUGEST barrier to becoming saner, more creative, healthier etc…
What do things ‘grow’ from, if not seeds? If ‘soil’ is E-M soup, then all that determines its qualities is its vibrational frequency / resonant frequency…so you can ‘seed’ anything by actively ‘transmitting’ on that frequency i.e. mind converts/encodes thoughts / desires / ideas into vibrational frequencies that start the EM soup to vibrating…to produce the ‘harvest’ of that seed i.e. a form corresponding to the thought-waves…like planting a seed, seeding a cloud, seeding crystals i.e. the catalyst is your projected resonating field…which is all ‘atoms’ are, layers of fields of different vibrational energy / frequency… they ‘collapse’ into states when we observe them / open the box with the cat / put a camera next to the 2 slits…but while no-one is ‘watching’ or ‘experiencing’ them i.e. interacting with them, they are potentials…with both valencies latent…don’t collapse to one potential until observed…then appear to be ‘real’ and ‘fixed’ and have particular qualities…

Resonate to reality you want…find things currently in life that resonate with this reality…vividly mentally be the new reality i.e. feel as if it is already real…focus on it… and everything congruent with it in your life now…become vibrational match to what want, not what have, in this way…don’t resonate to what don’t like / don’t have / don’t want…finite generative power of consciousness…pretending is way to raise vibrational frequency to reality you want to manifest…attend to those things want…those things congruent with what want…like attracts like…enjoy the things you have that you want and which are congruent with what want e.g. more / better of same…so authentic now vibration…raise tone to match higher / better version of reality you desire…no ‘distance’ between what want and what have…merely match frequency / resonance of what want…here and now…focus only on what similar in current situation to what want…vividly imagine it and become it…be it…as if it is already real…you will attract people / resources / energy that match this new vibrational orientation / frequency resonating at…enjoy process…life is eternal generative process…resonate to positive feelings / desires and not what don’t want / like in current life…enjoy process joyfully…spirit of playfulness…eternity means constant new objectives / goals to manifest…so actual object of desire that you wish to manifest not end in
itself...insatiable...imagine current car is car of dreams, be the driver of that car...make that reality real...experience it...be it...find what do have in current car that matches what want in desired car, so begin resonating at frequency/reality of that new car...line up vibrational signal and keep it there...like tuning radio/t.v...you will be tuned into it...will attract all convergent resources/people...current life is the one you are resonating/tuned into...you are generating it/manifesting it...don’t compare progress to others...play your own game...focus on own intention...any negativity/envy/jealousy will change your vibrational frequency i.e you will resonate at these, and lose your own direction/agenda...consciousness generates all...it is generative source...infinite...ecologically sound as can increase/manifest abundance in own life without negative externalities to others...increase total level of abundance...world mirrors out thoughts and feelings...we manifest our emotions/desires/thoughts i.e self-fulfilling prophecy...raising tone to imagined reality manifests/generates it...wrong to blame situation for producing feelings/emotions/tone when in reality other way around...setbacks are learning opportunities/feedback vs failures/obstacles...malice vs stupidity?...why resonate to unwanted things?...reinforce them and generate more/reproduce them...don’t become habituated to negative resonances...reject them, focus on positive, build it up by reinforcement...failure is manifestation of expectations/self fulfilling...no need to fail at all...but if think you need to, will...action cycles must come after have reoriented vibrations/are already resonating in line with reality want to manifest i.e to the things already have similar to it...ignore anything that does not match with what want, and act only when feel inspired i.e when action is aligned already i.e you are already aligned...and can manifest what want...resonating out what want, so reality empathically resonates with it, and thus ‘matter’ and ‘energy’ now generate a reality convergent/congruent with it...i.e treat ‘MEST’ as what it is, electromagnetic soup, that resonates empathically with the vibrations you send out, vibrate at, resonate at...like a catalyst that tells the soup what to become...your mind already is being that reality i.e vividly imagining it and being it, as if it already is, and this tells the soup how to organise into MEST...without any risk of harm to anyone/anything...universe infinite potential...will manifest/become what you project/program it to become...like nano-tech program or 5D printer...

Like unconsciousness, universal law doesn’t judge, or distinguish between desires and fears...they are just thoughts that universe will resonate to, and manifest...i.e no notion of good or bad...just stuff...will manifest whatever you are resonating to/at i.e vibrational tone...what is imagined vividly becomes real...we are infinite energy that chose this life to evolve/expand/become higher expression of infinite life force...heroic mission/goal...mind limited to this sphere...ignorance part of process...mind not attuned to
universal laws, has own internal logic which rejects what divergent with its experience … attachment to social reality…can step out of it, into unknown…
sense of loss as move away i.e loneliness…as move towards new, higher frequencies / tone / reality…can become aware of different bandwidths outside usual 5 senses…like tuning into radio waves, wi-fi… every event is manifestation of your own projection into universe i.e whatever you project is returned, without censor, judgement, valuation i.e send out fear, get what fear, send out happiness, get what makes happy…fear/hate produces war as war consistent with fear and hate … outer world is physical manifestation of your internal reality … if you ARE successful in own mind, will become successful…if vivid 100% convinced of reality, it will become real…universal law neutral … if you feel unworthy, guilty, undeserving, will resonate at these frequencies and you will be ‘punished’ i.e convergence and correspondence…you order bad luck and universe delivers it…reject what don’t want, resonate with what do…universe will match … this resonation will manifest itself in this plane…i.e how resonate internally, on that plane, will manifest in this plane…can only manifest for yourself...everyone else has own journey to make, not for you to ‘wish good for them’…energy has no valency…it is potential to manifest what you imagine … karmic energy is what you resonate e.g malice, jealousy, envy, violence projected Vs others is manifest as own suffering...we are responsible for only own evolution...adversity connects us with true self … suffering product of own internal reality i.e is manifestation of it…energy pure potential…the resonances / frequencies / vibrations you project onto it, shape it into forms and ‘realities’ you will experience…act as if what desire already real…just a matter of time for universal law to deliver it, from totally unexpected sources…enjoy it as fait accompli…have faith…certainty…thoughts create reality…reject doubt i.e dissociate as minds ignorance … focus on certainty…seek validation of miracle i.e proof that it is coming…is manifesting…you will be tuning self to higher tone realities...your reality will resonate at same frequency as you do…vividly imagine what want in full detail, all submodalities...see outcome desire…feel as if already attained…

N.B your object is the expression of a process, not the end in itself…it is a representation of the things associated with it…a gestalt...the impression you ascribe / interpret / construct may be erroneous … in normal language you visualize a sports car, associating that image with your hearts desire, then the universe produces the actual hearts desire in a form unexpected to you…but it is the actual projection, and you should accept what you get in this way, as being the actual, direct hearts desire / benefit you we’re seeking, but which your limited mind envisioned / constructed as a sports car…probably you wanted a certain feeling of success, approval, acceptance, freedom, power, status, and the sports car came to embody these to your limited consciousness…so take the gifts you receive i.e manifest as being
truer representations…do not idolize the resonance i.e limit it to some particular form … and define anything other than that form as a failure of the universe to manifest your true desires… and note that you may not be aware of what you are truly projecting i.e resonating i.e programming i.e ‘ordering’ … you must be careful of worldly temporal leaders / propagandists / false prophets / marketers who insist ‘X’ means happiness, power, joy, freedom, approval, acceptance, love … a very narrow ‘X’…including war as peace, noble lies as truth, deception as leadership, fake news as information, propaganda as higher truth, … so you end up projecting war, violence, force, lies, deception … and that is what you get…when you need to project truth, freedom, peace, noble truths …so the victory in a preemptive war you get reflected back to you / produced by the universe, will be a manifestation of a problem and not a solution i.e war, continual war, eternal war, and all the lies, propaganda, loss of freedom, pain, misery, suffering, insecurity etc… mass media of government and war industries project fear, get you to resonate at level of fear, and produce violence, war, terrorism, literally…they carry out acts of terror on their own people as a ‘noble’ necessity to preempt them into accepting war, which the leaders often imagine is real, and coming i.e preemptive wars of defence…because their minds are full of fear, they project that into the ir acts, manifestations, manifest fear in your minds, which manifests ‘defensive’ actions / wars / patriot acts / and even acts of terror upon your own people ‘for the greater good’ of your own people i.e sacrifice 3000 lives in New York for the good of the free world’…mental delusions they experience as real…though never trust YOU to see it THEIR way, so keep secret as ‘noble’ lies…

Move towards goal, ignore apparent ‘time’ it takes…focus on goal, not how long it is taking…time is illusion…affirm confidence by setting modest goals to establish compelling belief in the power of universe to manifest …

Reject anything in mind that contradicts your goals / beliefs i.e reject mind as limited, and NOT your SELF…affirm your goals, beliefs in manifestation…even as mind doubts…focus on self…own evolution…resonate on the highest levels you chose, not the lower ones your mind is often tricked into / confused / obfuscated / distorted / conditioned etc into…

Energize your shield by vividly brightening it,…resonate your body as high as possible…visualize this faster resonance…vibration…as increasing brightness, vividness, reality, hyper-reality…represent it as a higher tone of light, sound…and amplify it…each morning, before important events etc…remind self that manifestations not always obvious, takes subjective time to accumulate / manifest i.e new patterns forming / rebuilding … can
take years of subjective time...ignore chronological / subjective time ...
gradually move out of prison, gate is open, but habituated to prison life...like elephant tied with string...conditioning...

Must trust world...have faith that all is for the best...even when can’t see from limited perspective...

Free will? Universe cannot manifest what we do not project ... resonate ... otherwise could just instantly transform all life...MHR karma as this ‘nudging’... have to learn to accept world as perfect as it is, for what it there to do i.e its purpose, and not focus on changing world, but on manifesting higher resonances...focus on your own resonances...what you will...personal evolution...express this by helping anyone who seeks your help / notices you are different / better ... don’t try to force anyone to follow your path...let your manifest behaviors / emotions / life attract them...

N.B conditioned to expect everything has cost, must struggle, suffer...not true...reality simple...vividly ‘realise’ something in mind will manifest it in world...for subjective good or bad...

We are limitless, our potential limitless...don’t judge world as it appears...to our limited consciousness...

Aboriginal ‘dream time’ i.e ‘the dreaming’ of this world as it is...nominalized as past completed action, but it is process...we are in process of dreaming our reality right now...so ‘dream’ a better one...continue your ‘dreaming’ of your reality...which is what ‘creativity’ is...like Hume’s Pegasus...any writer produces a reality in their mind, then in our minds...

MHR statistical misleading i.e in ancient times, average life expectancy very low, as so few survived infancy, childhood...but once survived to adulthood, had same life expectancy as today...any adult with access to adequate food, and not killed in war, lived as long, if not longer, and with greater vitality, than today e.g Socrates, so many famous people...though most drank too much, ate too much, too many other drugs, poor lifestyle choices for long life, and died around age 60.

God force? Anthropomorphized as emotional being. Force is just neutral power that resonates with consciousness, to produce what that consciousness projects. Your happiness / sadness is subjective, and the force has no subjective awareness of it...simply resonates like tuning fork to same frequency you resonate at...we collectively resonate at? ... we are all like different strings on piano, resonate at different frequencies...and thus ‘produce’ different tones e.g sad and deep, or happy and high...though high
and low merely frequencies, and it is our representation i.e subjective ‘experience’ of ‘happy’ and ‘sad’… pleasure and pain related to organism’s survival and reproduction...

People still want to personify this force … as a being… either angry possessive jealous god of wrath, or caring, nurturing, of love…when it is energy / force / potential … E-M soup…infinite potential i.e can be vibrated at infinite range of frequencies and thus produce infinite variety / range of ‘realities’… We are tuned via ‘senses’ to very narrow bandwidths of very narrow range of frequencies…. infinite potential in and around us… not perceived by us… we imagine the world we perceive is the entire world… and the ‘cause effect’, input-output nature is the only way to ‘manifest’… but really have no idea how things manifest, how apparent objects constructed i.e Hume… if we free ourselves of definitions / limiting beliefs, we can manifest anything we desire… simply project the reality, make it real to our mind, vividly construct the model…it will begin becoming … becoming part of your reality...

Don’t limit own goodness i.e define self as unworthy, bad, which is what religion is all about… control… feel deserving… entitled… allow everyone to be entitled and deserving...

Attend to what manifesting i.e what receiving, what is materializing, and receive it with joy, as affirmation of principle of manifestation...

You are as much god as anything else. Increase your own power, affluence, excess, strength, health, so can be the change in the world, ‘help’ others who ask for it.

We are discrete? Individuals? Alone?

Consider how artist / designer allows their ‘creation’ to constantly inform their process i.e start out with a particular or general conception of the final product, but adapt to the product as it evolves… a constant iteration… constantly adjusting… so that the final product may be very different to the conception that mobilized / motivated the process at the start, and even during the process… Zen openness to letting the process generate its own outcomes… the plan is nothing, the planning is everything… and so our dream of a sports car is of value in setting us off on a journey, starting a process, investing the energy and time etc in the process, rather than as an end in itself… and the process it sets in motion may lead to a much more valuable, and unexpected, outcome … which itself will merely be part of a further process… or part of the animating game of life… i.e the motive for life… to propel us into life… the incentive / motive / propellant / drive …
Universal law as ‘mirror’ that reflects your intentions...as vivid and specific as you express it...e.g specific desire projected is returned as manifestation of the ‘reality’ you have in your mind...thus you create your reality in your consciousness, and the universal law / god force manifests it in your ‘external’ reality...so be specific...helps organise unconscious / universal law i.e plan any outcome required specifying what you want it to look like, be, provide, do, function as ... e.g a blueprint...takes time to draw it...then update as begin building it i.e allow process to inform you...

Don’t get frustrated that it takes time...as time is eternal...endless supply...of NOW...resonate them NOW...expect them NOW, at any moment, the readiness is all...if it not be now, yet it will be...wait with expectancy...knowing it is about to appear...certainty...reject any negativity or ‘complaining’ or ‘worrying’ about it...they will confuse and contaminate your blueprint...miss up your mix...add conflicting / disharmonious notes to your resonating frequencies...projecting...so get a mess manifested...rather than what you really want...

Creative visualization...convince self future state is already real...mind cannot distinguish between ‘external reality impressions’ and vivid impressions you actively construct in your minds eye, yourself...

No invention existed in world before existed already in someone’s mind...as a whole...Pegasus of Hume... but initial idea evolved...and continues to involve in other’s minds i.e we adapt earlier inventions in new ways...improve, evolve...

Forgive self. Accept self. Focus on positives, and resonate them bigger / larger/wider/brighter/more associated i.e associate with the positive, focus on, and express this positive, as existing manifestation of what want to continue manifesting...unconditional love for self... acceptance...so project unconditional love and acceptance...and vice versa... self-criticism / negativity projects and manifests in other’s reactions...we are on road to ideal self...let the best of you set your direction...and seek ways to strengthen these...focus on these...project all positive...manifest more of them, more of the like...like attracts like...reproduces more of like...extends like...builds on...

Set goals just one step ahead, so your really can believe in it...so real...so compelling...break down huge goals into steps...be flexible in changing goals as move on...use goal as motivator to move forward, to move i.e psycho-cybernetics requires purposely action to feel O.K...otherwise fall over...hard to stand still for long, will fall over...system builds up feedback
loops, end up losing homeostasis i.e blood stops flowing, pass out even…momentum easier to maintain than stasis…

MHR consider how I demotivate self NOT to go out, dress well, approach women i.e vividly construct rejection scenario, or failure of follow-through etc…so give up…

Never fixate on original first desire e.g to achieve X, when X was just a representation, the best your conscious mind could come up with that that time…a propulsion system…so if don’t get X, but something else, focus on what is in what you got that is like what you want more of the same /similar of…

During day, focus on things you like, and want more of, or more of the like i.e all the good things in the world…focus on them…attend to them…let them raise your tone…resonate with these good things…so you will match their frequency and project more of it…manifest more of it…i.e unconscious only understands X, never NOT X, so focus on Xi.e the good…so you tell unconscious that is what you want…!!!

Be the change you want to see in the world e.g kindness,…when you are kind, you resonate kindness…and when you appreciate other’s kindness you resonate at that higher tone…and tell unconscious ‘I want more kindness in my life’…be kinder to yourself and others and animals…focus on the kindnesses you have received and not the unkindnessess, so unconscious / universe knows what you want it to manifest

Reframe all thoughts in positive i.e what DO want, and visualize what DO want, and attend to / focus on / perceive what DO want throughout the day, and ignore / reject / don’t attend to / don’t dwell on / don’t get stuck on, any thoughts / images etc of what you do NOT want…

Build faith that you will always have enough money etc, so don’t fear, don’t hoard etc

Higher frequency is representation of higher tone / level of being / higher consciousness / positive state of being…more powerful / positive / generative…rather than literal, though it may be literal, no need to fixate on actual frequency … it is just representation …

Don’t resist negative thought, or feel frustrated / failure at having had it…accept it, then move in positive direction … never repress…express in some way, then move onto focus on something positive…reframe by letting bad remind you of the good you usually have, that loss meant you had, and can have again, that bad choice is exception to otherwise good…that failure
means usually succeed...or has taught you what not to do next time i.e learning experience...

Emotions mirror vibrational frequency i.e analog. representation of...so feel good, don't indulge in luxury of feeling bad / negative i.e dwelling on bad experiences / observations...to manifest best for you and others, have to feel good, maintain this good feeling

Thoughts can be represented as vibrations i.e electrical signals of certain wavelength, and frequency...which they literally are / may be...so positive thoughts equals positive vibrational frequency / tone / level...

Re: representation Vs 'objective reality'...Capsaysum is the compound in chillies that receptors on the tongue, and rest of the body, interpret as 'heat'...if you eat, you get the same 'flight or fight' response as if threatened by fire...adrenaline and endorphins released, after sensation of burning...brain 'thinks' you are putting fire in your mouth...that it is on fire...as receptors match / bind with Capsaysum molecules in chillies etc...in other words a 'harmless' compound is represented as 'fire' by the receptors / nervous system i.e it encodes capsaysum as fire, transmits to brain, brain decodes 'fire'...producing the typical sensations of burning which most people hate, but the addictive reward of hits of adrenaline and an endorphin 'rush'...i.e 'feel good hormone'...powerful pain killers which induce rush, and pervasive sense of happiness...brains pain centers go into overdrive i.e represent chillies as fire, pain...pain is subjective experience of Capsaysum...produced by mind...and NOT by chillies i.e NO fire / heat...but result is sensation of 'burning' i.e 'false impression of heat / fire / burning...which brain responds to as if it is real fire'...milk has casein which neutralizes capsaysum...surrounds capsasyum molecules i.e binds to them, naturally attracted to coat the...now they can't bind with / latch onto tryp V 1 receptors in body...just flows over, no impact, like any other liquid...so keep milk handy if eating spicy food...different people with different tolerances...tolerance builds up...though normally intense pain...and at some level of concentration unbearable to everyone...depending on Scoville unit rating of food's i.e intensity / concentration of Capsaysum in food...i.e more 'fiery' it is perceived as...eyes water, nose runs, mucous flows, can feel like throwing up...heart beats harder and faster, pupils dilate, breathe deeper, arteries widen, sending flood of blood to muscles...adrenaline and endorphins...i.e body's naturally self-produced pain killers...brain responds to chillies as to fire...assumes it is really burning...those who love chillies treat it like riding roller coaster, thrill seeking, seeking stimulation, sado-masochism, rush of excitement...feeding brains desire for stimulation...intense pain endured
for this rush...MHR question of any real health impacts?...I thought it was vitamin C? ...

Alcohol is poison...toxic...passes through blood-brain barrier i.e water tight membrane that usually keeps out liquids...Crystal Meth binds with pleasure center receptors in brain, which would normally respond to pro-survival / reproduction inputs i.e encourage us to repeat / seek out those inputs e.g sex, food...immediately addictive...like sex and food, first 'hit' of it most powerful, and spend rest of life seeking to reproduce that high i.e 'chasing the dragon'...

Enzyme Amylase in saliva breaks down starches to release sugars inside it...Peruvian alcohol...chew starch...even white bread will start to taste sweet if leave in mouth long enough...conversions starch to sugar...then expose to yeast in air...lands on chewed yuka, feeds on sugar, multiplies i.e process of fermentation...yeast digests sugars, and converts into CO2 and alcohol molecules...which are smaller than H20, so pass through water-tight blood brain barrier... CO2 makes bread rise, alcohol evaporates, in bread yeast fermentation...once alcohol content reaches about 6%, slows process i.e starts killing off yeast...this is why beer maximum alcohol around 6%...

Alcohol effects neurotransmitter / chemical messenger called Gabba, that regulates brains activity...acts like a break on brain cell firing...alcohol interferes with this so more we drink, more receptive brain cells become to Gabba already present...this has dampening effects on different brain areas...first blocks Gabba receptors on parts of brain most sensitive to Gabba, e.g. areas that control our inhibitions, level of excitement, sense of liberation...so first effects are sense of freedom, power, lack of inhibitions, feelings of excitement...next suppresses parts of brain that regulate emotions, the motor control regions, the memory...blind drunk leaves only most basic parts of brain with least Gabba receptors unaffected...so keep breathing even when unconscious...though too much can block even these i.e death...though documentary failed to mention this, implying you would just go unconscious...when people die all the time from binge drinking, as direct result i.e go into coma, shut down, stop breathing.

We have both an aversion of, fear of, and desire to try out / curiosity, of the new.

Peru has coffee, cheap stuff, cocoa, cocaine, coca, abundant cheap fruits and veges, soy, friendly people, climates and historical / UFO related i.e Sirius stuff...is coastal and rainforest and dry...great location to travel to U.S or South or Central America...uses U.S dollar ... speaks Spanish...so ideal next destination... 'rent' small room to store all my stuff, maintain an address / registration for Estonian residency, and find cheapest flight date ... have
passport...work on this book ... can bring cheap light notebook and in ear headphones and mobile with. Can pick up guitar there...have backpack already...start learning Spanish once there... save lots of Spanish learning materials to hard drive before leaving...and on phone...along with all my books/ music/ videos...camera in phone...get cheap simcard there...do a bit of research, then just see where it takes me...nothing to lose, nothing here...but can return...this time not lose all my stuff...can try to sell before leave...???

Manipulation

Attempts to influence conformity and conversion...i.e difference between private and public belief is conformity, but conversion requires the person actually change their belief i.e 1984 room 101 ... they’ve been studying all sorts of clinical studies, but little practical application / conclusions possible...real life situations much greater affects / imperatives / costs / benefits...some susceptibility appears demonstrated i.e compliance with group think...in studies...in real life can be life and death, career killer...HOLOCAUST AGREEMENT IS BEST EXAMPLE of conformity pressures...and even conversion i.e children ‘experimented’ on with Holocaust ... we all grow up taking it for granted that holocaust is ‘proven’...that there is no dissent...that there is consensus...that it is a given...Judges in Germany asset it as definitive dogma...fact...beyond question...Clinical studies tried to influence perceptions of participants e.g accomplices to study pretending to smell a scent, where no scent existed, or insist shorter line longer or same length, etc...with some success...though conditions in studies very unnatural...lots of contradictory results and mostly ‘anecdotal’ support for ‘shifting’ / convergence / consensus i.e impact of other people’s opinions / group on individual...i.e actually changing other people’s perceptions via deceptive descriptions...apparent agreement of others that your perceptions are erroneous, do you ‘go along to get along’, or even ‘see’ ‘experience’ the reality differently to converge with the group? Public agreement Vs private divergence? Or actually ‘perceive’ things differently, to conform to groups apparent perception? And what if everyone pretending? As in T vol I? Greater influence of accomplice if appear as ‘expert’ status, dressed well, presented as ‘highly intelligent’, successful on prior tasks given, high prestige, presented as ‘elected leader’, the greater the certainty, the less the conversion ... the greater the ambiguity / uncertainty, the greater the susceptibility...further from direct examination, the greater the susceptibility...absence of objective frame of reference i.e ability to ‘check’ / measure, increases susceptibility...factual matters and personal perceptions less susceptible...expression of social values more susceptible...publicly expressed attitudes susceptible more than actual conversion to attitude / belief...if ‘group
consensus’ pretended, individual more susceptible…conformity effects…shifting of perception / expression of opinion towards assume consensus position i.e faked…more likely for participants to volunteer if large numbers of other people in group are volunteering i.e naive Vs accomplices…

Shift from private opinion to reports by others … consistent uniform divergence pressures more effective than inconsistent, non-uniform pressure i.e complete agreement / consensus of ‘accomplices’…over various tasks…

Self-definition can be ‘shifted’ in same way e.g self-esteem, confidence in own ability etc…

Peer pressure i.e acquaintances more influential than strangers, unless stranger introduced as expert, or activity defined as ‘intelligence test’ and stranger defined as ‘highly intelligent’…

Greater readiness to shift under certain conditions?

Susceptibility to shifting…children influence other children, and younger children, more than adults do…acquaintances vs strangers…higher status than subject gives consistently higher shifting to that person…

Past public disclosure lead to resistance to shift i.e greater commitment to previous position…Anonymity allows greater shifting…public commitment leads to resistance to influence…i.e once publicly commit, less prone to shift…MHR lose face / appear indecisive

MHR All hypnosis is role playing…offers client new options i.e an ‘alibi’ to overcome inhibitions / limits they consider expected of them / manly / moral / upright / ethical / culturally conditioned / socially desirable / status related / dignity related etc…can allow prisoner of war to give up information to save own life / reduce own suffering, and thus betray friends, nation, unit etc… as an alibi, like people use alcohol as an excuse for bad behavior, or even just uninhibited / letting their guard down behavior…an alibi ‘oh I was drunk’ … socially acceptable alibi for sleeping with someone wouldn’t otherwise, and them not being able to expect anything i.e one night stand, i.e no obligations / no loss of face … allows to do what really want i.e avoid torture / get privileges / access pleasure / satisfaction, even commit destructive / malicious acts, and can blame on alcohol…or phenobarbital…etc…don’t have to admit ‘I wanted to avoid torture / pain/ prison / isolation/ room 101 and so I ‘sold out’, can claim socially acceptable alibi ‘it was the drugs’…sorry, but I had no control…alcohol typically present in rape, assault, anti-social behavior (and majority of ‘accidents’)...
So point about therapeutic trance is it offers people greater freedom than they would otherwise feel, to experiment, to act differently to conscious limiting values / beliefs / norms / culture / expectations etc… it is a role … like role of hangman, or soldier, or judge, not natural situations but people do very unusual / excessive things while occupying this ‘role’ i.e not ‘self’, not ‘personal’… things they would normally not be allowed, or allow self e.g fire bombing of entire cities of mothers, children, old people…and ‘hynotised’ or ‘in trance’ is another example,…allows person to ‘save face’, to ‘bypass their normal boundaries / inhibitions / noetic structures / what they ‘allow’ themselves to feel and think i.e under trance / stage hypnotist, they feel outside the usual judgements of self and others… so can do what REALLY wish they could normally i.e overcome normal inhibitions of conditioning / social expectations / socialization… which is why military ‘training’ necessary in most cases before most people would ever bomb cities, shoot people etc… they have to become immersed in a new role…one with different values, allowances, expectations, freedoms, limits… in case of trance it is about dissolving the usual limiting beliefs, and offering up new horizons, new options, ‘allowing’ new ways of defining, being, and seeing… new values… opens up closed system… allows flexibility… more choices… can displace / replace rigid conformity to some learned / conditioned reflexes / ‘stratagies’ / habits / muscle memory / knee-jerk reactions / rigid inhibitions / rigid rules / dogmas / ‘musts’ / idols … nominalisations that have become reified as rules, musts, dogmas, gods, superstitions, phobias, allergies, psycho-somatic symptoms …

If you constantly think of what you are NOT, what you can NOT do, what you are BAD at, and at bad experiences, and failures, then you will have low self-esteem. You will have very limiting beliefs. If you focus on what you CAN do, what you are GOOD at, at positive experiences and successes, you will become the best you can be. Happiness / contentment is not about being better than anyone else at anything, in any way, but about being YOU. You are unique. Special. Be the best YOU you can be. THAT will bring you satisfaction. Stop comparing yourselves to others, especially ‘fake’ others, and the ‘chocolate side of others they let you see’. Compare yourself to how you used to be, how much better you are at all manner of things, how you are moving forward, growing, becoming smarter, wiser, kinder, more compassionate, more competent etc

Define mistakes / errors as ‘learning’ experiences. Focus on what you learned, the benefit, not what the cost was. Don’t linger, over-indulge, or wallow in negative memories like a masochist. Get over it. Learn your lesson. It was feedback. Use the feedback. No live in the here and now.
Teachers with little motivation or competence will blame the student ‘you are no good at math, focus on English’. Instead of explaining to me what was expected in an Essay, a teacher told me I was no good at writing, and should focus on math. At least the worst my English teacher said was that I ‘enjoy’ singing. Of course implicit in this is that I couldn’t sing. I found it impossible to sing out of key with all the other kids. Can I sing? That isn’t the point. Whether you think you can, or think you can’t, you will tend to be right. I focused on learning vocal training exercises etc to improve my singing, and found a teacher who was willing to explain what was expected in an essay. Funny that it was a history essay I got bad grades on, given the propaganda level I was expected to reproduce! I topped English. I topped Economics. I dropped History because the teacher, who was fired soon after, was totally inept or totally unmotivated to teach anything.

Experiences accompanied by strong emotional affects e.g pain, pleasure, fear, joy, happiness, shock, awe etc tend to ‘stick’ more.

Doctor Wilder Penfield, a neurosurgeon at McGill University in Montreal, Canada, showed that persons could be made to relive past events simply by electrically stimulating certain brain cells. The scenes were so vivid, subjects actually thought they were happening all over again.

“Subjects feel the same emotions that were generated by the original event, and are aware of forming the same opinions and interpretations, whether true or false, as they did when they first had the experience. Thus the memory evoked by the stimulation of brain cells is not simply a visual or auditory representation of a past event, but an integral reproduction of everything the subject saw, heard, felt and understood at the time.”

When we worry, we start by thinking about some unpleasant incident that is likely to recur in the near future. It could be an event like the loss of a loved one, or being laid off at work, a letter we received containing bad news, an interview which did not go well, etc.

The more we think about the event, the more details it evokes, and the more real the event becomes. We soon start feeling the negative emotions associated with it - tension, disappointment, anguish, and so on. As Maltz remarked, there is no effort of will involved - the cause of our anxiety is simply the result of our uncontrolled imagination.

By forming a positive image of themselves, by imagining themselves as being happy and fulfilled, people actually create the possibility of their own happiness by triggering positive reactions in their organism.

Sick people who can visualize themselves being healed, who really want to break out of the cycle of illness, recover more quickly than others. The important thing
is that they get better not because they want to, but because they can actually see themselves as healthy, happy individuals.

Creativity works in much the same way - after considering a problem from all possible angles you have to relax and let it simmer for awhile, until a solution appears. Artists, inventors and other creative people talk about something called inspiration - new ideas are always there, all you need is some kind of mechanism to help you tune into them. Musicians often claim that they simply hear a new tune while walking along the street or daydreaming on a park bench. Mathematicians have flashes of inspiration that allow them to see the solution to a complex problem in their mind, almost as if it were written out in front of them.

Modern man, on the other hand, tends to rely solely on rational thought to solve problems. The myth of reason and logic is so strong, so overwhelming, it has all but buried our faculties of intuition and creativity. We become anxious when we can’t find an immediate solution to a problem, when our rational mind seems to let us down.

Consider who is more likely to succeed / look good. The person who believes that they are going to fail, they are no good at anything, are ugly, and so consider any investment in themselves, or their appearance, a waste of time, effort, money, and, assuming failure, is not willing to take any risks. Or the one who believes they can succeed if they work hard at it, invest the time, energy, and commitment, and take the risks? Who makes an effort to look good, investing in nice clothes, personal grooming, getting their hair styled regularly?

An anchor elicits / triggers a whole set of responses, in different representation systems. E.g watching someone bite into a juicy lemon. Red lights and stop signs hopefully trigger an automatic response. Soldiers are conditioned to give salutes if they see officer insignia on a person.

We represent that narrow bandwidth of the electro-magnetic spectrum we call ‘light’, ‘visually’. We ‘see’ it. Starting at a wavelengths ABOVE around 7000 angstroms, which most people perceive as ‘red’. Wavelengths below this are represented as ‘warmth’ or ‘heat’. Hence Infra-red devices convert heat signatures into images that we can see, allowing us ‘night vision’, and to ‘see through walls’. Different colors stimulate nervous and glandular systems, affecting functions like respiration, heartbeat, and blood pressure, differently.

Red: Symbol of fire, blood, conquest and virility, red has a stimulating effect. In photography labs, workers who spent long hours under red light developed psychological problems which disappeared when the red light was replaced with its complimentary color, green. Red is often a favorite color of children, very active persons, and people living in primitive cultures.
Orange: Linked to emotion, orange is less mentally stimulating than red. Being a gentler color, it is more intimate and inviting.

Yellow: The warm luminosity of yellow invokes light and wealth, both spiritual and material. It symbolizes daily activity - body and mind are active, but not inflamed as is the case with red.

Green: Green can be warm or cold, depending on whether it contains more yellow or blue. Situated in the middle of the spectrum, it is the color of balance, and symbolizes peace. Green has a soothing effect on the nervous system, and more green and blue are found in nature than any other color. In the Islamic faith green is the symbol of spiritual awareness, and is used extensively to decorate flags, tiles, drapery, etc.

At the other end of the spectrum are the so-called cold colors, which have a soothing, balancing effect on the organism. Closest to ultraviolet light are purple, blue and blue-green, all of which slow down heartbeat and reduce blood pressure. As the physical body relaxes, it becomes easier for the mind to concentrate or meditate.

Blue: Being the coldest color, blue suggests a state of calm, rest and relaxation. Therapists use blue, associated with night and sleep, to alleviate hyperactivity.

Purple: When composed primarily of blue, purple symbolizes the union of man with the divine. A lot of purple is used by the Catholic Church (for vestments, images, statues, etc.) and by other mystical orders.

Purple’s combined calming and stimulating effect tends to induce an almost hypnotic state of mind which is appropriate for spiritual endeavors. Interestingly enough, 75% of adolescents claim that purple is their favorite color, perhaps because purple is also associated with imagination, which most teenagers have a lot of.

So as you can see, the spectrum of colors starting with red and moving towards purple have an increasingly relaxing, calming effect on the mind. This makes the rainbow image an excellent anchor / trigger to induce the Alpha / meditative / creative / calm-alert / concentrated / focused / attentive / Zen state.

At first it may take some practice to vividly visualize some colors. Start by recalling something of that color. Orange fire. Red traffic lights. Blue skies. Aqua-marine water. Bright yellow-green grass. After a while you will be able to vividly visualize every color without effort, and gradually change your state by moving up or down the color spectrum.
Soon you will be notice more colors around you, and be able to move from, for example, yellow to green, going through those shades of green, like new spring grass, that contain a high amount of yellow, and then moving into aqua marines before entering the blues. This is Zen. Start noticing more. Let reality impress itself on you. Be a passive observer. Actually start looking and seeing. You will be surprised at how many interesting and beautiful impressions the most mundane places can offer.

Reverse the process when it is time to gradually return to a more active / outward focused attention, state. “I felt like I had just been sleeping for hours.” “After it was over I felt totally relaxed.” “I came out of it slowly and gently.” “When I got back to the surface I felt completely relaxed.” “I started coming back up slowly, moving faster and faster.” “I can hear and see better than before.” “I felt like a diver coming up from the ocean floor at a thousand miles an hour.” “I feel great, but I don’t feel like running around or doing anything special, just being quiet.”

Our traditional education system constantly demands that students concentrate and remember things, without teaching them how to concentrate, how to be more attentive and how to remember what they need to know. Instead of stimulating their faculties of visualization and concentration, they give them Ritalin, and punish them for being kids, and not drugged out, bored to death, neurotic, adults.

We also know that certain cerebral centers, like the one that controls language, remain atrophied if they are not developed in time. In other words, if children are not taught to speak by a certain age, they will remain more or less mute for the rest of their lives. Consider the damage we are doing kids. The potential left undeveloped, and thus lost, even before they had a chance at life.

The Alpha Seminar. Everyone is told to stand up, then stretch out on the carpet, using the pillows and blankets provided to make themselves comfortable. When everyone has settled down, the instructor begins talking in a deep, slow sophronic monotone: “Get ready to explore your inner levels of consciousness… start by visualizing the color red…” etc.

The first exercise is designed to help participants enter the alpha state. You visualize colors, and feel your body getting heavier and heavier. You count down from 10 to 1, feeling an increasing sense of well being. Your mind remains aware while your body is completely relaxed and calm. You learn to control your inner monologue, the thoughts that are constantly running through your mind, often to your own detriment, thoughts like “I’m so stupid…” or “I know I’ll screw things up again…” or “I’ll never be able to…” and so on. You’ll learn how to condition your inner monologue so that it can work for your benefit, replacing negative subconscious programming with positive thoughts like “I am attaining my goals…” or “My concentration is improving…” Since the subconscious is particularly receptive while you are in the alpha state, the process of replacing
negative conditioning with positive conditioning takes much less time, and is doubly effective.

Next come the actual mental dynamics exercises. You learn to focus on some goal you hope to attain, or on some memory that evokes the person you would like to become, or develop a signpost that will immediately bring your goal to mind.

After the mental dynamics exercises, the instructor helps you emerge gradually from the alpha state. You slowly become conscious of your body, regaining control of your movements until you are back in your ordinary state of consciousness. You feel wonderfully relaxed, in harmony with yourself, and with life.

After a short break, those who want to talk about their experiences while in the alpha state are given an opportunity to do so. A dialog is set up between the instructor, and the new and former participants. Then a second instructor takes over and leads the group through another set of exercises, the whole process being repeated fifteen times over the course of the weekend.

The Chinese proverb says, “The lantern of experience illuminates only the person carrying it.”

An ancient Hindu legend:

“There was a time when all people were gods. But they abused their divine status so much that Brahma, supreme among all the gods, decided to deprive them of their divine power and hide it in a place where they’d never be able to find it. He finally chose ‘within themselves’, as that would be the last place they would look.

The trick to ‘para-normal’ action is to believe you are already using it. No, ‘trying’. Just ‘doing’. Believe you have done what you intended. As in Scientology, travelling ‘out of body’ and reporting on weather conditions etc.

ESP supposedly easier with emotions and images, as these are more fundamental, and existed in our ‘lizard brains’, where our other ‘magical’ powers are expected to reside i.e the powers we ‘lost’ when we added the more ‘rational’, and thus ‘limiting’ beliefs.

REM stands for rapid eye movement. Researchers found that during certain phases of sleep, people’s eyes start fluttering very rapidly even though they remain closed. Movements of the eyeballs can be horizontal or vertical. In addition, researchers found that REM sleep is characterized by the production of more alpha and beta waves by the brain, while ordinary sleep produces more
theta and delta waves (having a slower frequency). This may sound like a paradox, since beta waves are characteristic of the waking state, while alpha waves are usually produced during a state between waking and sleep.

It was soon discovered that REM phases corresponded to periods of intense dream activity. Dement and Kletman showed that by waking people up immediately following a REM phase, it was possible to obtain very clear and precise accounts of their dreams. Waking people up when they were not in a REM phase often left them with no recollection of their dreams whatsoever. Based on these findings, it was easy to jump to the conclusion that people dream only during REM phases. Further study, however, proved that this is not the case. Whole or fragmented dreams, disjointed images and thoughts, feelings and bits of memories fill our minds continually while we sleep, even between REM phases.

During a normal night’s sleep you start by emitting alpha waves, during that period of reverie that precedes actual sleep. If you are dead tired, this phase may only last a few seconds. Under normal circumstances, however, it lasts about ten minutes. Your brain gradually starts producing waves with a slower wavelength - mainly theta and delta waves. Then, about every 82 minutes, you start producing faster waves, for a period that gradually increases in duration - about 5 to 10 minutes during the early part of sleep, and up to half an hour during the latter part. These are your REM phases. As the hours go by, you start emerging from deep sleep, so that by the time you wake up you are almost in a waking state.

Edison was in the habit of making a list of problems he wanted to solve before going to bed. Every morning he’d wake up and harvest the fruit of the night’s ideas and inventions. We can all set the paranormal and creative mechanisms we need to solve problems while we dream in motion. All you have to do is: 1. Visualize the final result of whatever you are seeking. 2. While in the alpha state, repeat the following: “Tonight my mind will solve the problem of … When I wake up tomorrow morning I will remember the solution, either in the form of a dream, or as an inspiration that will come to me sometime during the day.”

Drink half a glass of water at night just before going to bed, and think, “This is all I have to do to find the solution I’m looking for.” Next morning when you wake up, drink the rest of the water and think, “This is all I have to do to remember the solution I dreamed.” The second half glass of water will be the ‘anchor’ that is ‘triggered’, to aid your recall of the dream.

Program you waking times before nodding off, telling yourself ‘I will wake up refreshed and alert, calm, and enthusiastic for the day, at 8 a.m’ etc.
If a formulation is unacceptable or impossible to carry out, or if you really do not believe it can be carried out, it won’t work. Worse, you will manifest the thing you REALLY subconsciously believe you deserve / will get.

We are all inhibited in one way or another, and our rational minds often block out potentially damaging parts of a message in order to protect our self image. Things get even more complicated when we realize that our subconscious mind often uses symbols to try and express those very problems which cause us to form inhibitions.

During the alpha state just before falling asleep, add the following formulation: “I will understand my dream when I wake up. With each passing day it will become easier for me to understand my dreams.”

Occult rituals rely on symbols to change our state of mind, and help us attain altered states of consciousness. They often work on subconscious associations.

But symbolism changes over time, and many of the symbols used by ancient occult masters like the Egyptian Hermes Trismegistus, founder of the ‘hermetic’ sciences, or Hebrew Cabalists, are no longer comprehensible to us.

Dreams And How To Control Them written by Saint-Denis in 1867 about lucid dreaming, including its potential for therapeutic application. It took Saint-Denis two hundred and seven days to be able to deliberately lucid dream at will.

In Latin the word aura referred to breath. To mystics, aura represents a kind of halo of light, enveloping the body, visible only to those who have been taught how to see it. Others explain that aura is an emanation of the energy field that gives us life, and call it the subtle or astral body.

A Russian researcher, S.D. Kirlian, aided by his wife Valentina, worked with what he called ‘bioluminescence’ to the early detection of diseases through an analysis of the colors of a patient’s ‘aura’, which he recorded using his ‘Kirlian’ photographic device. Intense bioluminescent activity surrounds every living entity, while dead entities produce no bioluminescence. Long before the disease manifested itself in the living organism, it showed up as a clear pattern in the organism’s energy field.

Further, Kirlian believed in the existence of an of ‘energy body’, composed of ‘bioplasm’, which is closely linked to the physical body. If you take a leaf and cut away a small part, the energy image emitted by the leaf remains intact, although the part that was amputated become less bright. This phantom image of the missing part of the leaf confirms the theory of an energy body. The energy centers designated in acupuncture diagrams correspond more or less
exactly to the dense areas of light, called ‘sunspots,’ visible in Kirlian photographs.

People’s auras seems to be just as closely related to their psychological state of mind as to their physical condition. An unbalanced, nervous person will have a narrow, jagged aura, while a person who is well balanced and relaxed will emit a bright, broad aura.

An aura’s color is an indication of a person’s emotional state. Blue signifies a state of calm, concentrated relaxation. Red is an indication of violent emotions. Red and blue are the two basic color that comprise all auras. Distractions, worries or fears that arise after a period of calm will appear as red splotches mixed with the predominant blue. Anger will produce a large red aura (the expression ‘to see red’ is appropriate in this context). Red is also indicative of some imbalance in the organism, or of a physical wound. It is interesting to note that clairvoyants often perceive psychological problems as a reddish glow.

The word anesthesia is derived from the Greek ‘a’ meaning ‘not’ and ‘naisthesis’ meaning sensing. The phenomenon of body separation a.k.a astral travelling occurs when ordinary consciousness and its corresponding sense perceptions have been altered. It is as if the exteriorization of awareness can only take place when ordinary sensations are no longer being transmitted along their usual pathways.

Persons who lose their physical sight often develop an extra-retinal sense of color, meaning they perceive colors, but not with their eyes.

We have more than twenty senses, including a sense of direction, balance, weight, and so on.

Observers in audience often enter trance, and follow suggestions, including post-hypnotic suggestions. Hypnosis may occur spontaneously to avoid stress situations, including during interrogations i.e unwitting.

Hypnotic analgesia i.e surgery conducted using hypnosis as only pain relief / analgesic… not generalizable i.e only relatively few can enter deep enough trance…

Maintain a calm, soothing tone of voice as you read the formulations. When you are familiar with the text, you might want to record it so it can be played back while you are in the alpha state.

Get comfortable, either sitting down or lying on your back, and close your eyes. I don’t want you to try and fall asleep. I am telling you to close your eyes so you can concentrate without being distracted by anything you might see. Now tell
yourself that everything I am going to say will be recorded by your brain, engraved in your mind. And that, without your knowing it, without any effort on your part, your organism and your entire being will obey what your subconscious mind tells you to do.

The first thing I am going to tell you is that every day, three times a day, morning, noon and evening, at mealtimes, you will feel hungry. You will experience the pleasant sensation of feeling slightly hungry and think, “Mm, I’d love to have something to eat!” And you will eat, savoring every mouthful, enjoying your food immensely, without eating too much. You’ll be careful to chew your food well, transforming it into a soft paste in your mouth before you swallow. This will help you digest well, so that you will feel absolutely no discomfort in your stomach or intestines afterwards, no pain or heartburn, no discomfort at all. Your body will digest and assimilate the food you ingest perfectly, using all the nutrients it contains to renew your supply of blood, muscles, energy - in short, to regenerate life.

Because you digest your food well, your intestines will function normally and effectively. Every morning, shortly after you wake up, you will feel the need to go to the bathroom. Your bowel movements will be normal and satisfying, and you won’t need the help of any kind of medication or artificial stimulant.

Every night, from the moment you want to go to sleep to the moment you wake up in the morning, you will be able to sleep deeply and calmly, without having any bad dreams. When you wake up in the morning you will feel fresh and fully rested, ready to enjoy the day.

If you sometimes feel sad or depressed, if you sometimes get bored or worry too much, you can rest assured that you won’t have those kinds of feelings any more. Instead of feeling sad or depressed, instead of worrying, you will feel happy, very happy, for no reason at all, in the same way that you may have felt sad for no reason from time to time. From now on you’ll feel happy and joyous inside. And even if you have real cause to worry or feel sad, you won’t fall into depression. You will do what has to be done, nourished by the joy and happiness of being alive.

If you sometimes became impatient or angry in the past, you won’t any more. From now on you will have infinite patience, you’ll always be able to control your anger. You will no longer be bothered by the things that used to irritate or upset you in the past.

If you sometimes find yourself thinking terrible things, things that are unhealthy for you, fears, phobias, temptations, hateful thoughts, rest assured that these kinds of thoughts will arise less and less frequently in your mind. And whenever they do, they will melt away, like clouds dissolving in a clear sky, until they disappear.
completely. All your useless, harmful thoughts will simply vanish, just like a
dream when you awaken.

All your bodily organs are functioning well. Your heart is beating normally,
blood is circulating freely through your body, nourishing all your cells. Your
lungs are functioning normally, as are your stomach, liver, gall bladder, kidneys,
and bladder. If one of your organs happens to be functioning abnormally at the
moment, rest assured that the problem will get better day by day, and in the very
near future, disappear altogether, so that all your organs can function normally.

And if any of your organs have developed lesions, the lesions will start healing as
of now. They will get better day by day, until very soon they will have
disappeared completely.

I also have this to say, and it is very important: if, in the past, you felt there was
something wrong with you, if there was something you didn’t like about yourself,
rest assured that from now on whatever was bothering you about yourself will
gradually start to disappear, and will be replaced by a strong sense of self
confidence, based on the strength you draw from that immeasurable force that
exists in each and every one of us. You should know that this unshakable
confidence in yourself is absolutely indispensable for all human beings. Without
self confidence you’ll never amount to anything, with it you can do anything you
want, within reason. Your self confidence will get stronger day by day. It will
provide you with the certitude that, not only are you able to do things well, you
are able to do whatever you want - and whatever it is your duty to do - extremely
well, on condition, of course, that what you want is within the bounds of reason.

So whenever you want to do something, or when you have some duty to fulfil,
always remember that the task will be easy for you. Words like difficult,
impossible, can’t, too much, not good enough ... and so on, will disappear from
your vocabulary, and be replaced by words like I can, it’s so easy, I will... If you
think something is easy, then it becomes easy for you, although it might seem
difficult to others. Whatever you do will be done quickly, and effectively, without
fatigue, almost without effort. But if you consider something difficult or
impossible, then it will become difficult or impossible for you, just because of the
way you think.

(Coué suggests that specific formulations pertaining to individual cases be
introduced at this point.)

Rest assured that in all ways, both physically and mentally, you will enjoy
excellent health. You will start feeling much healthier than you’ve ever felt
before.
Now I’m going to count to three, and when I say ‘three’ you’ll open your eyes and emerge from the state you’re in, slowly, gradually. As you resurface you won’t feel at all tired. On the contrary, you’ll feel strong, vigorous, alert, refreshed, bursting with energy. You’ll also feel happy and joyous, both in yourself and in all your relations with others. One… two… three.
Mind Powers Christian Godefroy

The NLP Master Practitioner Training, July, 2004. Tad James, Advanced Neuro Dynamics

PRESUPPOSITIONS OF NLP

1. Respect for the other person’s model of the world. 2. Behavior and change are to be evaluated in terms of context, and Ecology. 3. Resistance in a client is a Sign of a lack of rapport. (There are no resistant clients, only inflexible communicators. Effective communicators accept and utilize all communication presented to them.) 4. People are not their behaviors. (Accept the person; change the behavior.) 5. Everyone is doing the best they can with the resources they have available. (Behavior is geared for adaptation, and present behavior is the best choice available. Every behavior is motivated by a positive intent.) 6. Calibrate on Behavior: The most important information about a person is that person’s behavior. 7. The map is not the Territory. (The words we use are NOT the event or the item they represent.) 8. (U) You are in charge of your mind, and therefore your results (and I am also in charge of my mind and therefore my results). 9. People have all the Resources they need to succeed and to achieve their desired outcomes. (There are no unresourceful people, only unresourceful states.) 10. All procedures should increase Wholeness 11. There is Only feedback! (There is no failure, only feedback.) 12. The meaning of communication is the Response you get. 13. The Law of Requisite Variety: (The system/person with the most flexibility of behavior will control the system.) 14. All procedures should be Designed to increase choice.

De-nominalization i.e taking idol / fixed / limited i.e frozen, and un-freezing it, like in a DAW…so we can re-edit it … take idol of stone and wood, dogma, beliefs, like a dead language, and revive it so now a living language, a process, dynamic, can change, improve, optimalise it…

Unconscious automatically relates things (primarily to reproduction and survival) to each other i.e defines things, ascribes meanings to them…a..k.a ‘learns’ very
quickly (therefore often erroneous associations / relationships e.g. cause and effect, free will, noble lies implanted / conditioned) … protects nervous system from overload i.e. excessive trauma whose processing threatens survival e.g. black-out to avoid sensory overload of pain (emotional and ‘physical’, though all emotions are physical affects i.e. electro-chemical reactions represented as pleasure, pain, relief, fear, hope, sadness, happiness etc.) … how impressions encoded into experiences and affects is ‘black box’ of unconscious and brain chemistry etc… Gestalt nodes means the expected pattern / whole associated with any input / part / element / impression is triggered e.g. speeds up reaction time, predictive, anticipatory, don’t wait for entire impression, stimulates response e.g. flight, immediately…don’t wait to see if prediction e.g. ‘a lion is approaching’ true…gives impression of lion immediately…can ‘qualify’ / analyze / reconsider initial definition / impression at leisure, in safety…but most of us never get to this re-consideration…i.e if what told is true, if gestalt accurate, if definition valid…

Nervous system, of which brain forms a part, cybernetic system…maintains balance using feedback…feedback includes conscious affects like pleasure, pain, relief, aversion, desire, fear, lust which determine our behavior e.g. trigger responses, motivate conscious actions...unconscious muscle memory once deliberately ‘learned’ or ‘modelled’ on others unconsciously or deliberately…introspection of significant others…conditioning by environment experience and ‘formal teaching / conditioning / brainwashing / indoctrination / ‘noble’ lies

Cybernetics requires purposeful action and definitions / feedback…purposes derived from system needs / requirements e.g. survival / reproduction (though circular i.e. random … if didn’t have this, wouldn’t be here i.e. evolution requires reproduction for mutation, otherwise would need to produce new totals each time for hit and miss i.e. accumulative evolution Vs one step…motives are purposes … desire and aversion are the experienced representations of the cybernetic feedback loops and hard-wired programs…experienced as affects…i.e. pleasure, pain, desire, aversion…all physiological / brain chemical correlates but direction cannot be ascribed i.e. no cause effect relationships can be fixed…appears re-iterative / interactive…but of course pre-req, no matter how it emerges i.e. random is instinct for survival, i.e. unconscious knows what needs, and works through affects, desires, aversion to achieve…may account for emergence of conscious sentience i.e. no need for ‘self’ awareness…robot can work cybernetically, without any actual perception / affects/ pleasure / pain / aversion / desire…just by feedback loops…

Experience engine like a nano-tech machine designed to provide the hardware for the ‘soul’ software… it is ‘will’ and representation…representation initially arbitrary? … but once begin programming, prior routines limit future…set up
system...of relationships...meanings...definitions...all built upon ‘I am’... and desire for experience...relief from boredom of pure being?...desire for pleasure? But now I could engineer a host system that defined just being as pure bliss?

First impressions most powerful...immediately ‘learned’ as ‘reality’...immediately imprinted as definitions...with appropriate ‘affects’ allocated to them...e.g pleasure and pain...imprinting...conditioning...but as affect arbitrary association, .e product of mind...why not just directly produce affects e.g pleasure, without need for complex ‘reality’?

Curiosity? But all ‘experience’ is illusion?

Symbolic representation? Actually we convert symbols / represent bandwidths of E-M spectrum as sense impressions...all about encoding i.e representing, then decoding into affects...transmission is communication...that requires symbols to encode, transmit, and decode e.g accessing cues, words, tone, body language, pitch, icons, images, utterances.

We can’t read minds...we interpret...hallucinate...miss much, add much to actual impression...filter, distort ... rely on programs without conscious thinking i.e efficiency of stimulus response / gestalt nodes / association / pattern recognition/ pattern anticipation before patter complete...that is performance IQ intelligence...model ‘success’ observed in others and ascribed to assumed behaviors, actions, beliefs, values, etc...though models always imperfect, assuming any ‘objective reality external to us exists...or even in terms of copying a program, assuming its code...and assuming our impressions i.e encoding of the code full and complete and valid...often assume X lead to Y, when it was Z etc...we make assumptions / fill blanks / incomplete information...so our programs don’t replicate observed patterns / models and thus fail to replicate desired outcomes / avoid outcomes want to avoid etc...

Reference for all impressions and motives is self

Does not process negatives i.e ‘NOT THIS’, only ‘THIS’. Leads to ‘target fixation / obsession’ i.e hit telegraph poles as tell self ‘don’t hit poles’...does not grok ‘don’t’, only processes ‘telegraph poles / desire’.

(MHR this may be fertile avenue of interrogation, may reveal nature of consciousness and life, sentence, awareness...and existence of consciousness / self-reflexive awareness, self-awareness i.e I say ‘I don’t want’, and I think, consciously ‘I don’t want’, ‘No X’. But unconscious only works with affirmative. Very interesting!!!

Unconsciously by nature programs self as fast as possible, responds to ‘external’ impressions as fast as possible. Non-rational. Once programmed, resists change
Lazy? Delegates this to conscious mind? Why couldn’t unconscious do this also? 

Produces sub-programs, routines, we call ‘habits’ and ‘muscle memory’ and ‘instinct’, and ‘self-evident’ and intuition, phobias, beliefs (many erroneous and limiting … though focus is on reproduction and survival, so unconscious probably not concerned with details of logic / reason etc…if it works for others, will copy, if it worked in the past for self, maintain etc i.e reproduce i.e model on past of own experience and observations of others, and even books etc )…

Sub-programs written / installed…remain active until we actively re-program them / uninstall them / re-install more optimal programs, just like with any computer

Unconscious / brain acts like any computer. Computes. Movement of atoms / electrons associated with all affects / feelings / thoughts ‘states’ a.k.a mental states, emotional states, physiological states…reduces to? NLP heuristic…makes no assumptions as to truth of its assumptions, beliefs, but they generate the desired outcomes, so act, Like David Hume, ‘as if’ they are true, as we do with ‘cause-effect’ relationships of every kind, and assumption that patterns continue i.e past relationships hold true in hallucinated future i.e that things will interact in ‘future’ as they did in the ‘past’…no need for ‘truth’…cannot ‘know’ anything with certainty…no way to know future will behave like past, or how posited causes effect their positive effects…no way to know if everything is not a reflexive illusion i.e mere thought and consensual social reality…seek truth, but never claim to ‘know’ anything, other than ‘this appears to work, to be the case, to hold true. Whether there is any objective reality, and whether our limited minds can know it, and whether what we think is true corresponds with this reality, we cannot know for certain. This is the principle of Zen, of Humean Skepticism, and of NLP.

MHR Everything a person says or does, including what they don’t say or do, is communication. Forcing someone to adapt to YOUR communication style is inappropriate to communication. Adapt to them. Listen / observe, and then use their communication system to communicate with them. Mirroring builds rapport, trust, empathy, and thus opens way to suggest / lead / correct. Though ‘correcting’ only a particular belief, /action / behavior i.e make clear you accept the person, but reject the behavior / belief (like my anti-semitism post)…and offer something in its place i.e displace / replace and don’t leave a void. Criticise the behavior / belief, not the person. Make this clear. Though people tend to overly sensitive to i.e define self as their ‘mind’ i.e brain, i.e beliefs and actions.
It is safe to assume everyone is managing the best they can, at this moment. Offer resources. Correct faulty assumptions. Train in new ways of defining and being and behaving. Assume they want to be the best they can be, but something is preventing this. This becomes your mutual adversary. Approach as team. Find way for person to dissociate i.e not be invested in ‘being right’ i.e ‘losing face’. ‘You are not your beliefs / actions / bad habits’.

Listen to their behavior, not their words. Words are the least important / significant, revealing etc of any person’s communications

Mind control is about regaining control of YOUR mind, not someone elses. You can only be responsible for your own actions / behaviors / ideas.

Reframe ‘failure’ as ‘feedback’. Same as ‘pain’. And ‘dissappointment’. i.e focus on aims, don’t be distracted by affects. Can reframe an affect i.e I just learned what NOT to do, one way that DOESN’T work etc Vs I just failed, and worse ‘I’ am a failure i.e globalization.

Communication is about having your intended meanings replicated in another mind. Don’t blame them for not being able to replicate your intended communication, simply because YOU imagine what what you said communicated it i.e you hallucinated lots of things i.e you assumed so much, left so many steps out, used your own representation system and not your interlocutors…what THEY hear / see / feel as a result of your communication is the message they got…that you sent…unintentionally…so adapt to them…until You can communicate with THEM…

State Vs goal e.g happiness vs concrete manifestation you can measure, set as an explicit, definitive, concrete, particular outcome / result / goal, then work back from and determine the concrete steps required to attain that goal, over time, remembering that the only person you can control is your SELF, and thus making all your ambitions achievable by being dependent only on yourself. If your happiness is defined in terms that make it dependent on others, then there is no way to guarantee your happiness. Then you’ll need a concrete goal that does only depend on you. This is why job interviewers don’t like ‘What is you goal in life’ to be answered ‘to be happy’. Because this does not show that you know how to determine and reach goals. It is like ‘the law of attraction’.

So...what does ‘I want to be happy’ break down into, in concrete terms? This forces you to be specific, and work out what it means, so that you can then work out how to attain it. What is possible and realistic, and do-able?

If you say ‘Don’t think of the color blue’, the first thing people will think of is the color blue. You cannot process that utterance without visualizing blue. In order to follow the communications intention, you must first visualize blue. To know
what you are not to visualize. And so you have a perfect ‘bind’. To internally 
represent the communication you have to represent the words, i.e decode them, 
to their meaning, what they represent.

The higher your level of abstraction, the easier it is to get agreement, and to 
hallucinate that communication has occurred. The more specific you are, the 
more likely you are to disagree, and realise you have been ‘talking past each 
other’. See T vol. I. Generalisations are correlated to trance states i.e vague, e.g ‘I 
feel certain that I understand the meaning of life, the universe, and everything’ 
while sitting, stoned, staring at something on the carpet’…this is why next day 
you are sure you DID know, but right now don’t know WHAT you knew.

A sentence that becomes deeper in tone, and louder, as it progresses, is usually 
more compelling?

Can find the most common ground possible i.e possible consensus / negotiated 
settlement / agreement / compromise, by raising and lowering level of 
abstraction…MHR but fake agreement i.e agree on general terms often falls apart 
when you get to details…but allows temporary point of rapport to work from. 
E.G wife wants to be appreciated, complains hubby never compliments her on 
her cooking etc. She communicates cooking, but if raise to ‘appreciation’, may 
find way hubby can satisfy by appreciating something else …maybe her cooking 
sucks? But she is a very good X etc? Work out what they mean in this book 
about using levels of abstraction productively / generatively. i.e to produce 
greater options / alternatives / freedoms /choices for hubby to express his 
appreciation, and for her need to be satisfied e.g to be loved? Change levels of 
abstraction until find one all parties can ‘agree’ on. I.e general or vague enough 
to accommodate each???

The Meta model

Mind reading. Ask how they know these ‘facts’. Value judgements. Ask 
according to whom / what authority / how do they know this? Challenge any 
cause-effect statements with ‘how do you know that? When assume behavior X 
reflects affect Y i.e hubby not putting out trash means he doesn’t love wife. 
Challenge this complex equivalence by asking if they know of any hubby who 
loves his wife who forgets to put garbage out. Challenge any other assumptions 
by asking how they know these to be true, what they are basing this belief on. 
Challenge any generalisations such as never, everyone, always, everywhere by 
asking if they can offer any example that contradicts this generalisation. 
Challenge ‘I have to X’ with ‘if you didn’t X, what would happen?’ Challenge ‘I 
can’t be honest with her’ with ‘why, what would happen if you were?’. Deletions 
include nominalisations, which exactly as I used the term a moment ago, refer to
‘actions frozen in time’ so that they become nouns i.e verbs expressed as nouns, limiting room for change i.e idolizing them. Challenge ‘I decided to X, and have to live with the consequences’, by reminding client that a decision is never final, but thinking makes it so i.e commitment is about committing, from one moment to the next, and usually you can change you mind, and decide on a different course. To ‘reject’ an idea, is to be rejecting it, from moment to moment. To live somewhere, you decide each moment to stay. To love someone, you do it here, now. You maintain a commitment to a decision or you change your mind. Until you are dead, nothing is final. Challenge ‘X rejected me’ with ‘How did they reject you?’ What makes you feel rejected? What did they actually do or say? Interrogate ‘I don’t like X’ by asking ‘What don’t you like about X?’ in what way?’ what makes you think that?

Basically you challenge assumptions, find out what was deleted i.e not expressed, that would …as in rest of notes…

**Milton Model (Hypnotic language patterns)**

These are a formalized modelling attempts to replicate and teach what Milton Erickson intuitively did with his clients, and which worked, after decades of practice using therapeutic hypnotism / trance.

**Mind Reading:** Claiming to know the thoughts or feelings of another without specifying the process by which you came to know. **Examples:** I know you’re wondering. . . I know you believe. . . I know you came here for a purpose. I know how you like that. I know you enjoy. . . I know that you knew that I know you’re thinking how wonderful trance is. I know that you’re in a nice trance now. I know that you’re learning a lot here today. I know that tomorrow you will learn even more than today. I know that when you leave this training, you will be much wiser. I know you all studied very hard before you came here. We know you don’t care. I knew you were thinking that. I’m sure you’re aware I’m sure you felt You probably are aware. . . You probably also know I bet you’re upset about that. I realize you already know I can tell you’re happy. I can tell how you feel. . . I can tell you’re happy. I can tell you’ve had a trying day. I can see you believe I see that you know You are enjoying the sound of Tad’s voice as he speaks to you.

**Complex Equivalence:** Where two things are equated - as in their meanings being equivalent You are relaxing, so you’re in trance. When you get moved, you’ll be happy. Being here means that you will change. Your question means you know it already. Asking questions means you are learning. Going to bed early means you will be alert. Your body relaxes as you let go each breath. You know the answer, so you are competent. Regular exercise makes you a better
athlete. Your being in this group deepens your trance. Being here means you will enjoy the process. Breathing that way means you’ll go even deeper. Sitting in this room, you are learning many things. Your relaxed body means that you are in trance now. The fact that you want to learn, means that you will. Just getting here means that you’re willing to change. As you master these skills, you’ll be a better therapist. You’re learning many things because he is a good teacher. As you exercise regularly, it means you will get healthy. Keeping your eyes open like that means you’ll go into trance. And closing your eyes means you’ll go even deeper. (Double bind) You’ve come a long way, & that means that you’re ready to change. You’re listening closely means you’re learning wonderful things. Your ability to go into trance enables you to change your behavior.

**Lost Performative:** Value judgments where the performer of the value judgment is left out. **Examples:** Its bad to That’s good. That’s right. That’s too bad. It’s good when That’s perfect! It is important to It’s wrong to cheat. One doesn’t have to Today is a great day! It’s best to do therapy. It’s good to study hard. It’s important to learn. It’s good to dispute that No one should judge others. It’s great to always be right! It’s great that you can change. It’s really good that you say that. It’s better to give than to receive. It was not right of you to say that. You’re wrong. (Or: "That’s right... you’re wrong.) And its a good thing to wonder (Nominalization: "thing") You shouldn’t be judging the comments of other people

**Cause & Effect:** Where it is implied that one thing causes another. **Examples:** If I help you, then you’ll learn this. As you sit there, then you can feel Don’t X, unless you want to Y. Don’t sit there unless you want to go into trance. Don’t move your foot unless you want to go deeper. If you sit in this chair, you’ll go into trance. As you listen closely, you will learn faster. As you sit there you can feel more confident. Reading this sentence, you get better and better. You can hear the music helping you to relax now. Just your being here makes you want to learn this. As you ask that question, then you begin to understand. Because we are here, you are learning many new things. As you sit here and listen to this, you are learning so much. Because you are here you are going to learn NLP more easily. You will become more relaxed as you feel the fresh air coming in. As you contemplate Milton Model, you can go deeply into trance. ... And that’s because it’s artfully vague.

**Presuppositions:** The linguistic equivalent of assumptions. You can do this even better. You’re learning many things. You are changing all the time. How else do you go into trance? You can see this more clearly now. You’re seeing things differently now. You’ll be able to learn even more tomorrow. You are going to go into a deeper trance soon. After you pass this class, the next one is easier. You can go through this process even more easily. You realize you have more
resources than ever before. Since your unconscious mind is listening all the time, you can easily move in the direction of your past memories.

**Universal Quantifiers:** A set of words that have the following characteristics: a. Universal generalizations and b. No referential index. Nobody’s perfect. Everything you know, all the things to learn, all the time. Everything you have learned, so every time you think of that, all the feelings there are to feel after all you have learned from the tapes with everything that’s happening in the world. Everything is wonderful. We are all in trance now. Everything means nothing. There is always tomorrow. Everyone knows it to be true. There is always more to learn. All the meanings will be clear. Everybody knows this part is easy. Everyone here has something to learn. One can never know all there is to know. Everybody knows you can learn all things. Everything in this room enhances your learning. Everyone can learn everything we’re doing here today. All the people doing this process are learning many new things. None of the most hypnotic phrases have been written yet.

**Modal Operators:** Words which imply possibility or necessity, and which form our rules in life. You should care for others. You should now clearly see. You should not hurry into trance just yet. You shouldn’t go into trance too quickly, now. You should know it’s OK to learn in this room. You could learn this now. You could write this down. . . or not. (Also: Double bind) You could feel more and more peaceful. (What’s the presupposition here?) You must be aware. . . . You must be getting this now. . . at some level. . . . You may discover you can learn here. You can change overnight. You may hear the words of wisdom. You might be able to learn this quite easily. It’s possible to learn everything easily and quickly.

**Nominalizations:** Process words that have been frozen in time by making them into nouns. [With minimal restructuring, I have taken various Nominalizations and linked them together for your reading enjoyment. Every (yes every) line contains a nominalization.] NLP is easy as you just trust in the process while you’re in trance and allow your intuitions to help you notice new feelings as those feelings come and other feelings may go your behavior improves so the renewed communication in your relationships means you have made many new learnings. because that communication shows respect for those relationships and all your new decisions showed your trust in the importance of your unconscious mind’s remarkably powerful desires and your demonstration of those new learnings and understandings showed your sense of wonder at the importance of all the work you’ve been doing in your life which is a perfect demonstration of the simple truth that trance works doesn’t it? (By the way, did you notice that "nominalization" is a
nominalization?) Your thoughts on nominalizations are an important form of communication

**Unspecified Verbs** • "And you can," I was wondering if you knew when you are feeling like you could just let go and notice how easily you begin to enjoy and as you continue breathing you may or you may not notice going deeper and you could go deeper since you really enjoy doing this and you could even continue or if you don’t you may discover how much you remember about how you’re improving, now and you will, of course be wondering just where this might be going so remember if you will that your being and your learning can only help you to move towards understanding just how easily you can be changing and inducing or simply *transcending* aren’t you?

**Tag Question:** A question added after a statement, designed to displace resistance. • "Can you not?" didn’t I? isn’t it? have you? will you? won’t you? haven’t you? aren’t we? aren’t you? don’t you now? don’t you think? won’t you, now? couldn’t you. . . ? wouldn’t you know? and you can, can you not?

**Lack of Referential Index:** A phrase that does not pick out a specific portion of the listener’s experience. • "One can, you know..." People can It is, you see. That’s the way. People can learn Now you’ve got it! You will, you know. One can easily see You know the feeling. You may not know it You have, and you know it. You can just let it go now. A person can, you know. . . . That would help you go deeper. It puts people through changes. Do you see this more clearly, now? One can, you know, accomplish a goal. When you can notice that certain sensation right there Please help them; they couldn’t think of any more of these

**Comparative Deletions:** (Unspecified Comparison) Where the comparison is made and it is not specified as to what or whom it was made. • "And it’s more or less the right thing." Right or wrong. . . . even more relaxed It’s a higher thought You will enjoy it more. You’re doing better now Now and then, things happen But that’s neither here not there. You’re going deeper and deeper. . . . Sooner or later you will understand. This is more or less the right time before or after you come out of trance. At one time or another, you may notice and it’s more or less the right thing to do But its better to change now. (Also: Lost Performative) And it’s better to do it that way. (Also: Lost Performative) You’re a better person than you were before. (Did you notice both?)

**Pacing Current Experience:** Where client’s experience (verifiable, external) is described in a way which is undeniable. • "You are sitting here, listening to me, looking at me, (etc.)..." You hear my voice We are in this group As we sit here now. . . . And you’re sitting here As you notice each blink As you continue breathing. . . . As you look at me like that. . . . And as you breathe in. . . . and out
As you kneel there sipping your tea, As you feel the weight of the notebook on your lap. . . . As you’re looking around (only if your sensory acuity verifies!) More of your muscles are relaxing. (only if your sensory acuity verifies it!) As you stop and look and listen (only if your sensory acuity verifies it!) you can feel the warmth of the cup on your lips. . . . While you are sitting there writing. . . . As you hear that plane overhead. . . . As your eyes continue reading the words on this page while you’re looking at it and from time to time you may become aware of the thoughts in your mind or those sensations in your hand or down there on the soles of your feet you could also begin to wonder if you could think of how artfully you can pace a person’s ongoing experience

**Double Binds:** Wherein the illusion of choice is offered using an “or.” However, usually both choices are desired by the therapist. Do you want to begin now, or later? As you dream, or upon awakening. . . . either before, or after, leaving this room When you go to bed you will either dream, or not. Will you begin to change now or after this session? Would you like to quit smoking today or tomorrow? Would you like to buy the car now, or test drive it first: Would you rather do that before or after: your meeting? You either will or you won’t [followed by an unspecified verb] Would you like to go to bed at 8:45, or at a quarter till nine? Do you want to learn that today or during your next session? Take all the time you need to finish up in the next five minutes. You can change as quickly or as slowly as you want to now. If you don’t write at least one more double bind in the space below now, you will either think of one automatically very soon, or else wonder when the next one will come to mind, so you can write it down then.

**Conversational Postulate:** The communication has the form of a question, a question to which the response is either a ‘yes’ or a ‘no’. If I want you to do something, what else must be present so that you will do it, and without you being conscious of it? It allows you to choose to respond or not and avoids authoritarianism. • "Would you feel more comfortable if your eyes were closed?" Can you imagine this? Can you close the door? Will you just let go now? Can you picture doing this? Can you see what I’m saying? Can you reach that level now? Would it be all right to feel this good? do you know that you know it already? Could you open your mind for a moment? How easily do you think you can do this? Can you remember to be kind to yourself? Does this sound like it will work for you? Do you think you can make the changes you want? Would you like. . . to just sit here. . . and relax now? Wouldn’t you like to just drift into that peaceful state? Would you mind writing down a couple more conversational postulates here?

**Extended Quotes:** Where it is not possible for one to tell where one quote leaves off and the next one begins. Last year, in San Diego, John Grinder was
telling us about this African drummer who asked Judy if she had heard the village chief say how easy it is to generate extended quotes. Last year, I met a woman who said she knew a man who had mentioned that his Father told him. . . . Tad said that in a training four years ago, he had told the story about when Richard Bandler was quoting Virginia Satir, who used to say that... I was speaking with a friend the other day, who told me of a conversation she had had with a therapist who told her about a session he’d had with a client who said. . . . When I went to Laguna the other day with Van and Carlo, one of them told a story about when his mother would sit down and explain to the children how Father had said. . . . The other day, a participant in the training was telling me that her husband said Tad had told him to ask you to write a couple of extended quotes down right here.

**Selectional Restriction Violation:** A sentence that is not well formed in that only humans and animals can have feelings. • "A chair can have feelings..." My Flowers like to be picked. My car knows how to get here. Put the noise down in your toe, and let it listen. What did your actions say to you? Could you open your mind for a moment? and just listen to what the butterfly has to tell you? because the words have power of their own The cat doesn’t care about the furniture’s outrage from the scratching. As he picked up the spoon, the Jell-O trembled with fear. And if your pen told us all the things it has learned. . . . My car loves to go fast when the road beckons. Do trees cry when they drop their leaves? Sometime the cookies just call to you. Do you know what the pen thought? These wall can tell such stories. Your pen knows how to write selectional restriction violations very easily, if you will just lead it to the lines below now.

**Ambiguities a.** Phonological: Where two words with different meanings sound alike. • "Hear", "Here" b. Syntactic: Where the function (syntactic) of a word cannot be immediately determined from the immediate context. • "They are visiting relatives" • "Speaking to you as a child..." c. Scope: Where it cannot be determined by linguistic context how much is applied to that sentence by some other portion of the sentence. you’re / your there / their here / here son / sun bare bear bottoms there’s no "their" in there He reddened as he read in it. You are the one who has won. After all you have learned from the tapes And here today as, you hear your unconscious mind. . . . you can trust you’re unconscious mind now. So you think you can’t deal with your lover? Love her; can’t you? b. Syntactic Ambiguities running water shooting stars babbling brook Hypnotizing hypnotists can be tricky. c. Scope Ambiguities your deep breathing and trance. . . d. Punctuation Ambiguities (a run-on sentence) Let me take your hand me the pen. See the butterfly drifting over the hilltop is a beautiful valley.

(punctuation) My wife left me. . . to go to Texas. I was looking for my tie. . . into this thought. If you hear any ambiguities, it’s all right to write them right here.
Punctuation: Run on sentences: • "I want you to notice your hand me the glass."

Pause at improper places: • “Can you please pass out (pause) the flyers?”
Incomplete sentences: The sentence is left unfinished • "Would you rather go into a trance now or…”

Utilization: Utilize all that happens or is said by mentioning what is verifiable. • Client says, "I am not sold." You say, "That’s right you are not sold, yet, because you haven’t asked the one question that will have you totally and completely sold." Client: "I don’t think I know." Practitioner: "That’s right, you don’t you know." Client: "I can’t be hypnotized." Practitioner: "That’s right. You can’t be hypnotized yet." Customer: "I’m not sold." Salesperson: "That’s right, because you haven’t asked the one question yet that will let you be sold."

Putting it all together: "I know that you are wondering... and it’s a good thing to wonder... because... that means... you are learning many things... and all the things, all the things... that you can learn... provide you with new insights, and new understandings. And you can, can you not? One can, you know. And it’s more or less the right thing. You are sitting here, listening to me, looking at me, and that means that your unconscious mind is also here, and can hear what I say. And since that’s the case, you are probably learning about this and already know more at an unconscious level than you think you do, and it’s not right for me to tell him, learn this or learn that, let him learn in any way he wants, in any order. Do you feel this... is something you understand? Because, last week I was with Richard who told me about his training in 1983 at Denver when he talked to someone who said, "A chair can have feelings... You can hear that here...."

PREPOSITIONS A preposition is a word that connects a verb and a noun by indicating a relationship between the things for which they stand.

There are positive statements implicit in any statement, which when the client makes explicit, produce positive, constructive, generative change in state. E.g my fridge keeps breaking down implies you have a fridge that usually works, so be grateful, focus on THAT positive. My car repayments are killing me implies you have good enough credit to get a car loan, and so far have managed to repay it, lucky fucker.

TIME SCRAMBLE AN EXAMPLE OF TEMPORAL LANGUAGE

Go inside and try in vain to have the same problem. It was a terrible problem, wasn’t it? You want to make changes haven’t you?... What would it be like when you have made those changes, now? In the future as you look back and see what it was like to have had that problem...as you think about it now, if you could make this change for yourself so that you could STOP...having made that
change and see yourself now. Do you like the way you look if you could make that change and look back at yourself having made that change now!

**DECISION DESTROYER**  e.g suicide, give up, give in, accept defeat

Where client says, "I’ve already decided." This process requires rapport! 1. Pace the problem. Get the client back to the decision. 2. "Where were you when you were deciding that?" 3. ".....just before that where were you?" 4. "NOW, as you think about your present situation in life, notice how many options you have, now." 5. "Think of that problem and notice how you feel now." 6. "As you think about the next time you may do X, knowing what you know now, notice how much better you feel, not doing it."

“What is it that you are pretending to not know to know this?”

**LINGUISTIC RE-SOURCING**

1. What’s the problem? 2. How do you know (it’s a problem)? 3. When did you decide that? 4. When don’t you do it now? 5. What are you not deciding when you don’t’ do it? 6. How is that different from how you were? 7. How do you know that, now? 8. What other changes would you like to make?

**Isomorphic Metaphor / story**…get client identifying with protagonist i.e association with their situation and how it evolves. So what happens to protagonist happens to client. Place protagonist in same situation as client i.e has similar enough problems to mirror client, a.k.a make the relationship between client and character, their situations etc ‘isomorphic’. then pace, and lead via story. Give protagonist the resources the client needs, to evolve, solve their problem, overcome their challenges e.g Hercules, which then by association transfer to the client. So as hero solves problem, finds solution, overcomes challenges, the client, de facto, by proxy, by association, also experiences same success, and it becomes an affirmation of the resources use, and a self-fulfilling prophecy / unconscious vivid personal reality i.e history of client. During story touch client at different points to ‘anchor’ these resources, and the problems, experienced as the hero of the story.

N.B the protagonist can be a person, an animal, a real person, a fictitious character, well known, made up, even a tree or flower. Work out what resources / attitudes client needs. Define outcome want to attain via story / metaphor.

Target client’s unconscious, and keep vague enough i.e don’t assume you know what is needed, or what unconscious resources exist…leave it to unconscious to interpret…leaves open … more opportunities…prevents projection i.e your assumptions forced on them, which are wrong, and thus miss mark, and fail i.e inefficacious.
Have hero in story do all things you want client’s unconscious mind to do. E.g reframing.

The conscious mind may reject the metaphor, if it recognises what you are trying to do. So try to prevent conscious resistance i.e conscious mind wising up to your strategy, by breaking up story with random details that break the pattern, i.e stop the real pattern you are aiming for being identified / obvious…got to trick…bypass consciousness…at least distract it…when it is about to say ‘hey, I know what you’re trying to do, and it won’t work’, you distract its attention on some digression, some non-sequitur (i.e that doesn’t fit the pattern), some random ‘noise’, or ambiguity that could be interpreted different ways to the pattern.

What are parts? 1. Parts are part of the unconscious with a purpose/intention & a function/behavior 2. They are functionally detached from the rest of N.S. (non-integrated) 3. Often they represent minor personalities - significant others (modeled, imprinted) 4. Usually they have their own values and beliefs systems 5. Some think they are in charge of maintenance of the system 6. They are born from S.E.E.’s 7. To protect (& continue) a non-integrated behavior 8. Parts are a source of incongruency in the individual 9. They themselves are incongruent 10. The incongruency is usually in the difference between the purpose/intention & function/behavior. 11. A part usually has its opposite number, an alter ego, the flip side of the coin 12. These 2 parts will have the same highest purpose/intention 13. They were once a part of a larger whole 14. Reintegration is possible on this basis.

PARTS INTEGRATION 1. Identify the conflict and the parts involved: Make sure you clearly identify the parts clearly, and understand the nature of the conflict. 2. Have the Part, which represents the unwanted state or behavior come out on the hand first: ‘I wonder if I can talk to this part. Which hand would it like to come out and stand on?’ (Show client how to hold hand.) 3. Make sure that the Client has a V-A-K image of the part as it comes out on the hand: “Who does this part look like; does it look/sound/feel like someone you know?” 4. Elicit the “Opposite Number” to come out on the other hand: “I’d like to talk to the Part with which this Part is most in conflict, the flip side of the coin the opposite number, and let’s have it come out and stand on the other hand.” (Show client how to hold hand.) 5. Make sure that the Client has a V-A-K image of the part as it comes out on the hand: “Who does this part look like; does it look/sound/feel like someone you know?” 6. Separate intention from behavior: Reframe each part so that they realize that they actually have the same intention by chunking up — ask, “What is the intention …” or “For what purpose …” (Begin chunking up first with the part that has the unwanted state or behavior. As you do, make sure that the client’s intention stays associated.) a. Now, have the parts notice they were once part of a larger whole. b. Ask for other parts that were
also once part of the larger whole. Have them join in the integration. c. What resources or attributes does each part have that the other part would like to have?

7. As the hands come together give additional suggestions for integration. 8. Take the integrated part inside and have it merge into the wholeness inside. 9. Test & future pace. Re-elicit the values to see if there is a change.

**MASSEY’S DEVELOPMENTAL PERIOD**

(0 - 7) Imprint Period (7 - 14) Modeling Period (14 - 21)
Socialization Period (21 - 35) Business Persona (Wm. James)

A MEME is a self replicating package of information which tends to propagate itself through a population spreading ideas and concepts.

The Values Levels: a model of the different levels of consciousness, and the societal forms their produce...leading up to the higher ones like my EP’s

1—BEIGE: SURVIVAL

• Instinctive automatic • The essence of human survival • Uses deep brain programs and senses • Distinct self is barely awakened • Lives much as other animals but better • Minimal impact on environment

2—PURPLE: A CLANNISH “US” • Obey desires of mystical spirit being • Show allegiance to elders, custom, clan • Preserve sacred places, objects, rituals • Bond together to endure and find safety • Live in an enchanted, magical village • Seek humanity with nature’s power

3—RED: MY POWERFUL “SELF” • Every man for himself • Express self, to hell with others • Escape domination by others or nature • Avoid shame, feel no guilt, get respect • Gratify impulses & senses immediately • Fight to gain control at any cost • Be not constrained by consequences

4—BLUE: A RIGHTEOUS “US” What is bigger than me, a guiding singular force, bigger than you • Find meaning and purpose in life • Sacrifice self to the way for the Truth • Bring order, stability, and future reward • Control impulsivity through guilt • Enforce principles of rightful living • Divine plans puts people in proper places

5—ORANGE: MY STRATEGIC “SELF” • If it ain’t broke—then break it & make it even better • Strive for autonomy and independence • Seek out “the good-life” and abundance • Progress through the Best solutions • Enhance living for many through technology • Play to win and enjoy competition • Learn through tried-and-true experience
6—GREEN: OUR COMMUNITARIAN “US” • Liberate humans from greed and dogma • Explore the inner beings of self/others • Promote a sense of community and unity • Share society’s resources among all • Reach decisions through consensus • Refresh spirituality and bring harmony

7—YELLOW: AN INTEGRATED “SELF” The swing back into a “Doing” thing, the action again • Accept the inevitability of nature’s flows • Focus on functionality, competencies • Find natural mix of conflicting “truths” • Self-interest without harm to others • Experience fullness of living on Earth • Demands flexibility and open systems

8—TURQUOISE: AN HOLISTIC “US” • Blending, harmonizing, strong collective • Focus on the good of all living entities • Expanded use of human brain/mind tools • Self is part of larger, conscious whole • Global networking seen as routine • Acts for minimalist living so less is more

Why is a good idea, a good idea …Because our honored chieftain says it is so” “…because it suits ME right here, right now” “…because it conforms to the rule of Law” “…because it serves my plans and objectives” “…because we have reached consensus on it” “…because it is the most functional approach” “…because the living system ultimately benefits”

MHR Voluntarism, if it submits to overall ‘policing’ e.g negative externalities, and to transparency e.g positive externalities available, can optimize freedom of individuals without imposing unfair costs on others i.e negative externalities not result of informed consent and corresponding positive externalities i.e costs-benefits. No need for arbitrary violence of law. Individuals can decide basis of their interactions between self i.e informed consent…but always problem is desire to exploit inherited inequality i.e enslave others to own will / trick / deceive/ opportunistict lies leading to ‘noble’ lies of religion etc / mind control / guilt / fear / violence / coercion…so cannot leave to ‘anarachy’…but allow regulated voluntarism…would result in some communities setting up as communes, others as corporations, etc…problem is tolerance of each for each, how to protect any individual community from others mobbing / ganging up on, and imposing unfair externalities upon…so WILL need a one world government with power limited to securing the freedom of each individual and community, and preventing individuals / communities coercing others into accept negative externalities / imposing their wills / values / beliefs… and some things cannot be negotiable e.g assumed right of some humans to exploit other animals, or sense of entitlement of one group to another groups products and services…and avoidance of all ‘conspiracies’ against the good of other groups…and to deal with trade relations, enforce contracts between communities…and allow communities to recover resources from those who leave their communities e.g enjoy all benefits of a commune, train etc at communes expense, then leave to
‘make a fortune’ in some other community … i.e typical problem of Scandinavian society i.e brain drain to U.S…after investing in citizens…and the general rules of lotteries i.e if the ‘winners’ can leave, after having ‘won’ the lottery, then all the resources leave the community…it is not just the individual investment in the particular individual e.g a record company must recoup the losses of 99 out of 100 of the bands it signs, from the profits of the one band that makes it big…that band doesn’t think in terms of this lottery, and complains that the record company makes more money from their music than they do…as if the investment the company made in them was a ‘sure thing’…in fact most signed bands do NOT have a playlist of hit songs just waiting to be recorded, produced, and distributed. ETC

People speak of values vaguely. Ask them to be particular. To define them. What are the criteria? How do they know when this value is being met or violated? When have they experienced either? What did they feel/ experience? How did they know it was being met or violated? Interrogate all sub-modalities of. See if their assumptions are correct. If they are really using words appropriately i.e the value they speak of, and how they ‘represent’ that value in practice. E.g freedom, tolerance, security, happiness, motivation…how do you know who and what to fear and when? Who and what to love and when, and how, and in what way, and in what contexts? What is justice? How do you know something is just? That you have been a victim or perpetrator? What is guilt? How do you know if you are guilty, or another is? Etc

Synesthesia

Frame any offer / suggestion in terms of the values interlocutor claims to have. MHR find out real values is more motivating i.e people imagine etc have much higher values than have…if can play their game i.e lie for them, and present the REAL values they have as the ones they pretend to have will get rapport and can lead…i.e they claim ‘justice’ as a value, but as non-vegans, clearly mean ‘I should not be the victim of injustice’…they claim equality, but really mean ‘no-one should have more than me’ etc…and ‘freedom’ really means I should be free to do what I want, no matter how it harms others, but no-one should ever be allowed to do anything I don’t want them to do, especially if it harms me, even via envy, jealousy, sense of special entitlement, exceptionalism e.g ‘Semitism’.

Take your most important value and notice how you represent it. What is the picture that you have? Is it: Associated -or- Dissociated? Black and White -or- Color? Focused -or- Defocused? Near -or- Far? Bigger than Life, Smaller -or- Regular Size? A Movie -or- Still? Is the Movement Fast -or- Slow? Panoramic -or- Does it have a Border? Does it have a Location? Are the sounds: Loud -or- Soft? Fast -or- Slow? Is there anything about the Pitch, Rhythm, or Tonality?
Are there feelings? What are they? Now do the same thing with another value, and notice that some of these elements are different with the second value.

List your values in ascending order of priority. Do the lower values support / reinforce / make the higher ones more likely to be attained / maintained? E.g you want security above all, does freedom support this…is current model of new world order to convince you to give up all the freedoms the terrorists, who are not your own government, hate, and want to take from you, which by submitting to the fear your government create via their acts of terrorism, you willingly give up i.e disinfomed consent…i.e the real terrorists, who hate your freedoms, your constitutional freedoms and rights, get you to give them up willingly by committing acts of terrorism against you...

Are your values positive i.e what you do want, or negative, what you don’t want?

Can frame desire for wealth as fear of poverty, desire for security as fear of violence, desire for partner as escape from loneliness…

Sometimes multiple desires reinforce each other i.e have common aim e.g desire for freedom, money, independence, options, choices.

**A continuum of values** (shades of grey open-minded-skeptical, flexible, situational, negotiable, open, skeptical, evolving, critical, freely arrived at, personal, consensus of participants local and representative, relativity to situation-conditions-times-places) **Vs absolute categories** (black and white certainty, categorical imperatives, dogmas, traditions, conditioned reflexes, religious dictates, societal, violence of law imposed from centralised state/authority, absolute truth of god / science)

**Values and beliefs are stored in different locations.** The question for determining the Storage Location is, [1] “Now as you think of that value (belief), where was it stored just before it came to you?” -or- [2] “In a moment, I’m going to ask you to clear the screen, and I want you to notice where the image goes to as you do.”

**ELICITATION OF BELIEF LINES** 1. Elicit the Dichotomy Meta Program 2. Determine the differences between the storage location of something which is: a. Absolutely Believed b. Doubted but not sure or uncertain about c. Absolutely Disbelieved d. Something that used to be true for the person but no longer is. 3. Check ecology. 4. Repeat steps 1-4 for 15 years ago, and 15 years into the future. 5. Change the storage location of an unwanted belief and notice the corresponding change in the strength of the belief. 6. If necessary make the corrections in the Time Line (deleting the corresponding limiting decision).

**ELICITATION OF VALUES LINES** 1. Elicit the Dichotomy Meta Program (if you haven’t already). 2. Elicit life’s values: “What’s important to you in life?”
(See the Values Elicitation section.) 3. Prioritize the values. 4. Elicit the storage location of each value: “In the context of (value) when you think of (value) do you have a picture? Where is that picture stored? Etc.” 5. Repeat steps 1-4 for 15 years ago, and 15 years into the future. 6. If desired, make an intervention in the values hierarchy by shifting a value along the line.

* The Dichotomy Meta program, and Values and Beliefs Lines were developed by Rene Pfaltzgraf.

**THE BASIC META PROGRAMS**

1. **EXTERNAL BEHAVIOR**  
   A) Introvert  
   B) Extrovert

2. **INTERNAL PROCESS**  
   A) Sensor  
   B) Intuitor … how you perceive

3. **INTERNAL STATE**  
   A) Thinking  
   B) Feeling … how you judge

4. **TEMPORAL OPERATOR (TIME)**  
   A) Judger  
   B) Perceiver

**Visual Rehearsal** – In almost every modeling, they have found that the successful people are doing visual rehearsal each time. Each shot each time. Disassociated, then associated. The human mind cannot tell the difference between a vivid visualization, and a real memory.

**A Positive Internal Dialogue** – To control: a) Stop It — (hard to do. Meditation 20+ years.) b) Jam It — (Mantra does this.) c) Substitute a Positive Internal Dialogue — (This is the choice in pistol, and in most training. Can use a listing of the steps or positive affirmations. Perhaps can also change the SMd’s of the negative internal dialogue. May need to change the SMd’s only.) d) Give it something useful to do

**Anchors** (spatial, visual, physical, tonal)

All NLP Was Created by Modeling & Creating Techniques. Some of the Concepts Utilized Were: • Rapport from Hypnosis • Anchoring from Pavlov and Behavioral Psychology • Strategies from Pribram et al — the TOTE Model  

**The Key:**  
DE-NOMINALIZATION

**MODELING OVERVIEW**  
1. Find someone or someone’s behavior that is worth modeling. Find a model of real excellence. 2. Find their...  
   • Beliefs and Values  
   • Strategy (Mental Syntax)  
   • Physiology - Key is breathing, then posture. 3. Install this in yourself. 4. Design a universal training. 5. Train others. 6. Train Trainers
Modeling is separating what is essential from what is idiosyncratic. In modeling, may have to chunk a large behavior down into the individual functions. Then feedback. Where they are getting feedback from, and what the mechanisms are, and the adjustments.

Two Ways to Do Modeling 1. Imitation a. Do it then model self to see how you did it. b. Essential to all modeling is to separate what is essential from idiosyncratic — the difference that makes a difference. c. Then consciously start dropping pieces to find what’s essential. 2. Cognitive Approach a. Analyze into components b. Physiology c. Strategies d. Motivation e. Contrastive Analysis — separate what is essential from idiosyncratic — the difference that makes a difference. Then consciously start dropping pieces to find what’s essential. f. Sensitivity Analysis — Determine what’s critical. Start changing things to find out if they make any difference. Find out if it makes a difference in terms of results. g. Strategies — A lot of patient pushing to find out what they are doing in their heads while they do it. h. Install in self — test is when you can get the same results as the experts do. i. Universal training design. j. Train trainers.

COMPULSION BLOW-OUT WARNING: This is a very "hard" technique. (It's like a sledgehammer.) If you begin it, you must complete it. When you finish, the client must have a positive future representation of what they will do without the problem. If there is a compulsion and a revulsion you must blow out both. PART I 1. Elicit a description of the thing compulsed about 2. Elicit a description of something similar, but not compulsed about Compulsed Non-compulsed EG: Pistachio Peanuts Ice cream Yogurt 3. Get SubModality differences 4. Test the differences for drivers PART II If you have an SMD that is infinite in extent then do a really fast continuous increase as in Method #1. Otherwise use Method #2. Method #1 5. If Size or any other infinite driver, blow up beyond known universe. 6. Initially feeling of compulsion will increase 7. At some point it will pop, or blow out Method #2 5. Use ratchet method (like a car jack) 6. Crank it like a jack 7. They will go over the top Both techniques use 8-10 to complete. 8. Wait till the client settles down — 5 minutes 9. Test by having them make a picture, no compulsion 10 Swish old picture with new picture. * ACKNOWLEDGEMENT: Steve Andreas developed The Compulsion Blow-Out.

THE LEARNING STATE AN INTERVENTION FOR LEARNING Learning is facilitated best by the student being in a relaxed, receptive, focused state. The teacher should watch the student(s) for the initial signs of relaxation, and as the teacher notices relaxation in the student, verify it by saying, “That’s Right. Very Good!!” 1. Ask the student to put their eyes up and centered, as if to look at the space between the eyebrows. A spot on the ceiling will do.
2. Closely watch the student(s) for the first signs of relaxation and centeredness. You will notice that there are certain signs of relaxation: the rate of respiration, muscle tension in the face, the size of the pupils of the eyes, etc. It is important that the student only do this for a maximum of two minutes or less, otherwise eyestrain may result. 3. Verify the relaxation in the student (as above). 4. Then ask the student to remain just as relaxed with their mind relaxed, and to move the eyes down and focus on you (the teacher). That’s the Learning State. There is also some evidence that this technique may synchronize both hemispheres of the brain.

*ACKNOWLEDGEMENT: Adapted from James Braid, “Neurypnology,” 1843, page 28, “the eyeballs must be kept focused in the same position, and the mind riveted to... one idea.”

ALLERGY MODEL - SNEEZING 1. Find the submodalities of the substance/allergic 2. Find something “similar/not-allergic” (assoc) 3. Anchor “similar/not-allergic” 4. Have them visualize a plate of Plexiglas (dissociated) Place allergic on other side Fire anchor throughout 5. Associate with anchor held 6. Test and Future Pace

Neurological Drivers are primary subjective distinctions, which are directly hard-wired to the nervous system. Peripheral vision has certain characteristics though its set of Neurological Drivers. FOVEAL VISION PERIPHERAL VISION tunnel panoramic sympathetic arousal parasympathetic arousal detailed contextual In the ancient system of Hawai’i, the state that occurred when entering into Peripheral Vision was called Hakalau, and was highly prized as a state that allowed the Kahuna to achieve centered calmness. The process consisted of learning how to enter into a deep trance while maintaining a heightened external awareness.

CHANGING PERSPECTIVE 1. Identify problem: Context and/or object of reference (person or thing). 2. Teach client peripheral vision. a. focus gaze b. expand awareness to periphery c. loosen jaw d. calibrate to physiological shift (sympathetic to parasympathetic activity) 3. Anchor peripheral vision 4. Associate client to problem context and fire peripheral vision anchor. 5. Condition 3 - 5 times (Break state each time). 6. Perceptual positions (ecology check) a. (Self) - peripheral vision b. (Other) - re-integrate (delete for trauma) c. (Observer) - re-integrate 7. Future pace ACKNOWLEDGMENT: Neurological Drivers developed in conjunction with John Overdurf, Julie Silverthorn & Susan Chu.

HAKALAU In addition to being the state of entering into deep trance while maintaining external awareness, ‘Hakalau’ is the state to take something from the material realm into the void and vice versa. According to the assumptions of Quantum Physics, you create your universe based on your personal
observation. If you didn’t ‘know’ something existed, then it didn’t. So by ‘knowing’ something, you are actually creating it. At the same time, the ‘knowing’ at some level also created boundaries and can be limiting to your choices since it stops you from being in touch with all the infinite other ways of ‘knowing’. MHR Zen notion of ‘violence of language’ i.e defining / idolatry / nominalisation / reducing infinite to limited.

FOR GETTING RID OF A PROBLEM This process can be used for single negative emotions, behaviors or complex problems in situations that involve more than one emotion. The key is the client’s ability to get in touch with the whole problem. Technically, the technique works by lighting up and removing the boundary conditions of the problem thus dissolving it into the void. Process:
1. Teach the client how to go into Hakalau: “Pick a spot on the wall. As you focus on it, now pay attention to the peripheral part of your vision.” Anchor it. 2. Elicit the problem: Ask the client “what is the problem?” Have the client talk about the problem. Have the client “get in touch with how you know you have that as a problem”. 3. “Now go into Hakalau.” Fire off anchor. Calibrate for integration. 4. (Optional) Suggest preserve positive learnings if any. 5. Break state. 6. Repeat steps 2 & 3 ‘till client can no longer access the problem. 7. Test and future pace. Elicit new options.

RELEASING ATTACHMENTS AND/OR MANIFESTING AN OUTCOME Since, in Quantum Physics, the whole contains the part and the part contains the whole, every desire contains the potentiality of its opposite in its essence. Every time we ‘want’ something, there is an inherent potentiality of not being okay with not having that. This technique can be used to get rid of desires that cause us to lose our balance and to be less than totally centered. Paradoxically, by dissolving the desired outcome in the void, you may actually enhance it happening spontaneously.

Process: 1. Teach the client how to go into Hakalau: “Pick a spot on the wall. As you focus on it, now pay attention to the peripheral part of your vision.” Anchor it. 2. Elicit the problem desire: Have the client talk about the problem desire. “Get in touch with how you know you want that ………(whatever the client desires).” 3. “Now go into Hakalau.” Fire off anchor. Calibrate for integration. 4. (Optional) Suggest preserve positive learnings if any. 5. Break state. 6. Repeat steps 2 & 3 ‘till client can no longer access the problem. 7. Test and future pace. Elicit new options.

EXPANDING CONSCIOUSNESS To go beyond all illusions, you can use this process for removing illusions creating by time/space/matter etc. The result is a rapid entry into a profound state of transcendence while connected with waking reality. It is a rapid way of achieving awareness of simultaneous reality. (WARNING: This is a powerful technique and requires you to be a balanced
person well grounded in life. It may produce significant altered states. Using it for this purpose is for yourself only. Use this primarily for yourself and a client only if they have gotten rid of a good amount of negative emotions, and they have a good reality strategy. You do not have permission to teach it to others. Only use it after you have cleared all negative emotions and limiting decisions.)

Process: 1. Go into Hakalau: “Pick a spot on the wall. As you focus on it, now pay attention to the peripheral part of your vision.” If you know NLP, anchor it. 2. Elicit Knowing of these and similar states or issues: • “How do you know there is time.” • “How do you know you are you.” • “How do you know this is …… (any object in your awareness e.g. a glass of water).” etc. 3. “Now go into Hakalau.” Fire off anchor. Calibrate for integration. 4. (Optional) Suggest preserve positive learnings if any. 5. Break state. 6. Repeat steps 2 & 3, until a trance state occurs. 7. Meditate in that state.

In 650 A.D., an Indian Sage named Patanjali wrote a little book called the Yoga Sutras in which he described the Void, or Transcendence and how to enter into it. This is a very short summary of his 8 limbs of Yoga. He said, “Yoga is the cessation of mental activity,” and is accomplished by:\n\nYama — When you are going to enter into the void, you probably would want to stop doing some things (Yama) ... Niyama — And there are some things that you would probably want to do (Niyama) in order to preclude any interruptions from inside or outside.

Asanam — Then, you would probably want to sit down, since if you were to really enter the void standing up, you would probably fall over. Make the seat comfortable. } Pranayam — You may want to do a breathing technique to calm the mind, but know that when you enter the void, the breathing will probably cease anyway. Pratyahara — Now turn the senses, which are normally turned outward, inward. Withdraw the senses from the outside and turn them to the inside. Dharana — Focus on something inside, and put all your attention on it. The attention should be one-pointed, but gentle, and not hard concentration. Dhyana — As you totally focus on the object of your attention, notice that the awareness begins to expand outward. Let it go outward as far as it will go.

Samadhi — When it expands to infinity then you are in the void. There is a moment of suspension, or no thoughts and no object of consciousness: as if there were consciousness itself with nothing that you were conscious of. The last three are called Sanyama, and involve taking something into the void. At the deepest level of the mind just before Samadhi, there is a place called “Rityam Bhara Pragyam,” “that place which knows only truth,” which is similar to the Hawaiian “I’o”.

Check if intention of behavior is clear to all actors or if jumping to conclusions, based on own definitions / assumptions / behaviors as to what another person’s behaviors indicate. We tend to assume behavior X means / reflects a belief / attitude / feeling of Y e.g. leaving dirty socks laying around means he doesn’t respect me, appreciate me, love me etc. She doesn’t initiate sex means she is not
sexually attracted to me. She won’t blow me means she is playing games or not really into me, just using me for other benefits i.e no real passion.

How realistic are our expectations of other person e.g sexual, financial, behavioral, time e.g always late / never on time…jumping to conclusions that failure to act in particular way / read your mind, means they don’t care, don’t listen, don’t love you, etc

How much of our disappointment is unreasonable i.e expect too much, unreasonable expectations doom to disappoint…or unspoken demands / expectations / needs not met, how fair is that?

Equivalences are statements that X means Y, X is equivalent to Y, X means Y, conflating X and Y, confusing X and Y.

Flip criticism to reveal hypocrisy implicit …’if you loved me, you’d be on time / wouldn’t always be late’…if you loved me, you wouldn’t fixate on time, and keep records on how often I am late’ etc. i.e why is punctuality the priority? You criticize what I don’t do, but how often do you praise / recognise what I DO do? I am busy, if I worry and rush to get on time all the time, I’d be a wreck, and I’d be no fun…do you want me on time, or here, available / present / mentally with you etc…have you thought that your fixation on punctuality is a compulsion / addiction / fault / irritation to me etc…is it more important than ME? …would you rather be alone, and always on time for everything? Or your ex, who was always on time, but lousy in other ways? Spin the problem to be theirs, which in a way it is, depending on how you look at it…Don’t you appreciate me putting up with your nagging about being late all the time? Doesn’t THAT prove how much you mean to me, that I’ll put up with that nagging? Being abused for something I can’t control, when I am out there earning money for us, our home, doing things, running errands, trying to make the world a safe etc place???

Erickson: Cancer is like a grassy field and your white cells are like sheep. If: Stress Excessive chemotherapy Bad diet, etc. reduce the amount of sheep in the field, then the grass gets overgrown and turns to weeds. But if you concentrate on growing and adding more healthy sheep back into the field, it will reach ecological harmony again.

REDEFINE ON (CAUSE/EVIDENCE) Equivalence: Saying mean things means you are a bad person. a. I’m not saying mean things, I’m: Telling the truth. Expressing my point of view. Stating the facts. Equivalence: Your being late means you don’t care about me a. I’m not late. I was delayed. Equivalence: Cancer causes death. a. It’s not the cancer that causes death. It’s the breakdown of the immune system that causes death…so let’s explore the ways you can bolster the immune system. Equivalence: Nuclear arms make (strength, protection, safety). a. It isn’t the nuclear arms that protect people, it’s
the fact that they deter people from taking aggressive action. b. What other things could stop people from wanting to be aggressive?

Most medically-treated cancer patients die from the severity of their treatment rather than from the cancer itself.

**How do you get:** ‘angry’, ‘horny’, ‘happy’, relaxed, stressed out, furious, irritated, frustrated, desperate, hopeless, terrified, motivated, bored, confused, certain, decisive, intimidated, worried, optimistic, pessimistic, fall in love, fall out of love, etc etc

Can you recall a time when you were totally X’d? Can you recall a specific time? As you go back to that time now ... What was the very first thing that caused you to be totally X’d? Was it something you saw (or the way someone looked at you?), Was it something you heard (or someone’s tone of voice?), or Was it the touch of someone or something? What was the very first thing that caused you to be totally X’d? After you (saw, heard, felt) that, what was the very next thing that happened as you were totally X’d? Did you picture something in your mind? Say something to yourself, or Have a certain feeling or emotion? What was the next thing that happened as you were totally X’d. After you (list previous), did you know that you totally X’d, or... i.e

When reading ‘eye accessing cues’, be sure to calibrate for individual first, then realise that some people will first verbalise your question again in their mind, if not aloud, before doing the actual accessing of the representation i.e recalling or constructing an internal image, sequence, dialog etc … to elicit, indirectly, non-verbally, the representation systems they used for ‘deciding when to get angry’ etc...

N.B criteria for evaluation must use same representation system as the data being used to evaluate.

**CHAINING ANCHORS - VERSION 1** Chaining is a technique that is used when the desired/resource state is significantly different from the present state. 1. Get in rapport. 2. Set the frame. 3. Identify the undesirable present state. 4. Decide on the positive/resource end state. 5. Decide on intermediate states to lead to the end state. 6. Design the chain 7. Elicit and anchor each state separately, beginning with the present state through the end state. Make sure that the subject is out of previous state prior to anchoring the next one. 8. Fire the present state anchor and when at its peak, release and fire the Int. anchor #1. 9. Test (subject should go into present state and then into Int. state #1). 10.Fire present state anchor, watch subject go into present state, and then Int. state #1. At peak add Int. state #2. 11.Add each Intermediate Anchor and End State Anchor in the same way. 12.Fire present state, and subject should go through all the states and end up at the end state. 13.Future Pace: “Can you think of a time in the future which if it
had happened in the past you would have ________________ (EG: Procrastinated) and tell me what happens instead?

**CHAINING ANCHORS - VERSION 2**

Chaining is a technique that is used when the desired/resource state is significantly different from the present state. 1. Get in rapport. 2. Set the frame. 3. Identify the undesirable present state. 4. Decide on the positive/resource end state. 5. Decide on what intermediate states to lead to the end state. 6. Design the chain7. Elicit and anchor each state separately, beginning with the present state through the end state. Make sure that the subject is out of previous state prior to anchoring the next one. 8. Test each state. 9. Chain each state together firing #1 and at its’ peak adding #2 and then #3 and #4, etc. 10. Test: Fire present state anchor. Client should end up in final state. 11. Ask the client, “Now how do you feel about __________.” EG: How do you feel about procrastination. 12. Future Pace: “Can you think of a time in the future which if it had happened in the past you would have ________________ (EG: Procrastinated) and tell me what happens instead?

How to find out how person originally got self into this belief / state / phobia / allergy i.e. ‘learned’ this response…what was it response to? … to find out how person, here and now, is actively (though unconsciously) reproducing that response i.e. how do they know to experience a terror attack when see a dog? How do you know when to be impatient / cowardly/ angry, after having established that often they have, and do, display patience, courage, tolerance i.e. why X and not Y condition / situation / trigger elicits that response (NLP calls it a ‘strategy’ to validate its good intentions i.e. why unconscious mind initially installed it … or significant others conditioned it, deliberately…now it is reflex, reproduced automatically…triggered … don’t need to know content of initial design, but simply the process person unconsciously undergoes to get into this state / get to this response / have this reaction e.g. when dog is clearly not dangerous, why don’t employ same patience have for X, when dealing with Y … etc… Here is a formal process to follow to ‘elicit’ the ‘strategy’:

Put self in a state of Uptime and excellence. Establish rapport. Set the frame. Identify a specific decision and when and where made. Put the person back into the experience. Make sure that they are in a fully associated, intense and congruent state. Anchor the state. Speak in the present tense. Use all accessing cues; predicates, eyes, breathing, tonal shifts, hand gestures, etc. Ask basic questions: “How do you… decide, know, think, etc… to? “What happens first?” or “How do you know it’s time to start?” or “How do you know that you have finished?” Backtrack to get to the next step. Make sure that you get a logical sequence. Notice loops or recurrent sequences of steps. Make sure that you have all the key functional pieces. Fire the anchor to assist them in accessing if
necessary. Be particularly alert for auditory markings. Elicit major representational modalities until complete. List possible options - Chinese menu- if appropriate. Elicit and do not install. Use unspecified predicates. Give more than one option. Use contrast frame. Use counter-example statement. Check to see if subject answers the question you ask. Feed the sequence back and calibrate. Go back and elicit the submodalities if appropriate. Write down what you get. Get as much detail as necessary. Test your work.

Well-formed new strategy to achieve new goal requires that this goal be well-defined i.e we have a clear ‘representation’ of what we want to achieve…vivid / intense / compelling by employing all main representation systems of client i.e so becomes ‘real’ in the mind, to the brain, and thus ‘is’ real to the mind. As Buddha says, we are thus ‘remembering’ the outcome / achievement / state / solution to the problem as if we already have it, which is same as ‘manifesting resonance’ universal law idea…remembering is easier than producing … most mathematicians first had ‘intuition’, most inventors first had ‘creative moment’ i.e saw the final solution clearly, without knowing the steps involved…then had to ‘prove’ their theorem / find out how their experiment worked…lots of hit and miss, and Zen reiteration…often ‘accidental’ discovery others missed, as were attending to something else i.e not interested in this, but something else, and didn’t appreciate value of it…or came from some other application field where the value clear, due to their past experiences i.e could see how to apply some phenomena / observed pattern, whereas to others just a random observation…or so focused on some other objective that simply not sensitive to / didn’t represent it / didn’t even ‘see’ it … it was just ‘background noise’ they filtered out, while chasing some other pre-judged (hence prejudice as bad) idea of ‘value’, ‘significance’, ‘utility’…hence violence of language, of prejudice, in preventing us experiencing the full reality, what is there…while our mind pre-defines what is of interest, and what is ‘real’ i.e made vivid, intense, representations of … while rest grey blurry background…

Ideally get from here to desired outcome by as few steps as possible, to maintain motivation, but set to ensure success at each step, to provide history of successes, and with no steps left out which would lead to ‘stumbling’ and ‘overreaching’ and ‘unrealistic’ and thus prevent success / diminish motivation.

FUNCTIONAL WELL FORMEDNESS CONDITIONS • Trigger which starts the process and carries with it the final criteria. • Operations to alter the present state to bring it closer to the desired state. • Test which compares the present state to the desired state based on presorted or ad hoc criteria. • Decision point which determines the next step based on the congruence or incongruence of the test comparison. Knowing the functional well-formedness conditions allows one to ask very specific and directed questions. Knowing the functional properties of
strategies allows one to recognize when one receives an answer to a different question than the one asked.

Making decisions can be hard. But we’ve all made them. How did we come to make them, given the difficulty right now of making a particular one e.g to buy or not to buy, move or not to move, sell or not to sell, study or not etc…How to get yourself to point of saying ‘this feels right’. How to generate alternatives? Act decisively?

**REPRESENTATIONAL SYSTEMS** Each person/culture tends to represent experience with emphasis on different representation systems, so we often ‘talk past each other’ when trying to communicate i.e our definitions / assumptions / models are different…and communications encoded into the ‘wrong’ representation system for the interlocutor, so they mis-understand us.

Digital encodings suffer distortion, deletion, but generalisations do offer compression of data size / speed of processing e.g gestalt nodes…with all inherent dangers e.g what NOT encoded / attended to / lost / distorted/ deleted / overemphasized i.e compare lossy compression to original analog …‘steps’ always missing and ‘generalised’ i.e ‘averaged’ i.e ‘pattern sought and maintained, rather than actual data / content…can easily misrepresent original…though efficient i.e level of abstraction, composition, detail, …So a digital encoding of an analog (continual / flowing) phenomena enjoys compression, but loses data integrity / precision / details i.e is a model of something, which like a map, can be useful, but must be used with a caution i.e map is not the territory, the model is not the reality (objectively, though when the interaction is limited to social then it is social reality, and if people act congruent to it, it is self-fulfilling i.e challenge it at your peril e.g beliefs / superstitions / traditions / rules / laws e.g German laws that are best example of ‘legal fictions’ are that the fanciful / fabulous ‘holocaust’ fictions of the Nuremberg show trials are ‘established facts’, just as earlier ‘god’ was an ‘established fact’, even under Napoleon, who was the supreme atheist.

The model helps compress overwhelming data into digestible format, so makes many tasks easier, even possible, that normally would be too wieldy. Such as data storage and transmission, encoding and decoding. Like an ‘abstract’ of a thesis, at best. But pure propaganda and deliberate malicious deception at worst i.e designed to ‘spin’ and promote very narrow vested interests e.g lobby / deceive/ con/ control / manipulate / enslave.

**Digital descriptions** are always secondary experience so they contain less information than the **primary experience** which they describe.

**Each representation system has its strengths and weaknesses.** And is thus more suited to specific tasks. E.g we tend to explain logic linguistically, Vs De
Bono’s ‘visual’ representations of problems and their solutions. Mathematical symbols are used to ‘reduce’ data to numbers that can encode linguistic arguments, and later be decoded. They represent the most formal language rules, with syntax key as always. But open to abuse as few speak this language fluently. And easy to change values of variables within the calculation/computation/model, and thus deceive, easier than when doing this things linguistically i.e less obvious, and fewer people willing to follow even the equation, than are willing to follow the argument.

Auditory/verbal is preferred by most people as immediate, requiring less work to attend to i.e most people are verbal before literate. Most society’s are verbal long before literate at all. Auditory frees the person to engage in other actions Vs reading and writing….no tools required…no records kept so easier to lie/misrepresent later, …and communications usually synchronous i.e no delay between utterance and reception, transmission almost immediate…with non-linguistic cues available (which texters to their peril often ignore, and suffer by ignoring, and thus the invention of emoticons, emojis) such as tone, speed of delivery, pitch, emotional indicators, amplitude/loudness, hesitancy Vs fluidity, confidence vs uncertainty etc etc.

One limit is the ability to utter and decode one item at a time….though predictive patterning usually occurs and we ‘anticipate’ and ‘fill in blanks’, and very often hear something NOT there…but generally communication is synchronous and/or necessarily sequential, as a series, that must be built up, and attended to, with attention to syntax, non-verbal cues, etc, while the entirety is ‘built’ as a series of utterances…if sentence too long can be ambiguous and unclear…if syntax not well structured same…

Vs optical/visual representations/observations, which can be more holistic i.e you can see an entire picture at once…with all its connections laid out…like a map…Vs a verbal description of terrain…though we can be misdirected to attend to some aspect of the image more than the rest, which can become ‘background’…even as with audio/verbal, we attend to one source, and rest blurs to become ‘background noise’, even though it may be important information e.g. growl of tiger, the argument of a person being deliberately ‘drowned out’ by malicious people intent on preventing their message being heard…etc

The kinesthetic system has more inertia and duration than the visual and auditory systems.

Visual system enables one to simultaneously picture different options and make comparisons between them. Written lists help organise, as do diagrams. Talking about things helps eliminate misunderstandings very quickly. Most people prefer telephone to email, as it is immediate, synchronous, requires least effort. Then
there is the ‘gut’ feeling / intuition / instinct, which is Kinesthetic tactile and proprioceptive sensation. Of course touch can sometimes help, and often smell and taste, e.g dangerous / noxious fumes, bad food, fungi, bacteria, ‘off’ food, bad air, cat’s whiskers provide spatial data i.e size of space / entry / exit

We make value judgements that have often nothing to do with any objective criteria, and are not shared by interlocutors, so need to make these explicit, rather than assume, implicitly, tacitly, that all interlocutors share the same models / assumptions / symbols / codes / values … often talk past each other for this reason i.e failure to make explicit what never really thought about i.e as ‘feels’ ‘natural’, normal, categorical imperative, obvious, self-evident to you, after imprinting and conditioning, but which can seem absurd, ridiculous, incredible, fabulous, completely unexpected and unanticipated by others…i.e relativity…notions of good or evil that don’t reduce to physical pain, pleasure, and relief, can be source of emotional / mental / psycho-somatic pain, pleasure, relief, dependant on conditioning, assumptions, definitions, imprinting e.g superstitious taboos, sexual taboos, notions of ‘race’ and ‘gods’ and ‘evil’ and ‘sin’ that have no objective basis / reference / reality outside of a social reality / shared subjective reality of a group…or particular individual…representations can be very subtle, hard to elicit, unpredictable…and many people just assume they are ‘right’ and cannot / will not comprehend relativity, that what they assume is ‘reality’ and ‘true’ is anything but some objective correspondence with an actual reality…

Once identify what makes one activity ‘easy’ and ‘desirable’ and thus requires little discipline / motivation i.e intrinsically motivating / desirable / interesting / compelling, can transfer the representations associated with it to something else right now you find hard to commit to / do / follow through with etc…it is the representation that motivates, not the reality, per se. How you think about it, imagine it, imagine the pleasure and relief vividly, or imagine the negative possible outcomes vividly…so that you ‘know’ if you should look forward to it eagerly, enthusiastically, or dread it with terror, loathing, and seek to avoid it.

We motivate ourselves with positives of having done X, or negative consequences if we fail to do X i.e put self in that position of having done it, and having not done it…and being rewarded / punished i.e positive / negative consequences, and thus we are ‘push-pulled’ to do some things.

MHR sometimes giving self NO choice works better than making it optional? Though people tend to respond better to offer of choice i.e illusion of free will.

Offer unconscious choice, so feels free, and if in case you are projecting sub-optimal solutions, better to let unconscious decide for self, probably knows best.
If process unpleasant, focus on feeling of having completed it e.g. homework, yardwork, exercise... but try to chunk down into pleasurable parts i.e. make process feel compelling i.e. pleasant, pleasurable e.g. ‘feel the burn’ is feedback that you are getting results, so motivating...

Avoidance can be employed ironically i.e. remind them if they avoid tomorrow, will probably end up avoiding over and over, and each time suffering the entire process re: heros die once, cowards over and over. i.e. that avoiding feels bad, and so you face future of feeling bad, or one time discipline and feeling good after i.e. focus on the feeling after... rather than process e.g. going to dentist, think of beautiful teeth after, and having ‘put the experience behind you’ for another 6 months etc.

If use mix of negative and positive, do negative first, then focus on positive, as positives are the only real motivation... negatives for most people just lead to putting things off, avoidance... but if focus on negative, then offer positive, you get a double hit of motivation... in right direction i.e. towards some state, which is how unconscious mind and ‘universal principle of manifestation of resonant frequencies’ works... literally or figuratively / metaphorically... in either way that is heuristically proven.

Avoidance leads to ‘you will have to feel bad over and over in future’... go through this entire avoidance process again and again... you have to relive the same experience, mentally, and thus for real, over and over... in your mind... meaning you will suffer fear, anguish, regret, worry, etc.

Of course take care, allow unconscious to decide, like universe, if what you desire is ecological i.e. removal fear of all dogs not clever, or make self trust every individual is likely to lead to bad outcomes... better to leave some fear, or even better, ability to chose situationally e.g. fear of some dogs reasonable, suspicion of some people, especially those claiming to have your interests at heart e.g. your own government is highly praiseworthy and legitimate / healthy... what want to do is to clear original learned behavior / belief, and replace with more flexible choices, self control, self-determination, options, ...

Often the criteria must be considered holistically i.e. all at the same time, rather than in series i.e. parallel, as their meaning / definition emerges from the whole... and positive desirable parts may add up to negative whole... so sequential analysis will yield bad outcomes.

Add options, so break out of ‘either or’ and ‘devil and the deep blue sea’ and ‘rock and a hard place’.
Never compare own outcomes to some ideal perfect outcome of some, usually faked television / mass media person. Otherwise doom self to feel inadequate / failure.

Avoid overwhelming with too large steps / challenges…chunk down into easily achieved, and quickly achieved steps, to build history of success…good feeling of optimism…self-fulfilling prophecy etc

Become more comfortable with ‘gaps’ in understanding...key to learning language...kids do this naturally...don’t get frustrated that don’t get everything at once...allow gaps to exist, and feel confident of filling them later...allow self this room / freedom to ‘not’ understand it all at once, right now. Access as many representation systems when presenting information, and trying to ‘grok’ it…

Vividly recall a time you felt sure you understood something...‘grokked it’, fully. Anchor these representations. Project them ahead of current task / skill etc learning, and feel them...then look back on how you got here...what did you have to do? How did you get in state to study? Arranged room, light, quiet, comfort?

Can use other person as model, or one of own experiences i.e clients, or yours, to produce a useable model to then install. ELICITING: Finding out what strategy someone is already using. 2. DESIGNING: Streamlining what is there to make it more effective or designing a new strategy from scratch. 3. INSTALLING: Automating the new sequence so that it becomes part of the person’s unconscious process.

Spelling Installation “I am going to give you a word. As soon as I do, look up here (hold hand in their visual remember), allow an image of the word to appear, and as soon as it does, look down here (hold hand in their K) to get a feeling of familiarity or not.” • Use simple words initially. • Have them spell words in reverse. Write out the word and hold it up in visual remember. Have them look at it and then close their eyes and see it internally as a memory image. Have them visualize the word on something that they can remember easily like their favorite actors / characters chest / forehead, or on their favorite sports car’s bonnet.

DEEP LOVE STRATEGY 1. How do you know you are loved by someone else? 2. Can you remember a time when you were totally loved? A specific time? 3. In order to know you are totally loved, is it necessary for you: a. To be taken places and bought things or to be looked at with that special look? b. OR that you hear that special tone of voice or those special words? c. OR is it
necessary that you are touched in a certain way or a certain place? MHR how do you define ‘being loved’ in concrete terms i.e get to specifics…often people don’t want to admit it is so prosaic as ‘a guy pays for sex with money, and being my slave’

VAKOG … representation systems…Visual, Auditory, Kinesthetic (sensations / touch/ feelings) Olfactory (smells), Gustatory (taste). Can be remembered or constructed. Associated or dissociated. Tonal or digital?

Strategy is how to achieve desired outcome. E.g get from A to B. Get directions, look at map, work out route, identify / find / ask for easy to see / know landmarks as reference points… until feel confident you’ve ‘got it’, then begin trip, looking for the landmarks, ticking them off your mental list sequentially, and looking for next landmark…your progress will ‘feel’ right, if the landmarks appear in the remembered order, i.e history of success that process is working, person gave good directions etc, and you have followed i.e constant feedback of next landmark builds confidence …Same applies to any emotion / feeling. Only these are usually unconscious i.e a pattern of stimulus-response sequences that trigger each other…or a gestalt node…trigger a generalisation that triggers the response that ‘worked’ originally e.g fight or flight…

Limiting beliefs are gestalts…triggered by some impression or thought…jump from A to Z immediately…over react…go to extremes…make unreasonable / irrational jumps…e.g ‘I am unlovable’ is triggered by some apparent rejection, which may simply have not been a powerful enough acceptance…like ‘tripping’ a mouse trap…

Another word for strategy is simply process. To identify / articulate / describe / formally note / analyse a process…how you got from feeling O.K to despairing, from neutral to despised, from A to B, from student to teacher, from poor to rich, fat to poor…how you decide what to do and what not to do…often unconscious and never observed by self dissociated i.e as observer…oh to see ourselves, as others see us…etc…Did you make a picture in your mind; did you have a certain set of words that you said to yourself? Did you think of somebody else’s voice, or did you have a certain feeling or emotion?

Meaning of words put together in a sentence clearly determined, in most modern western European languages, by the syntax i.e world order. Apple the bit John can be ordered to say ‘John bit the apple’ or ‘The apple bit John’, to give very different meanings. So my ‘phrasal syntax’ method is optimal. Learning words on their own can lead to miscommunication. Learning chunks of language as phrases, as sentences, with intended meanings, prevents such mistakes. Speeds up the process of learning useful language chunks. Creates confidence in being able to communicate. History of success. Also words run into each other in the real world use of them, and to the non-native it takes time to identify individual
sounds and words in a phrase or sentence. Learning meaningful wholes speeds up
your ability to put words together, pronouncing and enunciating them like
natives. Just repeating words in the correct order often is unintelligible to passive
listeners who are not actively TRYING to work out what you are TRYING to
say. But if you learn a fluid whole, you will more likely repeat more sounds that
trigger the gestalt nodes in your native listener’s mind …the gestalt of the
phrase, the context, and some individual words…but the phrase is the
communication, not the words…the phrasal syntax will trigger the gestalt node if
it ‘sounds enough like it’, as a whole. The Gestalt node for a phrase is not
dictionary of words. It is more likely organised as phrases. As groups of words
that commonly go together / appear together…groups of sounds that occur
together often…to model the language, need to break it down into meaningful
chunks…to reproduce sounds, need to break down into meaningful groups of
sounds, as they often flow into each other in use…like notes or lyrics of a song
appear as phrases, or licks, chops, and riffs…better to learn an entire ‘whole’…if
stop and start, lose the ‘feel’ of a riff / chord progression…trying to learn just the
notes individually is same as learning language by words and supposed ‘rules’ of
grammar…we can only remember 5 to 9 individual things…so if chunk as a riff /
progression/ phrase, increase our ability to remember, Vs independent words and
notes…they appear as chunks…music is not notes, but their relationship to each
other and silences…the meaning of words is their relationship to other
things…and then to each other…i.e syntax gives precise meaning when words
often have many meanings, and then there is metaphor and other figurative
language…so learning words and ‘rules’ is like learning spelling
phonetically…my old method is consistent with best NLP practice…n.b can
show people where to put tongue, so have a visual cue, phonic cue i.e does it look
/ feel like it did when teacher said, yes, that’s right…imagine teacher, then self;
compare / look for differences and similarities to reproduce sound, and feeling of
being ‘right’ …as I say language ‘feels’ right in the end…no child learns
grammatical rules most teachers use to teach English…EVER…most teachers
never learn them…and no teacher LEARN’T their language from such rules, if
native…they learned the rules AFTER and were told they were helpful…but to
whom? When? How?

If current strategy e.g choosing boyfriends, choosing when to assert self,
choosing what to eat and how much and when, choosing life goals, choosing
when to say no, etc…proving a problem, can revisit it…model it…see if can
‘tweak it’, or install a more optimal one based on your own other models,
someone elses, or one made up to suit the purpose…and then install it to displace
and replace the old, less optimal one…

N.B internal refers to how you feel inside, Vs external, how a thing literally
feels…so can have both i.e pat cat, feels soft and silky and warm externally,
which produces warm relaxing calming sensations internally
Tonal supposed to mean literally ‘sounds right’ Vs digital, it meet certain criteria and ‘makes sense’.???

What ‘triggers’ your habit (strategy isn’t the term I’d use, though NLP do use it i.e assume it is a deliberate strategy employed by the unconscious to set in train series of behaviors intended to ‘solve’ some problem / achieve some aim, and this term ‘validates’ and ‘approves of’ / ‘values’ the intention if not the habit / response / behaviors’. Neurological representations. If a specific pattern occurs, then a specific behavior is generated. If the neurological pattern does not occur, then the behavior does not occur.

‘Let’s see how that sounds’, ‘Let’s see how she feels about that’, ‘Let’s see what they think’.

Propaganda works by eliciting motivations i.e to risk death killing other people’s fathers, sons, daughter, and mothers, via constructed (fake) images, fake news, false flag attacks, CGI planes hijacked by imaginary Arab Muslims.

Find out why thinking of a certain situation makes your nervous, terrified, angry, happy, optimistic…what program do you run to get from image X, to feeling Y?

You can observe eye movements to model someone’s process i.e they look in certain directions, indicating they are accessing different representation systems, and recalling or constructing, internally or externally. If you note these, you can pretty much say how they construct that set of behaviors / that process / that habit / that state e.g of being sad, happy, mad, in love, certain, confused, terrified…what they do is imagine something, either see it in their minds eye, or hear something in their head etc, that sets the ball rolling, and leads to the final state / emotion / feeling.

Use of NLP etc to transform beliefs / system / definitions / habits / model of world / more specific models e.g racism, sexism, religion … to expand consciousness / open mind / offer multiple perspectives / options / models i.e offer more choices… trance / hypnotism offers ‘alibi’ … bridge … window of opportunity … can ‘blame it on the boogie / alcohol / truth-drug / drugs / moonlight / stress / just following orders / misunderstanding / situation i.e save face…all in good ways i.e generative / freeing ways i.e allow person to experiment with ideas / options normally ‘taboo’ and ‘frightening’ and ‘unacceptable’ or ‘beneath their dignity’, or ‘above their station’, or ‘pagan’ or ‘violation of some code / ethic / religious dogma / categorical imperative / nominalized and fixed past decision or learning…can save face…have ‘fallback’ to fall back on if overwhelmed … i.e if do something want to do, but feel ‘shouldn’t’ or ‘can’t’ … but now can do it, and have ‘excuse’ to fall back on…can blame it on the trance / lie detector / interrogation drugs…in best possible sense of ‘alibi’ i.e empowers to overcome inhibitions / conditioning /
mind control / implants of religion-authority ... so now free to speak what really believe, do what really want to, try something, challenge things didn't really believe...to grow...to expand...to generate more choice / options ... to 'try and see', to 'experiment'...in this socially acceptable situation / condition ... like 'mardi gras' / 'carnival'...or pick up bar...or war...or orgy...... everything can nothing must...socially sanctioned / allowed ... 'what happens in vegas stays in vegas'... the 'closed sessions' of governments and religious orders...the 'special occassions' and situations people agree to 'overlook 'bad' behavior / contravention of established rules/norms/ expectations...lie allowing 'Bacchus' once a year at the harvest festival etc to run riot...what happens at carnival doesn't count' ....what I say or do when drunk / intoxicated / under their spell / in love / in war / when desperate / for god and country / when under influence of truth drugs etc doesn’t count as it normally would...lie detector operator has placebo effect...if can trick person into believing they have the power many believe they actually have i.e of being able to detect lies, then no-one would blame you for giving up the truth, as it was inevitable / unavoidable e.g interrogation of prisoners of war etc...in fact 'efficacy' of ANY lie detection method, no matter how simple or complex technologically, is that it tricks people into admitting guilt / volunteering information...and if society accepts efficacy as real, the operators can use it to 'prove' their own speculations, and have these speculations, no more than 'hunches' and prejudices, validated as 'scientific'...lets FBI reject most applicants e.g any that show signs of authentic desire to serve the public, to find the truth, to catch criminals, and most importantly, defend the constitution, protect the people, and maintain peace, justice, and freedom etc.

Build rapport. Then 'soften up' with gentle persuasion rather than direct, invasive /aggressive assaults / coercion to gain compliance with process. “You know as we sit here talking about your business, I'm really motivated to ask you some questions that will allow me to serve you better. So I hope you don’t mind if I ask you...”

Once you have discovered how they get themselves to make decisions, to act decisively e.g how did you decide to X...you want to get them into that state again i.e trigger anchors set during eliciting of that decision strategy, at sub-modalities most efficacious i.e state in which they can easily decide / act decisively e.g if you are trying to 'close' a deal / sale / transaction...which could be sale of house, or sale of your NLP stratagem to help them ... i.e get them to vividly recall intensely positive decisive state, when felt confident their decision good, and committed to it, and thus could decide easily/quickly...anchor this, then trigger it in context you want them feeling good / decisive / confident / sure enough to ‘sign the contract’ or ‘decide to be your client’, or ‘decide to stop drinking / smoking / raping/ murdering / stealing/ hating themselves / overeating/ etc etc i.e UTILIZE this understanding of what it takes to make them feel positive
/ easy / happy / optimistic / committed / decisive … employ it in situations of own choosing…so can trigger entire gestalt node for ‘yes I’m sure and definitely decided to do this, where do I sign / when can we start etc

N.B this is the sort of area where NLP suspicious / problematic / potential sinister uses…but point is to be aware of how others may employ these as ‘tricks’ to manipulate you…and to employ them yourself, deliberately, or allow a therapist to use them on you, to gain the result YOU want for YOU… a gun can defend a family, or murder it…it is a tool…but closing sales / overcoming inhibitions / objections is a key application…will be used by anyone trying to ‘sell’ you on any product, idea, ideology, religion, government policy i.e by lobbyists / advertisers / promoters / salespeople / marketers / public relations / public opinion constructors …

Most people have some experiences of doing things they claim they can’t…it is just a matter of drawing their awareness to these ‘forgotten’ acts…of re-framing other acts which in principle demonstrate the quality / action desired e.g ‘I can’t say no’…tell to undress…they’ll say no…so you prove they CAN say no…

People under supposed hypnotic trance always comply with their normal social inhibitions, on stage, unless they WANT to break the taboo…i.e person who does NOT want to undress in public, won’t, no matter how deep the trance…most people WANT TO do this secretly, even if won’t acknowledge to self or others…unconscious desires…which is why you CAN get people to behave more extreme, but only if THEY really want to…they are playing a role…it is a role with more open options / flexibility than their usual / socially demanded / imprinted / conditioned roles…but the person still has total control…though may not be conscious of it e.g MK ultra segmented personalities…probably only works with people who just need a little prodding / alibi, to kill people etc i.e can only program within limits person comes with…and most peole capable / have destructive impulses that can be accessed, just waiting to be triggered by situations / conditions…while others could NEVER be brought to murder (consider how few people are vegan..they KNOW at some level they are murdering, torturing, imprisoning other sentient beings…it is just a question what they do with this knowledge, suppress and repress it or express it…and the social norms etc which condone/ allow / accept / actually actively encourage some violences and not others…e.g advertising of health benefits of animal flesh, milk, eggs…tobacco…alcohol…war…state terrorism…tyranny … dictatorship…

We have idea that the NLP hypnotist can make something ‘irresistible’ so you will feel compelled to do it. Which is true in cases of phobias, taboos, submission to authority, following orders, superstitions religious or otherwise…Madison avenue specialize in this…even ‘selling’ us on state terrorism / war / tyranny / stomping on the constitution etc…
So now you have sensitivity training to stop being abused in these ways. Freedom from religion, government, propaganda, phobias, superstitions, marketing, con-people, being manipulated / tricked / deceived…lead to slaughter, lead into slavery…

Structuring appeals so they appeal to the neurology of the person…their representation systems…their beliefs, their assumptions, their ideals, their values, their ways of forming conclusions and making decisions…that is NLP…find out how they get from A to B, where B was some state / action / behavior / belief / motivation … so that you can now replace B with anything you choose…NLP models the process, sans content…so it can be formally described, replicated, and employed to ensure that all the possible / personal means within a person for realising a particular state e.g. happiness, or performing a particular action / behavior e.g. showing kindness, decisively taking control of their own life and behaviors etc…can now be utilized / employed to their optimal ends…Right now the resources of each person are NOT being employed most efficaciously and to the most optimal of ends…the best outcomes for them, their families, their communities, their world. NLP, this book, my entire T books are about that…this book is specifically about empowering us to develop / utilize/ access / positively direct all our resources…our ‘black boxes’…to produce the states, the world, that when we are sane, informed, enlightened, and empowered, we will seek to realise…a-la my Eden protocols…

Communicate in the ways that are most powerful for the person / people…using their usual representation systems…their most powerful strategies…find out how they get from A to B, and use the process to get them to C, D,…Z. The destination they choose. Most of us accept B as the only, natural, unavoidable, no-option destination…unless we see other people at D, or ourselves have imagined some F, or some writer has presented a vivid vision of Y…and then few of us understand that we don’t have to be satisfied with B…we can all open up our destination options…we can get to Z, P, and L, and then keep choosing from all the unlimited possibilities…never getting ‘stuck‘ in any place…always having the knowledge of how we got to B, and employing that to get anywhere else we think worth exploring / investigating / trying and seeing / experimenting…just like evolution…THAT IS the process of evolution…

Whether ‘the law of attraction’ is a metaphor, or a literal reality, it is scientifically compelling…self-fulfilling prophecies are fact…most things that bring us value first existed in someone’s mind, before being realised…even random patterns observed had to be projected into the mind, to find an application…though with ‘genius’ it appears automatic / intuitive…the unconscious just juxtaposes a pattern observed…a number of patterns which for other minds appear unrelated, and meaningful…onto others…to form new patterns e.g. Hume’s Pegasus. Meaning is this relation between things. The
recognition of patterns. Of associations and correlations. Often speculations prove wrong e.g homeopathic and sympathetic magic, but soon we accumulate a set of useful apparent patterns e.g ‘cause effect ‘ heuristics, theories that appear to play out in predictable, and reliable, and thus programmable, useful, applicable ways…the scientists is really the Zen practitioner…the Zen observer…the Humean skeptic…they allow reality, the patterns, to form impressions on their minds, rather than seeking to impose patterns on the world…e.g force their models/ their theories/ their dogma onto the world, to make the world submit to their assumptions, which is so true of religions, and economic theories, Marxism, racism, sexism, etc etc…

Communication means ‘sharing’ what is in your mind, what you feel, what is ‘real’ to you, with others, to achieve correspondence with other minds so that they see, hear, feel, smell, sense, what is in your mind…and it becomes as compelling for them as for you…as vivid…as real…so you have a shared reality…so that the ‘reality’ in your mind appears as real and full in theirs. Then you have communication. Hence ‘Holy communion’. It is rare that people are communicating. Rare that they are even trying to ‘share’ the others. Most people are trying to express themselves, and not understand the other. There are so many traps and pitfalls, all explained in my T books.

Find out what the interlocutor needs to replicate what is in your mind…do they use pictures, sounds, details, overviews, criteria, longer term, shorter term etc to construct their reality? Don’t assume how things become real for you is true for others. You may rely on ‘gut instincts/feelings’, others have explicit criteria. You have to learn what representation systems they are using, and then translate yours into theirs, then get them to do the same, to verify ‘message received loud and clear’ i.e feedback…otherwise playing Chinese whispers…talking past each other…a source of many avoidable conflicts and misunderstandings, even divorces, unemployment, business break-ups, civil wars, wars etc etc…

Present information in the order and sequence that they process information, and in the sub-modalities (representations) they use…this corresponds to their usual strategy, and thus will be compelling / irresistible for them. you will be accessing their typical pattern / habit … you will trigger all the muscle memory, and ‘comfort zones’ and ‘confidence’ and ‘motivation’ that exists in them, redirecting it to the goal / object you intend e.g close a sale, change a value, motivate change etc

The first time I said, “You will probably see in a moment that this makes sense to you, and you can feel good about learning it.” No response. So, I pointed that out to her, and said “Well, I think that you will probably discover this makes sense to you as soon as you can see that it feels right.” And she went, “Oh, yeah, now I understand.”
We could say (assuming a visual construct / visual recall – auditory digital – kinesthetic strategy), “I'm wondering (hypnotic language pattern) how soon... “ (which is a temporal predicate) “I'm wondering how soon you will have the opportunity to look at our proposal and recall, seeing that it meets your criteria for feeling good about it tonight, won't you (hypnotic language pattern)

The magic number seems to be three presuppositions in a single sentence, which immediately gets you beyond the conscious mind. This sentence had 6. VC/VR K AD Given the above strategy, here's the sentence: I'm wondering how soon [1] (assuming they haven't even agreed to look at the proposal yet) you'll have the opportunity to look at our proposal [2], and recall seeing that it meets your criteria [3], so you can feel good about it [4] tonight [5], won't you [tag question – 6].

Hypnotic Temporal Embedded Commands Inside Strategy Temporal Hypnotic

So, what we have is a hypnotic language pattern followed by a temporal predicate at the beginning, and at the end, that collapses all 3 of the embedded commands together into one highly irresistible sentence. You can construct them any way you want by putting temporal predicates at the beginning and the end and putting the embedded commands in the middle.

There's also a command to feel good about the proposal tonight as opposed to some other night, which presupposes again that they're going to look at it tonight, whereas we began by asking them how soon, we now have ended up by suggesting that it's going to be tonight.

While you were in the process of eliciting someone's strategies you may also have set some anchors. When we do training for retail salespeople, we suggest they use anchoring in addition to strategy elicitation, and embedded commands. When somebody walks in to talk to a salesman on the floor that we're instructing how to sell, one of the things that we suggest is that the salesperson ask the client, “Have you ever purchased a computer (let's say it's a computer salesman), that really works well and you felt really good about?” And when the client or the prospective customer remembers that, they're going to access that entire strategy of buying that computer, aren't they? They're going through and access that state. When the salesperson asked the customer if they'd ever had a computer that they felt good about and really worked well for them, they'll have to go back and access a time if they did. If they did, it's going to access a state of having a computer that worked well for them, which you can anchor. Then you say, “How did you know it was time to purchase the computer?”, which elicits the decision-making strategy.

We can get stuck in loops / cycles e.g. collecting information / data / evaluating to criteria, and never deciding. So need to have exit strategy / implant one in
customer etc i.e potential buyer / decision maker. Elicit vividly represented desired end state. And compare potential decision with this. If it matches, you can decide. If not, need to find what ‘missing’ that usually present when you feel decisive i.e ‘Yes, I’ll buy this / do this etc now. Need steps from here to desired state / outcome. To overcome objections at each stage. Cybernetic feedback systems require momentum, like trying to balance a bicycle…much easier when moving forward. So need to keep moving, by using steps, and moving through them, overcoming each objection, with final destination vividly represented to motivate, and each sub-destination vividly represented…either moving towards desired outcome, or further from undesired outcome…better to have more choices than fewer … but at least 3 steps, then as few above this as possible…

MHR law of attraction / resonance communicating – programming E-M soup, can be viewed literally or figuratively i.e metaphorically. And how it operates can be viewed variously. We resonate at particular resonant frequencies i.e thought waves, organs have their own…nervous system electro-chemical signals have their bandwidths … pleasure and pain is produced when ‘receptors’ of signals process them, to produce these impressions / affects. Does DNA behave a little LaMarkian? i.e communicates with cells, and other organisms? Maybe direct to their minds / nervous systems e.g pheromones and love / desire . Is it merely interactive feedback loops, triggering of latencies. Is unconscious mind able to produce unlimited outcomes i.e super computer programmed by random experiences or deliberate conscious rational programs we give it…is mind one big mind or individuals? Are they networked on bandwidths we are unaware of vs our crude limited means of ‘communication’ e.g verbal, visual, body language etc. Do brains, bodies, anything exist? Or just impression i.e thoughts / ideas .. no necessary ‘pain’ or ‘pleasure’ but what the mind constructs…and electro-chemical signal indicating ‘excess heat’, or ‘skin integrity broken’, or ‘tooth broken / rotting’ has no intrinsic meaning…but receptors for these situations / conditions exist in brain…and when triggered we ‘feel’ pain and pleasure…and any chemical compound that mimics it / has similar enough structure, will trigger the ‘pain’ or ‘pleasure’, even though the ‘intended’ trigger is not present…i.e chillies and fire, amphetamines and euphoria, cocaine and pleasure…while others similar to ‘pain killers’ body naturally produces e.g endorphins…in presence of overload of ‘pain’ that threatens survival…or excitement, success, sex, food…so final ‘feeling’ or ‘emotion’ produced in brain…or in mind, if brain just another trick to distract us, make this ‘virtual’ reality appear ‘real’ i.e solid and ‘objective’ i.e external to us…not us…no need to go ‘mystical’ at all…let along
bring the dogstar into it (ma of dog, dog ma, dog star, visitors from dog star a.k.a ‘gods’). So many ways to explain why logical that ‘law of attraction’ and positive visualization works. Manmade products are all clearly first imagined products, so the manmade world is clearly a manifestation of someone’s thoughts / imagination / vivid imagination / resonation of their brain waves that certain patterns of frequencies that equate to the visualization of the proto-products which now fill our manmade world…even clearing a forest to produce farmland, building a home, canalization and redirection of water for irrigation, then idea of clothes and plants and … on and on…clearly our world IS a product of our minds…of someone’s visualization…and the things we seek e.g power, wealth, to dominate, to enslave, to exploit inherited inequality and amplify it i.e get more wealth, power, influence, sex, pleasure, relief, even at the expense of others i.e ideally we don’t want to pay for it ourselves with our own risk, effort, sacrifice, blood and sweat, if we can compel / trick others into investing all this, and handing over their produces and services at no cost to ourselves, whether other humans or other sentient beings i.e other animals…clearly every time we choose this behavior, we are producing a world defined by such behaviors…and likely to be the victim of another’s similar impulses…sooner or later, in this life or next lives…so clearly what we intend, what we imagine, becomes our reality. Only in ways we didn’t desire / anticipate i.e imagined ourselves as slave owner, not slave. As beneficiary and not burden bearer...as the receiver of pleasure, relief, and other benefits, rather than the supplier...to get the positive externalities of such a system, and avoid all the negative ones, which we can transfer, impose upon, force upon, others, whether those others are chickens, other humans, our employees, our servants, our subordinates, either local or overseas etc…I go into details in my T books.

This book done. Guy has Ph.D? years of experience?

[The government by a group of merchants is the worst government possible i.e Adam Smith speaking of Danish colonies...so apt for todays Banksters and corporations which rule defacto as world government ]

Through time people represent every part of their time line in front of them, usually from Left to Right, and view past etc dissociated, as if an objective bystander, and thus see themselves in their memories, which of course means they are constructed memories.

In time people (Zen) people more ‘here and now’, represent some part of their time line within themselves. So if it runs left to right, the present point is just behind their eyes, or inside their body, the past to their left or right, and their
future to the opposite side. If they represent time from back to front, the past will be behind them, and the timeline will run through them, with the future in front of them. Introduction / Prelude. They tend to recall their past experiences associated, i.e through their own eyes. They are often more able to recall specific experiences, as compared to ‘through time’ people’s memories which are a collage or abstract reconstruction of the content / meaning of several memories of a similar nature, like a compressed or collapsed time-line.

Some writers claim a Southern, Arabic, Islamic, South American, Mexican correlation with ‘in time’, and a northern European, North American correlation with ‘through time’. However the correlation is probably more to do with industrialization levels rather than any other cultural or genetic predisposition, with the means of production, and the interests of the owners of these means, the capitalist, determining everything else in society, including the value placed on ‘punctuality’ and even ‘just in time inventory’, schedules, routines, factory and production timetables, and financial time keeping.

MHR our first ‘representation’ of pleasure / pain / fear is the strongest…it is an automatic genetic program that produces a model, as fast as possible, of our environment…determining what we are drawn to e.g food and sex, and avoid e.g threats to our life etc…no to or for…it just occurred…at least once, and was reproduced in the carrier, as it increased its chances of survival…no design, or intent…just a random program / instinct / reaction / response … so what we are ‘told’ or ‘learn’ as infants, usually ‘imprints’ these ‘beliefs’ in us, including phobias, likes, dislikes, religious and political ideologies, racism, sexism, tastes, and fetishes…like chicken imprinted on tennis ball…if first orgasm was associated with e.g a particular material, or shoes, later can become a sexual trigger i.e fetish…

Trance is an altered state? Really just a natural state. That of attending to something. A thought in your head. Or a sunset. Being engaged, focused, so narrowly on that thought or view / sound / smell / memory etc that all other impressions / thoughts are excluded. We get into habits of attending to, and thus reproducing, and making more vivid and real, certain ideas. We can break that habit cycle, and stop reproducing counter-productive ideas / mental images e.g phobias…and having option of displacing / replacing limiting beliefs etc with generative ones e.g we can be terrified of a certain situation, or choose to become more alert, aware, reasonably cautious i.e to learn the lesson of a past experience rather than let it limit our future actions e.g all phobias learned instantly, so can be un-learned instantly … more aptly you can free yourself to take what you learnt e.g some dogs bite, don’t just jump up to any dog and grab it…Vs irrational fear of all dogs, from golden retrievers to stuffed toys…Bandler realises don’t need to put someone into an artificial altered state e.g hypnotise…/ trance…need to work our what trance they habitually put themselves into…e.g
how they create the terror...every time see / think of dogs...and then offer alternative responses / actions i.e how they can get themselves into a different trance state i.e what to focus on ... what to attend to...what to make vivid...what to dwell on...what to THINK about...to attain different states of consciousness...different trances...life is all a bunch of stories...what story do you want YOUR life to be...all reality is ‘will and representation’ as Schopenhauer put it. It is ‘illusion’ as Buddha put it. It is an ‘experience engine’ as I put it. It is all metaphor. You take the electromagnetic soup that makes up ‘objective reality’ and ‘represent’ it internally as sounds, images, smells, feelings. Our unconscious mind does most of our ‘work’ e.g breathing, muscle memory of skills learned e.g walking, sports, music ... and also our ‘representation’...it is great survival value to ‘learn from experience’ that some dogs bite...it can be totally incapacitating to learn to fear ALL dogs in EVERY situation. That is the point of a phobia. A lesson learned that was so powerful e.g life and death...that it ‘stuck’...and was reproduced without any alteration...from moment to moment...a sort of trance state / habit was formed...a survival knee-jerk reaction. But it can be too limiting a ‘belief’. It might save you from repeating the dangerous/ life threatening situation, but also limit your joy, freedom...some minds will fixate...some will learn to interrogate the experience / impulse of fear, and consider whether ALL dogs are the same...pose the same threat...all similar situations are the same, pose the same threat...it is about precision in thinking...and language...same applies to ALL of daily life...most of what we do is habitual, unconscious...we live in a trance...with limiting beliefs...that are the true prison and chains that prevent us enjoying complete, rewarding, satisfying lives...and people like this often seek to impose their own limiting beliefs, out of fear, onto others...they need to CONTROL others, out of fear...they need to condition others / limit others / make others conform to their own fears...‘collective guilt’ is one terrible outcome i.e the compulsion to make everyone comply with your own learned, limiting belief / superstition / phobia...because the individual with the irrational / extreme / learned fear / phobia / superstition believes that they themselves will suffer unless EVERYONE ELSE also complies with their own phobic / conditioned compulsion ... e.g compulsive hand washer imposes extreme ‘hygiene’ on everyone else...superstitious person forces all others to participate in THEIR ritualistic neurotic actions e.g rituals, practices, beliefs...

So NLP is about recognizing the individual and social trance we are all in right now. The trance might be a phobia, a ‘religion’, a belief e.g racism, racial supremacy, chosen people, gods, sin, evil, ideology etc...and removing its monopoly power over the individual and society e.g extending the limits to include many more options to chose from e.g of how to respond to seeing a dog, or how to organise the problem of production and distribution of goods and services a.k.a economics, or sexual experience, ... to remove the limiting
beliefs…the phobias, the indoctrinations, the religious dogmas, the sexual expressions… so that we can be more ‘reasonable’ and ‘rational’.

When we as individuals and societies escape the current limiting beliefs, the trance states we are in, as individuals, we are then free to ‘let others be’ … free to allow others to be free to express THEMSELVES how they chose, from the wide range of possibilities…we can then enjoy voluntary associations…and move between different models e.g within a federated universal system, we can allow and experience different models e.g capitalism, communism, different religious rituals and beliefs…without fear…without need to FORCE or compel others to AGREE to the same … this is the true potential for freedom…no-one feeling a compulsion to control what others feel, believe, and do…unless there are REAL positive externalities e.g you can take any drug you like at home, as long as you are not responsible for anyone else at home…Vs driving a car in public, caring for children etc…so we can become more flexible to solutions to problems…not fixated in some trance and motivated by irrational fear…which at heart was RATIONAL e.g a dog DID bite you, a car DID blindside you, people DID hurt you…but was never ‘adjusted’ to daily life e.g MOST dogs won’t bite you, but it is good to be judicious…MOST times you drive you won’t be blindsided…at the same time you should learn something e.g defensive driving, don’t just rush at a strange dog eg….So NLP is about ZEN is about Skepticism (always keeping an open mind and leaving all answers open i.e never assume you KNOW anything…never globalize from examples e.g one dog = all dogs…statistics is not fact, just history…about being here now, and looking at all situations as unique…while learning lessons of caution from past, not allowing history to entrance you…to limit you from what is here and now…i.e this dog, this road, this car, these people…right here now…never needing to fixate…to fix…to idolize anything as TRUTH, fact, the only way, the right way for all people at all times…to stop being automaton…to go off auto-pilot…to stop being unconscious…to stop reproducing history…to escape history…to learn from it, but not to be limited by it…

NLP is about being conscious of alternatives…being conscious per se…escaping current trance states…they don’t need to be induced…just recognised…and opened up for interrogation…to be replaced / displaced …simply by offering alternatives…choices…so in future you can chose to be very alert in traffic, or when around dogs, of potential risks, while being free to enjoy driving, or playing with dogs… or eating chocolate, or having a few drinks, or loving someone, or enjoying your unique sexuality, and then being able to choose for yourself…consciously…the most generative, optimal, rewarding, productive ways of being and seeing that are right for you, now. And not feeling any compulsive need to impose them on others, to force others to think and feel and act like you…letting THEM have the same choices, freedoms you are enjoying…
If one thing is clear, it is that the people who have the most limiting personal beliefs e.g. dogmas e.g. Homosexual Jew Paul, tend to seek to impose the most violent restrictions / prisons / mental rules / laws on others e.g. homosexuality defined as sin by Paul, because HE did not feel free to express his OWN homosexuality…people with benefits of monogamy envy those free to screw around, and will re-define their own envy as ‘morality’…etc…poorest people tend to support Marxists not out of ideological considerations, but out of class envy etc…envy of anyone ‘better’…luckier…etc etc

ASSUMPTIONS are a form of trance…they ARE trance states…preconceptions…pre-judices…rather than judging each instance in the here and now for what it IS, we allow pre-determined assumptions / definitions / dogma / beliefs to limit what we are capable of perceiving / representing, and the way we perceive and represent our current actual here and now experience…like letting some old book tell us what reality is, or the mass media, or some teacher or guru or leader…all belief systems / noetic structures other than pure Humean Skepticism (use this term to avoid current use of ‘skeptic’) represent trance states…we are currently in, without realising…we feel these are objective reality…fail to consider alternative options…force others to submit to our our beliefs i.e. enter our own trance states…participate in our own stories / narratives / metaphors…dogma…belief…we cannot escape as long as we fix assumptions / beliefs as dogmatic ‘reality’…we do ourselves and others great violence when we impose these limited and limiting beliefs on ourselves and others…even if we think our lies are ‘noble’, or assume our leaders have ‘good intentions’…it is like a phobia…a severely limiting, and damaging belief…prevents us enjoying a world of joy with dogs, people, situations, opportunities…which is exactly what dictators, often unaware of their own trance states, or deliberately employing trance states a.k.a state religions / belief / systems…when they impose and enforce limited ideas of TROONATNOOR upon the mass populations…to control them…keep them in a particular trance state…basically habitually, compulsively, reproducing a limited pattern of definitions, interactions, behaviors…from compulsive smoking and drinking, to fighting wars (propaganda produces a limited attitude / definition of ‘the enemy’)…to religion, to marriage, to family, to work…to the most fundamental questions of what am I, what is life, what is good, what is evil …

So NLP, seen holistically, is a tool for freeing all sentient beings from limiting, impossible to prove / justify / validate beliefs…to bring them to be Zen practitioners…free from prejudice, preconception, assumptions…whilst being able to learn from experience, …. To treat pain as feedback that something is wrong…and to learn to be responsible and appropriately aware of potential threats e.g. defensive driving, respect for potential dangers…without becoming
victims of phobias of all kinds e.g. homophobia, fear of others success, fear of rejection/abandonment …

You may immediately see the benefit of eliminating a phobia of dogs, but what about a phobia of ‘gods’ and ‘priests’ and ‘hell’? Please read my TROONATNOOR books so you can see WHY you need to apply NLP to ALL areas of your belief systems…your daily lives…you need to be able to extend lessons and analogies and metaphors to all areas of your lives…you think you are free? …you don’t fear dogs? But you fear GODS? …you fear made up stories? You will kill ‘enemies’ because someone told you they were your enemy? You think you can’t be conned by con-men, that you are no gullible fool…when every day you are living a lie, in the biggest con of all time…you think you KNOW the truth. You aren’t stupid. You aren’t ignorant. When in reality you are in the same sort of trance as the ‘entertaining’ people up on stage who are participating in what we call ‘hypnotism’, and are positively and negatively hallucinating all sorts of things. Exactly in the same way YOU are doing right now. And for anyone ‘outside the loop’ like me, your behavior is just as absurd. And if it wasn’t so dangerous to you and myself, and every sentient being, it would be great entertainment. To poke fun at. To laugh at. But the consequences of YOUR trance are horrific. Not merely ludicrously amusing.

Please, try to understand what I mean when I beg you to ‘wake up’.

Add ‘Expectations theory’ and various motivational theories to intro i.e what this book is all about…to show context of NLP i.e it is extension of all previous work…

NLP is another ‘convergence’ I have found since writing my TROONATNOOR vol. I. A convergence between conclusions I came to through the interrogation of my own experience, and those that other ‘great thinkers’ have dared write down in their own books. Usually before me. I stumbled across their ideas as I pursued my quest to interrogate TROONATNOOR, and my own ‘compelling arguments’.

I came to NLP last. Even though, like many people, I’d stumbled across a few vague and intriguing references to things like ‘accessing cues’ and ‘mirroring and leading’, in writers who preceded, or ‘borrowed’ from Richard Bandler and his colleague.
As usual, it is the insights gained elsewhere, from a very wide and sometimes deep range of sources, which allow me to ‘grok’ the insights made by others in NLP. To be able to express the ideas in a way that adds value, and makes them more accessible to the widest audience possible. As the ‘interpreter’ of the original prophet, where the insights came to me from another prophet, rather than as the fruits of my own interrogations.

Probably Bandler, like Carlos Castaneda, never read any Zen or David Hume, for example.

The aim of this guide is to make the potential contributions of sensationally gifted people like Richard Bandler, Carlos Castaneda, and all the people who inspired and informed their work, as accessible and easy to comprehend and put into practice, as possible.

There may be giants. Or there may be just a lot of dwarfs standing on each other’s shoulders. Probably a combination of both. I think you need to be some combination of both to produce the sorts of works I do. To be able to understand, to ‘grok’ the giants, but still be close enough to the ‘dwarfs’ to be able to communicate with them. To avoid the typical ‘giant’s’ problem. Their problem is that they find too many things ‘intuitive’. They cannot model their own process, and thus be able to communicate it, and share it. To allow the ‘dwarfs’ to be able to comprehend, apply, and thus replicate that process, and its outcomes.

Richard Bandler is, like me, a combination ‘giant-dwarf’. But not a philosopher. Not a sociologist. Not a prophet. That said, his contributions are enormous. And someone like me can take the tools he has made available, and apply them to producing a world defined more by justice, truth, beauty, freedom, and satisfaction, and experience engines worth reproducing.

My ambitious TROONATNOOR project has provided me with insights similar to NLP from a broad and deep range of materials and experiences, including many that Bandler and his colleagues were apparently never exposed to. In this context I can add value to their work. This is what ‘meta-research’ is all about. This is what TROONATNOOR is all about. Making the insights, often gained at great personal expense, suffering, sacrifice, and risk, of the most insightful, talented, and ambitious people, available to as many people as possible.

As Bandler is first to point out, most people ‘hallucinate’ when they imagine they are ‘communicating’. I defined true communication in TROONATNOOR vol. I. Few people achieve it. The danger is assuming YOU have achieved it. That the communication you present, the encoding of your personal representation of it, is decoded, and thus ‘shared’, in your interlocutor’s representation system.
Another way of saying this is that you have a vivid picture in your mind you want to describe, and you think you are doing this. The problem is that you assume that the denotations and connotations particular words have for you, their literal meaning, and the ‘loaded’ sets of associations implicit in them for YOU, are shared. The same goes for non-verbal communication. You may think your body language is ‘congruent’, or may not be at all aware that your body language is NOT congruent, such as when you put on a fake smile that everyone sees through, while your tone of voice is angry and frustrated. In written communications, such as emails, and SMS’s, and in instruction manuals and ‘how to’ guides, the problem is much greater, as all the person has to go on is what you actually write. Quite often people ‘come off as’ sarcastic when they are genuine. So I always add a ‘smiley face’ to avoid this.

Representation system is another word for ‘noetic structure’. Schopenhauer and Hume offered me many insights, as did Zen, Carlos Castaneda, Freud, and the list goes on. My insights come from a range more diverse than any other writer. And as an authentic ‘prophetic’ personality, with the highest ethical ambitions, who has made a commitment to spending their lives interrogating reality, in searching for truth, rather than to prove or justify anything. I have insights few other people attain, or have the emotional courage to actually face, validate, and integrate into their ‘ways of being and seeing’.

My fear in ‘empowering’ people is that unless they are aware of, and capable of integrating TROONATNOOR into their ways of being and seeing, they will simply become more able to pursue objectives which resulted from their earlier erroneous conditioning. If you don’t / won’t / can’t follow the pathway I outlined in TROONATNOOR vol I, and my other works, to challenge your most basic assumptions, then challenge the assumptions that make up these, in an infinite regression until you really DO ‘grok’ that you do NOT know anything, and then continue your journey on the ZEN / Humean Skeptical path, driven by the assumption that the ‘Optimal Ethics Generator’ is real, adopting a ‘veil of ignorance’, so that you actively seek the good of all sentient beings…if you fail to do all the things I have done, and fail to model your behavior on mine, as it is represented in TROONATNOOR vol I, then I will simply have made you a more capable / effective / efficient / competent, self-destructive, other-destructive, cruel monster.

After researching all the supposed ‘lie detection’ methods ever used, it appears that accessing cues offer much more reliable feedback to interrogators than any so-called ‘lie detector’. Lie detectors operate as ‘props’ to produce particular ‘placebo effects’, just as having a caring female, dressed in the typical fashion of a Doctor, with her diplomas and degrees decorating the wall of her office, and presenting full confidence in the ‘efficacy’ of whatever ‘intervention’ she is offering, such as pharmacological or surgical, will produce similar ‘placebo
effects’ in 30 to 50% of her ‘clients’, despite the fact that her interventions are pharmacologically or surgically inactive. Pure ‘placebos’. Sugar pills. Sears made to suggest surgery. In the case of ‘polygraph operators’, it is the belief in their own power to ‘read minds’ and ‘determine truth from lie’, that produces the placebo effect. The tubes and wires, the complex machinery, the readouts, and the confidence the ‘operator’ radiates, are hoped to induce fear in the client, that it will be impossible to lie, and thus motivate them to volunteer the truth, and admit the lie. THAT is the only way polygraph operators can gain ‘confessions’ and ‘admissions’. When the ‘victim’ decides that the operator, with their technology, has ‘seen through’ their lies, and admits they are lying. Like any placebo effect, its effectiveness depends on the individuals involved. How convincing the polygraph operator is in their own lie, of being able to ‘read minds’. Remember that many polygraph operators, like many judges, and jurors, imagine they can read minds, and know who is lying, and when. They deceive themselves, and hallucinate these ‘mind reading’ powers. The technology is merely a way to ‘justify’ their own hallucinations. Many priests and Shamans believe they have ‘super powers’ also, given to them by ‘god’. Their self-belief often convinces their ‘victims’ also. In this case we have the placebo effect. The victim simply resigns themselves to the fact that their ‘interrogator’ has such super powers, either granted by the ‘gods’, by advance education and training, or through the intercession of high tech machines and drugs. The efficacy of any placebo depends on many factors, such as the person’s hormone levels, suggestibility, state of mind, and especially the rapport / trust developed with the ‘administrator’ of the placebo. For therapeutic uses, caring females produce more placebo effects, ceteris paribus, than males. But for interrogative purposes, authoritative, threatening males produce more fear, and submission, from ‘victims’.

[Note that, like the ‘Atom Bomb’ lie allowed the Japanese to overcome their inhibitions regarding surrender in 1945, the ‘excuse’ offered by the interaction i.e. that the interrogator has drugs, training, and technology that is going to discover the truth sooner or later, may allow ‘victims’ to overcome their normal inhibitions e.g. shame at ‘letting down’ their mates, patriotism, ‘loss of face’, cowardice in the face of threats, self-respect, etc, and volunteer information. The fire bombing victims were real, but like in Germany, the Allied war crimes never broke the fighting spirit of the Germans or Japanese, especially in military circles. But presenting a fire bomb attack as the result of some new technology, some ‘miracle weapon’ that they had no defence against, allowed the Japanese military leaders to ‘save face’, and surrender. The real reason was the opportunistic declaration of war by Russia, to acquire Japanese territory. If you doubt that WWII was about destroying Germany, consider the supposed ‘reasons’ why Britain and the U.S declared war on Germany in both wars. In WWI it was the movement of troops through a neutral nation (Belgium). In WWII Britain did the same thing with Greece, and the U.S did nothing. If the
reason for Britain fighting Germany was Germany’s invasion of Poland, then why didn’t Britain declare war on Russia, for the same reason, when Russia, at the same time as Germany, occupied half of Poland, and then later, when it ‘liberated’ and occupied Poland at the end of WWII? If it was a war crime for Germany to sink the Lusitania (now proven to have been a false flag), then why did the U.S allow the British to maintain an illegal naval blockade of Germany during WWI? A blockade that was a criminal act under international law, and the ‘law of the seas’.

The reason that the U.S government uses ‘lie detectors’ is to give them excuses as to why they reject the best, most patriotic, honest, constitutional loving, liberty loving candidates. They simply have their polygraph operators ‘fail’ them, or define their test results as ‘inconclusive’. All you need to do to ‘fail’ a polygraph test is to be tricked into admitting, at ANY point in the test, to ANY question, that ‘maybe’ my first answer was not correct. ‘Maybe’ what I answered to one question in the pre-test questionnaire was wrong. Maybe, instead of having smoked marijuana twice in my life, it might have been between 3 and 5 times. THAT is enough to ‘justify’ a ‘failed’ or ‘inconclusive’ result. And have you blacklisted from ANY government job, or ANY job with any CONTRACTOR to the government. I am writing an essay on ‘lie detection’ to explain these facts in detail, and to help you avoid being the next ‘victim’ of ‘lie detection’. The polygraph operators collect ‘admissions’ like scalps. Like notches on their rifle barrels. Like trophies. Their ‘success’ as polygraph operators is measured by the number of ‘failed’ or ‘inconclusive’ test results they can fabricate. Sure many believe they have special powers, talents, and skills for ‘lie detection’. Just like most people believe what they want to believe. Their more successful colleagues ‘MUST HAVE’ slept with the boss. The person you are in competition with for anything you value is OBVIOUSLY cheating, lying, and unworthy of their good fortune or success, and therefore YOU have a right to deceive, cheat, and even harm or even kill them to take what is rightfully YOURS. We all are our own propagandists!

‘Alpha’ states

Different brain wave activity is associated with different mental states. The ‘Alpha’ wavelength is very low frequency. It is associated with deep meditation, creativity, trance, and similar ‘altered’ states of deep relaxation, calm alertness, and narrow focus / attention. Many people experience these states just before going to sleep. And many famous inventors such as Thomas Edison reputedly kept day beds in their work rooms, deliberately taking naps during the work day, to take advantage of these mental states. States during which their best ideas came to them. During which ‘solutions’ to ‘problems’ suddenly ‘dawned’ on them.
Franz Schubert the classical composer used the Buddhist idea of ‘remembering’ melodies, rather than trying to ‘compose’ them. To act ‘as if’ he was simply noting down a melody he already knew, and remembering it, rather than doing something as mysterious and demanding as ‘inventing’ something new. Remember in Zen time, all time exists in the now, like on a computer hard disc. So everything that can happen already has, and you can see into the ‘future’ simply by ‘remembering’ it. Like moving the laser reader on your computer hard disc to a new location in the ‘now’ of the hard disc, and ‘reading’ it.

Alpha states can become ‘muscle memory’, like any other state from a phobic reaction of terror, to a feeling of love or sexual arousal, to be ‘triggered’ by any stimuli of your choosing. Some people refer to these as ‘anchors’. So that at any time in the future that you want to access that creative, calm, alert, joyful state, all you need is vividly imagine that ‘trigger’ / ‘anchor’. In order to avoid ‘crashing’ suddenly into a very different state from the current one you are enduring, you can program a gradual change from your current undesirable state, into the desired ‘Alpha’ state. Such as imagining a count-down from ten to one, or a color scheme gradation from an energetic color to a more calm color. You can vividly recreate a particular situation from memory, either one that you had, or one you have constructed, and ‘recall’ ‘as if’ it were real. Remembering that the mind makes no distinction between something vividly imagined, and something actually experienced. The ‘experience’ is the same for the mind.

Doctors in the past often gave their patients something simply to ‘placate’ (from the Latin ‘placere’ meaning ‘to please’), because like people today, they expected to be given something, even though the doctor did not expect it would really help. They simply obliged the patient, to ‘please’ them. This is the source of the term ‘placebo’, which means ‘I will please’. However the term gained its current meaning after the U.S Army carried out research into the effectiveness of new antihistamine drugs which had the potential to greatly improve the training and combat readiness and effectiveness of soldiers. Dr Hoagland carried out double blind studies in which one group were given the new drugs, another a pill containing lactose (milk sugar), and another group were given nothing at all. Ultimately the group given the new drugs, and the group given the sugar pills, both showed a 35% success rate at preventing cold and flu symptoms. He concluded that the effects were all psychological. What we today call ‘placebo’ effects.

It has been proven over and over that it is the way in which a placebo or drug is administered that has the power. If the person appears to be a doctor, appears confident the drug will work, and says so, the placebo or drug will be more effective, statistically, than if the drug is handed out by someone of less medical authority, in an indifferent way, or worse, with comments either verbal or non-verbal, indicating a lack of confidence, or worse, even doubt as to the likely
benefits / efficacy of the drug. So the authority and attitude make the difference. It is a question of ‘faith’. In ‘believing’. In having that faith / belief transferred to the patient. To ‘infect’ the patient with the expectation of relief / cure. Placebos have been shown in controlled studies to increase physical endurance much more than actual amphetamines. The same applies to success with surgical procedures. The expressed expectations of the doctor, belief of the doctor, and in the doctor, can make all the difference. Even with ‘faked’ operations that never took place. Some people have even been reported who even developed fake ‘scars’ from operations that never took place, but which they ‘believed’ had taken place.

This reveals the power of suggestion, authority, belief, and faith.

Many animals ‘lower’ in the evolutionary chain can regenerate limbs and organs. Our own organism is an extension of these older organisms. Our brains have developed new structures, piggybacking on these older structures. Our more recently acquired critical reasoning and language brain centers still ‘piggy back’ on the earlier ‘lizard’ brains. It is quite possible that these ‘lizard’ brains have powers that our usual conscious mental activity limits. Such as the ability to heal, repair, regenerate, and rejuvenate tissues damaged by disease or accident, and to resist and recuperate from all sorts of illnesses and diseases from viruses to cancer. It is a question of ‘getting out of the way’ and no longer limiting these abilities with limiting beliefs we have been taught, conditioned, imprinted with.

The effectiveness of both ‘placebo’ and ‘real’ pharmaceutical and surgical interventions can thus be improved, or sabotaged, by negative attitudes and negative expectations, and limiting beliefs. In fact most of the supposed benefits of expensive treatments are placebo effects which we could have for ‘free’, if dispensed by someone we trust, believe in, etc. Whether because we believe in the power of prayer, or of their ‘healing powers’, their ‘miraculous god-given powers’, etc, or in the authority of their degrees, diplomas, reputation, and fancy office. Even the lab coat ubiquitous in any television commercial can do the trick. Anything that ‘lets you believe’ in the relief / cure, and the person administering it.

The conscious mind is conditioned. Trained. Brainwashed. Limited. The more primal ‘lizard brain’ doesn’t suffer from any taboos about sex. It does not suffer ‘guilt’, or ‘oedipal complexes’. It is never neurotic. It is always healthy. We need to access this more primal part of our brains to regain our health and vitality.

Remote reading is entering into the mind of another person, even one you’ve never met, and describing their ‘symptoms’.

Christian Science based on the belief that we are naturally healthy, have a right to be happy and healthy, and that any illness / unhappiness is a result of some mistake in our thinking. That it is our limiting beliefs that produce the symptoms.
All we need do is think positively and allow our body to heal itself, and maintain itself in optimal health/condition. MHR religion has always insisted we are guilty, and deserve punishment, and thus to be sick and suffer !!!

You can ‘suggest’ to someone that they are a great artist, and suddenly they can draw and paint?

In altered states/trance people able to do things can normally not do, e.g lift very heavy objects.

Trance states induced by narrow attention to anything e.g clock ticking, dividing lines on highway, monotonous voice, listening to beat of drum, dancing to insistent steady beat, twirling like a dervish…

Plato talked of using a special voice, that feels to listener as if it is their own internal voice / replaces their internal voice…deep, resonant, calm.

**Sophrology** is the study of methods designed to induce a serene/calm/creative/calmly alert/meditative state of mind, such as those experienced by the most creative people / geniuses / monks / etc

**Franz Anton Mesmer in 1800s German** argued for a kind of energy, which he called animal magnetism, originating in space, which penetrates the body and has an impact on our health. The theory resembles that of the oriental concept of vital energy, called Qi by the Chinese and prana by the Hindus. However studies showed that the convulsions experienced by participants in his group therapy sessions were produced by suggestion, aided by his ‘props’ of purple robes and iron rods i.e placebo effects. The **Marquis de Puységur**, in 1784, a student of Mesmer, is accredited with the first official induction of a sleep like state known as ‘hypnosis’. It was de Puységur who first used the term ‘clairvoyance’, to describe how one client, in this state, could touch another, and somehow ‘know’ their medical conditions / symptoms as if experiencing being the other.

300 B.C.E Druids combined hypnosis and music to induce a state which they called the ‘magic sleep.’

In 1813, Abbot Faria employed an approach which became a precursor to modern techniques of suggestion, and he is credited with coining the phrase ‘now you feel sleepy… very sleepy.’

Bertrand discovered that staring at an inanimate object could induce a state of somnolence, but it was James Braid, a surgeon from Manchester England, who is credited with discovering the technique we now refer to as hypnosis in 1840.
Braid theorized that it was visual fatigue, resulting from prolonged concentration on a single object, that induced the state of sleep, which is why he called the process hypnosis, after the Greek ‘Hypnos,’ the name of a sleep-inducing demon. He published his findings in 1843.

In 1859 Dr. A. Liébault, living near the town of Nancy in France, received a letter from a colleague which described how a certain Dr. Broca had been able to perform an operation on a patient under hypnosis. Dr. Liébault, who had expressed a previous interest in hypnotism, decided to pick up where Dr. Braid had left off. His method, which gradually evolved into the type of verbal suggestion used today, produced immediate results. He would tell patients to concentrate on an object, and at the same time describe symptoms of somnolence - heavy eyelids, relaxed limbs, dulling of the senses, etc. On one occasion he cured the patient of a colleague, who happened to be a highly respected member of the medical community. The evidence was plain for all to see - hypnosis did, indeed, exist, and could be used to cure people. Liébault became a celebrity in the medical world.

Liébault developed his method of hypnotic suggestion and its application as a way to cure disease, notably by introducing mental images of healing. Bernheim, who felt that results were due solely to the power of these suggestions, did not consider it important to put patients into a deep hypnotic trance - they could be induced to enter a state of mild reverie, or even remain fully awake.

Many claims that under hypnosis a person becomes clairvoyant, and can see, hear, taste, smell what inducer does, and inducer can communicate telepathically with them.

Hypnosis became less important with the advent of pharmaceutical anesthesia. Up until that point many famous cases of the use of hypnosis in this context were reported.

By the 20th century hypnotism was relegated mostly to entertainment performances.

Sigmund Freud preferred working with patients in a waking state rather than in a hypnotic state as he attempted to treat mental illness. Emile Coué, carrying on the tradition of the Nancy School, also rejected hypnosis, using the power of suggestion on conscious subjects to try and cure physical health problems.

Psycho-kinesis (mental displacement of objects) and telepathy (mental communication)

In Germany in the 1950’s, J.A. Schultz developed a relaxation method that used verbal suggestions to describe the physical effects of hypnosis (I am calm… my
arms and legs feel heavy… my right arm feels very warm… etc.). In 1960, a student of Schultz, Alfredo Caycedo, developed a therapeutic method which he called sophrology, using the equivalent of a mild hypnotic trance to treat patients suffering from a variety of disorders.

Sophrology deals with all related phenomena - relaxation, yoga, Zen meditation - in fact, all techniques that aim to induce changes in our ordinary state of consciousness, not just hypnosis.

In the Charmides Dialog Plato tells Charmides, one of his disciples, how to cure the mind and body, beginning with the terpnos logos, a kind of gentle monotone resembling an incantation, which induces a state of relaxation, total concentration and mental calm required for the verbal treatment of physical or psychological disorders. Plato’s ‘terpnos logos’ … tone and rhythm of voice adopted… to be most efficacious at inducing trance / implanting suggestions … inducing deep relaxation… Caycedo explains how to adopt the right tone: “Adopt a tone that is as familiar and relaxed as possible. Your voice should reverberate, as if it were coming from inside the subject, as if it were the subject’s own voice, resonating deep within himself.”

The subject’s own voice, resonating deep within himself… If we take the notion one step further, we could say that it really is a subject’s own inner voice that is most effective for orienting the mind. Unfortunately, in most cases this inner voice communicates negative messages: ‘I’m so stupid… I can’t take it any longer… I’m nervous… I’m afraid… I feel sick… I’m fed up…’ and so on. The accumulated effects of these negative messages, far from being harmless, can actually result in physical or mental health problems.

There is nothing new about the notion that negative thoughts can have a harmful impact on behavior and health. Korzibski, a Russian researcher, observed that verbal formulations like ‘I’m always clumsy with members of the opposite sex…’ or ‘I knew I could never be successful…’ or ‘I have a terrible memory…’ etc. have a paralyzing effect on the individual.

As Buddha said, ‘We are who we think we are.’ Our thoughts, formulated as verbal phrases, resonate inside us much like Caycedo’s terpnos logos is meant to do, although often with negative results, conditioning our mind without our being aware of it.

Saying ‘I don’t like this or that…’ or ‘I am this or that…’ stems from a static vision of the self, when in fact the self is in a constant state of evolution. Personal development is a dynamic, rather than a static process, so any opinion you may have about yourself is really only temporary.
Our logical, rational mind, centered in a part of the brain called the cerebral cortex, must be subdued, leaving room for more primitive mental functions, centered in the rhinencephalon or olfactory brain, to operate. Over the course of human evolution, the primitive olfactory brain was covered over by the cerebral cortex. Altered states of consciousness, induced by various means, allow intuitive data to rise to the surface of our awareness.

Staring at anything - a crystal, a coffee bean, a pendulum, etc. - will induce a semi-hypnotic state. Oracles of old, like the one at Delphi in ancient Greece, used noxious gas (probably a kind of drug) to achieve the same result, while mystics concentrated on their navel or on the blood of a sacrificed animal, and shamans relied on rhythm and dance.

A state ‘between waking and sleep’. Caycedo, a student of Schultz and founder of sophrology, concluded that autogenic training was the best technique for inducing the desired state.

1908 J.H. Schultz, a young doctor fascinated by a new discipline called psychotherapy, became interested in hypnosis and suggestion, claiming that it is possible for certain gifted and cultivated individuals to enter a state of hypnosis of their own accord, simply through an effort of will (the idea of self-hypnosis had originally been proposed by Oscar Vogt. Schultz to try and develop a method of self-hypnosis. A state of ‘disassociation’ he deemed necessary for the liberation of intuitive, as opposed to rational, thought processes. Autogenic training or autogenic relaxation, defining it as a system of physiological exercises carefully designed to induce a state of general disassociation from external stimuli in the organism. Autogenic relaxation improves physical health as it relaxes the body and allows the subconscious mind to express itself with much greater freedom. It takes a few months to master the technique of autogenic training, i.e to induce state of deep relaxation, but then it becomes muscle memory, and you can ‘anchor’ it and ‘trigger’ it quickly, using a gradual ‘slide’ into it, to avoid any possible dangers from immediately becoming totally relaxed.

Hypnagogic images that appear just before sleep, after have closed eyelids… a twilit space, which would soon start filling with spots, veils, lines, shadows and shapes.

Most research tends to confirm that paranormal faculties originate in the more primitive levels of our being, i.e. those controlled by the olfactory brain.

Hypnotic suggestion: ‘The state of having a belief, an idea or a desire, when that belief, idea or desire originates in the conscious mind of another person (the hypnotist) without the subject being aware of the outside influence exerted by the hypnotist.’
It is only after the mind has become calm, entering a state between waking and sleep, that subconscious intuitive factors come into play.

The brain contains certain receptors, called proprioceptors, that most people hardly ever use. Yogis, on the other hand, develop these receptors to the point where they can feel, and even modify, physiological functions. Yogis in India who could provide perfect descriptions of their inner organs, without ever having seen an anatomical model or diagram.

Electronic biofeedback device: electrodes attached to a patient’s body were used in place of proprioceptors, allowing researchers to detect physiological sensations that could then be transformed into auditory or visual signals.

Many pregnant women suffer from so-called morning sickness. Nausea and vomiting stem from an unconscious rejection of the fetus, which is perceived as a foreign body. Dynamic relaxation helps future mothers become aware of their new corporeal structure, causing morning sickness to disappear.

In 1967, Dr. Raymond Abrezol was hired to teach dynamic relaxation to the Swiss national ski team. Athletes can improve their performance by developing an awareness of the physiological effects training has on their body, and by transforming equipment (skis, paddles, balls, javelins, etc.) into extensions of their own body. The process resembles what happens when you buy a new car: at first, unsure of the vehicle’s dimensions, you have to be extra careful not to run into anything when you drive. But in only a few weeks the car’s structure becomes so deeply engraved in your brain that you can avoid obstacles by only a couple of inches with hardly any thought or effort. In other words, you develop an intuitive awareness of the car as an extension of your body. The same applies to athletes: skiers who do dynamic relaxation exercises while wearing their equipment, for example, can considerably enhance their performance.

Imagine a perfect performance, visualizing themselves as they complete a perfect run down the course. Not concentrating long enough to reach the finish line, or becoming distracted for any reason, is considered the equivalent of a fall - the subject has to start all over again.

The key factor is the sophrologist’s attitude - if he or she lacks conviction or doubts his abilities, the climate of confidence between therapist and subject, which is crucial to the success of any treatment, is undermined.

Subtle, sometimes clandestine means of persuasion are commonly used by businesses to advertise their products, by government for propaganda purposes, and even by educators, in order to manipulate students without their knowledge.
“People who are exposed to these influences are totally ignorant of the psychological techniques being used on them - they think they can resist advertising and propaganda, that they are free to form their own opinions, that they can detect when they are being manipulated, and that ideas have no power over them.”

Psychological laws governing the principles of advertising were formulated in the twentieth century, although many of the techniques had already been used for centuries. These laws helped advertisers influence potential buyers on both a rational, and irrational or intuitive level.

Ernst Dichter. A group called the Color Research Institute conducted an experiment on housewives: each housewife received three boxes of a sample detergent, one yellow, one blue, and one blue with yellow dots. They were asked to test the detergents and comment on which was best for delicate washing. Of course, all three boxes contained the same detergent.

A majority of women responded that the detergent in the blue box was too strong, that in some cases it damaged clothes. They said the yellow-box detergent was not as effective, leaving stains on some clothes. The third box the one with both colors - was the best by far. Women said it was “marvelous” or “extraordinary” for cleaning delicate laundry.

People act for two kinds of reasons:• Logical, rational reasons (originating in the neo-cortex);• emotional, seemingly irrational reasons.

Under hypnosis, an idea or suggestion can be planted directly into a subject’s subconscious mind. Subjects can be told not to act on the suggestion until some later point in time (this is called posthypnotic suggestion). The subject invariably will express / find a rational reason for doing something irrational, in this case an action that was planted in his subconscious mind by the hypnotist.

1. The real motivation for our behavior often has nothing to do with the reasons we think are behind our actions, as demonstrated by the women comparing detergents, or the hypnotized subject closing all the lights.2. These underlying motivations usually originate in the most primitive part of our brain.3. Why we do things can be influenced through the power of suggestion.

The type of mild concentration required to watch TV also places viewers in a state that is very close to hypnosis. Driving a car on the highway can have the same effect: the purring of the engine, the comfortable seats, the monotony of the passing scenery, combine to place you in a state of mind that is very receptive to suggestion. Advertisers take full advantage of the situation, transmitting powerful suggestive messages on billboards, bus and truck panels, car radios, etc.
As people unconsciously slip into a kind of collective trance, the market potential for all kinds of products grows larger and larger. Companies hire and train sales people by the thousands, using the very same advertising methods to convince their own personnel that the products they represent are excellent, and deserve to be sold. In many cases sales people are not simply dupes of the system - they are aware that they are being programmed, but allow themselves to be conditioned, knowing that the best way to sell a product is to believe in its merits.

Advertising and propaganda try to induce a semi-hypnotic state in target populations, enabling the suggestions that are made to bypass the critical, conscious part of the mind.

Suggestions are planted in people’s minds with the help of images (the term ‘image’ is here used to include auditory, tactile, olfactory and gustatory, as well as visual images).

We are bombarded with visual images through various media: TV, movies, magazines, window displays, brochures, billboards, and so on. Since psychoanalysis discovered that our subconscious mind thinks in terms of symbols as well as images, symbols have become an important vehicle for transmitting suggestions: a photograph of a man’s hand holding a box of detergent is retouched to accentuate the hairs growing on the back of the hand. Why? In order to enhance its virile symbolism and suggest that the detergent is more powerful.

The body and mind are in constant interaction. A tense mind is translated into nervous tension and muscular contractions. If the mind is to be receptive, the body must be relaxed.

The mind stores information unconsciously. In the example of the detergent being held by a manly hand, the symbolism, although not perceived on a conscious level, still has an impact. Subliminal advertising, discovered in 1965, transmits messages which are received on a level below that of ordinary consciousness. Superimposed images pass by so quickly that the conscious mind does not have time to perceive them. Nevertheless, they are perceived - tests have clearly shown that consumer behavior is influenced by these subliminal suggestions. The practice is now illegal, but the mechanism is still in place, occurring whenever you concentrate on a given object, but continue to register periphery information (for example while staring at a computer screen). MHR NLP Bandler makes big point of this i.e that our peripheral vision registers more than we realise...MHR way to subliminally influence i.e get focus on one thing, then introduce real messages / communications on periphery, where don’t consciously notice, but subconsciously process...

If repeated often enough, a new cerebral pathway is formed. Napoleon once said, ‘repetition is the best part of rhetoric.’
Intense emotion, whether it be fear or joy, can rapidly create a new model of behavior when associated with a suggestion.

A suggestion becomes much stronger when people can identify with the person or group making it.

The greater the faith or confidence we place in a person or object, the more susceptible we become to suggestion.

It can also place people in a state of semi-trance, making them so enthusiastic their normal cerebral functions become inhibited.

Suggestion is a form of cerebral conditioning, but between the suggestion and the act it implies lie a whole series of complex processes. A researcher named Bernheim was the first to discover what he called ‘ideo-dynamics’ the theory that all suggestions tend to result in actions, as the subconscious automatically attempts to induce us to act on what it perceives.

Driving a car along the highway, lost in thought, you may suddenly realize you’re approaching your exit. It’s as if you were driving on automatic pilot. The same type of thing happens when you are trying to solve a problem - unable to find a solution, you concentrate on something else, when suddenly you’re hit with an inspiration, as if the mental process had continued on a subconscious level, and guided you to the answer you were seeking.

B.F Skinner observed ‘the birth of superstition’ in the pigeons he was ‘experimenting’ with. They had been locked in cages with automatic feeders for 12 hours. These feeders regularly and automatically dispensed food. After 12 hours some of the pigeons displayed particular behaviors, such as the flapping of one wing, or standing on one leg. They appeared to have assumed a cause – effect relationship between these behaviors and the appearance of the food. He posited that the birds may have been flapping one wing, or standing on one leg, the first time the food appeared, and then having assumed a connection, ‘found’ that flapping the wing, or standing on one leg, if continued, repeatedly resulted in the food appearing. This is no different to what David Hume observed about all our assumed cause-effect relationships. Imagine the impact of a ‘magician-priest’ demonstrating the power to ‘cause’ a solar eclipse would have on their ‘believers’!

Symbols are used to bypass the conscious rational mind which works with language. All sorts of ‘divination’ practices use their props to bypass conscious resistance. They also allow them to dispense common sense, or information gained from intuition, observation, and other sources, in a format that will give that advice greater authority, and induce as great a placebo effect as possible, at the very least instilling confidence in a cure, relief from symptoms, which is
often enough to relax the patient, calm them, and provide the preconditions under which the body can heal itself. Latin had a similar ‘mystical’ authority among the masses, for whom it was unintelligible, and as ‘magical’ as any runic, tarot card, or other system of communication. It lent the authority of education, training, wisdom, all the equivalents of ‘mystical insight’ or ‘participating in the mysteries’, and sharing some ‘magical power’ which they could use to the client’s benefit. Whether formulated in religious terms a.k.a ‘angels’, ‘power of god’, ‘miraculous power of Saint’s bones’, or more abstract, esoteric forms.

Professor Robert Tocquet of the Paris School of Anthropology, and a distinguished parapsychologist, offers the following hypothesis:

We know that the ability to regenerate organs exists in some animals. The higher we get on the evolutionary ladder, the more this ability is diminished. In man it has more or less disappeared. Invertebrates have astonishing powers of regeneration. Cut a sponge into tiny pieces and each piece will reconstitute itself entirely. The same is true of worms - when cut into segments, each part become a whole worm. Starfish, a little higher up the ladder, are able to contract themselves when afraid by expelling most of their internal organs, which they then regenerate when the source of danger has passed. Fish are able to redintegrate (the process of regenerating limbs or organs) some amputated body parts, including fins, jaws and sexual organs. Salamanders can redintegrate eyes, legs and tail (as can some other lizards).

Under normal conditions, this regenerative ability is absent in humans. But does that mean that it does not exist? Professor Tocquet believes that it does exist, in a latent state, in all people. As we said earlier, man evolved by superimposing a new part of the brain (the neo-cortex) over its more primitive part, at the same time refining and re-organizing its functions. Almost instantaneous regeneration of tissues observed in so-called miraculous cures.

Deacon François of Paris died in 1727. His followers prayed at the deceased deacon’s tomb, hoping for a miracle that would incite the Church to admit the error of its ways and cease its unjust persecution of the Jansenist movement. One such miracle was reported to have occurred, attracting pilgrims seeking relief from their own health problems. In terms of the ‘efficacy’ of electroshock’ I posit, there are interesting parallels. Many of the supplicants believed in the efficacy of using torture as a way to earn forgiveness for real and imagined / ascribed sins, and thus relief from their suffering, assumed to be a product of those ‘sins’. Thus appellants would be found, in the original ‘group therapy’, beating, burning, stoning, and whipping themselves and each other. There are countless reports that these acts of flagellation and other forms of torture actually seemed to improve a patient’s condition. Electroshock is not more ‘modern’ a process, and may ‘work’ on some people for the same reasons, consciously or
subconsciously. The participants demonstrated similar ‘convulsions’, brought about by the pain, and imagination, in this case, rather than external voltages applied to their heads. The king, horrified by accounts of mass hysteria, grotesque convulsions and other bizarre occurrences, closed the cemetery on January 29, 1732. Of course today the process is carried on behind locked doors, literally, upon patients who have not, or could not, give their informed consent. So tell me who the ‘modern’ medical practitioners really are!

Imagine color gradient from Red, to Orange, to Yellow, to Green, to Aqua-marine, to Blue, to Purple, to Violet…moving from infra-red to ultra-violet. You will probably move from greater emotional intensity and energy, towards greater calm and peace. This is a great way to gradually decrease brain wave frequency, corresponding to decreased mental activity / worry / internal dialog, down to the desired Alpha wave, meditative, creative, calm alertness associated with creative generation and deep relaxation / meditative calm. You can also use the process in reverse to increase energy levels from the calm blues to the more vibrant oranges and even reds. Imagine if every school class began with the appropriate ‘tuning’ of the participants, to bring them to the most receptive, generative, calm alert state ideal for learning and creative interaction, and possibly for waking teachers up from their mental slumbers. The color gradation can be vividly imagined, with the imaginers entire body becoming immersed in the color, changing color, to ‘change gears’ from more active to more calm states.

Construct your own ideal group of advisors, in your own idea ‘creative workplace’, which you can retreat to, in your minds eye, at any time. Just enter the Alpha-state / Blue zone / Zen state / creative state and vividly visualize, using all representation systems, the sort of ‘rooms’ most conducive, for you, of creative problem solving, studying, research etc. You can ‘invite’ anyone to work with you as colleague or advisor. You can have each adopt one of DeBono’s ‘thinking hats’. You can invite famous characters from the past to ‘assist’ you. In this way you can free your subconscious from the usual restraints / constraints / conditioned / learned limitations of your conscious mind. The setting can be futurist science fiction fantasy, historically accurate, historical fantasy, another planet, another dimension, a room you always found conducive to calm, alert, productive, generative (creative) thought etc…

Our conscious, limiting beliefs, often sabotage and limit our complete powers of self-healing, creativity, problem solving, and potential for happiness and success. The sub-conscious is the much more powerful. So we often need to spend time doing an audit of our unconscious, to identify such limiting beliefs. But first we begin with the conscious limiting beliefs or negative ‘self-talk’ we engage it. Often we are unaware of how we are consciously limiting ourselves, because it has become habitual and automatic. We do not attend to it. Each time we say ‘Oh, I’m not smart enough’, ‘Oh, I am not capable of that’, ‘I don’t deserve that’,
I couldn’t possibly ever be happy’. Often the assumptions / limiting beliefs are not stated, but are implicit in what we do say. This is why Richard Bandler’s work on deconstructing language, and seeking the implicit assumptions and limiting beliefs underlying how people communicate is so important to anyone wanting to offer therapeutic benefits to anyone. Self-talk is a sort of self-programming for failure. A self-programming for defeatism. For de-motivation. For setting up negative self-fulfilling prophecies. If you don’t believe you can, or deserve, to be happy, or successful, you are unlikely to invest the effort, time, and risk required to attain the good things in life. You are unlikely to approach people you would like to befriend, or become lovers with, let alone make a determined effort to ‘win’ them over. Why bother, if you are doomed to failure? If you can not do it. If you don’t DESERVE to do it?

People often draw strength from a belief in the power of a talisman or ‘good luck charm’. It provides the confidence they lack in themselves. It allows their natural powers to become active, simply by overcoming the conscious limiting beliefs. Belief in the power of the magical charm overcomes the usual lack of confidence in their own powers. It was the belief that was limiting / constraining their own body from healing etc. All the talisman / charm did was overcome that obstacle to self-healing. The same ‘faith’ in a priest, magician, shaman, Saint’s bones, idols of Saints or Jesus or some other ‘god-man’ or ‘goddess, or even medical doctor or therapist, or even ‘pharmaceutical product’ or surgical technique or tool, operates in the same way. The Placebo effect achieved by these ‘props’ is due to their having the power, in the person’s mind, to offer relief or cure. This belief overcomes the usual tendency to defeatism imposed by conditioned, learned, limiting beliefs. Beliefs learned often in single, powerful events / moments. Or over the course of years of repeated indoctrination by external authority figures, either directly and deliberately as in the case of religion and education and marketing propaganda, or indirectly from peers, experience, observation, and erroneous correlations / assumptions, like B.F. Skinners pigeon’s believing that waving one wing, or standing on one leg, was the ‘cause’ of food appearing.

Often the ‘placebo’ was offered as ‘noble lie’ by practitioners who knew the placebo to be inactive, but realised the power of the placebo effect. Often some actual active ingredient was applied, while the patient’s attention was focused on the ‘magical healing powers’ or ‘charms’ or ‘rituals’. The rituals often induced a deep state of relaxation necessary for the body to regain its balance, and repair itself. Telling people obvious truths that they would otherwise just gloss over, as part of some ‘magical ritual esoteric ‘reading’ of leaves, entrails, birds flight, coffee grinds, lines in their palms, crystal balls, tarot cards, runes, etc, gives that common sense advice much greater authority, and increases the odds that the person will act on it, rather than gloss over it. Often simply distracting a person from their suffering offers enough of a break in attention, a pause, for them to
relax, and recuperate. Muscle tension and other physical manifestations of mental stress often produce psycho-somatic symptoms and real medical conditions. Free the person of that stress, tension, etc, and the psycho-somatic conditions simply disappear, miraculously, as if by magic. Sometimes immediately. More often gradually, after rest and sleep give the body a chance to recalibrate, repair, heal, and regain its ‘ease’.

Consider all such props, and the ‘noble’ lies that give them their ‘power’, as catalysts that stimulate the body’s own healing mechanisms, in an active way, or at bare minimum in a passive way, by removing the obstacles, the self-generated obstacles e.g defeatism, negative expectations, negative self-talk, negative ideation, stress, tension, fear, etc, so that the body can regain balance, and heal itself.

Phineas Parkhurst Quimbey, a watchmaker living in New Orleans in the mid 1800’s, gradually came to realise the power of suggestion, after seeing how the placebo effect his ‘patients’ enjoyed bore no relationship to his prescriptions. He realised that the power to cure and relieve was not in the prescribed potions, but in his patient’s belief in their efficacy. Their belief in HIM. He started what today is known as the ‘Christian Science’ (Science of Health) movement. This movement started from the assumption that health and happiness are the natural state. That illness, disease, and unhappiness, are all, as Socrates posited all evil to be, the result of erroneous thinking.

When Quimbey died, a very success-oriented and energetic Mrs. Baker-Eddy took over the reins of the fledgling movement. Mark Twain described her in these words: “She was born with the mind of a businessman, and a great appetite for power. If she found a job as a chef’s assistant in a hotel, there is no doubt in my mind that in two years she would own all the hotels in the city, and in twenty years, all the hotels in America. She is the driving force behind the huge fortune amassed by the Christian Science movement.”

In half a century, Mrs. Baker-Eddy built a vast occult empire, based on a strictly hierarchical system of management and efficient organization. At present the movement has attracted over two million followers around the world. Members must pay to take courses, pay to be treated, pay to attend ceremonies. If and when they finally graduate as accredited Christian Science healers, they have to pay a monthly fee to retain their license to practice.

The ideological basis of the movement can be summed up as follows: Man, being an emanation of God, is spiritual and eternal. Man never was, and never will be, a material entity. Pain, suffering and disease are all imagined, caused by mistaken beliefs. Restore truth in the minds of patients, and they will be cured.
Christian Science contains some very positive, and very negative, elements. Rejecting all medical intervention does not seem the best approach. But the mantra that ‘I deserve to be healthy and happy’ is optimal. As are the beliefs that health is the natural state. That negative, erroneous beliefs / ideas are the cause of dis-ease, illness, and poor health. That everyone DESERVES to be healthy, happy, and successful. This conditions a positive, self-fulfilling prophecy in all practitioners, from birth.

The faith healer merely removes psychological obstacles, which are the source of real psycho-somatic symptoms and medical conditions (consider how stress produced by imaginary threats will produce the very real tension and very real pain of migraines, tensions headaches, and even heart attacks and strokes), freeing the mind to heal itself, freeing the body to heal itself. They remove the limiting beliefs, and replace them with generative, therapeutic, productive, positive, healthy beliefs.

Sadly entire institutions and industries devote HUGE resources, energy, and talent to producing the limiting beliefs responsible for our lack of health, vitality, confidence, well-being, and happiness. They are called marketing. They are called propaganda. They are called religion. They are called education. This is why we must act and think holistically. As my Eden Protocols do. And begin before birth.

The most common, historically, form of ‘transferred authority’ is the typical ‘Priest’ who claims to represent some god, and to be given, by that god, special powers.

Today medical degrees and mass marketing campaigns are used to grant ‘doctors’ a similar ‘transferred authority’. Having been ‘trained’ by famous Dr. X is a further benefit, in terms of having the authority of Dr. X, whose reputation has become famous for curing what ails you, transferred to their student, the Dr. you have the good fortune of being able to afford.

Or you could employ the ‘noble lie’ of claiming you have been ‘possessed’ by such a famous doctor. One long dead even. Or you have been possessed by some other spirit, demon, god, or saint.

If you can get a patient to really believe in ‘subtle / astral bodies’, then you can ‘operate’ on that astral / subtle body”, and the benefits will appear in the corresponding corporeal organs / limbs / body. Again you are simply overcoming ‘conscious objections’ and ‘subconscious objections’ a.k.a ‘limiting beliefs’, and letting your body cure itself, return to equilibrium. All you have done is what marketing people call ‘overcoming objections’. The objections being ‘that is not possible, I can’t do that, I don’t deserve that’, whether ‘that’ is good health, success, happiness, great sex, a loving partner, respect, a nice home, a nice car,
that great figure, or even simply good luck. Whether the salesperson is selling you on a new home, car, or healthy attitude, or cure, makes no difference. There are always mental obstacles you have unwittingly placed in the way of your own happiness, or which you have accidentally ‘learned’, or been deliberately conditioned to accept and believe, as natural and normal. I go into great detail in my TROONATNOOR books.

Imagine living in a time when getting a Doctors degree were next to impossible for anyone not born to the right economic and social class. Imagine you had an exceptional aptitude for medicine. You read everything you could get your hands on. You were a natural. It all came ‘intuitively’ to you. But you were doomed never to be able to practice, and employ your talents to anyone’s benefit. You would never be able to access the ‘transferred authority’ of a medical degree. So what do you do? You imagine / pretend to have become ‘possessed’ by a very famous, now deceased, doctor. It is not YOU doing the treatment, writing the prescriptions, but this famous doctor. Your treatment now has the transferred authority it required for people to ‘take you seriously’ as a doctor. Edgar Cayce was illiterate, but exceptionally talented, as proven by the massive success of his treatments, the huge number of patients he successfully treated, who benefitted from his talents and skills, wherever they came from. Maybe he himself believed in his story. Or maybe he was simply convinced that this ploy was a ‘noble’ lie, and he resorted to it in benevolent desperation. Despairing at never otherwise being able to help others with his talents, he took the option Plato recommended to all ‘philosopher kings’, and those who were sure of their ability to rule well, but lacked any ‘natural authority’ to impose their will on anyone. To impose their ethical system. Their system of government. Plato’s gospel was that propaganda was necessary and good, as long as the intentions were good, and the user competent. Funny though, how many incompetent, malicious people convince themselves they are both competent, and benevolent, and thus employ ‘noble’ lies to every imaginable ignoble end.

Imagine a philosopher who has no chance of ever being ‘taken seriously’, deciding to employ a similar ‘noble lie’, and simply claim that some god, or angel, had dictated his ‘ethical treatise’ to him. Wham. There’s your transferred authority. Suddenly millions will take you seriously. Imagine a would-be prophet. A would-be ‘philosopher king’. A would be dictator of the world. Once you have tricked you way into power, like a Stalin, it won’t matter that your lack of talent, your true intentions, your incompetence, become obvious. By then you will have absolute power. The authority of violence. Power. Secret police. Puppets everywhere with the power of life, death, and fates worse than death, to ensure ‘your will will be done on earth’. And in heaven? You will probably delude yourself you ARE a god, and your will is GOOD. Power does not just corrupt society. It is reflexive of a corruption of the minds of those in power. As below, so above. Marx was so disingenuous in pretending to naïvely believe that all the
evil in the world was concentrated in one small class of capitalists and aristocracy, whose evil was expressed in the society they ruled, in every institution and form of interaction. As if, given the same power, any of the supposed ‘innocent good-natured victims’ of that society, would NEVER abuse that power to their own selfish, narrow, egotistical ends!

Emile Coué formulated the laws governing suggestion, to be used in the waking state, rather than while hypnotized. **Coué’s Law of Inverse Effort** states that If you think, “I want such and such a thing to happen…” and your inner mind says, “You want this to happen, but it won’t…” not only will you not get your (conscious-deliberate) wish, you’ll get the opposite of what you want.

Pascal is credited with the analogy that forms the basis of ‘target obsession’. He noted that anyone can walk along a plank of wood 30cm wide, when it is placed on the ground. However place it placed between the windows of two 10 story buildings, and most people find what was a simple task, to be impossible. They stagger, trip, and fall off. The stability or width of the wood has not changed. All that has changed is the internal voice warning them of the danger, and the mental images constantly arising of them falling. Like the telegraph poles along the side of the road, it is the falling, rather than the ease of walking, which dominates the mind, and determines the outcome, that of falling, and of hitting the pole, and managing to miss the far greater target of the gaps between them.

Stress, frustration, agitation, and fear of not being able to fall as sleep, all lead the person to fail to fall asleep. Until they stop thinking about NOT falling asleep. Their ‘target obsession’ is insomnia.

Framing desires as ‘I will TRY to achieve X’ contain the implicit negative expectation / belief / assumption of failure. The doubt is what your subconscious will attend to. It will assume you do NOT want to achieve X, and it will prevent you achieving X. So reframe the desire as ‘I will achieve X’, along with a vivid all representational systems representation of how great it is going to feel when you have achieved X, and a calm, casual, natural, assumption that you will achieve X, with the same natural sense of assurance as when you ‘try’ to pick up a cup of coffee. You just DO IT. You do not ‘try’ to do it. Like someone stuttering, as they ‘try’ to speak. Or falling off a bike because you suddenly realise you are riding upright, but somehow feel it is not possible, it is too easy, and you expected it to be too hard (my own experience).

When you say, ‘I’m going to give it a ‘try’ you are implicitly doubting yourself. And THAT doubt is what your subconscious mind will focus on.

‘Trying’ implies a limiting belief in your ability to ‘Do’.
Coué is famously credited with the self-affirmation / mantra / auto-suggestion many people are familiar with. ‘Every day, in every way, I’m feeling/getting better and better’. John Lennon sang it as ‘Every day, in every way, It’s getting better, and better’.

Coué believed that for another person to ‘imprint’ a suggestion on your subconscious, you first have to adopt it, and make it your own. Turn it into an ‘auto-suggestion’. Once you have ‘owned’ it, it become operational.

Which gives people like me hope that we can save you from ‘noble’ lies, propaganda, mis-information, brain-washing, and the mental equivalents of malicious software, viruses, Trojan horses, etc.

This gives you the final power of arbitration. You do not have to accept the definitions others seek to impose on you, about you, and have you consume, and incorporate into your conscious and subconscious mental programs. You can say, hey, wait a minute, I disagree with that definition. I am going to find my own definitions. Write my own scripts. Program my own conscious and subconscious mind. RE-program my subconscious and conscious mind.

The ‘Ma’ of ‘At’ (On) is to ‘Think rightly, Speak rightly, Act rightly’. This was the principle tenant of Akhenaton’s original non-theistic religion that preceeded the Judeo-Christian-Muslim theistic cults that today dominate our world.

“Everything we are is the result of thought: our present condition is based on thought, it is made of thought. If a person speaks or acts while under the influence of negative or harmful thoughts, pain and suffering will follow, as surely as a cartwheel follows the hooves of an ox.” That’s accredited to ‘Buddha’, an ‘awakened’ person. Someone who woke up from their dogmatic slumbers. From their ‘zombie’ state. ‘I think therefore I am’ was Descartes. Buddha would say ‘What I think, BECOMES’. Become reality. ‘By our thoughts the world is generated’. TROONATNOOR is reflexive of our thoughts. As you think, so you will speak, and so will you act. That is why ‘living in Ma’at’ requires you to start at the foundations, your thoughts. To become disciplined in your thinking. To frame all thoughts positively, in terms of what you WANT, and not negatively, in terms of what you do NOT want. This way you will be mentally rehearsing for what you WANT to BECOME. You will be sending clear instructions to your subconscious about what it is to do for you. What it is to REALISE. You resonate like a 3-D printer program, encoding the forms you want to make real, then sending them in ways we cannot yet measure, like Wi Fi signals to the 3-D printer, so that ‘REALITY’ can manifest what we are resonating, in the same way the 3-D printer will manifest the ‘form’ being sent to it by the WiFi signal. Clearly the ‘idea’ came before the form, and came before the output of the 3-D printer. In the same way that thoughts produce intentions
which produce mental images which produce actions / desires / motives and finally conditions / situations / states / actual material objects.

Someone had to imagine every technological product you use every day, before it could become an object, a tool.

The oldest and most compelling philosophies of reality, of TROONATNOOR, conclude that all of reality as we experience it was first a desire. A thought. An impulse. That reality is the manifestation of these ‘original’ desires / impulses.

Who could argue that war is not the manifestation of an idea? That all gods and all religions are not ideas, manifest as their current institutions? Reflexive of them? That every act is preceded by some thought. Whether consciously expressed in self-talk, or carried out so swiftly, as a ‘reaction-response’, a ‘triggered reflex’, that there was no time to formally verbalise the idea in the actor’s head?

Genetics researchers argue quite compellingly that most of our DNA is actually operating as transmission and reception material. LaMarck appears to have been validated to some extent. For it appears that DNA is in communication with the environment, and with the DNA of all other organisms, at some level.

Consider the primary impulse for existence. Was it relief from boredom? Or a desire for pleasure / excitement / experience? Consider how absurd the ‘official’ Western Judeo-Christian-Islamic doctrine is. That some god whose presence is never explained (who made god) created us for his own pleasure. Got angry with us. Decided to punish us for millennia. Then decided that those who would not submit to his will should be punished for eternity. How compelling a story is THAT?

Compare this narrative to the older Eastern traditions in which all life always existed in some form, as pure consciousness. It generated all the forms we know as ‘the world’ and ‘reality’ in a spirit of ‘play’. A desire to have fun. To experience pleasure. To experience excitement. To have adventures.

But at some point the ‘code’ for this virtual reality became ‘buggy’.

Schopenhauer’s unique use of the pre-existing concept of dialect was that the thesis was this generation, the anti-thesis was the ignorance that it was done, and the confusion arising from the ‘bugs’ that emerged, and that the ‘synthesis’ will be us realising our true nature, TROONATNOOR, and fixing the bugs, accepting that life is a game we generated for our own pleasure, and ‘knowing’ this, and at the same time enjoying the game for what it is, a virtual reality.
But ‘virtual’ is misleading. It is REAL. Reflexively. Just not NECESSARY. Within the game the rules are ‘necessity’. For the sake of the game. But you can exit this game any time, and start new games.

But inside the game you cannot have arbitrary values. You have to have rules. Otherwise games break down into chaos. No fun at all. Unless that is your taste, at that time, for that particular ‘experience engine’.

Buddha felt the weight of the suffering of this world. The ‘bugs’ have gotten out of hand.

Or did we design this game to be so perversely violence, vicious, and competitive?

Either way, you are free to choose. This is NOT the only game. The way this game is going right now is NOT necessary. It can be much different. If you CHOOSE it to be so.

Right now you can CHOOSE justice, truth, and beauty. It is YOUR thoughts that produce this world.

Of course right now most of us are being manipulated, tricked, controlled, unobtrusively and more obviously, by governments, propaganda, ‘noble’ lies, religions, mass media, etc etc.

It is time to take back your ability to choose FOR YOURSELF. Not merely reproduce the limited choices offered by those who seek to enslave you.

First you need to identify the errors. The lies. The propaganda. The misinformation. Remove the viruses and Trojan horses. Clean up the ‘buggy’ code.

That is what my TROONATNOOR books are all about.

This one is the capstone to my TROONANTOOR work. Giving you back control of your own mind. Of your own consciousness. First by bringing you back from your current Zombie state to fuller consciousness. Then showing you how simple and easy it is to re-program your own mind with compelling, correct, definitions.

Basically it is a call to free you, the slave, from your invisible chains.

To free you to make choices.

The feedback of pain, misery, war, violence, slavery, etc, will always show you the way. How long you suffer is up to you.
My aim is to make it possible for you to choose justice, truth, and beauty, so that your life becomes defined by happiness, satisfaction, joy, justice, truth, and beauty.

As long as you choose violence, slavery, exploitation, injustice, malice and so on, you will manifest these things in your own life.

You cannot choose to inflict pain on other sentient beings, to abuse your power over them, to use them as mere means to your own ends, to inflict injustice, slavery, and misery upon them, and then expect your own world to be defined by joy, happiness, freedom, justice, and so on.

That would be insane.

Of course most of us are insane.

The world is insane.

TROONATNOOR is about sanity.

For those of you who want it.

I believe that karma is simply feedback. Like pain tells you ‘stop that’. Avoid that. Do not repeat that. Pay attention, you are doing something wrong.

I believe that sooner or later you will get fed up with the stupid, frustrating, ugly, miserable, dissatisfying life you experience, as a result of your own thoughts, words, and actions. That this ‘feedback’ will lead you to seek alternatives. Will lead you to seek out the ideas contained in my TROONATNOOR books. Maybe not in my own lifetime. Maybe not for millennia.

But wise people tell us not to judge the effects of our efforts by the fruits we harvest, but by the seeds we have sown.

I have no super-powers. You have to learn from experience. You have to become, finally, fed up with the consequences of your own thoughts, words, and actions.

Only then will you start down the road that leads to a Vegan world. A world defined by something like my Eden Protocols. Where all decisions are made under some form of Rawls’ ‘Veil of Ignorance’. Decisions made consistent with my own ‘Optimal Ethics Generator’. A simple question. ‘How would I think, speak, and act, if I were sure I would be continually, for eternity, randomly new-incarnated as any being on this planet?'
Ultimately you can only live among the free. You can only experience justice if you act justly, in all your actions. You can only be happy among happy people. You can only live peacefully among peaceful people enjoying mutual security, peace, justice, and SHARED prosperity.

Any time you abuse your inherited power vis a vis any less powerful sentient being, you are signing your own ‘I.O.U’ for pain, misery, suffering, dissatisfaction, injustice, exploitation, etc.

So start ‘paying it forward’, as they say. Start writing I.O.U’s for the things you want for YOU and YOURS.

You cannot escape the consequences of your own thoughts, words, and actions. You cannot express ‘Z’ into the world, then escape ‘Z’. Karma is a bitch because, generally speaking, what you put out into the world, generates the world that is, and the world that is becoming. You are responsible.

Sure, you may have less power, vis a vis those with more power. But consider how you use the power you have, for example, over farm animals. Over lab animals. Over poorer people with less power than yourself. Do you ‘do unto others as you want them to do unto you?’. Meaning do you exercise the power you do have, in ways you want those with power OVER you to exercise that power in relation to YOU?

Obadiah warns ‘For as you do unto others, so shall be done unto you’. This is the motive for obeying the golden rule. It is pure logic. Unavoidable over the long run. Over many new-incarnations. The gold rule does not require huge tomes of argument to support it. It is simple. Do unto others as you wish them to do unto you. In principle. No games. No self-deception. No attempts to ‘trick’ the system and deceive others, while hoping they will be honest with you. To exploit others, expecting they won’t notice, or that you can get away with it, because you have more power, influence etc.

Coue recommended me make our positive self-affirmations in the state in which our subconscious is most receptive to them, that state just between sleeping and waking, when we are falling asleep, or have just woken up, or after having entered a deliberate ‘altered state’ or ‘trance state’, such as when meditating / relaxing, or focusing on something like the tick of a clock etc.

‘It will pass’ is the second affirmation Coue recommends. After ‘Every day, in every way, It’s getting better and better’. He considers these affirmations globally applicable preventative medicine, and cure combined.

Many magicians believe that their ‘misdirections’ and ‘sleight of hand’ are actually registered with the subconscious, but that their audiences prefer to
pretend they didn’t notice, to enjoy the act. Eastern Philosophy suggests the same. That we know it is all a game, at some level, but ignore the ‘tells’, to gain a greater immersion in the game. To ‘lose ourselves’, our TRUE self, in the ‘selves’ we experience during this ‘play’.

That said, most ‘tricks’ become obvious only AFTER you have been shown them. Like simple card tricks. It is not a matter of intelligence. They are ‘tricks’. And once you have ‘seen’ the trick, you find it hard to imagine how you ‘missed’ it. And how others continue to miss it. That is exactly how philosophers feel about religion, how historians feel about propaganda (the official history written by the victors is usually totally distorted, if not completely fabricated a-la ‘The Holocaust’ which was written to justify the war crimes of the ‘Allies’ committed against Germans).

When our mind is focussed on exterior objects, when we are conscious of the world around us and of the passage of time, actively using our five senses, beta waves predominate. When we are literally unconscious, delta waves totally dominate. The state most meditation practices seek to reach is that dominated by Alpha-waves. We lose track of time, sense of self, and become focused on our own thoughts, or ideally, on ‘nothing’. Emptiness.

Of course the typical ‘Western’ approach to all things is the desire for a ‘quick technological fix’. A pill. A surgical procedure. A ‘gadget’. So you can buy many gadgets that claim to be able to place you in this mental state. They either produce Alpha waves, or measure them, allowing you a visual or auditory ‘biofeedback’ method to know that you are either moving towards that state, or away from it, and thus reinforcing what you are doing, or telling you to do something else. Basically feedback about whether your attempts to reach this state, to become deeply relaxed, are working or not. Like a beeper that tells you when your heart rate is excessive, and you need to calm down. The reason the ‘gadget’ is of value is that it represents feedback in ways easier to recognise, by converting a pulse, or in this case a brain wave, into a number or color or sound on a scale. Most people have become distanced from their bodies own attempts to communicate e.g headache, haemorrhoids, muscle tension, blurred vision, light-headedness, tiredness, irritability, skin tone, sweat, or have come to ignore these, due to social pressures/external pressures over-riding them…all these ‘symptoms’ indicate stress, over-excitement etc…deep tranquility is alien to most people…’doing nothing’ is defined as a ‘waste of time’ and ‘laziness’, with ‘activity’ being ‘boosted’ as ‘good’ and ‘ideal’ for the ‘workers’ and ‘soldiers’.

So most people have lost touch with the communications their bodies provide, and require some gadget that ‘quantifies’ their physiological state as a numbered or colored scale. The ‘red’ flashing, beeping light is responded to as a ‘warning’, and as the frequency of flashing reduces, the color moves towards blue, the person can ‘know’ their attempts at relaxing are ‘working’. Rather than get back
into contact with their own bodies. Rather than become sensitive to their own posture, breathing, heart-rate, pulse, muscle tension / relaxation.

Some people believe they can ‘remotely read’ patients, and make clinical diagnoses, or even ‘enter into’ the patients subtle/astral body, and carry out procedures on that magnetic body, which become manifest in that patient’s ‘physical’ body. Some people claim to be able to do this with dead people. Many claim to have ‘become’ Adolf Hitler, and thus can ‘explain’ his reasoning, or his health problems.

Remote reading involves visualizing a person not present, and ‘entering into’ them, becoming them, and either merely describing their thoughts, feelings, symptoms etc, or actually imagining they ARE them, and curing them / alleviating their symptoms.

MHR…color is determined by what frequencies of light are absorbed, NOT reflected i.e if all colors reflected, it is white…so it is about what is absorbed…if our subconscious / conscious mind absorbs / reflects different frequencies, we will perceive / represent only certain frequencies…those not deflected / reflected, or is it absorbed?…either way, reflexively, we only ‘impress’ i.e ‘take in’ very narrow bandwidths … this could be how ESP etc work…appear to be talents of individuals, when really universal…just some people do not ‘block out’ i.e ‘tune out’ other ranges of bandwidths e.g that enable some people to ‘read minds’ or ‘communicate telepathically’, or ‘astral travel’.

Seeking pleasure, avoiding pain, seeking relief from pain, are the primary motives of all action. Depending on the balance between these motives, people behave / have particular ‘personality’ types. All actions result of at least one of these motives. All attempts to motivate people must appeal to one or more of these motives. Often they exist in conflict i.e seeking pleasure involves risking pain. Positive and negative reinforcement targets avoidance and seeking motives. Painful feedback will negatively reinforce a behavior, and feedback which provides pleasure and relief will positively reinforce it. This is the basic principle of cybernetics, bio-feedback, and motivation.

Brains waves per se are imperceptible. We have no representation system for them. However their correlates in muscle tension / relaxation, skin tone, sweating, heart rate, pulse etc DO reflect the brain wave frequency. A person experiencing predominately Alpha-wave production in the brain is deeply relaxed, calm, alert, positive, etc…but as people have been trained to only accept ‘quantifiable indicators’ like statistics and mathematical readings, they are more easily convinced, can more easily respond to, feedback of this type, as offered by the gadgets.
The idea is that learning to lower your brain wave frequencies into the Alpha spectrum (8-14 Hz), will give you access to the mental states associated with those Alpha frequencies. Of course yoga, Zen meditation, and so on, all produce this state. But a quick fix is more easily marketed and sold.

1924 a German psychiatrist, Hans Berger measured the electrical impulses emitted by an accident victim whose skull had been partly removed. He observed that brain cell activity was organized into distinct patterns, in the form of waves. He observed different bandwidths for different levels of brain function. Berger referred to brain waves with an average frequency of \textbf{8 to 14 hertz (cycles per second)}, and an amplitude of around 100 microvolts. Berger, as ‘Alpha’ waves. Berger discovered called the frequency range above 14Hz with a lower amplitude (10 to 50 microvolts) ‘Beta’ waves. These waves corresponded to a state of vigilance, attention and concentration on exterior objects, while Alpha waves, corresponded to a state of internal focus / attention / deep meditative calm, in a state between sleep and wakefulness, such as when falling asleep, or just waking up, or a deliberately achieved meditative state.

The development of the electroencephalogram allowed researchers to measure other types of brain waves including Theta waves (4 to 7 hertz, 200 microvolts) which are emitted during certain phases of sleep or under certain emotional conditions, and Delta waves (3 hertz or less, 200 microvolts to 1 millivolt amplitude) which characterize deep sleep or a state approaching death.

MHR In this ‘zone’ perhaps the brain is more receptive to electromagnetic bandwidths outside the usual ranges. Like being ‘tuned’ into them. Or maybe it simply does not ‘block’ them at this range. Allowing apparently ‘para’ normal experiences. Such as monks being burned alive while completely calm and peaceful. Or perhaps ESP, astral travel, telekinesis, etc.

The ‘Alpha’ state can be reached via narrowing attention, and becoming completely absorbed in it, whether it be a ticking clock, a swinging pendulum, focus on your own breathing pattern/rhythm, staring at a candle flame or tarot symbol or mandala, or practicing Zen mediatin, yoga, etc...in other words through conscious effort, this state can be attained, and more importantly, maintained indefinitely. Outside stimuli will not break into this peace, as they normally would. The mental chatter is stilled. The internal visualization is turned off. The person can focus on ‘nothing’, a point of nowhere, absence, nothingness, emptiness. The ‘Om’ mantra is just one way to ‘empty the mind’ of ‘mental talk’ and ‘intruding thoughts, images, and ideas’.

Substances like marijuana, LSD, heroine, alcohol and other drugs also increase alpha activity. It may be a reason for their addictive nature. Learning to access these states naturally may make these drugs redundant.
People generating waves between alpha and theta levels (between 5 and 8 hertz) have reported experiencing sensations comparable to those produced by various drugs. A number of addicts who have learned to attain the alpha state report feeling much like they did when they took LSD.

The word cybernetics was coined by the ancient Greeks. Plato uses it to refer to the art of directing, controlling or governing, which always requires the selection of some objective. The helmsman of a boat must have a destination in mind, in order to regulate the rudder, to attain that destination. We must coordination our mental and physical actions to attain the desire goal. They must be in accord. In harmony.

The first law of Maxwell Maltz’s ‘Psycho-cybernetics’ is that our general definition of ourselves must be consistent with, harmonized with, in accord with, any goal we seek to attain. So we must work on our self-belief first and foremost. We must believe, deep in our subconscious, in our own self-efficacy. Our ability to attain what we desire. Our own capacity for success. That we can succeed. Otherwise all our plans will be thwarted, at the most fundamental level, by any limiting beliefs. Any lack of self-belief.

The successes and failures we have experienced in the past condition our future. They are the reference points on which we model our expectations...consciously and more importantly and powerfully, because we are unaware of them, and thus unable to challenge and correct them, sub-consciously.

Maltz found you can develop ‘muscle memory’ by vividly imagining going through the actions in your mind. This is especially valuable at the start of the learning process, allowing you to learn and ‘rehearse’, in your mind, and even physically e.g pretending to drive a manual car, moving your feet, hands, etc as if there were pedals and gear shift and steering wheel...

We learn generalized expectations e.g I am not smart, good at math, able to learn new things easily, good at dancing / sport / making friends...they are limiting beliefs or generative / motivating beliefs i.e negative or positive...

The subconscious mind does not differentiate between actual experience and what is intensely imagined...this is pure David Hume, but most ‘psychologists’ have no idea who this great philosopher was, or what he demonstrated in his books. I consider him a father of modern psychology. Descarte used the same logic to produce his ‘brains in vats’ arguments, which are the basis for the film series ‘The Matrix’.
Being told that pill is proven to work, that that ‘healer’ has magical / spiritual powers and has healed many people, that these ‘relics’/charms / medallions have magical / miraculous healing powers, all ‘trigger’ self-fulfilling prophecies…you believe you will succeed / be healed … your mind is set at ease…you are more likely to experience the positive effects expected, than when you are mentally negative, stressed, frustrated, and de-motivated.

Teachers treat students they believe (have been told) are gifted differently, and get different outcomes. Suspicious people will behave in ways that bring out the worst in people. Negative, critical, ‘down’ people, will suck the life out of others. Motivated, energetic, positive, visionaries will bring out the best in people. It is an element of ‘manifestation’ that is a proven fact that anyone can prove for themselves, any time. Simply visualize success, expect success, and then perform the action / interaction. Do the opposite, expecting failure, rehearsing failure vividly in your mind, and see how people respond differently towards you. Do this test on something simple, like someone for something.

How we imagine reality, determines how we ‘frame’ the inputs arriving at our senses, and will determine which of the huge number of possible things we will tend to focus on, including good experiences, positive things, beautiful things in our surroundings, positive people, opportunities, or the bad things that are also present…determining whether we will be pessimistic or optimistic, motivated or depressed, actively seeking what we want, or giving up in despair…being defeatist, or determined and motivated.

Hume’s ‘Pegasus’ example shows how we can imagine new things, by combining elements of experienced things, and so come up with a flying horse. Wings exist, and horses exist, in ‘reality’, but only in our mind do horses with wings exist. The elements exist first. We simply re-combine them in ways that nature has not yet. All technology is the result of this process. Observing interactions and outcomes. Ascribing / observing / noting patterns. Determining which outcomes are desirable, and how to repeat the patterns at will, to get the desired result. Nothing can be ‘created’ as such. Creativity is the process of recombining things that already exist in ‘new’ ways. To ‘produce’ things that would not have occurred in nature, or to re-produce things that do occur in nature. To produce fire at will. To contain that fire in internal combustion engines, then jet engines.

When we mentally rehearse challenging, threatening, hostile, dangerous, stressful, irritating, frustrating scenarios, in an attempt to find the optimal way of dealing with them, or avoiding the worst imagined outcomes, what we are doing is programming our subconscious to produce them(?). At very least we suffer the stress, fear, anger, and other harmful, negative emotions associated with these ‘possible’ interaction outcomes, and thus suffer them over and over. We end up
suffering things that never come to pass. We thus produce a lot of suffering, misery, etc, for ourselves. Zen notions of ‘be here, now’ aim to eliminate this suffering. However ‘rehearsing’ potential threatening situations is key to planning. To working out the best way to approach a situation. To be prepared for the likely possible responses people are going to make to, e.g, ‘proposing a smoke free work area’, or ‘asking someone if you can open a window in a smelly, overheated train compartment’. People can react very violently, negatively, hostilely, to the slightest of requests and suggestions. You will want to plan ahead, to have ‘counter arguments’ ready for their ‘objections’ and attempts at denying reality, e.g ‘you don’t have to breathe my smoke, you can wait for the next train if you like’…But the problem is when you get yourself all worked up for all the possible negative, stupid, fatuous, typical non-argument, hostile / defensive responses, and so approach the interaction all wired up and projecting what to the other interactors can appear to be hostile / aggressive / threatening vibes / body language / voice tone. It is incredibly frustrating to deal with the average person in any sort of minor conflict, from expecting service from someone paid to serve you, from expecting people to be fair, just, reasonable, considerate, to dealing with corrupt police, legal systems, reporters etc…to dealing with would-be attackers…

People like me who try to re-shape the world in a more desirable, optimal way, suffer a thousand defeats, in rehearsal. We live through many lives worth of conflict, hostile interactions. We know what to expect of people. We know the low common denominator of ethics, competence, self-awareness, honesty, enlightenment etc to expect. So we suffer many lives worth of suffering. We suffer migraines. Tension headaches. All manner of stress related dis-eases, illnesses, maladies, and discontents.

We can all just ‘let it be’ and ‘be here, now’, and forget about trying to improve the world. Just ‘settling’ for whatever life throws at us.

Or we can find the optimal balance. And find ways to ‘pretend’ to expect the best from people, to ‘give them a chance’, to promote self-fulfilling prophecies in our interactions, while having been prepared for the worst…so that when it happens, we are not caught unprepared by surprise…so we will give people a chance to be the best person they are, while having the camera and microphone running to document their corruption, their lies, their ‘how I behave when I think no-one is watching and I can get away with it’, when they feel ‘unaccountable’ because you appear to be unable to hold them accountable i.e you have no lawyer, no power, etc…

If this seems like being ‘fake’ or ‘false’, then consider that we WANT people to be the best, to behave the best they can…We assume that they may well do this…we give them every opportunity to show their best side…we are not
‘faking’ or ‘trying to trick’ anyone. We honestly WANT this to be true. So we act ‘as if’ it IS true, until proven otherwise. But we have rehearsed likely sce narios where they will NOT behave the best ‘them’ they can be, so that if and when they fail to meet our hopeful expectations, we are not taken advantage of. We are not shocked and left speechless, to be trampled over, our rights ignored.

Just as importantly, we NEVER over-react. We are not caught by surprise, and REACT. We RESPOND with prepared, productive, positive, creative, responses we have worked out beforehand, when we had time and calm to work on them. So we NEVER over-react. We never LOSE control. We set the agenda. We do not let them set the agenda. We don’t let them provoke us. We don’t let anger, no matter how well justified and ‘righteous’ it would be, how valid and appropriate it would be, from emerging. We remain calm, cool, level headed, and focused on our agenda. OUR agenda. Avoiding escalation in the direction THEY want e.g many people WANT violence / emotional interactions, to distract from the facts of the situation. To portray you in a bad light. To re-define the situation. Often, like the Polish parable where ‘the Jew screams out ‘help me’ as THEY are attacking YOU…Someone commits an act of violence against you, waits for you to respond, then calls attention to the interaction, pretending they were the innocent victim, had done nothing to provoke you, and that you attacked THEM. People can ‘push your buttons’ until they get an emotional response, which they use to undermine your ‘mental state’, credibility’, paint you as ‘irrational’.

Jews provoke pogroms, with their open claims to the right to commit genocide, enslave you, rape you, lie to you, and steal everything you own, and then claim to be the ‘eternal victims’. This is Zionism 101. And it has benefitted Zionists to the tune of hundreds of billions of dollars, make no mistake.

This is part of my response to ‘be here, now’. The power of now. Expecting that your subconscious will provide you with the optimal response to every situation, without mentally rehearsing and planning ahead, seems overly optimistic to me. But we need a balance between this confidence in our subconscious, and the calm, alert, optimal state it provides, and the value of mental rehearsal, preparation, and planning. We need to ‘be here, now’, during the interactions, and most of the time. To avoid living many lives of suffering each life, during our mental rehearsals and preparations. We need to rehearse, make plans, and then get back to being here now. The planning is everything, the plan is nothing’. We need to discipline our racing minds, our unbridled thoughts. We need to commit X time to worrying, planning, rehearsing. Then ‘let it be’. Leave it to our subconscious to continue calculating optimal responses. So that when the time comes, we are not ‘loaded guns / trigger happy’, but calm and alert and positive. We are fully ‘here and now’, open to all opportunities, allowing our subconscious freedom to choose the optimal responses, from ones we rehearsed, and ones it came up with in the meantime, or spontaneously…we have to trust in it…it is
much more powerful than our conscious mind…it has unlimited programs it can run simultaneously, whereas our conscious mind is limited to 5 to 9 items, and can attend to very few of the impressions available to us…Compare how much the subconscious observes through our peripheral vision, compared to what we are consciously attending to…How many times have you reached out to catch something, like a football, or a dropped cup, without any thought at all…spontaneously…instinctively…and then how many times have you suddenly thought, ‘this is hard’, and fumbled, and dropped it…

Consider learning juggling. Once you get into the rhythm, it all flows without conscious thought. But to get to this state, you first had to (if you are like me), ‘see’ the individual moves involved. At first you see chaos. But when you break down the actions, and can ‘see’ them individually, you can then re-combine them, practice them till they become automatic, reflexive, muscle memory, and then carry on many other things consciously while calmly ‘juggling’. The same goes with learning to drive, shoot, serve a tennis ball, cooking, or finding your way from A to B. The first times you need to pay close attention. Find landmarks. Break down apparently complex series of actions into their individual (often sub-group level is necessary i.e reflexive meaning like learning a ‘riff’ rather than trying to learn individual notes) actions. Often people have ‘learned’ these actions subconsciously, over a period of time, and never really considered what they are doing, or have forgotten all the ‘steps’ they progressed through. They first learned X, then Y, then combining them with Z, then added more subtle changes, and then found the most elegant / efficient way to ‘do it’. These people often make the worst teachers. It takes a ‘modeller’ to break down their steps, and make them conscious even to the talented performer…or someone who learns slowly the hard way, by breaking down entire processes, then building them back up…people who are not ‘easy’ learners, and who thus develop skills the natural talent does not have, for ‘explaining’ and ‘deconstructing’ and ‘breaking down into small, easier to learn and later re-join, units…

Some people were lucky to ‘enter into it’, and learn many things ‘intuitively’. It was ‘easy’ for them. Others had patient, competent teachers who broke things down for them, into parts they could comprehend, master, then re-integrate back into the wholes they form. They can then ‘replicate’ and ‘reproduce’ actions, behaviors, and attitudes that appear to come ‘natural’ to the lucky few. Most of use exist in between the two extremes, for most things. We find some things ‘self-evident’ and ‘intuitive’. We find other things ‘mind bogglingly complex and difficult, even mysterious and impossible’. Lucky we still have a diverse population. And lucky there are ‘modellers’ out there, like the author of ‘How to win friends and influence people’, and Maxwell Maltz with his ‘Pyscho-Cybernetics’ and Richard Bandler and co. with their ‘NLP’, and myself.
Learning self-confidence may at first be a case of ‘fake it until you make it’. Acting. Pretending. Entering a role. Vividly being that character. Until you become it. But it is important not to remain in the ‘faking’ start position. Follow through until you have complete integrity. Faith in yourself. In your subconscious. Until the act becomes real. The dancer becomes the dance. Just faking it won’t make it real. You can trick others, but not your own subconscious. At first it will be an act. But it has to become genuine. You have to vividly re-program your subconscious and conscious mind to be positive, confident, like those lucky few whose lives were full of positive feedback, where significant others always had faith in you, believed in you, valued you, were confident you would succeed, and offered every assistance and opportunity, resource, and support, to ensure you enjoyed a series of constant successes, overcoming setbacks, overcoming obstacles, finding solutions to problems, finding ways to compensate in one area by strengthening it, and finding alternative ways to achieve the same outcomes with the strengths available…Only when your subconscious and conscious are in true, genuine, authentic, agreement, harmony, will the best you you can be emerge, and express itself, as a matter of habit, automatically, instinctively, naturally. Up until that point you need to rehearse, train, consciously direct, be self-aware of any negative ‘self-talk’, interrogate your subconscious for hidden self-defeating, limiting, sabotaging beliefs e.g I am not worthy, I don’t deserve to be happy, I am guilty, I deserve to fail, to be sick, to be a failure etc…THAT is the more conventional side of the therapy we are undergoing in this book…after that we then install NEW beliefs…we re-build a YOU that you WANT to be…it really is THAT simple…like re-programming a computer…

But first you need to comprehend TROONATNOOR, so that your super-computer does not use its powers in self-defeating, malicious, destructive, ways. We need to ensure your DEFINITIONS are correct. We need to remove ‘bugs’. Errors. Etc…

I don’t want to make a super-you that is ignorant, destructive, malicious, egotistical, and selfish. In other words ‘evil’.

Anxiety, fear of failure, fear of embarrassment, fear of losing face, all have their place. If disciplined to be ‘sticks’ to motivate us. But if we let them RULE us, our lives become miserable. Pretty much like most lives today are, sadly.

We need to be here, now. Full of positive expectations. But we need to use the power of now to go back and forwards in our time lines, to learn from the past, and to rehearse / plan for, possible futures. In a disciplined way that does not return to our bad habits of ‘wasting our lives worrying about the future, and reliving / regretting / punishing ourselves for mistakes etc in the past…we die a
thousand deaths by worrying about the future. We need to impose limits. Not end up wallowing in self-pity or self-destructive self-loathing / guilt / regret.

Balance. In all things moderation. Even moderations. We need to ‘let go’, and ‘allow Dionysus into the city’ regularly. In relatively ‘safe and controlled’ environments. And even sometimes take risks. That is REAL balance. REAL discipline is not to be totally ‘emotionless’ and ‘in control’ at all times. That itself is an extreme that shows a lack of true self control and discipline. Only people who FEAR losing control, failure, loss of face etc, NEED to have total control, be totally organised, totally ‘in control’. They lose all joy in life. They miss so many opportunities. Sure, they may live a little longer, if they don’t die of stress, frustration, irritation, despair, heart attacks, strokes, but they miss out on the whole point of existence. Life is an experience engine. It is not some struggle. Not some punishment. Not some purgatory. It seems that way. We have MADE it that way. But it does NOT have to be that way.

It MIGHT be some huge trick. We MAY be brains in vats, like in ‘The Matrix’. We may be entertainment for some different dimension beings or aliens. We may be ‘learning’ lessons to allow us to ascend to ‘higher’ planes / dimensions.

But none of the positive possibilities are inconsistent with what I am trying to do here.

And the negative possibilities may be overcome by what I am trying to do here.

So either way. Just do it. Try and see. Really commit yourself to the process. Either way it will make the lessons easier to learn, you can ‘pay your dues’ quicker and get out of purgatory sooner, or you can ‘outsmart’ the tricksters who are playing games with us.

Oh, and nothing here is inconsistent with the best in religion. But most religion is malicious junk added to enslave you. So your masters won’t be happy with me. But you can rest assured that any true prophet or ‘god of love’ would be behind me 1000%. I am not trying to empower you to be more powerful versions of your worst selves. I am empowering you to be the most empowered versions of your best possible selves.

Like Socrates, I think that enlightened people realise their true best interests, and become the best people they could be, which benefits them, their family and friends, their communities, and the entire world.

Not like some Semitic ideal of seeking power to enslave others to become mere means to their own ends. The success of this ‘Judaism’ / ‘Mosaic ideology’ lies in its appeal to the average person. Until YOU stop desiring to opportunistically exploit other sentient beings as mere means to your own ends, this Semitic ideal
will continue to bring war, chaos, suffering, misery, slavery, rape, genocide, and the worst of all possible universes. YOU manifest this world as it is through your innermost desires. Your thoughts. Your actions. No Jew world order could ever emerge, let alone flourish, without YOUR support, in principle. Until you adopt a vegan lifestyle, that is, one defined by the Optimal Ethics Generator, the sort of principles you would agree to under Rawls’ ‘Veil of Ignorance’, the ‘Jew world order’ is going to strengthen, and repeat history, the history of the Biblical holocausts committed by the Jews, and realise the Jewish dream, openly expressed in the Torah and Talmud, of a world in which the Jews are the only beneficiaries, and all other non-Jews are relegated to the status we today relegate all the OTHER non-human species to.

That is why the ‘Zionist ‘Jews’ hate me. Actually hate me as a person. They hate people. I only hate their ugly beliefs. Their ugly ideas. Their exceptionalism. Their racism. Their ideology of racial supremacy. Their proud history of genocide. Of exterminating entire people’s and cultures. Their notion of entitlelement. Their delusions of superiority. Their macchiavellianism. Their abuse of ‘noble’ lies. Their propaganda. Their usury.

N.B that the art of writing is to rehearse how different readers are likely to ‘respond’ to what you are writing. What will they understand by the expressions used? How could I streamline the entire process of communication, to make it more elegant, and thus decrease reader burden? Etc etc..

Advertising is about making you feel dissatisfied with your life. Inferior to the unrealistic models of perfection offered. The unrealistic good fortune of the actors in the commercials is designed to make you feel lacking in some way. The product is subliminally, subconsciously offered as the solution to filling that lack. Of compensating. Of enjoying the super-satisfaction the characters in the ad appear to be enjoying. If you don’t have X, you are inferior, so go buy it, now, on credit. Only then will you be, and feel, ‘O.K’. What are you waiting for? The happiness, success, and satisfaction you see on the screen is just the swipe of a credit card away!

Comparing ourselves to unrealistic benchmarks / base-lines / models dooms us to feeling unfortunate, dissatisfaction, and unhappy. David Hume demonstrated how happiness, the subjective feeling of being happy, usually reduces to feeling more fortunate than others, or to our past selves. In other words to be happy is to feel either that our own good fortune has improved, things are getting better for us, or comparing our good fortune favorable with others. Do we have more X and Y than others? Or than we used to have? Then we feel happy. Do we have less? We will tend to feel unhappy. Thus happiness either requires we continually have more of what we want, or more than others we are aware of. Comparing your figure, beauty, bank account, success, status, achievements, etc, with the
extremely unrealistic benchmarks offered by television, magazines, and so on, dooms you to feeling unhappy. We are usually only shown the ‘best’ moments of other people’s lives. They are usually only happy to share these with others. They veil the misery, unahappiness, dissatisfaction, suffering etc and present only the ‘choice’ bits, the ‘chocolate side’. So you are unlikely to ever gain a realistic basis for comparison. Don’t fall into the trap of making comparisons. For every one person you know who ‘has it better’ than you, there are thousands struggling even harder, with even less, than you have. You are guaranteed of feeling better by turning off the television. Putting down that magazine. Going out into the real world and seeing how most people live. THAT will be the best tonic for your feelings of deprivation. And to counter any sense of entitlement you have.

That said, everyone is entitled to be happy, prosperous, successful, in their own way, in their own lives, and at the expense of no-one else. The working class taboo on being happy, on shining too brightly, less it make others feel inadequate / less fortunate, can be very damaging. Sure, don’t go around flaunting good luck in the face of the unlucky. There is no need to torture people. But sabotaging your own success and happiness out of guilt is insanity. Perhaps the Arabs have it right where their houses all face internal courtyards. From the outside they never flaunt their wealth. Never rub it in anyone’s face. But they enjoy their private happiness.

Often we feel the need to ‘impress’ others. To highlight any success we have. Because deep down we feel insecure. We feel that other’s do not value us. Do not respect us. Consider us failures. So we want to make sure they see any success we have. In fact most people, in public, present a wealthier, happier, more successful image than the facts would support. How many ‘happy’ couples suddenly start demonizing each other? As if overnight. Suddenly they dropped the public pretense of ‘happy couples’ they had put on to impress family and friends. To avoid ‘losing face’. To appear happy and successful. Even to seek others envy. Most business people keep up a successful front right up until they declare bankruptcy proceedings. How many people maintain an ideal figure at the expense of their health? Of constant hunger, constipation, obsession with food, frustration, irritation, health problems, and abuse of tobacco, alcohol, amphetamines, laxatives, bad breath, and terrible moods? All you see is the perfect figure. You don’t see what it costs that person to maintain it. We never see the price people have paid for their ‘success’. Selling your soul to the devil is the literary equivalent. How many people ‘sold out’ their integrity? How many sold out their values? How many committed fraud, engaged in corruption, or live with terribly dark secrets haunting them, shadowing their apparent ‘happiness’, destroying their sense of peace and harmony, dooming them to constant sleepless nights, anxiety, and quiet desperation of being ‘found out’? The biggest ‘success’ stories like Donald Trump are quite different to what you imagined. The idea of the ‘self-made man’ is usually a myth. Trump is worthless. Bankrupt. He was
‘created’, and is owned, by his Jew World Order masters. A puppet. The furthest thing from the ‘self-made man’. Sure he lives in luxury, but only at the whim of his ‘owners’. He will plunge the entire world into war if his masters decree this. And they plan to. Who would you rather be? Yourself? Or Trump? Sadly many of you would still choose to be Trump. Maybe he, and you, will learn something from the mass suffering coming, which will prevent you repeating this error in your next lives?

If you compare yourself to any other person you are going to come up short, if you focus on the ‘one in a million’, or on some particular aspect of their lives. If you compare yourself to Mother Theresa you will come up short. If you compare yourself to some movie character, you are never going to be satisfied. You will never be as brave, beautiful, clever, brilliant, talented, happy, etc as any movie character, as they are not real. Most ‘based on a true story’, and even ‘autobiographical’ movies stray very far from the ‘truth’. Take ‘A beautiful mind’ as a case. Not to mention ANY Holocaust movie. People in real life are full of imperfections. We want some hero’s, so we leave out the bits that don’t fit this sort of illusion. We want ‘The Allies’ to be the ‘Good Guys’, so we have to demonise the Nazi’s with propaganda like ‘The Holocaust’ which have no basis in reality. Otherwise how could the Allies be ‘good guys’, after the millions of women and children they firebombed in Germany and Japan? So the movies present false realities to us. Realities that conform with what we want to be true. To provide ‘perfect hero’s’ that never existed and ‘perfect bad guys’ who never existed. To simplify things. To draw things in black and white. To propagandise. To sell products and services and versions of history so a few people can profit. From the products, services, and the version of history. The Holocaust is known as ‘Shoa Business’ among the Jews. It is perhaps the single greatest piece of propaganda ever produced. The single largest ‘industry’ to have emerged from WWII. Profiting a few million ‘Jews’. They are selling guilt. Just like television adds make women feel guilty for not being perfect mothers. Or fathers for not being successful providers. Or adolescents for not wanting to go to foreign lands to murder children, women, and old people, in their sleep, as ‘war heroes’.

Failure in anything only demolishes the self-esteem of those who do not possess a healthy, realistic sense of self. Some people walk away from a public embarrassment or failure feeling a little embarrassed and foolish. Others go home and kill themselves. Most of us are good at some things and bad at others. But we don’t dwell on the bad. And when we make a fool of ourselves trying to dance, we laugh it off. Others repeat the event over and over in their minds, exaggerating it, embellishing it, and building up a fear of, and expectation of, future failure.
If you have a balance sense of self, a healthy, realistic self-image, you can brush off experiences that would devastate those with low self-esteem. Everyone got their self-image from experience, and how others treated them. Many of us are very unlucky to have had overly critical parents, and a lack of support in learning new things, or opportunities to develop social skills. But we can now replace that past experience with new experiences. Even go back and remove the experience that taught us unrealistically low self-worth, and expectations, and replace them with the sort we SHOULD have had, that we WISH we had had, that others with healthy self-esteem were lucky to have had...

Observers in audience often enter trance, and follow suggestions, including post-hypnotic suggestions. Hypnosis may occur spontaneously to avoid stress situations, including during interrogations i.e unwitting.

Hypnotic analgesia i.e surgery conducted using hypnosis as only pain relief / analgesic… not generalizable i.e only relatively few can enter deep enough trance…one failure of any hypnotic suggestion reduces chance of any future suggestion being effective…hypnosis can work, but not as post hypnotic suggestion i.e needs to be very specific, as general suppression of all pain would be bad idea i.e pain = feedback…and then ANY pain ever felt would reduce chance of any future suggestion working … Simulators can tolerate more pain than those in deep trance, in studies…self-hypnosis to manage anxiety produced by solitary confinement…autogenous training represents sense / feeling of mastery / control … cannot deprive of this power…illusion of control / mastery of situation cannot be taken away…training of what to expect if captured can give sense of control i.e takes away element of unknown / anxiety … can’t induce trance in resistant subject, and if did, can still lie / withhold information…hypnotic situation offers psychological chance at ‘saving face’ i.e relieve of any guilt at having divulged vital information…no-one can hold responsible … no shame attached to… i.e ‘magic room technique’…convince subject they are responding to suggestions e.g that hand growing warm, when hand being warmed by concealed heater, or that cigarette will taste bitter when wakes from trance, then give specially prepared cigarettes that have bitter substance added etc…
Manipulation

one failure of any hypnotic suggestion reduces chance of any future suggestion being effective…hypnosis can work, but not as post hypnotic suggestion i.e needs to be very specific, as general suppression of all pain would be bad idea i.e pain = feedback…and then ANY pain ever felt would reduce chance of any future suggestion working … Simulators can tolerate more pain than those in deep trance, in studies…self-hypnosis to manage anxiety produced by solitary confinement…autogenous training represents sense / feeling of mastery / control … cannot deprive of this power…illusion of control / mastery of situation cannot be taken away…training of what to expect if captured can give sense of control i.e takes away element of unknown / anxiety … can’t induce trance in resistant subject, and if did, can still lie / withhold information…hypnotic situation offers psychological chance at ‘saving face’ i.e relieve of any guilt at having divulged vital information…no-one can hold responsible … no shame attached to… i.e ‘magic room technique’…convince subject they are responding to suggestions e.g that hand growing warm, when hand being warmed by concealed heater, or that cigarette will taste bitter when wakes from trance, then give specially prepared cigarettes that have bitter substance added etc…

Amnesia most popular ‘simulated’ illness among criminals…and P.O.V’s…i.e claim head injuries, or PTST…genuine amnesia from head injury, acute infection, epilepsy, alcohol, toxaemia, acute anaemia…usually immediately before and after…stupor, delirium, bizarreness…in and out state of awareness, falling in and out of consciousness…spotty memory…inability to acquire Vs recall info…recall very isolated events from period.. retrograde usually of very short duration, and only few seconds / minutes, though up to 24 hours, memory loss…even entire life…and aphasia i.e inability to do things use to take for granted…sometimes loss of identity…retrograde amnesia rarely more than very close to event that caused e.g seizure, head injury … usually limited to period surrounding time of the injury…may result from psychic trauma…hard to determine hysterical Vs ‘real’ … anxiety provoking experiences…in real patient they wishes to fill in gaps, but overcome with anxiety and fear as approaches events / experiences leading up to trauma…neurotic tremulous, restless, over-responsive, poor apetite, sleep difficulties are correlated symptoms…faker often argumentative, demanding, evasive…lifting conflict can lift amnesia… narco
analysis effective on neurotic when given barbituates, as patient WANTS to remember, and sodium amatol helps them regain memory of traumatic episode…faker does not want to recall / always negative / barbituates don’t work on…Sodium amatol leads to fabulizing in fakers…Most control subjects able to NOT confess, so assumption is that truth serum’s merely prop to allow person to volunteer without loss of faith…deception possible under truth serum…neurotics groping for answer, upset when can’t recall…as attempt to recover events, in discussing period near amnesia, breath rapidly, may cry out, usually perspire, get tense / rigid, move convulsively, intensity of emotion unbearable as approaches climax of story i.e under sodium amatol…physiological reactions not shown by simulators under sodium amatol…though some neurotic / hysterical show little overt anxiety etc…several sessions often required to recover trauma…hysterical Vs simulated therefore revealed by narco-analysis…honorable / face-saving opportunity to tell truth…sodium amatol won’t work for damaged brain or acutely psychotic individuals…interrogation likely to provoke simulation…conflict of interests ranging from threat to life to loyalty to own side…prisoner must be careful as may lose value to interrogators if simulates inability to be of any use i.e can’t remember / mentally ill / unreliable source of info…incompetence thus potentially life threatening…so simulation may produce worst outcome…in criminal arena, can produce better outcome i.e reduced sentence, but fear of worse outcome i.e mental patient worse than prisoner…If interrogator can earn goodwill of prisoner, can promote desire to please / guilt …to influence behavior…’the one person helping them’ …

Short jail term Vs indefinite medical incarceration, electro-shock, lobotomy etc…

Prisoners on same ward coach / train each other how to ‘trick’ judge and jury…cross-fertilisation … may even hear back about what worked and what didn’t…lawyer clearly will provide with such information / feedback…

Prisoner may pretend the ‘cure’ worked, and recovered memory, to avoid having to admit was simulating / malingering … or continue simulation, while providing information requested, so never have to admit…benefits of ‘medical care’ with better treatment / privileges …

Symptoms may be mere exaggerations of latent tendencies i.e first faked, shows up as real illness later…Ganser state may be produced by fear i.e to avoid…so must be careful interrogation does not produce Ganser state which is NOT simulated … feigned…really only a confession or ‘catching out of character’ will reveal ploy / simulation … but some real mentally ill may pretend were simulating, so no way to know for sure…i.e faked confession of really mentally ill…

Risk of producing genuine ‘Ganser’ syndrome gives the advantage to the potential simulator, in P.O.W interrogation etc situations.
Fake ‘magic powers’ by drugging, then after brief period unconsciousness, pretend that during that time they divulged information, so give up trying to fight it. i.e pretend have power to do X, so they make admissions...i.e trick...situation effective ‘noble’ lie...in reality you can lie under hypnosis, withhold info, only do what want to do...i.e faked ‘hypnotic situation’ i.e ‘magic room’...trance cannot be induced in resistant subjects...but can be induced without their awareness if trust / rapport exists...i.e in hostile situation unlikely to be able to build rapport...bad cop / good cop attempt at this...relieve person of sense of responsibility for own actions i.e can now do what really want i.e tell all, not responsible for...can avoid negative consequences, be rewarded by captors...

Shared success leads to conformity, and feeling that others dependent on you...also if finds group attractive, or feels groups likes them...high group cohesion increases conformity...even if group fictitious i.e notes sent between assumed group members...rapport increases conformity...shifting of opinions towards other group members in high cohesion...feeling of high acceptance by group...shifting towards group view...publicly expressed views...least secure members most susceptible to rejection of group more likely to shift...telling participants they are least accepted and lowest performing can lead to increase in conformity...shift...high cohesion increases pressure to uniformity...shift...conformity...telling there is a correct answer, can increase pressure to uniformity, or that task is important...group penalty increases readiness of individual to shift opinions...i.e don’t want to be the ‘one out’ responsible therefore, if wrong, for group penalty...anxiety and insecurity increase likelihood...failure in past increases tendency to shift to group, even if only one other person...success decreases tendency to shift...if group failed in past, decreases shift / conformity...if confederate/s reported ‘correct’ in past increased shifting...prior individual failure on same task prior, increases anxiety, and susceptibility...anxiety increases susceptibility to pressures exerted by others...individuals who experienced late independence training as infant, more prone to shifting...college educated women less prone to conformity / shifting than men...sleep deprivation and thirst impact...

Malingering / faking illness – disorder...sometimes pretending acting i.e real disorder...attempt to avoid undesirable outcome...commit murder and feign / simulate psychosis to escape / reduce punishment...captured soldier P.O.V may feign illness to avoid obligations, escape sense of responsibility / guilt...more extreme circumstances lead to ‘forgiven’ by self and others ...‘not themselves’...i.e enduring personality traits ‘bypassed’ by extreme conflict of needs...simulator portrays symptoms as they understand it...can learn from others when confined to mental institution and other malingerers...today from internet...faking low I.Q...mental incapacity...
Trance individual holds strictly to rules and expectations of their culture i.e. won’t break taboos just because put in trance…culture specific…even hallucinations tend to be ‘shared’ i.e. ‘cultural artefacts…

Malingering often presents rare symptoms public identify with the mental disorder, but which are rare i.e. feigned psychosis … overdramatisation, overly bizarre, calls attention to ‘disorder’, Vs real sufferer tends to avoid this, seeks to be ‘saved’… need to maintain simulation over time, as no way to really ‘tell’ if acting … real disorder often unwilling to discuss symptoms, but will talk about at length with sympathetic listener Vs actor keeps drawing attention to i.e. ‘look at me, I’m crazy’, and delusions vague Vs vivid. Hallucinations auditory and visual rare in schizophrenia, and usually associated with tremors, slurred speech…thought disturbances…psychotic depression hard to fake concomitant physiological traits, loss of weight, constipation, sleep disturbance, loss of weight, lower red cell count…though can actuate some of these changes if motivated i.e. psychosomatic…self-reproachful / self-condemning…need to be slow in reactions…drugs and sympathetic listener can lead real sufferer to re-live experiences i.e. recall ‘forgotten’…faker usually slow, puzzled, unaware, unable to answer simple questions…and inconsistent i.e. observe secretly to see if departs from behavior in private…good actor behaves consistent…and even psychotic behaves differently in private than public…mutism from psychosis / hysteria / organic brain disease usually withdrawn, unresponsive…faked mutism hard to maintain, but hard to detect…narco-analysis hysterical patient can speak during this, while actor remains mute…faker often unco-operative / suspicious / cautious / mistrustful, but so are true paranoids…complains of illness etc to forestall / avoid examination…being too alert and watchful…those who lied in detectors reluctant to take test, tried to postpone/delay, anxious and hostile to test and examiner, evasive tactics like sighing, yawning, moving about to obscure recording…felt obliged to explain why would appear to be lying…lead to suspicions in tester…psychopaths show little anxiety, often cool, reserved, non-reactive…exert effort to avoid … Thomas Mann’s hero pretended wanted to get into army, and feared his epilepsy would be discovered, (which he was faking)…

Can suggest infallible cure available to see if actor avoids it / fears it…can lead to admitting defeat, and admitting simulating / malingering / faking it…

Rohrshach test used to detect simulation…i.e. how to predict what interpretation expected of someone with their supposed condition? Hard to fake that. MHR or pretend this is so. Increased reaction times clue that trying hard to work out what ‘expected’ of them. Easier to appear disturbed than well adjusted?

Ganser syndrome…person appears psychotic but behavior similar to simulator / malingerer…bizarre, wear clothes inside out, … unable to answer simplest
questions precisely, but gives one wrong, but not too far long i.e 11 months in year, cat has 3 ears, patient not upset when told wrong...seen as non-conscious attempt at evasion i.e NOT consciously deliberate...or way to avoid real psychosis ... between faking and hysterical states...intolerable stress / helplessness...throw off sense of identity and responsibility...not purposive deception, but hard to differentiate between deliberate malingering and Ganser syndrome...Ganser only answers odd answer when asked question Vs actor volunteers up ... Ganser responses approximate correct answers, and more able to adapt to life in institution ...

Electroshock ‘therapy’ successful within few sessions, on Ganser patient!

Mental deficiency / feeble mindedness / not responsible for acts ... reduced scope awareness and discrimination ‘right and wrong’ and consequences of acts...

Defective usually avoids many IQ test question...faker often fails questions too easy and gets some right that shouldn’t be able to...often scores too low, though answer too slow on easy, too fast on ‘hard’ questions...fakers do too well on some things...administer twice to see if inconsistent i.e changes answers to individual questions...ask hardest first, then go back to simplest...if cannot do simplest, probably faking...fakers often perform correct arithmetic, but then spoil answer deliberately, Vs real uses wrong methods...performs wrong operations...fakers do too well on vocab, and similarities, but do badly on comprehension, i.e makes wrong assumptions about ‘feeble minded’...
Timeline therapy and the basis of personality. James and woodsmall. (expansion on work of Bandler)

Assumes people have a ‘core’ personality … but NLP concept is that personality is just a story / narrative / compression of accumulated ‘learnings’ and imprintings and installations, that is totally fluid, and can be deliberately replaced…easier in trance as conscious resistance bypassed…but anyone can re-install a new personality…

People represent time differently, but in two basic ways, as ‘in-time’ where part of their time-line passes through them / behind their eyes etc, or ‘through time’, where all of their time line is represented as being in front of them, so that they are dissociated from ‘now’ rather than Zen ‘in- the here and now

Meta-programs another term for ‘noetic structure’ or ‘filters’ that filter incoming data, direct attention towards and away from particular potential impressions / data and so filter out, exclude, include, distort, omit, color, etc incoming impressions and thus the persons models / views / values / definitions / experience / subjective reality…

No need to assume ‘sensory data’ comes from some speculated putative ‘outside world’ i.e notion that some objective ‘basis’ reality exists ‘out there’ which ‘truth’ would represent a ‘convergence’ with i.e truth is convergence between subjective and objective reality…in some particular dimension / aspect / ‘fact’…i.e with supposed ‘laws of nature’ and ‘physics’ etc…though quantum physics sort of discounts the very notion of any objective reality independent of an observer i.e subjective experience of it…

But if we know the subjective reality of a person, their prejudices, experiences of life, backgrounds, education, indoctrination, socialization, we can predict their behavior to some degree, and find ‘common ground’ and rapport, and communicate with them in their own terms, in ways more compatible with their definitions and assumptions etc…reveal to them flaws in their models…using
their own language / codes / symbolism … Vs ‘talk past each other’ and make globalizing rejections of them as a person, rather than some of their ideas i.e my Anti-semitism Vs the propaganda definition of irrational hatred without sound basis i.e desire to hate someone etc…

Values as different from beliefs? MHR indicate what value by what willing to sacrifice, risk, labor, bleed for…most people do NOT really value what claim to, nor believe what claim to…belief is so strong a certainty that you act according with it e.g. belief in gravity Vs belief in god / that bible world of god etc

The divergence between what we claim / imagine we value and believe, and what we actually do, are clear in our ‘actions’. Of course we have value and belief hierarchies. For most people survival is valued more than freedom, and they will live as slaves rather than risk death by rebelling against their masters. People claim to value honesty, but this is a low priority when it comes to competing values like survival i.e there are few categorical imperatives outside of survival…though in ‘heat’ of moment sexual urges often place it higher in the priorities … the species with this instinct had better chances of projecting themselves into the future…those species that failed to reproduce fail, no matter that each individual, avoiding the risks associated with sex e.g. vulnerable during mating, fights over mates, death in childbirth etc, lived as long as their hearts were destined to beat / programmed by genetics to function, would go extinct within the lifespan of the longest living individual.

So key to discover REAL values and beliefs, as Jesus with the fig tree, rather than bother with self-delusions of interlocutors. Better to target their real values and beliefs, than those offered, while avoiding confrontation i.e person claims values justice, but really wants cheapest price, so you offer that with the cheapest price, while playing up some imaginary ‘social justice aspect’ of that that product as a ‘moral masturbation’ for the buyer…they can pretend they are ‘good’ and ‘nice’ and ‘superior’, while getting what they really value, the cheapest deal possible.

Right and wrong, no matter how people kid themselves, and reframe it, spin it, play games with it, ends up being ‘what leads to my benefit, pleasure and relief, and avoids my pain, cost, discomfort best. THAT will be what most people, in reality, define as ‘good’. No matter how they spin it. Go along with their masturbation, it feels good to them, but target the REAL implicit / unspoken / tacit values of ‘good’ and ‘evil’. The Exclusivist / exceptionalist Judaic tradition a.k.a ‘Mosaic law’, if you recall, only applied to ‘Jews’ i.e to those in the group, and was immediately brutally contradicted by Moses and his men in butchering thousands of their own people, (maybe Akhenaton and his Egyptians massacred the ‘Jews’ who had joined them…in reality)…and then immediately Yahweh
ordered Moses to commit genocide, which later Joshua carried out (as the messiah of the Jews…Joshua – Jeshua- Jesus

MHR because personality appears ‘fixed’, any changes made appear ‘miraculous’, but it is really no more miraculous than taking a computer program into which someone has entered faulty data, and correcting that data…or re-programming a robot from being a terrorist / solider / genocidal murderer, to being a nurse, doctor, teacher, carer. It was just that people were told ‘personality is real and fixed’, and very few people ever got the chance to ‘change’ i.e history of serfdom / slavery / inherited social status / job/ position/ roles/ sexism/ racism/ all forms of chauvinism from ‘chosen people Jews’ onward…

You don’t have to understand higher mathematics to make your arrow hit a target. Heuristics is about patterns of behavior that achieve their desired result e.g hitting a bulls-eye. You model Robin Hood, find out what makes him such a great archer, and then formally describe it in words, pictures, sequences, and model the actions, and anyone can learn what he does, thinks, imagines etc that leads to his success rate…and if they have the necessary strength, hand-eye co-ordination (which is self-fulfilling prophecy mostly of practice / and self belief motivating practice and overcoming obstacles / difficulties), then anyone can achieve similar results. Same goes to top achievers in sales, in music industry, teaching, learning, etc … any field of endeavor…any behavior…and set of actions, skills, abilities…

So heuristics side-steps the whole debate about ‘reality’ and ‘facts’ and ‘truth’ and ‘proof’. We don’t have to claim to understand WHY the elements robin hood naturally displays / the behaviors he has learned, inductively and deductively, consciously and deliberately, and unconsciously /seemingly intuitively, and by pure accident displayed instinctively…we are interested in that they DO…later we can see if we can work out the WHY, to improve on them, apply them to other fields, but Heuristics is about ‘attaining end goals / objectives / states. Like a rough map that gets you from A to B without sinking in the bog marsh forever, drowning in the lake, dieing of dehydration in the dessert etc..it doesn’t nave to be a one to one representation…just a sketch that serves our purposes, for now. Later we can add details as needed, depending on our intentions and needs.

You don’t need a theory of gravity to ‘learn’ how to ‘work with’ the apparent force of nature we call gravity. Whether it exists, and operates how we imagine it operates, is not of much interest to Heuristics. That we get the results we want is key. Gravity may be a collective consensual agreement among atoms to ‘act in that certain way’. Maybe they’d be embarrassed not to comply. Maybe they’ll get in trouble with someone? Maybe they just learned this way of acting, and took it for granted as natural, and normal, like it is for U.S citizens to pay taxes, and
fight wars for Israel, and to let their own government get away with murdering 3000 U.S citizens in a few hours in N.Y.C on 911, while murdering millions of Iraqui’s for that crime? Doesn’t matter. To seek truth, you don’t ever need to assume truth exists, or can be found. All you care about is, will X lead to Y? I want Y, will X do the trick? Heuristics. Rules of thumb. Even David Hume acts as if cause and effect relationships are real, and objects are real, in daily life. But like a true Zen practitioner, he never limits things to what they appear to be to our limited human conception. He is skeptical. Which means always seeking. Always open minded to the possibility that things are nothing like what they appear to be, if they actually exist at all, outside our own thoughts.

I have thoughts, therefore I am? Thoughts exist is more precise. We think everything into being, at some level. Some things argue back with ‘pain’ i.e walk into a wall you don’t believe in, and it will communicate with you that it insists on ‘existing’. But all you really have is the feeling of resistance/ even pain. Feelings exist. But they are all generated in the mind. Everything ultimately is.etc etc

The earlier model of how we communicate with ourselves and with others from Cognitive Psychology, was developed by Richard Bandler and John Grinder. It is called NeuroLinguistic Programming (NLP)

NLP assumes external reality, but no need to. Actually ‘reality’ as we know it makes more sense if you don’t bother assuming this unnecessary step in the process by which we form our beliefs of TROONATNOOR. Like assuming some God ‘created’ the world, and then having to explain who / what created this ‘God’ It is just as simple to say the world always existed, in some form, and merely changes from one form / state to another. We know that our final experience is generated in our minds. Maybe the entire experience is a thought process. And the ‘brain’ is just another ‘thought’ that plays its part in producing a compelling ‘reality’. A game. An experience engine. In a virtual reality we suspend disbelief, and occupy ‘bodies’…to make it seem more real, we could easily program the ability to cut open these virtual bodies, showing virtual brains, and the virtual participants could be reassured that, yes, the reality is finally experienced in here, in my brain, but there really is a reality ‘out there’, external to that brain. Just another prop to make the narrative more believable, more real, more compelling as entertainment, maybe edu-tainment. Maybe we are teaching ourselves something here. Or someone else is. Or its just game stuff. Either way, adding the notion of ‘external reality’ is really just saying that ‘there are some thoughts we are all compelled, by fates worse than death, to accept as ‘unchangeable’ i.e as ‘concrete’ i.e as ‘real’ and outside of our social reality i.e some definitions that form the basis of the game we play…the ‘field’ we play our game on, with the ‘gravity’ and ‘laws of equal and opposite reaction’ necessary to make all forms of ball games possible / fun / predictable i.e you can change the
rules of the game, and be playing soccer, or tennis, or football, or hockey, or golf, but the rules of ‘The Game’ are fixed, for the duration of our gaming experience. Rules like gravity let us design games around them. If every player could choose their own rules arbitrarily, you’d get chaos, the games would be less satisfying if you could change the rules so that now you can use your hands and not just your feet, now you could fly, now you could push and shove…cheating…virtual games have ‘cheats’, but only a few…if everyone could choose their own rules, from moment to moment, it would be like playing card games or ball games with people who kept changing the rules…frustrating,”no fun at all…

Distinguishing between conscious and unconscious is a similar class of action / distinction. Imagine being aware of every rule of nature, every frequency of the EM spectrum, every sound, every sight, every smell, every cell in your body, the firing of every synapse, every organ functioning, every heart beat…whew…like sitting in a theatre and being aware of every sound everyone is making, smelling every unique scent, seeing every facial gesture of everyone…no…you want to focus on the movie…or on your coffee…or on your orgasm…or on your favorite song, even the lead guitar bit here, the drums there…and imagine the boredom of having to constantly monitor every body process, to ensure that your heart rate matches your needs at the time, the flow of hormones, adrenaline, etc calibrated perfectly…each individual muscle co-ordinated to produce each individual step…well of course you’d prefer to be more conscious of some things, and less conscious of others…to do some things ‘automatically’ without attending to them explicitly, unless they got out of hand e.g racing pulse, muscle cramp, need to calm breathing…or need to get sexually stimulated to satisfy someones insistnt demands or paid for enjoyments…

Unconscious implies you are not conscious of them. But in fact your mind is constantly monitoring and calibrating and adjusting. Right now you are conscious of millions of things that you don’t attend to. Like things in your peripheral vision as I write this. The pressure on my butt, back, legs from the chair, and each stroke of the keyboard…I am aware of some of these things…from time to time…but then I become focused on the ideas flowing, and forget, for hours at a time, to attend to anything else…suddenly I become aware of an aching back, aching bladder, blurred aching eyes, tension all over my body, cramps in my wrists…these are all common ‘trance’ experiences…really meaning my active attention was so narrowly focused on my thoughts and writing this, that all other impressions / sensations were blocked out…but they were there…and they made themselves felt when they became severe…drew my attention to them via discomfort / pain etc…

So there is no real fixed thing called an ‘unconscious’. It is simply those elements of the minds / (if you want to assume a brain actually exists, then brain too) activities that we don’t normally attend to. We leave it to do its work without
shining the narrow bandwidth of our attention (what we usually call our conscious mind) onto it.

Which can be fine, like trusting your government. Allowing it all manner of ‘secrets’ and ‘powers’ and ‘lack of scrutiny / oversight / transparency’. Until one day you realise it has gotten out of control. Gone rogue. A shadow government has taken control, and is behaving in ways you never intended it to, never wanted it to, never gave your consent to, leading you to war, crisis, and destruction.

The same happens with parts of our mind. It is a good idea to do an ‘audit’ now and then, to see if it is producing the results / the government / the security and prosperity, you want from it.

Most government functions emerge over time, in the shadows, without any real attention given to them…so boring…and rarely do we deliberately and consciously audit them … most functions just emerge without anyone paying attention…

Our minds are the same…what we call our ‘personality’ and ‘beliefs’ emerge over time, are installed, conditioned, learned and reproduced…sometimes deliberately when we choose to undergo training, education, therapy etc…more often haphazardly, ad hoc…so it is great to take an inventory of our minds, like we should of our governments. WE cannot allow any part of it to remain ‘secret’. We have to audit all of it. Interrogate it. See if it is doing what we want it to do. Are we happy? Satisfied? Motivated? Enthusiastic? Healthy? Are our habits taking us where we want to be? If not, we can do an inventory, interrogate them, uninstall some programs, install some new ones, update some definitions, rewrite some code, and so get our systems up and running more optimally, generatively, productively.

We need to do the same with our governments that we are going to do, in this guide, with our minds.

Clear out the junk. Throw out the bath-water. Clear out the toxins. Remove the poisons. Redecorate. Re-define. Re-construct. Re-calibrate. Clear house. Clear shop. Get back to the very basic fundamental basis and move from there. Until we have the ‘personality’ and ‘government’ we deserve. One that is most likely to bring us the happiness, joy, prosperity, peace, and life experiences that we imagine we, or some creator, originally intended, both for our individual lives, and our social lives, as a species, as a planet.

Everything you need to do to optimize your own life experiences, needs to be done to optimize our collective life experiences i.e apply this guide to our own lives, and to our governments.
MHR notion of ‘sensory input channels’ another ‘heuristic’ notion, not justified (like cause-effect or free will are NOT justified) by inductive reasoning i.e interrogation of the observable facts … but assuming molecules exist external to us, and photons exist, and air exist through which a narrow bandwidth of vibrational frequencies travels, and that objects exist (at least as independent qualities of texture, density, mass etc), then we have 5 basic human senses, or ‘modalities’ of impression/ input / awareness/ consciousness/ experience…We see, hear, taste, smell, and touch, using Visual, Auditory, Gustatory, Olfactory, and Kinesthetic representation modalities / systems respectively.

We assume these inputs arrive from outside of our own body, and thus brain, and ‘mind’. Our brains compute an ‘internal representation’ of the impacts of sound waves on our ear drums, patterns of photons on our retina, molecules on taste receptors on our tongues, and smell receptors in our noses, and nerve cells all over the surfaces of our external and internal organs, from our skin, to our tongues, eyes, digestive tracts, etc…which we experience as sounds, sights, smells, tastes, and tactile feelings (as distinct to ‘emotional’ feelings)…

Give example of chillies and fire, drugs/ alcohol i.e of external substances and receptors not ‘intended’ for them…but which activate same neural networks / gestalt nodes

We generalize data to compress it…for storage, decreased processing time, efficiency…but at a cost of ‘loss’ of detail … same as MP3 or MP4 compression algorithms…lose some detail, but smaller data size for storage and transmission and decoding…draw global generalisations from very limited instances…speeds up ‘learning’, but often at cost of validity i.e prejudices, knee-jerk reactions all survival value, but at some point start costing more than worth…are all gypsies more likely to steal? All priests corrupt rapists? All politicians liars? All men stronger than all women?

We selectively pay attention to / attend to / are consciously aware of, some things, at the cost of other things, which we overlook, at least in terms of conscious attention…though often those impressions still reach our minds, and are stored…debatable how much we store…everything?…or do we really ‘delete’ anything, to save on system resources? Otherwise we would be overwhelmed, consciously…limited RAM i.e 5 to 9 pieces of information, parallel (MHR good spelling exercise…break into Par all el. And see as 3 words).

Values can be positive i.e what you DO want, or negative, what you want to AVOID. Attraction and repulsion. But subconscious mind only works in positives … i.e no idea of good and evil…so never visualize what DON’T want, as subconscious will only see the image in your mind, and realise it i.e target obsession / telegraph poles. And ‘Law of attraction’.
MHR most people’s values inconsistent / conflicting e.g I want to avoid being enslaved, but wish to enjoy the ‘benefits’ of slavery i.e be beneficiary of something, but never the victim, gain the benefits, but never pay the costs…free rider…moral hazard (exceptionalism) occurs where some system / mechanism makes this possible e.g ‘society’ and ‘religion’ and ‘government’ and ‘coercive states’…all best exemplified by the one of the original exceptionalist creeds / religions known as ‘Semitism’ i.e ‘Judaism’.

MHR ‘Belief’…‘I believe’…not usually based on any conscious reasoning…just ‘oh yeh, that’s what I’ve been given to believe / told to believe / told others believe ‘… i.e mere acceptance … sure I believe X… meaning nothing at all…next moment will believe Y, or Z. Different level of totally ‘imprinted’ ; conditioned, learned ‘beliefs’…basically used synonymous with ‘accept’ or ‘assume’ …without any basis…couldn’t explain why…what process lead to this conclusion … just about ‘consuming’ or ‘adopting’ or ‘wearing’ the belief…so people don’t really act according to it, in private, when unwatched, feel free from public censor … beliefs are not even emotionally binding / compelling…just airy fairy words…mere utterances…not given much thought…barely impacting on behavior, and easily swept aside to satisfy some impulse or urge e.g ‘belief’ in justice, freedom, equality, freedom, truth…

A conviction, when real, is more compelling of congruence and convergence, but often competing / conflicting convictions present, so clear the person has not evaluated either, and sort any resolution i.e synthesis…more an emotion than an intellectual property of the person…it is a feeling, not a conclusion of any mental process of reason / interrogation… like a conviction that some religious dogma is ‘fact’…like a ‘mind reader’ being convinced they can ‘call out’ a liar, a lie…or see the future, or predict which horse will win a race…

So as a philosopher I find the word ‘belief’ to be empty of content, devoid of meaning…just an utterance, and conviction just a feeling, and as irrational as any other emotion…

If you believe, the belief compels you, like a belief in gravity compels you to not to step off a cliff ledge, or leads you to anticipated, with full expectancy, that something you dropped will head lower in altitude, so that you reach lower to catch it…or that anything thrown into the air, like golden coins, can be expected to fall back, so you calculate likely projectories for it, and landing spots, rather than start to climb a tree to catch the gold coins as they fly off into space…

Attitudes? ‘how you feel about X’? To ‘cop an attitude’? Surely they are just behaviors? Postures? Defensiveness, pessimism, assertiveness, malice, are all attitudes?
Memories…when not precise, often form around a locus gestalt node, and are accesses as wholes…so that parts of distinct memories appear to form / are accessed as, a gestalt…as if part of one experience…for better or worse…efficient form of compression…if ‘learning lesson condensed’ … but generalisations all risk being invalid…n.B ;cause and effect is a gestalt…formed from a pattern interaction – outcome experiences…doesn’t exist…except as a gestalt…the generalisation that so far, X+Y gave result / product Z.

Personality appears combination of push genetic pre-programmed behaviors / impulses / drives / desires / needs / wants … and conditioning based on experiences i.e ‘memories’…more precisely HOW experienced and WHAT learned…i.e subjective construction…often erroneous e.g easy to learn ‘I can’t learn’, ‘I’m dumb’, ‘I’m unlovable’, ‘I’m useless’, ‘I’m unwanted’, I can’t get what I need / want…i.e series of experiences/ being told that / misinformed / brainwashed…these are all like a book that can be rewritten by NLP i.e replace / displace sub-optimal with more optimal ‘experiences’ and ‘learnings’…history is just what happened…random…can rewrite history and free ourselves from it…not like Jews and Allies rewriting history of WWI and WWII, to demonise and destroy Germany, and justify their own war crimes…but giving yourself new impressions / conditioning / learning e.g ‘fake it till you make it’…to have no respect for content of past experiences…they are just shit that happened…if they have limiting impact on you, then replace them with better, more optimal ones…escape history

A limiting belief is an assumption that was ‘fixed’ at some point, consciously or unconsciously, as a ‘decision’ of the conscious mind, or not-conscious parts of it, especially in early years before conscious, rational mind developed…i.e definitions of ‘danger’, ‘threat’, ‘food’, ‘security’ etc learned without words, rational conscious deliberation…very key to survival…i.e so learned quick, that fire burns, mama hits, daddy hits, rustle in leaves could be tiger …any member of species with such ability to generalize quickly, and avoid risks, ensure benefits, will more likely reproduce that impulse in their offspring…until it comes to define the species…as a ‘typical’ impulse / instinct…no ‘for’ or ‘to’ or ‘design’ or ‘intention’ required to produce instincts like this…as I say, many species exist DESPITE their impulses, so functionalism is bunk…an illusion imposed upon reality…like creationism, design etc

Any belief, decision, value, attitude you have that you don’t interrogate i.e take for granted, as natural, self-evident, or totally blind to i.e totally non-conscious strategy / definition / plan/ decision, risks being suboptimal. You may have survived because of it or despite it. In any case your current situation may be very different to the ones which gave rise to the original ones…in which case, whether you survived because of it or despite it, you have good reason to revisit it, make it conscious, interrogate it, see if it is optimal to your current and future situations
or not…see if you can generate better outcomes…new strategies…if beliefs etc limiting you, or helping you…

N.B people with less fixed beliefs more open to being ‘manipulated’, or ‘enlightened’, either way i.e more flexible. Having expressed public commitment to beliefs, they are loathe to renounce them i.e ‘lose face’…people often stubbornly refuse to reject clearly erroneous beliefs / attitudes / values e.g racism, sexism, chauvinism, exceptionalism (most people are to some degree i.e only 1% vegan, so 99% exceptionalists when comes to freedom, justice, freedom from slavery and violence and torture…etc

Often someone who has changed their publicly expressed beliefs, will be loathe to change again, for fear of losing face i.e admitting wrong, … often hold new beliefs just as irrationally / emotionally rather than rationally

we have investments in erroneous / sub-optimal beliefs…true ZEN and skeptics / scientists NEVER get emotionally invested so far that they resist scientific method of seeking to prove something wrong, rather than the typical human motive of seeking to prove what they already believe to be right…often going to huge lengths to ignore, censor, even criminalise and persecute truths that appear to contradict them, threaten to contradict / reveal to be wrong…

e.g ‘lessons’ learned, definitions set down, in times of war, famine, poverty, extreme threats to life, etc, often totally misplaced later… good intentions of not-conscious mind, and conscious mind, can be validated i.e I took the best decision / course of action / strategy I could find at the time…so no need to ‘lose face’…just ‘correct’ i.e ‘improve’ based on better information, / changed conditions / situations …

Any internal representation we make / model / noetic structure / definition of reality / gestalt we produce will impact our mental / emotional state, and psychologically, our health, our posture, our muscle tension, even how much effort we put into basic things like articulating words, lifestyle choices, effort in diet and exercise, in getting training and education etc… watch someone interpret your action wrongly i.e as aggression or rejection or mocking, and see them suddenly change before your eyes…harden, stiffen, poise for flight or fight, color rising in face or disappearing…all these are external signs / behavioral indicators for an internal representation they have made of your intentions / behavior , which are often totally wrong i.e what they ‘read’ in your behavior does NOT reflect the response you are witnessing…their interpretation of it…often wildly wrong…shocking…so you look at someone neutrally, and they suddenly act like you have insulted them, threatened them with violence, and they flare up or shrink back dramatically…
MHR spelling strategy...break up dis app earing into three distinct visual groups, and remember the image and sound of the three parts dis app earing..like par-all-el parallel ... i.e stupidly spelt English words...

Our behaviors are ‘triggers’ in others...Always our utterances or non-verbal communications / behaviors trigger the production of internal images, visuals, internal voices, internal states like fear, desire, hope, ease, dis-ease...we transmit A, but they often construct B from these transmissions...because we are either bad at transmitting i.e not good ‘actors’ i.e are inhibited in our body language, tone of voice etc...or because our meanings are not shared e.g words / connotations / denotations...people often hypervigilant to something, and any part of that ‘gestalt’ can trigger the entire gestalt...often gestalts share common elements...but by selective perception / attention, those elements taken out of their gestalt / intended / authentic locus, and trigger a different gestalt...as each person has different experiences, definitions...same X can trigger gestalt ‘acceptance / approval / security’ or ‘rejection/ abandonment / threat’, depending on recipient / observer / person...

N.B even our ‘teachers’ and ‘trainers’ and ‘coaches’ and ‘parents’ and ‘peers’ unintentionally install limiting beliefs / sub-optimal definitions of TROONATNOOR etc in us...with best intentions...trying to save us from disappointment, or protect us from dangers / threats, ... but often enough malicious in intent i.e intending to harm us, and limit our future prospects i.e envy, jealousy, between peers, ‘friends’, family, siblings and even parents...

Concept of ‘threatening’ someone...being perceived as a threat...to their self-definition...sense of self-worth...historically proven that the ‘best’ people are often destroyed by the ‘lesser’ people...like Socrates, Aristotle, even Buddha poisoned, and Jesus crucified...pacificists murdered an their families removed from the protection of the law (out-lawed literally)... key to understanding world, for anyone seeking idealistically to model it into better shape / form...it is logical...your better represents competition for perceived scarce resources...all ideas of ‘protectionism’ Adam Smith attacked / warned about typical of human nature at every level...if you want to keep some benefit for yourself you are ‘jealous’ of sharing it, so seek to monopolise it as best you can...limiting access to knowledge, resources, ideas, money, training, education, employment...if you want what another has, so that you have it, and they don’t, you are envious...and seek to take it somehow...traditionally by direct violent force or threat to use it...today by more sophisticated forms of violence called ‘finance’ and ‘law’.

The internal representations we make of experiences / events / situations / conditions / explicit statements made by significant others deliberately seeking to ‘train’ or ‘educate’ or ‘condition’ us, are subjective...constructions...active constructions...often divergent from ‘objective’ ‘external’ ‘reality’...rarely
completely corresponding to the ‘inputs’...and in all cases including ‘affects’ e.g. happiness, fear, terror, ease, comfort, sense of security / acceptance / approval, threat etc...which forms part of entire ‘gestalt’...and often any part of the IR can be triggered by merely one of these elements of it, as subjectively ‘interpreted’ / received / decoded by actor... i.e a feeling can trigger the entire gestalt...over and over...until it becomes other peoples’, and our own, notion of a ‘personality trait’ e.g indecisive, neurotic, anxious, over-sexed, fearful, phobic, confident, outgoing, introverted, extroverted...i.e notion of ‘personality scales’ all assume some sort of ‘real’ fixed, concrete, limited ‘personality’...when all there are are loci of gestalts...lots of independent qualities/ attributes triggered by impressions as wholistic gestalts i.e which have some trigger as their locus...i.e no unity of ‘personality’...just bunch of potentials that can be triggered and expressed...but also changed totally, so that appears miracle of ‘loss of phobia’, ‘overcoming fears’, ‘totally out of character behavior’...a whole brand new person’ appears to come from nowhere...it just came from a rewriting of personal ‘training’ i.e ‘history’...new programs, new definitions etc...

Self-fulfilling prophecy and placebo / nocebo effects key to, and reveal, nature of ‘personality’ and ‘change’...personality IS itself a placebo/nocebo effect...a self-fulfilling prophecy based on the contents / impressions / gestalts / memories / constructs of your time-line a.k.a noetic structure a.k.a model of the world laid out by chronological order...projecting into the future...as an accumulation of the past which defines the present, and gives the past a momentum to carry on, to reproduce its gestalts, forms, programs, definitions...Zen lets you escape history by focus on present...NLP lets you CHANGE your personal history, and RE-WRITE it to project a new YOU into the future, to re-define the YOU of the present, here and now...give it a positive momentum to carry you forward positively, full of positive expectations, generative beliefs, new protocols...

We need to ‘re-draw’ our maps, and constantly remain alert to / attentive to, details that require us to let our maps ‘evolve’ i.e never assume ‘map correct’, always constantly look to improve maps...and always remember map is not terrain...reality cannot be ‘defined’ by our minds...we can only work heuristically, identify apparent patterns, employ them to our ends...never confuse model with convergence...attempt to approach convergence, but never idolize / fix / assume you ‘KNOW’ anything for sure...never idolize any ideology as ‘final’, any prophet as ‘the final prophet’.

The great news is we construct our reality. The bad news is other will seek to install a model of reality that suits THEIR needs, at YOUR expense...and so far they have been VERY successful i.e religion, central banksters, fake news, propaganda...
In a study of communication at the University of Pennsylvania in 1970 the researchers determined that in communication, seven percent of what we communicate is the result of the words that we say, or of the content of our communication. Thirty-eight percent of our communication to others is a result of our verbal behavior, which includes tone of voice, timbre, tempo and volume. Fifty-five percent of our communication to others is a result of our non-verbal communication, i.e., our body posture, breathing, skin color and movement. The match between our verbal and non-verbal communication indicates the level of congruency.

MHR Imagine our decision making apparatus e.g. when to do X, or Y, how to respond, how to feel, what emotions to have re: X or Y etc., as scales stretching from the center of a huge wheel...experiences accumulate in buckets at the ends of these spokes...the bucket that weighs the most ends up 'tipping the scales' in its favor...and this response / gestalt / strategy will be 'produced' ...out history is nothing more than buckets filling up with stuff...our 'personality' is defined by the 'heaviest' buckets...but there are only individual spokes / buckets / elements...not 'personality' as such...at any time we can empty some buckets, add to others, and thus produce a different outcome a.k.a. 'personality profile'...set of stimulus-responses, patterns of behavior, habits etc...a 'habit' is just a heavy bucket...or if you like, a path that is repeatedly trodden will become a road...in terms of neurological processes in the brain...some paths become 'rutted' and thus 'ruts' literally i.e. bad habits we wish we could 'get out of'...we want to get out...mixed metaphors for different representation systems...

The buckets are filled with things people said, looks they gave us, things they did to us, experiences we had, assumptions we made, assumptions imposed on us as 'self-evident facts', conditioning imposed on us at home, school, by media, by army, by 'authorities' of all kinds, random experiences we had with random people that 'made an impression' i.e. 'filled a bucket'...sometimes adding to a bucket, taking from a bucket e.g. learn later that religions is all lies / deception / mind control / Slavery...sometimes totally empty buckets get content, start filling, and a person suddenly 'breaks out of the mold' / their bad habits / appears to take on a totally new personality...often to disapproval of all those who now feel inferior, less fortunate, less able to compete (threatened by)...due to the 'miraculous change'...what has come over them? they aren't themselves lately!!!

e.g. the bullied kid stands up to the bully, and the entire group must seek to impose the 'social reality' that that kid is weak...try to psychologically weaken...by laughing at, making fearful of bully, try to undermine confidence, fill head with fear and lies...i.e return them to their 'normal' 'comfortable' loser
self…which was just a ‘personality’ i.e. product of conditioning / experiences/
self-talk / other talk etc…

the arrow of the trajectory of our personality / self / identity is driven from behind
i.e. pushed / propelled by past actions / impressions / representations …to give a
future trajectory…but we can change this trajectory…here and now…but we will
be facing a great momentum i.e. the ‘now’ is loaded with kinetic energy…with a
direction…a projection…a trajectory…like when you press hard on your breaks,
the break pads absorbing lots of energy, but the moment you release them, that
energy propels you forward once more…so cannot ‘break’ habits / trajectory so
easily, and when do, end up ‘skidding all over the place’ and even ‘oversteering’
and maybe crashing…so best to go back and install a new set of experiences…a
new retrospective / retrograde history / trajectory…and produce a new
‘personality’ from all the potential options available to us, which our ‘limiting
beliefs’ had cut us off from…

We can literally go back, retracing out steps, until we get to where we feel ‘things
went wrong’ and we started down ‘the wrong path’…we can then decide what
path to take…a path that intersects with NOW, but is headed in the direction we
want to go i.e. the momentum / kinetic energy is directed this way, so we don’t
have to fight it to get where we want to go…it is now our ally, an asset, a
help…our angel rather than our demon…

Start by ‘turning into the drift’ i.e. ‘opposite lock’, so the momentum is working
for you, and you gain ‘control’ i.e. chose the direction, even as the pushing
momentum is directional and not where you want to go…then back up…to the
start…start again…really…why not…life was a random series of events…that
got you here…so that you can now assemble all your resources and go back, and
this time ‘do it your way’, as Sinatra sang it!!

No need to EVER speak of ‘serving a purpose’, unless YOU have a purpose in
mind, an intention, and have designed a means to attain this ends i.e an
intentional purpose can only be YOURS…don’t erroneously ascribe intentions or
purposes to, e.g. a hurricane, or a drought…or opposable thumbs and forefingers,
or any other randomly generated outcome of the process of hit and miss
evolution…binge and purge…not design, is the key to ‘creativity’.

Deletion and distortion do not ‘serve a purpose’…they are just shit that
happens…but your mind may have intentions i.e programs, that run without
asking you if you agree or not…but you can decide you don’t like outcomes, and
say, ‘I withdraw my consent’ to this program…let’s try a different program that I
get to write, consciously, deliberately, now that I have evolved far enough to be
able to do this…
Desires / emotions provide ‘motives’ for action…but how we define something / think about it, ‘informs’ the basic desires, plays on these emotions…i.e define as ‘good’ for us, pleasurable, likely to increase chances of survival of us, and species…so it is our definitions / thoughts, that set the entire series in motion…thinking makes it so…and our definitions thus determine what we feel vis a vis something i.e how we feel about X, is determined by our definitions of X i.e what X ‘means’ is translated into an emotion regarding it e.g fear, aversion, desire, longing, avoidance, attraction to/ of X…‘assumption’ is better word than ‘belief’…as belief has a real meaning in philosophy i.e compelling argument, but for most people it is mere ‘assumption’…with nothing compelling about it, rarely even considered / reflected on / interrogated …just taken for granted, as self-evident that we are the chosen people, entitled to enslave every other people, that blacks and women are inferior, that …i.e these are typical ‘beliefs’ / ‘attitudes’ / values…

Notion of consistent ‘personality’ is debunked by research…there is no ‘core’ personality…just a bunch of independent, sometimes interdependent and reinforcing, or conflicting, attitudes, assumptions, desires…conscious mind appears to be final arbiter…though really just takes responsibility for i.e likes to pretend to self it is in charge…or ego / some element e.g ‘self’-consciousness…

Our current relationship to the world, how we define it, ourselves, others, their motives, the world’s motives, god’s motives etc…by our past history of implants / lessons learned or taught / dogmas imposed un our impressionable minds, imprints etc.

Meaning is the relationship between things…

Past is a function of memory. Without memory, we’d have no reason to ever conceptualise anything like ‘the past’. The past only exists in our memories, or stored as physical objects e.g artefacts…otherwise we’d just be here now, with no history, an eternal now…like a mineral awareness / consciousness…each moment now, with no meaning at all…just here…there…now…there would be no relationships…nothing could ‘become’…no processes could take place…these require duration…memory to relate one thing to another…always in this thing we call ‘time’…duration is a better word…as duration exists…things En-Dure…for a duration…duration OF time…??? Indefinitely indivisible re: what units perceivable…tree Vs rock Vs human Vs hummingbird …relative to changes experienced…rock Vs tree Vs human…and stone age Vs factor worker Vs physicist / chemist / scientist.

We distinguish between past, present and future. How? We represent ‘memories’ differently according to how long ago they occurred…and project imagined future scenarios, along time line, where the present is the reference point, now.
Either left to right, right to left, or back to front, with timeline either passing through us (in-time), or all of it in front of us (through time). Some people combine both.

You can literally tell, to a degree, how they represent time, by how much they need to turn their head to ‘access’ particular points of their time line. Draw a line following their point of focus, as you get them to access things long distant in the past, in the recentpast, happening right now, or imagined in the near or distant future.

Through time memories usually dissociated i.e watching self as in a movie, or floating above their body, as timeline is always in front of them, and they are not ‘connected’ to it as such Vs in-time association, is seeing through their own eyes, what is happening, and thus not being able to observe self, as time-line passes thru them physically.

Through Time people often have collapsed several experiences into a single gestalt. (A gestalt is constructed memory that represents all memories of that type.)

Float above your timeline until you can see the entire line, and notice if past/present/future equally bright or not? Float down into particular events, and experience them associated. Then float back up above timeline. Identify some random, unimportant memory, float down into it, associate, then remove the entire memory with you as you float back up. Dissociate from it like a movie/book, and place it in front of you, then push it away, further and further, so it gets smaller and blurrier and darker, till it ceases to exist. Now you have left a hole in your timeline that you can fill with any memory you care to construct. A great memory you can later use as a resource, motivation, energy boost, relaxation exercise memory, motivation exercise memory, excitement inducer, calmer etc. A memory where you feel exactly how you may want to feel at some time in the future i.e fully energized, alert/calm/at ease/relaxed, patient, sexually passionate, in love, totally indifferent i.e different states that you may want to access in future, for different purposes. Repeat this to construct a new personal history full of such resources. Histories of success, joy, feeling loved, feeling accepted and approved of, feeling secure, feeling successful, feeling validated, feeling confident, feeling horny, feeling sexually satisfied i.e experiences of full body orgasm, full acceptance by peers/parents, feeling brave and courageous and unstoppable, or just totally at ease, calm, relaxed, blissed out, one with the universe, feeling efficacious e.g able to defend self, giving a successful speech to a group, overcoming some obstacle or resistance, achieving something worthwhile, getting what you want …

Repeat process, this time implanting some experience in your future timeline. Float up above your Time Line, now. As you do, notice how good it feels to be
above all that, and float toward now. And this time I'd like you to go out into the future, to an event that you want to have happened. Find something that you would like to have happened in the future, something you really want. Check and see if you lick your lips when you find this particular event. Richard Bandler always says, "If they don't lick their lips, it's not compelling enough.

This is like manifesting i.e ‘universal law of manifesting’. Set objective for universe / nonconscious mind, and leave it to manifest that for you. Making existence more ‘pull’ than ‘push’ determined i.e determination of resonances i.e you project a resonance / a blueprint into the future, to be realised, rather than being pushed by the accumulated kinetic energy of the past...

‘Now’ as a reality moving along the timeline of possibilities...leaving a trail of memories, running along a track towards the desired / projected outcomes...or pulling that track through the now, to draw these projected manifest realities into your now, and push the past away?

Make the projected / desired ‘manifestation’ more compelling, vivid, thus ‘real’ and compelling to the universe, easier to ‘grok’ and thus manifest, by becoming ‘associated’ with the construct, making it MORE of whatever it has to have to feel totally compelling and real, whether that is brighter, bigger, detailed, on all representation systems i.e sights, sounds, timber, loudness, brightness, color, vivid details, and how this manifest reality makes you feel i.e happy, enthralled, calm, alert, optimistic, full of love, acceptance, approval, satisfaction, pleasure i.e really experience it fully, as if you really are experiencing it...make it so real that your mind cannot tell if it is constructed or real i.e compelling, convincing, like a great actor / director / camera operator/ soundperson etc has actually produced it, and it is the finished Oscar winning film...just like the Jews do with their Holocaust movies, making an imaginary scenario feel ‘compellingly real’, as if it really happened.

Program you own future. Project what you want to manifest. Believe your unconscious or the universe has this power. Believe it is going to happen, just as you imagine it. That it is a fait accompli. A given. And you are so looking forward to it you can’t wait. Like a kid before some exciting party / event. Like lovers anticipating their next meeting.

As Buddha suggested, ‘remember it’, rather than ‘imagine it’. Act as if it has already happened, and you are remembering it. That you can move along your time line at will, like the Zen concept of time as a Hard Disc or DVD, on / in which all time exists at one moment, and all you do is move YOURSELF, your point of view, to different locations on the HDD or DVD, to experience that moment encoded on the disc, like hitting playback from any location. All time being HERE and NOW. Your consciousness, you narrow beam of attention, is directed like the laser beam on the DVD reader. You move your focus on
attention along your time-line, all of which exists at any moment...all here now...just you re-direct your attention, change the focus of your attention, like standing on a mountain peak, you can move your eyes left, right, up, down, focus on some detail, but outside of your concentrated zone of attention, everything exists here, now, you just attend to that very limited part you are ‘looking’ at at any particular moment. What if our entire eternity was like this. We simply have to change our focus / what we attend to, to move backwards and forwards in ‘becoming’, rather than time...with a limited duration of memory allowing us to ‘make sense of’ i.e ‘ascribe / construct meaning from, our otherwise disjointed experiences?

Bathe in the powerful, luxurious realisation that you can have anything you want. You can manifest anything you want to. Know this with certainty. Bathe in the luxuriousness of this empowering feeling. You have ‘become cause’. In your own experience. You can only change this for yourself. And teach others how to do it for themselves. This is true power. The power to define reality for yourself. Immerse yourself fully in this feeling. Total control. Total power. Over your OWN experience. Your OWN reality. FREEDOM.

GROUP TIME LINE (TRANSCRIPT)

"OK, now, let's have some fun because that's what we're doing. What I'd like you to do is to stop, and to think about... You could actually stop and float up above your Time Line so that you have the opportunity to see the entire continuum of past, present and future below you as though it were organized in a line. And as you think about it, notice how good it feels to be above all that. You do, don't you? Excellent. "Now, I'd like you to float back in time remembering, of course, where now is... and I'd like you to go back in time... and pick out a memory in the past that made you very happy... and drop right down into that memory and relive that experience. Step into your body, see what you saw, hear what you heard and feel the feelings of being in that happy memory. Isn't that good? But enough of this happiness. Putting that memory aside, now, for a moment, just put it right back in your Time Line where it was. Excellent! "I'd like you to float up above your Time Line again. And I'd like you to look at the continuum of past, present and future. Get up high enough so you can see the whole thing now. This time I'd like you to float out all the way into the future. Just go right up to just before the end of the future of your Time Line and turn around and look back toward now. You're standing above your Time Line looking down on it so that you're looking back all the way from the future, all the way across now, all the way into the past. "I want you to notice if the past and the present and the future have the same brightness. If they do, nod your head 'yes.' If the past, present and future do not have the same brightness, nod your head 'no.' If the future is darker than the past, nod your head 'yes.' "Now, let's float back and take a memory from the past that's not really very important. Now, some people try to fool me when I say things like
that. They say, 'Well I'll just take the biggest event,' and that is not what we want for this exercise. Take something that is really light-weight—a memory that you don't care about for now, for purposes of this experiment, and I'd like you to take that memory out of the Time Line, lock, stock and barrel. I mean the whole memory. Just take it right out of the Time Line, and stick it out in front of you and push it farther away than it is now, and farther, and farther, and farther. And make it darker as it goes, speeding away until it blows up into the sun. Now there's a gap in your Time Line where that memory was. And you can make up a new memory, now, that makes you feel very good about yourself, one where you're like the way you want to be. Now, I'd like you to put that new memory in the Time Line where the other memory was. Excellent. "When you've done that, take all the time you need and then float up above your Time Line, now. As you do, notice how good it feels to be above all that, and float toward now. And this time I'd like you to go out into the future, to an event that you want to have happened. Find something that you would like to have happened in the future, something you really want. You might want to check and see if you lick your lips when you find this particular event. Richard Bandler always says, "If they don't lick their lips, it's not compelling enough." That's OK, we don't need a super-compelling experience yet. Just an experience that you want. We'll show you how to make it more compelling. Just take something you want, you like to have. "By the way, notice that, just like the past events, there are future events in your Time Line, too. What does that say about your ability to have what you want? What if the future events are already there and all that happens is that 'now' just moves along your Time Line? How about that? What does that say about your ability to program the future so you can be having whatever you want? Now, wouldn't that be exciting? "Can you pull up this outcome or event that you really want, and step into your body if you are not already there, and feel the feelings of having what you want? Now, take whatever it is that makes this memory of the future more compelling for you—turn up the brightness and make it brighter. Some people turn down the brightness and it becomes more compelling. Some people turn it up. I want you to do whatever you need to do to make it more real, so you really want it! Bring it closer. Bring it close enough so that it makes you feel really good. Yes, and make it more focused and clearer and sharper. Excellent. Just one more time, feel the feelings of being able to have whatever you want.

"Now, take that event and put it in the Time Line. As you put it in the Time Line, step out of the picture so you see your body in the picture and then put the event back in your Time Line, and notice that the work on the one event in the future has affected all the events between now and that event in the future. As you stand in the future, looking back toward now, notice that the events from then to now have changed to support the compellingness of that event. Notice how it happens automatically. Excellent.
"Now, take that event and put it in the Time Line. As you put it in the Time Line, step out of the picture so you see your body in the picture and then put the event back in your Time Line, and notice that the work on the one event in the future has affected all the events between now and that event in the future. As you stand in the future, looking back toward now, notice that the events from then to now have changed to support the compellingness of that event. Notice how it happens automatically. Excellent. "Now, what I’d like you to do when you’re ready... Not yet, but when you’re ready, is to float back toward now, float right down into now, and open your eyes. You can come back now whenever you’re ready. Did you notice that making the event more compelling changed the gestalt of events going back toward now? Good. Now, you may or may not have noticed it, but what happens is that any changing of a future event will change the events in the gestalt."

So Tad James and Wyatt Woodsmall’s contribution to NLP appears to be this visualization i.e of removing memories (as Jim Morrison put it ‘learn to forget’, and many people have long desired to be able to do this), streamlining the method, giving a simple, clear, method for doing this, and for placing the general notion of vivid positive visualization implicit in David Humes’s original psychological writings, PsychoCybernetics, then the work of Milton Erickson and Richard Bandler, in the same context, to give one clear method for ‘forgetting’ and re-writing history, like a Holocaust judge / film maker / fake historian / fake news producer, and then writing the script for your own future. It is more about packaging than content, this contribution. Nevertheless it is rare for anyone to add anything at all novel, and typical that this contribution be marginal i.e building on existing i.e dwarves standing on the shoulders of dwarfs...with the occasional giant not so much necessary to the project, but gladly speeding it up considerably, so that it takes fewer generation to reach the heights / overview.

This method more direct, simple, vivid, clear, and quick, Vs anchoring and re-writing...gives same ‘reality’ kick to the process to satisfy Hume’s observations of what makes ‘reality’ i.e how we construct TROONATNOOR...N.B this whole project makes TROONATNOOR a wet clay tablet, an etc-a-sketch, adding an ‘undo’ and ‘redo’ button, offering access to the source code to re-write code, eliminate bugs, update definitions...etc

People who imagine reality to be fixed / objective / ‘real’ beyond our own minds constructions will argue that this is ‘wishful thinking’, ‘delusion’, self-hynotism...but in reality ALL our ‘experience’ is this...at some level...and most of what people believe e.g gods, religions, cause effect, free will, Arabs hijacked planes and flew them into the WTC and Pentagon, somehow totally collapsing buildings they never came close to hitting, that ‘government takes care of YOUR interests rather than being the real terrorist etc etc...is just that...so the question is, which ‘ideas’ are going to leave you, and us as a society, happy, cheerful,
satisfied, just to each other, fair to each other, productively co-operative with each other, most innovative and caring and sharing and happy and content?

It’s the same old problem of walking into a fight half-way through. You’re bound to assume whoever YOU first saw throwing a punch had started it…that YOUR religion is true, and all other lies, that YOUR idea is sound, and all others delusional…the earlier impressions are often the hardest to change / modify …imprints are by nature most compelling…the first lie / stupid has this advantage over all later lies / stupid, and even other the truth / intelligent.

Changing your memories, changes the inputs / assumptions / definitions your programs run on. Thus it can change your ‘personality’, attitudes, values…like suddenly realising that your own government is your enemy, and going from being a staunch supporter of the current system, to calling for massive changes e.g to lobbying, election finances, media ownership laws, censorship laws, a removal of all executive powers for the president, impeachments, war crimes hearings, removal of all ‘patriot act’ type infringements on your constitutional rights…a return to the letter and principle of the U.S constitution i.e the spirit of liberty and representation, with real ‘balances’ returned to the system to pull back the overreach…to investigate 911 and charge and imprison all those, including the Bush family, complicit in the mass murder of 3000 people in broad daylight, and all the ‘Jews’ involved, CIA involved etc…

A model is made up of assumptions / definitions / beliefs…remove any, and if you allow it to, it will re-organise…giving you a new personality, a ‘paradigm shift’, new, more optimal attitudes, and ways of being and seeing, actually improving TROONATNOOR in the sense of making it more appropriate to the outcomes we want….but here’s the rub…do you really WANT justice? Meritocracy? Fairness? Truth? Freedom? Or you do really want the power to impose your own beliefs, prejudices, irrational fears and hopes, on others, and to enslave them in some way, exploit them in some way as means to your own ends, to ‘use’ them as mere means? Are you an exceptionalist that wants to secure liberty, freedom, justice, and fairness and freedom for just your own particular narrowly defined group, whether you define it by family, friends, locality, state, nation, ethnic group, or some imaginary ‘race’ you construct to make ‘drawing the boundaries i.e deciding who is in and who is out of your ‘chosen people’ easier?

You are going to have to endure many uncomfortable self-analysis sessions, as you iterate between what you CLAIM you want / are seeking / are willing to support, and what your actual motives are…imagining YOU can cleverly outplay some system to your narrow advantage is what got us here…everyone imagining they could benefit from slavery, exploitation, opportunism, clever lies, manipulations, propaganda, even outright physical violence…so everyone
secretly, in their little and larger groups, employing all these strategies, while seeking to trick others into behaving ‘fairly’ and honestly, and giving up the right to bear arms, to become pacifists...just so that they can exploit any concessions the ‘other sides’ make...as if this trickery can work in the long term, and won’t come back to bite you in the arse...as if everyone won’t employ the same model of deception, in the same way...and you wonder why everyone points the finger at everyone else...when everyone is doing it...and so the deluded participants, who are mislead away from seein their own groups crimes / deceptions, clearly sees it in the other groups, and you get this ‘seige’ mentality e.g sense of being the victim of others’ evils, totally unwilling or unable or deceived from seeing your own equal villainy, of your own group...and so you get nationalism, religions, ethnocentrism, ‘race’-ism, exceptionalism...you get small groups claiming they are the ‘victims’ of history, totally unwilling, unable, prevented by propaganda and brainwashing from seeing their own sins, removing the log from their own eyes, worrying about the cinder in another’s eye...totally convinced they are the ‘innocent victims’ of others, and thus justified in breaking every law, moral code, ethical code, to ‘protect’ themselves...e.g yes I am talking about Zionist Jews and their fake holocaust...history records how Germans leaders struck back, retaliated against the jews...it fails to show the actions of the jews that necessitated this self defence, and so it appears as unprovoked, irrational hatred and hostility...an act of sheer aggression without any justification, and we are supposed to wonder what makes germans so genetically irrationally hateful of such a loving, kind, harmless, generous, ‘people’...

So James and Woodsmall use the concept of ‘memory management’. The idea that you can edit your life like you would with a movie editing software.

Traditionally this would be done as I did audio editing, by physically cutting magnetic tape, in which the ‘past’ was to the left’ and the ‘future’ was to the right.

Today we store the representations of sound and image as digital data, on Hard Drives SSD drives, or DVDs. So there is no real ‘left and right’. Our time is now truly ZEN. All at once. All there. Waiting to be accessed. In any linear or non-linear fashion. We can have it appear as left to right such as in Adobe After Effects / Vegas Pro 13, as a analog, continuous process. That is how our minds work right now. Interacting with an analog, flowing, continual world. Of course the continuum is produced by a short term memory i.e when you watch your hand move past your face, you see a blur, you retain a ‘memory’ and visual imprint of where it was just a few milliseconds ago...so you get the notion of movement, of action, and of time...you can compare position A to position B, and feel that your hand has moved, in time, during that time. Without that short term, and long term memory, you would have no notion of time...nor or any meaning beyond immediate impressions...maybe feel pleasurable or painful
sensations…’see’ ‘stuff’…but none of it would MEAN anything, beyond the immediate sensation i.e pleasure, pain…maybe relief, though without the memory of pain, there is not true relief? Or?

Key events form the nodes for gestalts, which are triggered later by any single element of that gestalt. Gestalts include ‘moods’ and ‘attitudes to something’ and ‘optimism’ and ‘pessimism’, and self-esteem, confidence, phobias, hopes, aspirations, limiting beliefs, generative / motivating beliefs…feelings of security, approval, acceptance, feelings of being vulnerable to being a victim…

Imagine if jews were allowed to realise that what did happen during WWII was the result of what they, and other jews, did to Germans and Germany…that there was no holocaust, just a terrible tragedy…they could stop blaming some genetic defect in some imagined ‘races’ that were opposed to jews, hated them irrationally, wanted to destroy them…they could take responsibility for their own actions, come to terms with those they have offended / wounded / damaged, and work towards a bright future…give up their ‘chosen people’ ‘manifest destiny’, ‘victims with a right to ANY means to defend themselves against a world out to destroy them’, exceptionalism…and employ any merit / superiority they have to their own, and our collective good…imagine that.. most jews are the victim of the definitions / historical lies… the very definition of ‘jew’…the faked holocausts, the lack of sense of responsibility i.e that people among their group did bad things, and brought woe and misery down upon the rest of the ‘jews’…and that really, there is nothing ‘jewish’ about them except their belief that they are ‘jews’…different…they are just humans…with no calling to suffering more than any other human, no exceptional rights or privileges…but equals free to compete equally, fairly, openly, transparently, and to their fair share of the collective outcome of the human race…

Changing just one belief / assumption, as I have been arguing for decades now, long before hearing of NLP or this ‘memory management’ or ‘timeline therapy’, can change the entire noetic / belief SYSTEM…the entire MODEL…the entire PARADIGM (big word for model)...can change your total attitudes to EVERYTHING…change your supposedly fixed and discrete ‘personality’. So much for all those ‘personality tests’. They just tell you what you have been conditioned, by life, directly and deliberately, and indirectly, to be. It is just one option available to you.

Geneticists and Quantum biologists are even seriously documenting and talking about genes that actually behave more like La rather than Darwin i.e that are sensitive to feedback, and feedback into the genes, thus ‘programming’ them to change…to manifest the resonances they receive from the mind…e.g to actual self-re-program…like a giraffe extending its neck to reach the juicy leaves up there…so don’t dismiss the ‘law of attraction’ or ‘law of manifestation’ or ‘law
of empathic resonance’ just because of the terms and language and figurative language they employ, and the sort of characters who are ‘pushing’ them in many cases i.e don’t judge the goods by the retailer…this is all becoming as ‘scientifically credible and ‘reputable’ and ‘respectable’ as gravity.

My interest in NLP, psychology, cognitive science came from a desire to overcome the obstacles to people facing facts, being freed of their imprinted models, their erroneous assumptions, their faulty reasoning, their history, their education, their conditioning, their brainwashing…rather than the typical ‘how to sell more X to make more money’…or to earn a fortune as a lobbyist, marketer, advertiser, propagandist, or get elected to some office, to sell my influence to the highest bidder (always the Jews who have the legal right to literally print money, make the laws, and construct / manipulate public opinion via a control of the mass media, the federal education system, the academic journals, academia itself via endowments / foundations / grants / federal and private )…

This book completes the cycle…because the challenge, I found, is not to discover ‘the truth’, or how to seek it, but to get people to be willing to seek it at all, let alone accept ‘compelling arguments’ when they are presented with them. I assumed the old Dark Ages of censorship were gone for good, and that I’d not have a problem presenting people with ‘the truth ‘ a.k.a ‘compelling arguments I found and found a way to express…that my final problem would only be this one, of getting people to be willing to even consider anything that challenged their current / inherited / learned beliefs, assumptions, noetic structures i.e their current subjective reality…so this book is about that….my other books are about the censorship…many have been banned…if only because they prove censorship is real, ironically…THAT is the biggest secret….they want you to imagine that any consent you imagine you are giving (they don’t care, they make laws by executive order and Jewdicial means, and totally undemocratic , illegal ‘rules’ and ‘codes’)…is informed…that there are no secrets being hidden from you…not alternatives than the two meaningless options you have … that puppet or that puppet…different faces / clothing, but same puppet master…

This book is going to take more effort than all my previous books combined. .. and probably I will lose you at the starting gate. Seeking truth and justice is for the very few, I guess. It is those few I target. Even the current owners of the world, of the media, of the jewdiciary, the jews and their golems. The path they are travelling ends where all similar paths end. They now have the power, if only I could get them to use it optimally. Probably they will just torture me to satisfy their malicious need to harm others, to control…they are really that mentally deranged…maybe one or two will wonder for a moment if they want to be part of what they know is coming, if maybe there is not a better way..
Right now the power exists…centralised, to do great harm or great good, to bring freedom and justice for all, or return most of us to slavery, or to dust.

xyz

The holocaust is an example of deliberately producing / manifesting / constructing a phobia for an entire ‘group’ of people, the self defined ‘Jews’. A fake ‘memory’ is vividly constructed, so vivid and compelling it becomes real. This has been set down upon each ‘Jews’ timeline from birth, as a real event. This is the way to produce a phobia of ‘non-jews’. A sense of entitlement of free goods and services from Germany. A sense of having a ‘special’ right i.e exclusivist right, to employ violence against perceived enemies. Enemies that the Jews never created, but which emerged due to their enemies irrational hatred of them, and their special place as god’s chosen people, which they are all envious of. At the other end of this constructed timeline is a glorious destiny promised to every ‘Jew’ who will comply with the whole ‘Jew thing’ i.e by ‘being a jew’ and subscribing to all the faked history, denial of responsibility, idea of eternal victimhood, right to exploit, kill, enslave, trick, deceive all ‘enemies’ i.e Non-jews…as all gentiles / goys are out to get them,… envious of their superiority etc…’keeping them down’ from their rightful place as the rules and slave masters of the entire planet…funny that how you can ‘spin’ your own evil aggressive desires as defense from other people’s stubborn refusal to accept YOUR right to exploit and kill and enslave THEM!!!…so they have had implanted in their future timeline a very compelling, vivid impression that feels as real as the faked history…that motivates them to ‘stand together’, maintain solidarity, keep up their lies…remain ‘true’ to their ‘jewishness’…the jews are the master of lies…they have been doing this timeline stuff for millennia…

A client comes to you and says, "I've got a phobia." You say, "Great. Can you float up above your Time Line?" "Yes." "Go back into your past and recall the earliest time that you can remember this event." Now, you run the Phobia Model on the event. **THE PHOBIA MODEL.** Run the memory in black and white, dissociated (seeing your body in the picture), on the movie screen, run it out to the end. 2. Then freeze frame, and white it out (turning up the brightness), or black it out (turning the brightness down).3. Then run the movie in color backwards to the beginning, looking through your own eyes. 4. Do a swish pattern,1 using how you used to act in the phobia situation as the old picture, and how you want to act in the future as the new picture.1

**THE GESTALT.** When you keep people up above their Time Lines and run the double dissociated Phobia Model where they're outside their bodies watching the event, it will change the entire gestalt. That is, it will change the events backward
and forward from the event in the past by changing one event. If you change the major event, the other events that are connected to that event in the gestalt will automatically change. When you change the major memory in a gestalt, you will change many more memories. First, it dissociates the client completely. Second, it tends to change the whole gestalt more easily. You can also suggest gestalt changes too. If you're doing a Phobia Model, or changing personal history, it's most effective to suggest that, "You might also notice that as you change this event, other events both forward and backward in your Time Line are changing or disappearing too!"

Removing or changing any memories changes the entire gestalt / structure / noetic structure / belief SYSTEM and PROCESS...so you can get a huge global, domino effect from working on any one ‘memory’, or introducing new ‘memories’.

Never remove a memory without replacing / displacing it i.e Buddha. Nature abhors a void. MHR the MEST is active, will always construct something to fill it i.e ‘desires’ structure i.e has billions of ‘potential’ structures, so no ‘void’ in nature...no ‘vacuum’ of ‘space’. Like random dreams when the brain ‘wants’ to be active / to experience something or more randomly, the brain will be randomly active...

Engrams may appear as ‘dark’ apparently empty, or very vague positons on timeline i.e mind has decided to ‘hide’ them, as were too traumatic at time...but still resonating...so taking up lots of energy...so need to have courage to ‘brighten’ them, make vivid again, to ‘face’ them, and process them...

If you ask them to brighten up their history or brighten up that particular event, they may not be able to do it easily. So what you say is, "Take an event that is unimportant to you. Make it darker, turn down the brightness. Can you do that?" "Yes." "Now, turn up the brightness. Can you do that?" "Yes." "Now, just like you did that, can you turn up the brightness on those events in the past that are dark?" If they still cannot, it might be that a part of them is keeping those events hidden. If that is the case you should proceed with caution because you may be uncovering major traumatic events from their past. In the work on the mouse phobia mentioned earlier, all the memories had to be deleted. As long as the memories existed, there remained the possibility of her going back and getting reactive about mice. I would say, "Mice," and she'd freak out. So I took all the memories out. I took them out of her past and replaced them with other memories of her acting the way she wanted to around mice. In essence, we installed a new strategy during her Imprint Period.
In the case of a traumatic event, I'll ask both the conscious and the unconscious mind the following: "Is it appropriate to remember the event?" You see, one of the things about traumas and phobias is that there are some learnings that have occurred where part of them is protecting or that part of them needs to remember.

You will also want to say to the person something like, "Before we change this memory completely, you know that you learned something from that event, and it's important to learn from the past, so I'd like to ask you to preserve the learnings. You can preserve the things you learned from this event in the special place that you reserve for all such learnings." By the way, I don't know if there is a special place, but if it sounds right, they'll put it there. If they do not have one, they can make one. If someone, for example, has been raped, you must preserve the learnings for her so that she can make sure that she knows the next time what the signs are. Then you may or you may not want to take out the memory. We don't want her to have to go through the same experiences to acquire the same knowledge. You can say, "Preserve the learnings, put them in that special place," and then destroy the memory. Sometimes you will have to go so far as to install a new strategy for dealing with X, the phobia subject / situation.

Her new strategy was (1) see something that looks like a mouse (2) kinesthetic panic (3) see that it really is a mouse (4) kinesthetic relief (5) auditory—"Oh, it's only a mouse." (And when you think of all the things it could be...) "Oh, it's only a mouse." I installed that strategy and saw that it worked. Next, I went back and installed that strategy in her history. She only had to put it in there once because it created a whole new gestalt. It created a new chain, because the original gestalt was open since I had already destroyed it. Now she had a new operative strategy: "Oh, there's a mouse. That's only a mouse. Could have been something worse." The first week she went to a neighbor's house and held a pet mouse. Before the therapy she would not even go into her neighbor's house, or into any house where she thought there were mice. Of course, she did not remember the content of the therapy.

Erickson would say, "I want you to become a bodiless mind floating in space." His clients did it! Floating above your Time Line is the same.

Three main periods: Imprinting, modelling, socialization.

The first is the Imprint Period, where a child is like a sponge. The child soaks up and imprints all the events that occur: sights, sounds, feelings, tastes and smells. The Imprint Period is from approximately age birth to age 7. The groundwork for a phobia is laid during the Imprint Period. Phobias often have their origins before age 7.

Then comes the Modeling Period, where a child models its parents and other people whom the child admires. That happens from age 8 to 13.
Then there's the **socialization period** which occurs from **14 through age 21**. Our **social values are created** at this time.

Making individual changes in memories will change an entire gestalt. It changes a person's entire history in a matter of minutes—a very fast and effective procedure for making change.

**MHR Compliance Vs Conversion** i.e short term compliance Vs a convert to ‘your way of thinking’ i.e true commitment that continues / endures when not observed i.e change attitudes / values / beliefs

‘The magic room’ is a set up that uses the SITUATION of hypnotism i.e hypnotism is always voluntary, and anything done while ‘under’ is voluntary…if person APPEARS to be behaving ‘out of character’ or ‘complying compulsively’ to ‘controls’ of hypnotist, it is only a case of actor taking advantage of situation to satisfy secret desire i.e use as ‘prop’ or ‘excuse’ to overcome inhibitions set by ‘normal conditions’…so allows to ‘save face’ e.g ‘I was drunk / hypnotised’…same goes for ‘truth serums’…though these often help patients face terrifying memories i.e relive them / recall them…the SITUATION is used to trick victim into making confessions, or to allow them a ‘way out’ to give the information / do the act required of them to gain some reward or relief i.e benefit, when in ‘normal’ situation they would feel inhibited by values / attitudes / ethical codes / oaths / promises / shame / fear of losing face / fear of letting down mates / fear of ‘breaking’/ fear of cowardice ‘…operator will act as if ‘seen through your lies’…maybe believes i.e positively hallucinating or just bluffing…i.e like any ‘player’ e.g willing to ask 1000 women / be rejected 1000 times, to get laid once…numbers game…aim of ‘lie detector’ is to get you to volunteer ‘confessions’ i.e ‘whats the use, you will find out anyway with your high tech gadgets that can’t be fooled’…operator will act confident…can get ‘actors’ in bewailing how they got caught out ‘you can’t beat em mate, I learned the hard way, just tell em the truth and it will go easier on you, why suffer when you know they are going to find out anyway? Etc i.e a ‘set up’…even have people in other room they can overhear, fake prisoners’ in own cell or next to…lots of ‘tricks’ to make you think someone else you ‘trust’ i.e fellow prisoner, suffered for no reason, and was ‘found out’ by the ‘super computer algorithm / truth serum / genius machines you can’t beat a.k.a atom bombs and japan…operators compete in this way…if they can get you to confess to ANY lie, they can claim that their test is ‘inconclusive’…even if you change a previous answer in a ‘harmless’ way e.g first day you smoked marijuana twice, later ‘admitted’ i.e ‘conceded’ that it may have been 3 to 5 times. To you that seems irrelevant difference, but operator ‘won’ an ‘admission’ i.e ‘discovered’ a ‘lie’…it is THAT stupidly simple…so NEVER change ANY answer to ANY question that forms part of the ENTIRE process…from written questionare right until left building…they are NOT conscientious…they ‘win’ any time you change an
answer ... you become another notch on their belt / barrel ... a ‘win’ ... at YOUR expense and expense of justice, truth etc... Many ‘ruses’ and ‘bluffs’ have been reported by their ‘victims’ ... these include: operator acting like they found a lie, but want to help you ... they pretend they have put themselves out on a limb to give you another chance at the test, to convince their ‘superiors’ ... all you need to do is admit to this or that lie ... they know you are hiding SOMETHING ... and it doesn’t matter ... it is harmless ... they believe in you / trust you / credit you ... it is probably just that question about 2 times Vs 3-5 times ... something harmless, but if you don’t tell them NOW, they’ll have no choice but to fail you, because you HAVE ALREADY failed the lie detector test ... they might even, at huge risk to their own reputation, arrange a second lie detector test tomorrow ... in fact they say this to ALL victims ... it is standard practice to give 2 tests ... to try to ‘fake’ and ‘bluff’ people into admissions, even just changing something THEY think is minor ... operator will give them that impression too, that it won’t matter, just ‘fess up to’ that small ‘lie’, and you’ll be fine, flying high ... but in reality the moment you change ANY response you gave earlier they have ‘won’ ... they don’t have to catch you out in a lie, they just need to get you to ‘admit’ that a previous response may not have been the most representative e.g. 2 times Vs 3-5 times ... maybe it was 3 to 5 times, you can’t be sure, so why not agree with the operator that ‘it is possible it was 3-5 times’ ... or on the repeat of the same question (a typical ploy i.e. repeat the same question, different ways, in different or even same test, to see if you always give the same / appropriate / equivalent response ... any time you do not, they have a ‘scap’ to hang as a ‘trophy’ ... your head ... they are NOT your friend ... they have NO special mindreading skills ... even Richard Bandler’s keen eye would not be accepted as ‘proof’ of anything in a court ... assuming these days anyone ever gets a trial, unless they are one of the elites, and it is only show trial for public consumption to make it look like ‘no-one is above the law’ etc ... and of course ‘the interview process’ starts the moment you walk into the testing facility, or anyone associated with it ... probably the fellow test-taker they have you share a room with is one of them ... until you get home ... common to ‘invite you to lunch or dinner or drinks’, to see if they can get you ‘relaxed’ and trick you into saying something ... FBI did this with the Bundy family and their associates, pretending to be documentary makers, lure them into ‘matey’ ‘jokey’ ‘confessions’ i.e. statements that they would never have made in court, and hadn’t made seriously, like you’d joke among friends, even ply with alcohol, then spin entire situation later in court as an interrogation and confession ... taking out of context ... to give lie sentences as ‘warning’ to all other patriots / upholders of U.S constitutional rights etc ... get people to ‘boast’ vaguely e.g. ‘have you ever killed anyone yourself?’, and they want to impress, and make statement meant to imply ‘maybe’, or ‘sure you want to know’ or ‘that’s confidential, but I can leave it to you to decide for yourself if you want to take the risk of getting on my bad side’ etc ... things of no legal significance but which can be presented, out of context, and spun, to appear as ‘confessions’ and ‘threats’ ... or to ‘pin’ some law they dug up somewhere, that might just somehow
be twisted, contorted, distorted, to make that statement ‘square peg in round hole’ fit…as mere ‘window dressing’ for show trial…just to give appearance of ‘justice’ and ‘legal proceeding’ etc…superficial…nominal…disingenuous…lie detection is all bluff…a con…an attempt to produce a self-fulfilling prophecy i.e if you believe the bone pointed at you can kill you, you may die afterwards…or avoid death by ‘admitting’ you broke some taboo / lied, to avoid the bone being pointed…if you assume the shaman / priest / interrogator / prosecutor / parent / teacher / lie detector operator have special powers, that they CAN read your mind, read your body language, tell if you are lying, then firstly you will be very apprehensive / fearful / anxious, and will probably decide ‘I can’t trick them /deceive them, might as well tell the truth i.e make confession…but anxiety itself NOT an indicator of ‘guilt’…and different people behave differently…appear differently…NO_ONE can read minds…no matter what they imagine…Lie detection dismissed by courts for scientific reasons…but Federal Government insist of typical Jewish ‘exceptionalism’ because the ‘bluff’ often works, and it gives them an excuse to avoid hiring patriots, people who believe in the U.S constitution etc…can claim ‘their lie detector test was ‘inconclusive’, even though it is technically totally meaningless…so over 50% of F.B.I applicants are filtered out / denied positions with this ‘excuse’…while there are so many historical cases of people passing ‘lie detection’ tests, batteries of them, series of them, and then later admitting they had been actively spying, selling secrets etc…so it is ALL for show, ALL for bluff…but because YOU believe THEIR lie, that they can detect lies, you make voluntary admissions, or worse, change your responses to the same / similar question, thinking it harmless, and give them a scalp …. All the while they act like your best friend, on your side, going out of their way to help you…”just admit you are lying about SOMETHING, they promise, and it will ‘explain away the readings’ and let them pass you…it’s something harmless, they are sure…like 2 Vs 3-5…so you play along, hell, why not, and say, yes, well, you know, maybe it could have been 3 to 5 times, and BANG, they’ve won, got their scalp, their notch on their rifle barrel, one more ‘success’…one more ‘proof’ of their exceptional expertise / natural talent for this line of work…maybe a promotion…and you pay the price for their self/deception…but now you know…and are prepared…and won’t make this mistake.

Get notes from audio on typical signs operators try to pin on you…how NOT to behave, and how TO behave, to play their game, and win i.e not let them trick you, fake a ‘detection’.

**Guilt / shame removal**

Float up above timeline, and find event you feel guilt or shame about…then go to a moment BEFORE that event / feeling arose…where there is NO guilt / that you were laughing? Do you still have the guilt? Some will say, 'It's right in front of
me." If that is what they say, then say, "is it in front of you, or is it gone now?" That will destroy the guilt of an event for almost everyone. If the guilt is still remaining, then there is a part that needs to be reframed. Ask that part if it is all right for you to assist it to accomplish its intentions more easily, while allowing you to expand your capabilities? Good. Now, looking along your Time Line toward now, now, where's the guilt? All gone. Good. Come on back to now. Float down into now and open your eyes.

Client complains: "I'm compelled to please everybody all the time." "Why?" "Because I might feel guilty." "Good, can you remember an event you feel guilty about?" "Yes." "Good, float back to one minute before the event." This is very important. The language is very important in this. The next thing you say to them is, "Now, where's the guilt?" What does that do? It leaves them oriented in the now. "Now..." See, they're floating back, they're one minute before the event, but now, where's the guilt? They'll laugh. I guarantee you, they'll laugh. The first time you do this with somebody, they'll go, "Ha, ha, ha." If you do this three times on three different events, they'll probably laugh harder, and all their guilt will be gone. Good-bye guilt!

When doing Time Line, if the guilt does not disappear, then a part of the person needs to be reframed. A part thinks it is important to be guilty, and probably that part has provided certain positive intentions for the person. So you say, "I appreciate the part's desire to provide certain positive intentions for you all these years. And I wonder if you'd be willing to learn new ways of accomplishing your same intention, while discovering new ways to do it better and more easily in the future, learning how to create your life, being better and better, and if you can do that now, wouldn't you be willing to let go of the guilt while preserving the learnings?" And if that part says, "Yes," then we are off and running.

Think of an event about which you're fearful—fearful or have anxiety about. When you have one, I'd like you to float up above your Time Line again. Go out into the future—one minute after the successful completion of the event about which you were anxious. (Of course, make sure that the event turns out the way you want.) And I'd like you to turn and look toward now. Now, where's the anxiety? Notice how you chuckle.

Knowing how people store time internally allows you to match their internal world and then to change it.

Richard Bandler & Tade James / Wyatt Woodsmall make extensive use of temporal language. E.g "Go inside and try in vain to have the same problem. It was a terrible problem, wasn't it?"You want to make changes, haven't you?... What would it be like when you have made those changes, now? In the future as you look back and see what it was like to have had that problem... as you think about it now, if you could make this change for yourself so that you could
STOP... having made that change and see yourself **now**. Do you like the way you look if you could make that change and look back at yourself having made that change **now**!". These are all sorts of (binds?) where unconscious tricked into assuming things have taken place / will take place. You'd say this casually, to bypass conscious resistance i.e limiting beliefs…

MHR visualize a ‘glass’ you…and represent any pain etc as colors in this ‘glass’ you…then have those colors evaporate, taking the pain with it…use this ‘second you’ for all the things you need to represent i.e feedback, without suffering in the usual you. Story where hero slowly builds up this ‘other’ self, this ‘glass’ self, and transfers more and more of their ‘self’ into this copy…until it becomes fully functioning…a ‘virtual self’ … when interacting with others, it collapses from potential states into one state, that others interact with…quantum self…which consciousness has built / constructed and has total free will / control over…can pass into / through dimensions, de-materialise into quantum indeterminacy, appear at any point in space-time, as a ‘collapsed’ probability function i.e an actual state…to other ‘conventional’ ‘selves’ appears to disappear, teleport, re-appear, and have supernatural powers…maybe begins this journey as means to fight pain/ migraine / prison cell limitations…at first works as pain relief / lets body represent pain externally, dissociated i.e offer feedback e.g ‘relax’ or ‘eat’ or ‘get cut sewn up’ etc…without any suffering…or even pain…’see’ pain as colors in the ‘other self’…can then adjust brightness of colors, even ‘evaporate’ them…is psycho-somatic…or keep as reference i.e feedback…so allows mind to fulfil function of feedback / cybernetics, without actual pain / suffering i.e pain is representation of some impression / condition…demands urgent attention…stop…relax…eat…drink…

Make sure you're matching the client's internal experience. When doing Time Line, you do not have to fool around with a formal induction. You do not have to say, "Excuse me, I’d like to put you in a trance now. Could you uncross your legs and put your hands on your thighs?" Time Line allows your client to access a trance that will make those changes easier and easier, doesn't it?

Get client to access a memory from different ‘distances’ in their past, ask and observe them to discover how they store time i.e the nature of their timeline, e.g left to right in front of them etc. If they keep saying "I don't know", you can say, "I know there's a part of you that arranges all the time inside you. I'd like you to talk to that part and ask it if it's willing to participate and allow us, (slower tempo) for the purposes of this exercise only, to discover how time is stored for the purpose of making it easier for you to achieve your intention. "You're willing to do that, aren't you?" The answer is usually, "Yes, I am." Usually, that'll get it. If not, go for more rapport. If necessary, you can do a formal trance induction and then investigate their time recall.
You can simply tell a client to ‘put your past behind you’. While the past was behind him, he was in great shape. One day, his past flipped back to Through Time, and I asked, "Where's your past? Put it behind you again." And it stayed there. So, you can change the direction of your client's Time Line. All you need to do is float him above his Time Line, and ask him to change the angle and then float back down. It will usually stay that way.

Sometimes people have an elastic Time Line. So if they say, "Every time I put it there, it sort of flips out on the side or flips back the other way," you'd say, "Good, I'd like you to put an elastic band on the other end of it so that it will hold it in place this time when you float down in your Time Line." If he is in a light trance, you can ask him to do anything and he will do it. You can also use the following metaphor: "Do you know the sound that Tupperware™ makes when it seals?" As they are saying, "Yes," you say, "Just like that lock(ed) right in there." Or you can say, "Do you know the sound a Mercedes door makes as it closes?" As they are saying, "Yes," you say, "Just like that lock(ed) right in there." It really does not matter what metaphor you use; if it is consistent with his internal experience it will work.

Many of you arrange your Time Lines In Time; many are Through Time. Some of you have both operative simultaneously. What you want to do in working with clients is to make sure you are consistent with their models when you ask them to go back to the past or in the direction of their past. The reason that you want to know how they organize it is so that you can be consistent with their models when giving them instructions or when you are using temporal language.

Once we found someone whose past was in front of him. Was he conservative? Yes, he was! Was he resistant to change? You bet! I discovered somebody recently in Honolulu whose future was in front of her, but around the center. Her Imprint Period, ages 0 to 7, was stored above her head! From 0 to 7 was up above her. Everything else in the past was stored out in front in the center. The future was off on the sides.

The Time Line should have similar brightness, for example, running from the past through the future, with the future perhaps a little brighter than the past. The past should not be black or substantially darker than the future. The future should not be black or substantially darker than the past. When there is trauma, usually there are some gaps, holes and dark spaces in their Time Lines. In fact, dark areas are a tipoff that there has been trauma in the past.

"There are a lot of dark chunks in my past." I said, "Turn up the brightness on them." She said, "I don't want to. There are a lot of things there I don't want to see." So I said, "Can you take them out of your Time Line, just for the purposes of this experiment? Can you put them aside, where you know where they are but they don't need to bother you, where you can put them away, and they will be
OK? You can get them later, if you want to; but you may not want to." She said, "I can't do that." So I said, "Take one memory that doesn't matter out of your Time Line and put it on the side." She said, "I can do that." "What did you take?" "I took snow." "Just like you took snow out, all the others can blow out now."

She said, "Wow, you just totally disarranged my filing system. All the black memories are on the side over there, so disorganized." I said, "Good, you can leave them there." Her whole being lightened up at that moment. I then did overlap. The process of overlap is moving from one representational system (from most favored to least favored) to another in order to help someone develop more flexibility in a certain representational system. She couldn't visualize, so I said, "Walk along the beach, feel the cool, wet sand in your toes, listen to the sound of the birds overhead, and now look down at your feet and what do you see?" She said, "Oh no, I'm seeing sand. This is the first time I've ever seen pictures in my head since I can remember." Then we took her back and did the Phobia Model with the Time Line, and she ran it perfectly.

Another woman called me on the phone and said, "I can't make decisions." I said, "Float above your Time Line. What's the relationship between the past, present and future?" She said her future was black, and the present and past were of a normal color. I said, "Good, can you turn up the brightness on the future?" She said, "I can't." "Can you turn the brightness up on an event that's not important?" "No, I can't." I said, "Can you find an event in the future?" "Yes." "Is it bright or dim?" She said, "It's moderate." I said, "Good. Can you turn the brightness down?" She said, "Yes." "Can you turn it up, so it's normal?" She said, "Yes." "Now can you turn all the events up?" She said, "Yes, I can." Great! That was the extent of the therapy. Three days later she called me and said, "I'm making decisions like a champ. I can't believe it. I'm totally decisive. I know exactly what I want and I am able to make decisions clearly and easily." All in just three minutes on the phone, turning up the brightness on her future. If your future was black, you wouldn't make decisions well either. Who wants to make decisions with a black future?

The submodalities of the Time Line regarding past, present and future make a major difference in present experience. Black holes and black areas in the past indicate a trauma or some kind of abuse or something similar in the past. If it is ecological, you might want to lighten it up. It takes a lot of energy to keep the past black. When you lighten up the past, you're also going to increase the person's ability to direct that energy (that they were using to hide past events) toward the future, toward what they want. It takes energy to keep the brightness down on those events. By turning up the brightness on those events, you give them more energy.
Trauma therapy: When returning to suspected / known past traumas to remove them / dis-energize them, there may be discomfort as other events that were suppressed also begin to surface and sort themselves out. I.e the ‘blacked out’ memories, the chunks of time they have suppressed / repressed / blacked out / blocked. So say to the client, "If we do this therapy, then there may be periods of time where there may be some discomfort, or there may not. Is that all right?" Give them a choice, so that they understand by making these changes, they may have to go through discomfort that may occur as the unconscious mind begins to sort out the memories. The Time Line is certainly more benign than other kinds of therapy, including traditional hypnotherapy. Without the Time Line process, a person may have to go through a year or more of old memories coming up. Using Time Line we can complete it quickly.

Take out the memory, taking out the gestalt if necessary, and then to replace it. If it is appropriate, you can take out the whole episode or at least change their personal history. Then the whole incident will be able to be normalized fairly quickly, or there may be a short period of adjustment. Some of the experiences may be oppressive, so you will want to make sure to give your client a choice. Now, with all that out of the way, go back and run a phobia cure model with the abused person, or you can go back and change his personal history, and you will have resolved the matter.

DETACHING affects / pain / suffering: You can very simply, quickly, and painlessly remove all negative affects from your timeline, while retaining all the lessons learned. The data, without the negative emotions. "When you think of a specific event that is particularly unhappy for you, it's OK for you to continue to remember that event, but perhaps you'd like to have the emotions detached from that event. As you think of that particular event, notice down at the lower right-hand corner a little hook there. What I'd like you to do is to unhook the emotions that are there, just unhook them. Now, step out of the picture and make sure you see yourself in the picture. Notice now that changes the event." After you've done it with one event, you can do it with many. If they have a lot of negative events in their Time Line, you can then say, "What I'd like you to do now is to take all the events in the past that you're not particularly happy about, unhook all the emotions that are there." And it does happen. They unhook the emotions. Then the memories that remain are informational rather than negatively emotional. They are useful, productive, generative, offering choices, rather than limiting you through fear, pain etc. MHR pain should / could be disposed of in the same way i.e if you can replace the representation system called ‘pain’ with another, so long as you attend to this ‘other’ equally as you would to ‘pain’, it can allow you the feedback without any suffering, especially chronic pain, where the feedback makes the condition worse, rather than motivating you to stop the ‘painful’ action, and/or where that condition is unavoidable. Buddhists monks demonstrated this with self-immolation. Perhaps they ‘represented’ the burning
sensation (like that of eating chillies is inversely mis-represented) as a bright blue color…they acknowledged this blue color feedback, accepting what it represented, but having no fear of death, it was just saying to them ‘hey man, you are burning up and this will kill you’ and they are going ‘yes, thank you for your feedback, I’m quite content to ‘die’, so I’ll just sit here and burn up. I intend that this shocking demonstration will lead people to empathy and justice, and towards the teachings of the Buddha in every new incarnation of the Buddha.

Another possibility for deleting negative emotions is to put the person on the other side of the event from now. Shifting the temporal perspective in that way also will delete the negative emotion MHR imagine the peace and calm of nirvana, heaven etc, displacing any current negative affects / that representation we call ‘pain’, replacing it with the peace on the other side of this current situation i.e MHR ‘being there, then’. BE THERE, THEN. Which may account for some reports of martyrs burning at the stake with joy / rapture / calm / peace / tranquility.

**TIME VERB ‘SPIEL’: THE TRICK MILTON ERICKSON INTUITIVELY USED, AND BANDLER MODELLED, AND LATER NLP DEVELOPERS ADAPTED**: Erickson, then Bandler, shifted their verb tenses between past, present, and future, as they made suggestions to clients, in unobtrusive ways, bypassing the client’s potential conscious objections i.e observation / notice…quickly speaking of a desired change as if it has already happened, and so that the positive desired outcomes are already attained. As the client accepts the utterances, they implicitly accept the assumptions made i.e that the changes will / have / are taken place. Simply by change a verb tense here and there, in a way that doesn’t attract the attention and objections of the conscious mind / the client. This allowed Bandler, and other talented / competent / expert NLP practitioners to ‘implant’ new beliefs / assumptions in clients even over the telephone. These new implanted assumptions are accepted by the unobtrusive part of consciousness as ‘real’, as ‘reality’, and so this part of the mind immediately begins manifesting these new realities, e.g I am now a non-smoker, in control of my drinking and eating, capable of doing X and facing Y, unaffected by the presence of Z, etc…Like Buddhist teaching of ‘remembering’ things you want to ‘learn’, as if you are accessing a memory you already have, which is much easier than ‘learning’ something new you don’t know yet…such as a solution to a problem, or a design for an idea, or a story, or a song, or a skill.

This is Wyatt’s, but find Bandler and Erickson examples, then model them more clearly, maybe with blanks and exercises, as this seems quite powerful. ‘What would it be like as you look back upon now, having made those changes now? That you wanted to make, haven’t you. You like the way you look, don’t you? Because that’s the you that’s most compelling to you, isn’t it? And those are the things you want to have. Now, don’t you? Good; what I’d like you to do is to put
that memory back in the future, make sure it's just as compelling and just as lower-lip-licking as it was before, and float back to now."

MHR So now you unobtrusively replace ‘was’ with ‘is’, and replace ‘will be’ with ‘is’ tenses. So the things you WANT from the future are already implanted as present realities, in the mind, which the mind will then begin working on to ‘realise’ i.e ‘self-fulfil’, in terms of things you WANT. And in terms of things you do NOT want, the change will be from ‘real’ to ‘was once real’. They are no longer real.

Use language that assumes the past problem is dealt with, over with, by being careful to say ‘You HAD … Versus ‘were hav-ING…i.e closure. Finished events Vs ongoing / continuing. You are working on changing / optimalising their inner representations of the past events / present events/ and future events …conditions, situations, affects, etc.

Let’s pick an easy past traumatic event to begin to work with. I want to make sure that as we talk about it that you are... that working on some of these events may cause other events that were hidden and buried to begin to come up and surface, and you may have to handle those. I'm wondering if you're willing to do that.

what I'd like you to do then is to float up above your Time Line. Where's your future? Right there, OK, good. Where's your past? (Moves out of John's Time Line.) OK. I don't want to get in the way. (Pause) I'd like you to float up above your Time Line and go back into the past. As you stand outside of that event, looking down on it, you get a sense that that's an OK event to change?

Remember, you're above your Time Line, you're right here now. As you're floating up above your Time Line, I want you to make sure you stay right there, and since you have all the training that you know you have, you can do that, right? I'd like you to very slowly turn up the brightness on the event. Staying right here. Now, staying above the Time Line, I'd like you to take the event and put it on the screen in front of you. Staying above your Time Line, I'd like you to create a screen in front of you, and bring that event right up on to the screen. And I want you to have it in black and white, the event. We're going to run the movie of the event out from the beginning at high speed, dissociated, so you see yourself up on the screen to the point of maximum emotion, just one moment past that point of maximum emotion. And when we get out to that point, I want you to freeze-frame and white it out. "Now, turn the brightness back down, and I want you to associate it and run it backwards in color, associate, step into the picture, run it backwards in color at high speed right back to the beginning. Bang. OK. "Now, as you think about that event, is that event OK?"
John: "Much better. I was just sad, and I don't know why." Tad: "You were just sad. And now are the emotions a lot less? So you feel a lot better about that event?" John: "Yes, not totally."

60 TIME LINE THERAPY

Tad: "Not totally? OK. Would you like to run that again?"

John: "Yeah."

Tad: "OK, go ahead. (Pause) And now, because those things you learned... because those learnings are important to you... and you learned things from that experience... and you want to preserve those things that you learned... while yet allowing yourself in the future... now... to be able to have those things you want and not have to keep those. You can let them go now. Can't your

John: "Yes."

Tad: "Good. So, as you think about that event now, is it OK?"

John: "Yes."

Tad: "Completely OK?"

John: "Yes."

Tad: "Great. So put that event back in your Time Line."

John: "Something just happened. I'm seeing that a difficulty, going back in the past in the Time Line, almost stops it. It gets very muddled and a lot of the Time Line is dark and strangled out like it's been S-curved around, and so it's hard... I see chunks of bright, but I know that on either side there's chunks of dark, you know, where it's curved around... and it just straightened out, so, it's cleared itself up."

Tad: "OK. Now, are there other events in your past that are as easy to handle as this one that you'd like to have cleared up at this point? And I know you're very quick at this, because you're probably one of the faster people I've ever seen doing this type of thing, and I'm wondering if you could do those all at once. Just sort of turn up the brightness and have them be OK simultaneously."

"Could you, for example, run all of the ones that needed to be dissociated so that they were OK simultaneously, maybe, one, two, three, four, five, however many there needed to be simultaneously, so that they were all OK? Now. You can do
that, can't you? So now as you look at your Time Line, is it the same brightness all the way? Are there still some events in the past that are... (Pause)

John: "None real dark."

Tad: "None real dark? So they've lightened up considerably?"

John: "Yes."

Tad: "Good. Good for you. So you're doing the hook thing, detaching emotions, too?"

John: "Yes."

Tad: "Good. All right. OK. Good. And, notice how they begin to go by themselves without you having to do anything. Yeah. Notice how quickly they can all sort of line up. Notice how much easier it is to breathe. You seem to be becoming lighter, yeah, if your whole past lightens up."

John: "It's a real big difference. The future is getting real bright too."

Tad: "All right!"

John: "Wow."

Tad: "You can leave it that way if you want to. (Pause) So now, as you look at the entire continuum of past, present and future, is it OK?"

John: "Yeah, it's really good!"

Tad: "Good. Excellent. Now, one of the things you may begin to notice in future weeks is that all the energy that you were using to hold that past the way it was has now been lightened up and can begin to be applied to future things that you want. And you can use that to make things that you want more compelling and even more irresistible to the point where, even without your seeming to have to do anything, you can begin to produce results that are seemingly miraculous in the future, now, as you think about it."

John: "Yeah, that's really exciting."

Tad: "Very good. Good. OK, can you float back into the now? Before you put your Time Line away totally, at the moment, I'd like you to notice that there is a number of events all the way from the past into the future that have changed, the gestalt theory, if you will, and notice that those things that you've, in the past,
now lightened up, that it's actually changed the future so that those things that you wanted are really becoming easier to get."

John: "Yes." Tad: "Good. So, what will you have to do in the future now that you've done these things that you've wanted to?" John: "I won't do much, but I don't have to, it's going to work anyhow. I'm going to put some more compelling stuff in there." Tad: "Almost effortlessly?"

John: "Yeah." Tad: "Excellent. OK, good. Come back to now and when you're ready, you can open your eyes."

Dan: "When you said, 'He's the fastest person,' you were using language patterns and creating the fast person, weren't you?"

Tad: "Haven't we? And that's what Time Line is all about. You may discover this, here. Dan, you may discover that you're learning things already unconsciously that you had no idea that were coming so easily. In fact, in our trainings we are training the unconscious, haven't we?"

Time Line is the most powerful therapy you can do. You can make major shifts in a very short period of time." What do we do in NLP? We change personal history, which is totally applicable to Time Line. We do reframing. We do visual squash, or spatial reframe (see "Changing the Basis of Personality"). All fit very easily into the Time Line format. Use it and you'll get major personality shifts in people. Time Line changes tend to generalize better than any other model I have seen, because we are working on the history of the person. You see, we are nothing more or less than our collection of memories. If we change the memories, using Time Line, then we can change the person.

To allow for the possibility of past lives, you might say, "Now, I could guess when the event was that caused this problem, but your unconscious mind knows better than you or I do. There was an event that was the cause of this... (condition or behavior) ... and if you were to know when you decided to have this... (condition or behavior) ... would it be before, during, or after your birth?" If the client says that the event was before birth, then you can say, "Was it while you were in the womb or before?" (If you've already done some Time Line Therapy, you probably have found that many people can remember back to the womb. They remember events that happened and experiences that occurred while they were in the womb.) If the client says, "In the womb," then handle it as you would any other memory. If the client says, "before birth," then "Did it happen in a past life?" "If you were to know, how many lifetimes ago was it?" (Before you float them back to past lives or past generations, if it's the first time, have them mark "now" with a big flag and tie a string around their toe so they can find their way back. using this kind of language does not imply the existence of past life experiences, but it does allow for it. If the client's answer indicates a belief in past
lives you can utilize it and enter the client’s model of the world. MHR rejecting this model destroys rapport…use it as a resource…a belief that can be employed to positive ends…it is not your job to judge their model, but to employ it for their benefit, in this context.

MHR ‘I guess you are here because you want to CHANGE NOW. (last given as suggestion / command).

I’d like you to float right down into your body at the time of that trauma / first instance of this phobia / feeling / limiting belief, and tell me what emotions were present at that time. 'OK. Float up above your Time Line again, go back five minutes before that moment, float down just above your Time Line, turn back around, and look toward now as you look along the continuum toward now and tell me where has that affect / emotion / feeling gone? 'Now, I know that there may be a part of you that thinks it’s necessary to hold on to that, so before you let all of it go, I want you to take all the things you learned from that betrayal, all the learnings that you have, and I’d like you to store them in that special place, that special place you reserve for all such learnings, the place that’s important to you, where you can preserve those. 'Cause the things you learned were important, and it’s OK to let that emotion go now... (Pause) haven't you? (Pause).

"You will change when you are ready to change, aren't you?"

We’ve made a number of changes, there may be some adjustments going on inside. Just allow them to continue, and allow your unconscious mind to continue (speeds up) to sort out those processes and things that it needs to sort out so that it continues to make these changes and allows you to be completely and absolutely, totally successful. As you sleep it'll be able to do that, and you may have some, lots of weird dreams and lots going on inside your head and that's OK. And notice that the completion of the sorting out process will be done by the end of tonight, and it will be (slows down) totally possible for you to be (whisper) absolutely successful, now.

A way to program your future so that you achieve your goals, that what you want in the future becomes real, and undeniable to your brain.

There is a direct relationship between the specificity of the goal and its achievability. MHR more vivid, real, cues unobtrusive part of consciousness to ‘realise’ / ‘manifest’ it.

MHR Be sure the goal is a concrete outcome, and NOT a state e.g ‘happiness’ (re: job interview failed! She wanted to see if I’d learned goal setting etc…and assumed my answer indicated I hadn’t, when in fact I was being MORE precise!)
MHR NLP teaches that ANY state can be experienced IMMEDIATELY i.e it is just a mental construct. The objective takes time. Projecting a state into the future just puts it off forever i.e it remains a ‘future’ state. Whereas an object can be realised / requires time, a state can be had immediately, maybe confuses unobtrusive part of consciousness because we are working with time-lines, with time, and no state requires ANY time at all !!!

KEYS TO AN ACHIEVABLE OUTCOME: NLP's outcome definition techniques. 1. Stated in the positive - "What specifically do I want?" 2. Specify Present Situation - "Where am I now?" (For this question, make sure that the picture is Associated.) 3. Specify Outcome - "What will I see, hear, feel, etc., when I have it?" (This means that the outcome is viewed as if it were accomplished now. Make it compelling. Then insert it in the future. Be sure that before you insert it in the future, that the picture is dissociated.) 4. Evidence Procedure - "How will I know when I have it?" 5. Is it Congruently Desirable? - "What will this outcome get for me or allow me to do?" 6. Is it Self-Initiated and Maintained? - "Is this only for me?" 7. Is it Appropriately Contextualized? - "Where, when, how and with whom do I want it?" 8. Resources - "What resources do I have now, and what resources do I need to get my outcome?" a. "Have I ever had/done this before?" b. "Do I know anyone else who has it?" c. "Just suppose I had it now." 9. Check Ecology - "For what purpose do I want this? What will I gain/lose if I have it?" a. "What will happen if I get it?" b. "What won't happen if I get it?" c. "What will happen if I don't get it?" d. "What won't happen if I don't get it?"

Aim is detailed, vivid, compelling representations of what you want.

Find the most appropriate moment for the accomplishment of your outcome, position yourself above that point in your Time Line. Now, bring up the picture of what you want in vivid detail. Associate into the picture. Float right into your body, and feel the feelings of having what you want. Check your feelings as you make sure that the picture is bright enough, but not too bright. Notice the feelings you have, and increase or decrease the brightness until the feelings are the strongest. Next, bring it closer and closer until the picture is close enough so that the feelings are the most intense, but not too close. Turn up the colors so they are really, really rich, but not too rich. You know, just right! Make sure that the focus is very clear. Clear enough, but not too clear. Make any other adjustments you need to make the picture the most real and desirable. And when you're done, step out of the picture, so you see yourself in the picture, looking at yourself. Now, staying in the future, as you put the picture in your Time Line, turn back around and look toward now. Notice that all the events between then and now are changing and rearranging themselves so as to totally support your having exactly what you want in the future. And you can, can't you? Come back to now and,
looking toward the future, notice that this is just the beginning of your having what you want.

You needed certain resources for the accomplishment of your outcome. (Let’s suppose for purposes of this exercise that you discovered that a resource you needed was to learn about something, in order to achieve your outcome.) So, I’d like to ask you to float back into the past to a time, a happy time, when you learned something easily and elegantly. The learning doesn’t need to be something related to a school situation, just a time when you learned something easily, and perhaps so easily that you surprised yourself. You may have said, "Wow, I didn't know I knew all that," or something like that. It could be any context where you were perhaps even surprised by how easy it was to recall the information. Maybe you were talking to a friend, or to several friends, and you were pleasantly surprised about how much you knew about the subject. (If you can't remember a time like that, then imagine what it might be like to have had that experience. Perhaps you've seen it in a movie or had a friend who had that experience. Imagine what it would be like to have it, or pretend you're someone who has had that experience.) Good. So float right down into your body, and feel the feelings of being an exquisite learner. Now, wrap the feelings of being an excellent learner around you. Take those feelings and let them permeate your body. Feel the feelings of being a great learner. And here's one more thing. Before you had the feelings of being an excellent learner, your unconscious mind had been going through a process of allowing it to be assimilating and organizing all the information that you needed into a format that the conscious mind could easily use as it needed. Whether or not you were conscious of it, your unconscious mind was doing the work of making that information available to you in a usable way. So bring that process, even if you aren't fully conscious of it, with you as you float back up above your Time Line.

Now, float back above your Time Line and float toward now, and as you approach and pass now, find the appropriate place to put all that you need to know to ensure your outcome. Take the feelings and put them in that most appropriate place, in your future. As you do, I'd like you to notice that the experience of being such a good learner changes and affects all the events between then and now, and that in the future you can draw on this strategy of being such an elegant learner any time you choose. Any time you want you can have that ability. Any time you want these learning resources they will be available to you. So, any time in the future when you need to learn something, or you need to use any information stored in your unconscious mind, it will be there for you automatically. Turn and look toward now, and notice that the process is also installed, and that it reaches back all the way to now, and even into the past. Even if you don't notice it, that's all right, because the process is now installed all the way from now, out into the future, and even further into the future beyond the event and out into the future as far as you can see. Your ability has always been
there and now you can make use of it as you need. When you have done that, turn and float toward now, float right back into now, and then open your eyes. This is how to program your future.

ASSOCIATED VS. DISSOCIATED

When you put a future memory back into the future, it should be dissociated. When you complete work on something you want to make compelling, make sure it's dissociated. (A memory that is associated is an outcome or a goal. A memory that is dissociated is a direction.) Dissociated future events tend to generalize better than do associated future events—rule of thumb. The problem with reaching a goal is that the mission has been accomplished. You have it, and then what? Sometimes if a future memory is associated, you have the feeling of already having it. It's less compelling if it's associated. Dissociated is more compelling because you do not have the feelings of already having it. If you have the feelings of already having it, then you're associated. Dissociated makes it more compelling and gives a sense of direction. After you reached the goal, everything seemed to change, and the momentum of going toward the goal was gone. In that case, you attained your outcome but you didn't have a direction set up beyond the outcome. If your outcome is dissociated, it creates a direction so you continue to go beyond that particular goal or event in the same direction. It's the same rule for swish patterns—present state—associated, future desired state—dissociated. Present state associated, desired state dissociated.

There are several different possibilities for change work using Time Line Therapy. Each way will have a major effect on the personality of the individual.

1. Memory Removal: Take the memory out of the Time Line, and blow it up in the sun. Then replace it with a favorable memory.
2. Change Events: You can go in to an event and change it. Say, "Now run the movie, looking through your own eyes, acting the way you would act, with all the new resources you need." That is a standard for changing personal history. But then you can also have them change the gestalt, saying, "... so notice how changing this event also changes other events forward and back on the Time Line that are of a similar nature." They will go through and make the changes.
3. Delete Negative Emotions: You can erase negative emotions such as guilt, shame, anxiety and fear. The procedure is to float people above their Time Line, and have them go 15 minutes on the other side of the event about which they had the negative emotion. Then have them look toward now, and say, "Now, where's the emotion?" The emotion will disappear. Alternately you can unhook the emotions (a metaphor) from the lower right hand corner (lower left hand if they're reverse organized) and then have them step out of the picture—step out, so they can see themselves in the picture. This will dissociate them from their feelings.
4. Phobia Model: What does the Phobia Model do? The Phobia Model, if you run it enough times, will destroy the memory. In this model, run a movie of the memory dissociated in black and
white, at high speed out to the point of maximum emotion or to the end, freeze-frame and white-out or black-out. Then out of the white-out turn the brightness back down (dim the brightness until they can see the picture), associate to it and run it backwards in color. That's the Phobia Model. If you run it enough, it will destroy the memory. You can also assist it by giving the appropriate suggestions. The most I've ever had to run the phobia model is 15 times. This was on a very intense phobia. When we had run it 15 times, the memory was destroyed. The Phobia Model begins by blurring the distinctions during the initial three or four times it runs. This causes the person to have a lot less feeling with the memory. After three or four times, they may still have the memory, but it will be fuzzier or less distinct. 5. Compelling Future: There are ways in Time Line Therapy to change the future to make it more compelling. I don't know of any reasons to want to make a memory more compelling. You can change future events to make them more compelling. (See "Programming your Future on Time Line."). 6. Changing the Direction of the Time Line: Finally, you can change the way people organize time by changing them from In Time to Through Time or vice versa. Just have them float above their Time Line, and then say, "Now, as you float back down into now, just rotate your Time Line by 90 degrees so that: a. it is all in front of you and stretches from right to left, or b. your past is behind you." This will change a person from In Time to Through Time, or vice versa.

Your values, beliefs, phobias, anxiety, and much of what constitutes what we call your ‘personality’ is a product of past experiences, imprints, implants, and the definitions of T etc these collectively produced…so by going back along your timeline and removing / replacing these, and adding new, more optimal same, we can effectively change your personality … your definitions of T…your outlook on life, attitudes, values, limiting beliefs … you modelled certain behaviors of significant others…sustained engrams from traumatic experiences…were imprinted at impressionable periods / instances…can process engrams / remove the affects while retaining the lessons learned…

SAMPLE OUTLINE OF TIME LINE THERAPY USING GESTALTs

1. Discover if the person is In Time or Through Time. 2. Have them Float above their Time Line. 3. Note the Submodalities, and make sure that the client's experience is that SMds are the same for the past, present and future. If not the same, change the SMds so that they are the same brightness, and approximate color, or the future slightly brighter than the past. 4. Have them go back into the past and find the earliest unwanted experience in the chain that they can find. (If using a visual squash, such as Robert Dilts' model for integration, have the new part do it.) 5. Have them preserve the learnings, saying, "Just before we change these memories, I want you to preserve these learnings in the special place that you reserve for your learnings." 6. Change the memory using the Guilt/Anxiety Model, Change Personal History, or Phobia Model, or just have them remove the
memory. If you are using the Phobia Model, ask them to run the pattern until the memory is destroyed. Say, "I want you to run it until you can't get the memory back." 7. If you removed any memories, replace the removed memories with favorable ones using swish patterns or movies. 8. Continue steps 4-6 using the earliest memory available, until the unwanted memory, state or behavior is not accessible. 9. Have them float down back into their time line and come to now. 10. Future Pace and Test... (Have them go out in the future and look back to now. Test ecology.)

Computers ‘sort’ information i.e ‘organise’ it in specific ways. Determine what ‘attend’ to. Theory of coherence / personality insists we have one personality, and it is coherent...a model...that requires distortion, deletion, and generalisation...that the model is not-conscious...MHR 1000 flowers of the soul...conscious denial...deliberate self-serving (perceived self-interest) ... don’t let people off the hook so easily as if they are innocent victims of own non-conscious...they know what they are doing, just numb their empathy etc...have all sorts of ‘noble’ lies, theories, models, fictions, narratives, to ‘justify’ their actions...Machiavellian...self-service...egotism...which means both ironically there is LITTLE hope, as people are aware of what they do, and insist on continuing...but SOME hope i.e it is conscious, so if they are ever willing, we can appeal to their conscious arguments...vary with emotional state / affect at time...MHR this is bad for us, as it means people only empathise when feel vulnerable...once this passes, they become ruthless again...usually...stress can lead to ‘behaving badly’ i.e good person can ‘fall’...so never judge person, judge behavior, until it gets to the point that it is clear the person knows exactly what they are doing, have no excuses, and then what? Have to be practical...not act of malice to remove them from ‘sane’ ‘conscientious’ society i.e so they cannot harm those doing their best to be their best...

I fucked up, failed, fell, etc VS I AM a fuck-up, a failure, ‘fallen’...

NLP like Plato (none of these people are vegans so all make excuses for self) assume people behave the ‘best’ they know how, at the time, given their conscious awareness of facts, situations etc...but bullshit...only 1% people vegan...not like it is hard to ‘know’ what suffering, misery, pain, etc inflicting, simply for ‘convenience’ and ‘culinary tastes’ of ruthless (in this context of invulnerable power over animals) people...

You shall know the tree by it’s fruit...What people DO is the real answer to your questions about them...not what they CLAIM they are, not their verbal communications / expressions / utterances...who does NOT think they are basically ‘good’ people???

Sigmund Freud was one of the people in the history of psychology who was concerned with defining the elements that make up the basis of personality. Freud
had two primary students—Jung and Adler. The basis of Meta Programs is based largely on Carl Jung's work as outlined in his book Psychological Types, written in 1923. Jung was concerned with type casting a person in order to predict his personality and therefore his behavior. Jung's work was later continued by Isabel Briggs Myers, who used it in creating the Myers-Briggs Type Indicator, the most widely used psychological profiling system in business and government today.

In each case, the desire was to discover what elements make up a person's personality. Interestingly enough, Jung's and Myers' models fit quite nicely into the NLP model. In fact, it seems that their work is completely aligned with the model of personality in NLP. In NLP, we are concerned with Internal Processes, Internal States and External Behaviors: Internal Processes are the internal processing strategies that we use, essentially the "how"—how we do what we do. Internal States are the emotional states that an individual experiences, providing the "why"—why we do what we do. External Behavior is the "what"—what is generated as a result of the combination of the Internal Processes and the Internal States.

"When it's time to recharge your batteries, do you prefer to be alone or with people?"

A) Introvert:

Someone who is introverted will prefer to be alone; he prefers the internal world of thoughts and ideas over the external world of people and things. Asking the above question will usually separate the Introvert from the Extravert. Although some Introverts can learn to come out of their shells and do well with other people, when it comes to the question of recharging their batteries, they prefer to be alone. Introverts make up roughly 25% of the population. As an Introvert, a person will be more interested in the inner world of concepts and ideas than in the outer world of actions, objects and people. He will be more interested in how that idea, person or thing influences their beliefs. He will have a greater depth of concentration (as opposed to breadth of interest). Introverts will view Extraverts as shallow and not real or genuine. Introverts will have a certain space or territory that they call their own. An Introvert will be "lonely in a crowd." Even at a party an Introvert can be lonely. (Whereas an Extravert says, "Look at all these people. How can you be lonely?") Introverts tend to have few friends and look for deeper relations with them to look for causes reflect before acting be self-sufficient enjoy working alone be less carefree be more solitary. Value aesthetics. Score highly on aptitude test like to deal with concepts and ideas Introverts tend to prefer jobs like: mathematician engineer dentist artist writer printer farmer carpenter technical jobs creative architect scientific jobs creative research scientist.
"If you were going to study a certain subject, would you be more interested solely in the facts and their application for the now, or would you be more interested in the ideas and relationships between the facts and their application for the future?"

A) Intuitor:

An Intuitor will prefer to perceive the possibilities, the relationships and the meaning of their experiences (as opposed to immediate facts and experiences themselves). Intuitors make up only 25% of the population. They will be more interested in the abstract big picture as opposed to the specific details. The Intuitor is most interested in the future, and in grasping possibilities. The Intuitor is so much into relationships that he may disregard sensory data coming in right now. They may disregard it to the point that they fail to notice what is going on now. Intuitors describe themselves as imaginative and ingenious, and the Sensor as being too much of a "stick-in-the-mud." Intuitors tend to: have a positive attitude toward change like new possibilities be tolerant of complexity be aesthetic and theoretical like open ended instructions value autonomy seek patterns in complex situations prefer working at symbolic and abstract levels be more creative in direct proportion to their Intuitor score have higher turnover in mechanical/clerical jobs read more for pleasure than Sensors Intuitors tend to prefer jobs like: research scientist architect writer mathematician psychologist musician minister physicist chemist Regarding time, Intuitors will be the poets, dreamers and visionaries. They are the dreamers. They dream of a world that they would like to have in the future, and then they move toward that dream. They are constantly trying to make today into what they already envision for tomorrow. This kind of inspiration for the future is often lacking for the Sensor, who is mostly in the now. Intuitors, however, have no patience for doing the actual work of "getting there," because they are still farther off in the future and dreaming up new plans. And what is intuition? It is simply the ability to (1) move to levels of greater abstraction of thinking, (2) find the relationships between ideas and then (3) move to levels of greater specificity or more detailed thinking and (4) relate it to the current situation. This is the process.

On the Myers-Briggs, there tends to be a direct correlation between the score of the individual on the Intuitor scale and his level of intelligence.

People who tend to favor Auditory Digital tend to be more dissociated and are called Thinkers. People who tend to favor Kinesthetic (Internal) tend to be more associated and are called Feelers.

Be sure to ask the questions in a way that is non-judgmental, and in which your tone of voice is neutral and does not bias the answers. As you elicit someone's Meta Programs, you may discover that the person is not one or the other but a little of both.
The Direction Filter deals with whether you move toward or away from these values and whether you have an approach (attraction, reward) or avoidance (repulsion, punishment) type of personality.

We are looking for the PREDOMINANT direction, the way a person responds most of the time in most situations. (Remember that Meta Programs may vary according to state, context and stress levels.) In addition, it's important to note that at some level almost everyone will move away from. MHR so this biases people currently enduring chronic stress Vs people who have it relatively easy.

When you ask someone what he wants in life, he will either tell you what he wants or what he doesn't want. "Toward" people move toward what they like. "Away from" people move away from what they don't like. Your client will either tell you what he wants or what he doesn't want. Toward answers will be about what a person wants. Away from answers will be about what a person does not want. Interrogate e.g I want more money…to find out if it is a means to avoid what doesn’t want, or to get what does want, etc. Motivate a team using a mix of carrots for ‘toward’ and ‘sticks’ for ‘from’, to appeal to / motivate the different members. Find out what works for each. The intensity of movement is called motivation. How active are they in the avoidance / striving? Apathetic? Active? Inactive? Satisfied with current situation?

Zen says, "The Great Way is not difficult for those who have no preferences." i.e no desires, no attractions or repulsions. Take all equally and accept. i.e Acquiescence.

‘Against’ people simply oppose things, rather than strive towards, or avoid.

Is the person is motivated by possibilities in life or by obligations? i.e uses phrases like I want to, Vs I must / should / have to. i.e why they do something. What degree of control of own life have?

External Vs internal check people…e.g when do they know they’ve succeeded, e.g in learning something? If they are internal, they may assume they ‘already know’ something very well and are ‘competent’, even ‘great’ at it, without seeking external feedback i.e. Verification MHR especially problematic re: communication and assumed ‘intuition’ e.g human lie detectors …then question of whom do they seek feedback from / respond to feedback from e.g parents? Peers? Television? Teachers? MHR respect for ‘authority’ figures Vs actual testing of ideas / own experience. Do they care what ‘others” think, and which others? i.e trust own judgements or refer to ‘authorities’ or ‘norms’ or ‘peers’ or t.v?

The Convincer Filter is the filter that someone uses in becoming certain or confident that something is true. The two Convincer Filters tell us how a
person becomes convinced (through what Representational System), and how many times a person has to see, hear, do or read something before being convinced.

Often bureaucracies get caught in a reactive mode—avoiding mistakes.

Ability to move between big picture, holistic, abstract, and concrete, immediate, details...motivated by details or holistics? ... how to make concept / goal / benefit / risk meaningful for person...concrete and real...and motivating...some people need to know WHY they are doing something, and not just HOW to do it, others happy to just do it, knowing how, without caring, really, why i.e get A’s on test / do job well, get positive reinforcement / acceptance / approval / good grades / success without caring to what ultimate ends their work being employed e.g soldier wants to kill ‘enemy’, no realising they are doing work of evil people i.e who define ‘harmless’ person just like themselves as ‘enemy’...etc...longer term bigger picture of no interest to most people...just go along to get along, and get ahead...

Often question of where to start i.e what level of abstraction e.g concrete detail or big abstract general holistic picture...each individual different...listen for cues in their language and feedback as proceed, as to whether you are operating on the appropriate level of abstraction for them...

Some people happier dealing with details, sequences, step-by-step and others bored by, want to delegate and focus on strategy, goal setting, bigger picture...some see the pattern, others just the pieces...some happier dealing with just pieces, others go out of mind if forced to deal with minutiae, while developing big picture strategy, i.e identifying and developing the pattern...

Induction is observing pieces, and inducing a pattern from them...often falsely ascribing i.e hit and miss, try and see, they who make no mistakes make nothing...need to be comfortable with abandoning projects / speculations i.e ‘losing face’...i.e finding out the 999 ways NOT to do something, 999 ‘wrong’ ways...to hit on the ‘1’ way that works...then being willing to abandon it when better explanation / pattern appears compelling etc...

Deduction is breaking down the pattern into its parts i.e deducing something not obvious in the pattern, FROM the observed pattern (induced, speculated, ascribed

Ability to tolerate ‘no knowing’ i.e ‘gaps’ in what know...like when learning language...some more frustrated / irritated / intimidated by such gaps...

Data not information i.e does not help form clear understanding / reveal pattern...often apparently contradictory, refuses to ‘take shape’ or ‘form a
pattern’ in mind’s eye…information structured to offer meaning more valuable…aids decision making rather than overwhlms…

Does person look for ‘match’ with what already believe (know), or contrast it with what already accept / believe / know? Mix of both common. Thus ‘compare and contrast’ comprehension exercises.

Acting looking for ‘match’ leads to deletion of much detail i.e impressions i.e selective perception / reinforcement of what already believe / know, while deleting rest that does NOT correspond to current noetic structure.

‘Mirroring’ is about ‘matching’ people, to develop rapport, gain trust, confidence, so can then ‘lead’.

**As we expand knowledge, in a theoretical sense, we:**
1. Experience noise
2. Look for patterns in the noise [Matching]
3. Form correlations
4. Express laws
5. Find exceptions to the laws [Mismatching]
6. Find patterns to the exceptions [Matching].

Modal Operators are those words in grammar that talk of possibility or necessity. E.g. Can, Can't Will, Won't It is Possible, It is Impossible Could, Couldn't Would, Wouldn't, May not Must, Must not Should, Shouldn't Have to (Got to), Don't Have to Necessary, Not Necessary Need to, Don't Need to,

Our beliefs and values are often a result of, as well as a justification for, our actions. We also judge our actions based on our consistency. That is, we find ourselves doing something and then justify it by saying that the action represents a belief. We adopt belief systems and values in order to fit in.

**Morris Massey’s three major periods** are the Imprint Period, which occurs from birth until age. We pick up and store everything that goes on in our environment. We get our basic programming in that Imprint Period. Our basic programming occurs between ages 2 and 4, and by the time a child is 4, most of the major programming has occurred. Most phobias created between ages 3 and 7. There may be amplifications or reinforcement of the phobia after that. May also be no remembrance of the creation of the phobia because the learning processes that occur during the Imprint Period are largely unconscious. The child unconsciously picks up the parents' behavior. Family is most critical during the Imprint Period.

The Modeling Period, is from 8 to 13 child begins to consciously and unconsciously model basic behaviors. They notice the behavior of friends and family and model them. At that point, children begin to develop heroes. We notice that children have fewer conscious heroes before age 7 than after; from age 8 to 13 they begin to start picking up the values of the people they have made
into heroes. Massey's point of view is that our major values about life are picked up between 8 and 13 (at around age 10). In addition, his point of view is that your values are based on where you were and what was happening in the world when you were 10.

The Socialization Period, from 14 to 21. At age 21, values formation is just about complete. At this point core values do not change unless there is a significant emotional experience (or other therapeutic change is done). Using techniques described in this chapter, we can change the values in a matter of several minutes. Other than through NLP intervention, core values do not change unless there is a significant emotional experience. Other, more conscious values change and evolve continually. People change and grow and their values change over time. The values people start with, however, the basic core values, are formed around age 10 and locked in at age 21.

MHR Phobia just extreme form of prejudice against something (or possibly FOR it e.g inversion of taboo desire, Thanatos, Odipal etc). If locate ‘imprint’ of ‘belief’ or ‘engram’ of traumatic experience, can re-write these scripts / narratives and the fear / phobia / prejudice evaporates i.e it is the product of these e.g traumas / imprinting episodes / long-term conditioning…it is re-produced moment to moment by the background playing of these scripts / narratives / films, the constantly resonating engrams…simply stop re-producing the source and the symptom ceases to be re-produced i.e it is an artefact / product, not a thing in its own right…stop the interactions that were / are producing it from moment to moment, and it has no existence…it never existed…it was always a product of a process…which we nominalized / reified / deified / idolized as a thing / event.

Many current ‘problems’ have multiple interactive sources i.e many things interacting to produce the ‘gestalt’ e.g reaction / desire / aversion / prejudice / belief / hatred / phobia…interactive determinism…so as remove each element will weaken total product…interplay of traumatic engrams, imprinting, conditioning, e.g ‘The Holocaust’ comes at you from all angles, over and over, imprints from childhood, reinforced by fake history, corrupt laws, mass media presstitutes, and apparent ‘fact’ that everyone else appears ‘convinced’ it happened, no reason to doubt, no motive to doubt (that you are aware of i.e huge impact / power this gives the enemies of freedom / liberty / truth / justice etc)…

Any part of a gestalt can trigger the entire gestalt…so look for triggers…multiple triggers…i.e ‘objections’ to the truth…e.g ‘BUT…excited reaction / anger / incredulity / malice i.e also reveal what sub-motives being satisfied by the ‘belief’ e.g need to hate someone, feel superior to someone, put someone down, cut down tall poppies, vent, project…on the poor truth seeking / would be teacher of reality / truths…
A story about values elicitation and the visual squash: I actually did this over the phone with an associate in Philadelphia, who said to me, "I am not making as much money as I think I really ought to make." I said to him, "What's important to you about what you do?" (I asked that because "what you do" is the way that you earn money, isn't it?) He said, "You're eliciting my values, aren't you?" First I found his top eight values. The first value was freedom and the fourth was money. Now, to my way of thinking, that's the way it should be. He had money in there, so he should have been making money. So what was the problem? If money was not there, I could have put it in the values hierarchy, using submodalities changes that we are about to describe. If money wasn't there, just putting it in the values hierarchy would change how he acts. But money was there, and I thought, "Well, that's interesting!" And I said to him, "So, the problem is that freedom is your highest value and you want to make more money. Is it that part of you wants to be free and part of you wants to make more money?" He said, "Yes." I said, "What I'd like you to do is to have the part that wants to make money come out, (pause) and which hand would that part like to be on?" He said, "The right hand." "I'd like the part of you that wants to be free come out and be in the left hand. I'd like to ask the freedom part, what is its intention, its purpose?" He said, "Freedom." "And what's the purpose of the money part?" I asked. "To make more money, so I can have all the things I want so I'll be comfortable." I asked this question, "For what purpose..." about five times, and finally he said, "... freedom, (pause) and my hands are moving together." "Just allow them to continue," I said. When his hands came together, he said, "Oh my God, my whole body is tingling and shaking. It's light!" I said, "Great, the parts have integrated! Now, do you have a visual image of this new part that is in charge of freedom and money, allowing yourself to make as much as you want and yet retain your freedom?" I couldn't see him because I was on the phone, but he said, "Yes." I said, "Good. We've created a lot of new behaviors today and I want you to make sure that your new behaviors are OK with all the other parts inside you. Could you just go inside and check and make sure they are OK?" He said they were, and we were done. Since we were on the phone, I said good-bye.

Visual Squash for integrating a person's values and beliefs, to resolve conflicts between conflicting parts to integrate them.1. Identify the conflict and the parts involved. Use values elicitation and other language patterns to sort out the values, beliefs and the parts that represent them.2. Ask each part to come out on one of the hands Form (or discover) the visual image for each part. Describe each part. (It is much better if each part is described in "people" terms.) 3. Separate intention from behavior. (Reframe each part, chunking up so that he realizes that he has the same intention. See "Hierarchy of Ideas"—next chapter.) What resources does each part have that the other part would find useful in helping it to be more effective? 4. Have each part tell you what is good about the other part. And then have each acknowledge that the conflict is getting in the way of
achieving their intention. 5. Resolve the conflict by getting agreement that they will work together. (If integrating, continue. If not integrating, end here.) Point out that they have a lot more in common than they realized and get agreement to integrate. 6. Ask how they would like to integrate. (Hands should move together; if not, help to collapse the image so that only the new part remains.) Then ask the person to describe the visual image of the new part. 7. Take the integrated image inside.

If you haven't made the shift agreeable with the part that is responsible for maintaining these value systems, then the part may shift them back. And if you have forgotten to change or align the history, then the parts may shift back. So, have the new super part go back and make the shifts in the Time Line so that the history becomes consistent with the new belief. If you have a history that is not consistent with the parts, the change may regress. You want to make the history in the past consistent with the new behaviors that are going to be generated by the new "Super Part," so have the part itself do the changes in the Time Line. That will make a major shift. We are talking here about major personality shifts, more than just a few values changes. Have your new Super Part go back and clean up the Time Line, then make sure you integrate the part. When you're done, have all the parts get around the center and give each other a hug and integrate as if they were one.

MHR sad fact that most people only ‘learn’ stuff ‘forced’ to i.e to pass a test and graduate school, then uni, then get a job, then get a promotion / qualification…few people invest much effort in learning anything they haven’t been directed to / compelled to by some ulterior motive i.e NOT by the desire to learn that particular skill / subject matter … which is why school and higher education and mass media have all the power…i.e passive learning…people just doing what told…then given emotional investment in it e.g ‘you did well’, ‘your self-worth / acceptance / approval is based upon you having ‘mastered’ that subject i.e regurgitated a point of view / distorted view / deleted view e.g you ‘know what you know now’ … have investment in your religious dogma, your fake history, you false impressions…they define you as ‘smart’ and ‘worthy’ … you’ve invested so much effort, sacrifice etc into ‘learning’ these, you are loathe to admit they are worthless, and worse, counter-productive, negative, destructive of value, toxic, etc

MHR levels of abstraction…interlocutors using different levels / more comfortable on different levels e.g abstract to concrete…often value abstract, and getting person to give concrete examples of it either explodes it as absurd e.g weapons spending prevents wars, giving up freedom to protect freedom, the exaggerated and thus irrational fear of ‘terrorism’ Vs driving a car, and what you are giving up for supposed protection from the one Vs the real threat, and what you would NEVER be willing to give up to stop car accidents happening e.g
habeus corpus, posse cometas... i.e 'make it real'...don't let people get away with catchy emotional slogans i.e abstract 'noble' lies...move between levels of abstraction to ensure there is 'tracking' between concrete examples given / accepted, and their supposed abstract principle counterparts i.e is the example REALLY valid i.e an example of the supposed principle / idea / abstract notion? Often no tracking between i.e not even in same ballpark...comparing apples with tanks...peace with torture...freedom with prison...

Seek out common concrete objectives / aims ... often people talking past each other at higher levels of abstraction i.e both may want X, but imagine their model will bring it...and always comparing models, rather than what they both want...someone told them THEIR model is ONLY way...so fighting about models, not what really want...can show that many options can produce what they want, they can find one they can both agree on...MHR models / 'noble' lies / theories / ideologies usually disingenuous, to produce conflict, not harmony i.e divide and conquer...two stupid ideas competing for which color stupid is best...when need to focus on the aims / objectives i.e and work out if people really DO want peace, or playing games i.e ulterior motives for 'peace talks'...

Abstractions employed by those seeking power i.e vague / general / diffuse, can be used to justify anything, as 'excuse' for anything...e.g 'party line trumps any facts / individual cases'...so abstraction form of power...vagueness can be employed to 'legitimate' anything from individual corruption to genocide...’all in the name of ‘freedom’ etc’...’Scientific socialism’ / ‘Marxism’ as excuse i.e means justifies ends...ends expressed so vaguely / shiniingly / emotionally free of real concrete content, that motivates the very worst torture, mercilessness, ruthlessness, violence etc as ‘justified’...when if you went into the details e.g of Marxism and its supposed ‘utopia’, you’d find the model much less motivating, i.e raises so many questions that you’d be unlikely to carry out atrocities in its name i.e some vague perfect utopia is to many ‘worth’ all the suffering...but when you focus in and start asking concrete questions about how this utopia would look in reality, you find all the flaws, imperfections, dissatisfactions etc...and so you’d lose the momentum offered by the vague, perfect, satisfying...thus the idea that the ends justifies the means would be undermined... it is easy to be ‘sure’ and ‘certain’ and ‘have faith’ in a vague perfect utopia / heaven than a concrete one, which would reveal many dissatisfactions...who wouldn’t die for perfection? And kill? But for just another world mostly like this with some superficial differences? Thus the level of abstraction is always pushed higher by propagandists / tyrants, mass media...

MHR How dare Spielberg make me feel sick for days after pretending to show me ‘historical’ incidents e.g nazi’s pushing man in wheelchair out the top story window of his own house in front of his family !!! Fucker had NO right to do that. It was an act of REAL violence against MILLIONS of viewers.
Tail wags dog in propaganda / fake news / fake history / social engineering / brainwashing of entire populations...i.e the ‘abstract idea’ of ‘terrorism’ justifies everything...but if you broke it down into facts, figures, concrete terms, it is an illusion i.e that ‘threat’ of terrorism. So the media needs to constantly control the narrative, to force all the concrete realities to appear to mirror the rubric, the abstract lie they have pushed on us all...which is why censorship is necessary for them...e.g of ‘The Holocaust’, because none of the concrete facts add up to give any holocaust...they are all contra-indicative of the abstract lie fed us for 60 years...so we get fake news, fake history, a barrage of fake education, and censorship of all competing (factual) data / narratives...

The structure of intuition is the ability to chunk up and find connections and relationships and then to chunk back down and relate them to the current situation.

If the communication is too abstract, then the person receiving the communication has to hallucinate or make up the details. The problem in making up the details is that the details are often wrong!

MHR changing values...re: role models, and swaying people to change behavior e.g ethics...If you go to work for a group of people who are vegetarians and you love and admire them greatly, you will probably become a vegetarian. It happens all the time. (???) i.e people WANT rapport with people they admire, want to be like...we need to do what alcohol / tobacco industry has done i.e BE what people want to be, so they will emulate our veganism...when it is seen as means to getting what people want in life...(mhr raises question of vegans rewarding non-vegans with sex / affection / love ... could they convert someone? ... or will they more likely be converted by them back to bad ways?...could ‘carrot’ of possible relationship sway them / motivate them? which is most likely i.e most often the case in reality? E.g Paul McCartney and Linda the rule? Or ‘lapsing’ and ‘toleration of cruelty / ruthlessness of partner?"

We can make major short-term shifts in behavior by using the basic NLP techniques. One of the problems in NLP is getting long-term shifts in behavior. Our opinion is that longer-term shifts in behavior come from major changes in the belief and values systems that are the basis and cause of those behaviors in the first place.

MHR ‘happiness’ very abstract...majority of people apparently claim this is their goal in life, in employment etc interviews...and some recruiters see it as a bad sign i.e it is NOT concrete...sign of lack of goal setting abilities...realism...efficacy in business / employment world i.e would prefer a vivid concrete objective e.g ‘to retire on 100k a year at age 55’ would make them happier as answer i.e ‘we can work with that’...but we can’t offer vague ‘happiness’ i.e sounds loopy to some, of no use as motivator ... to become part of
a ‘machine’ i.e organisation, which motivates on money, prestige, status etc…can’t offer ‘happiness’ to anyone…the recruiter not aware of anyone who ever became ‘happy’ as a result of working with their organisation…so debatable if priority i.e main objective / goal should be concrete or vague i.e level of abstraction e.g ‘to become a millionaire’ is easy to track, measure, quantify, work with…can work out what need to do, when etc…Vs ‘be happy and free’ which is unquantifiable…a feeling…which no-one can ‘plan’ i.e ‘break down into steps’…so need iterative goals i.e vague / inspiring and actual concrete steps to get there…n.b ‘feeling’ can be produced in dreams, trance, hallucinations, fantasy, IMMEDIATELY…unconscious knows this…so is confused by such goals itself…O.K, be happy…what’s stopping you? … when really people have concrete desires e.g sexy partner, freedom, status, admiration of peers, acceptance, approval, freedom to travel, opportunities, being loved / admired / respected … etc

N.B advertising rarely sells concrete product…sells vague feeling e.g of happiness, sex appeal, self-esteem, ‘success’, ‘happiness’, ‘love’, acceptance / approval…

‘Tad’ claims can simply remove / replace real deep values etc…just have to be careful to limit context i.e danger if allowed to globalize i.e need ‘well formedness’ and ‘ecological congruity etc like all NLP installations / renovations.

once you have elicited someone's values (and for this purpose, we are only interested in the words they use), you can use his top four or five values in a single sentence, and provide an undeniable motivator to him. By using someone’s top values in a single sentence or a paragraph, you are giving him a powerful unconscious motivating compulsion that will propel them toward the goal. This is so because values provide the kinesthetic push or drive behind our motivation strategies. They are the actual push. In other words, the kinesthetic (feeling) that causes the motivation strategy to be motivating, is the same kinesthetic (feeling) that comes from the visual (picture) of the value. By feeding back someone's values to him in order of importance, you provide an undeniable motivator because of the kinesthetic push and because of the rapport you have established with them. For example, just suppose these are the business values you have elicited for your client, arranged in order of importance: Results Integrity Success Relationship Money You can then feed him back a sentence such as, "You know, Wyatt, in supporting our proposal, I am also committed to RESULTS and INTEGRITY, and realize that our SUCCESS depends on our ability to maintain our RELATIONSHIPS as we make MONEY." That sentence will be very motivating for your client.

Make sure that what you do is reversible, until you are sure of what you are doing. You can put it back. We are doing major shifts here. The important issues
are: You want to know that you can do it, and you also want to know that you can shift back if you need to. These submodality shifts in the values hierarchy are very simple, so it's easy to put them back the way they were.

Whose voice do people hear when they seek to express their values? Their own? Their parents? Teachers? Priests? Clarify this. Ensure it is THEIR voice, and thus THEIR value, not some value they think they SHOULD have etc

MHR what does ‘money’ or ‘freedom’ or ‘power’ or ‘choice’ or ‘love’ or ‘security’ actually MEAN to them, in concrete terms? Often conflicts real, often apparent, and have to work out which is which, and deal with i.e ecological aspect…often problems / conflicts not real at all, but artefact of level of composition i.e abstraction…

People may claim ‘I want to earn more money’, but it is really a low priority i.e they value independence, freedom, fun, variety, challenge, etc more than money i.e thus real conflict exists if they insist they really DO want more money…they will have to adjust to the reality i.e if you want more money, you need to sacrifice X and Y, which are really more important to you than money…so make up your mind…make a choice…compromise…you will be unhappy without X and Y but have more money, is that O.K? Or do you imagine more money will give you more X and Y? will it really? Etc

Elicit sub-modalities of each representation of their imagined state of ‘having more money’, or ‘freedom’ or ‘happiness’ i.e actual concrete meaning of these abstractions … can then install values using the most vivid of these i.e copying sub-modalities of which values REALLY valued e.g fun / sex and copying them into the values you WANT to be motivating e.g money and so you will be excited about working hard, making sacrifices, studying, compromising you ethics etc to make more money…N.B ‘Jews’ have benefit that their religion promotes usury i.e be a lender, and thus enslave the goys…Vs the conflict the Jews set up in ‘Christians’ and ‘Muslims’ with usury as sin, and ‘kindness’ and ‘mercy’ Vs Talmudic brutal exploitation, without mercy, of all non-Talmudic ‘Jews’…

Change sub-modalities of one priority that you/client are having trouble with e.g insist want more money, but motivated to do stuff that is fun, exciting, sexy etc…so that now the priority / value ‘make more money’ has all these affects attached i.e gestalt / triggers that will motivate the actions required to make more money, as previously was motivated to have more fun…so now ‘make more money’ is REALLY the priority motivator, whereas before it was what you thought SHOULD be, but wasn’t i.e you said it was number 1, but you were not making more money / taking the steps necessary, you were actually focused on supposedly lower priorities e.g fun, freedom…now it really IS your prime / number one priority and you will be motivated to do what is necessary, as before you were motivated to do what lead to ‘having more fun / excitement /
sex’…MHR use to replace ‘cheating partner hot sex’ priority with DESIRED priority of ‘commitment / fidelity / long term partnership’ and thus save marriage…i.e take philanderer and turn into fidelity / monogamist/ serious relationship person…

When you take the submodalities of whatever value it is that you're putting up there, and make it the same as the number one value, it becomes a number two value. It wouldn't become a number one value unless you change the number one value's submodalities to another set of submodalities, or unless you took the number one value out of there, which I would hesitate to do. "Typically, I've found that this particular shift is sufficient to have people remain with that value as their number two value (or wherever we put it) for long periods of time. It does not tend to shift back. It stays right there.

The difference between what we did here and the visual squash? Visual Squash is used when there's conflict. You see, if Marvin's parts did not agree with what we did, and there was a conflict between the money and the staying happy parts or any of the other values, what we would do is do a visual squash and integrate the two. After you've done the shift, if it shifts back then there's an internal conflict. In Marvin's case, when you have major values or belief conflicts, you use a Visual Squash, it's as simple as that. We did this quickly and the whole process took twenty minutes.

Participant: "When you're eliciting the list of values and you sense a conflict, would you do just a simple values shift or would you do the squash instead?"

Tad: "I would have started with the Visual Squash and then done the submodality shift afterward, once I had checked the congruency of the parts integration."

"Now say that there's a conflict between several parts regarding the freedom and money values that we pick up. You're going to have to integrate them all. Keep doing the Visual Squash until you get them all integrated, until you get one part that is in charge of freedom and money. Remember that when you're dealing with someone's values, and he doesn't use the same words that you do, that doesn't mean that his values are different. If you want to find out what those words mean, you need to elicit the complex equivalents."

THE MODEL

1. INVESTIGATE - GATHER INFORMATION: Meta Model, Keys to an Achievable Outcome, Presuppositions, Ecology

2. FIND PRESENTING PROBLEM: Presenting problem is the problem that the client presents to you as you begin the therapy. At this time you may also want to find the causal problem, although it is not absolutely necessary.
3. PRESENT MODEL FOR CHANGE TO CLIENT: (the language used is intentional) "A lot of things underlie other things, and sometimes when we do something, what we do is based on a belief that we have. Everything we do is a response to a situation, and so change is very easy, and frequently when we change something fundamental, as we are going to do today, everything in life changes. Sometimes when we dig up a weed, we find one root, or sometimes we find several roots that all go together to form the problem. So we can deal with all that easily by dealing anywhere in the system, since like a weed, everything is connected."

4. INSTRUCT CLIENT TO GO TO THE CORE: "We're going to go to the core belief or value that makes this possible."

5. QUICK INFORMAL REFRAME: "We're going to explore new ways of doing things that will still allow you to get everything you want; we're going to get you everything you want today and you'll discover how to get it more easily, and you'd like that, wouldn't you?"

6. REGIN COMMUNICATION WITH THE UNCONSCIOUS: "I'd like to talk to the unconscious mind..." (If necessary, set groundwork with hypnotic language: "Now, you know you have a conscious mind, and I know that you have a conscious mind. But one thing that many people don't know is that they also have an unconscious mind, and the unconscious mind is the part of the mind that is here, and it is really responsible for all that you do. And as I talk to the unconscious mind, there isn't really any need for the conscious mind to listen to me, because the unconscious mind will hear everything that it needs to hear here, and that's what we want (need) today. And I want the unconscious mind to comfortably and easily decide what the conscious mind can do while we talk. Let him go off somewhere while we talk. I want to know some things about him..." etc.)

7. ESTABLISH SIGNALS: "... and what helps me when I talk to the unconscious mind is to have signals that I can see easily set up so we can communicate more clearly. Now I know you've seen people unconsciously moving their heads up and down when they meant 'yes' and back and forth when they meant 'no.' And that's one easy, comfortable way to communicate. Or even the movement of a finger could mean 'yes,' like this." (Grab finger and move it as a demo.) And the movement of another finger could mean 'no.' (Demo it.)

8. SET UP PROBLEM: "You know, I can guess what's the most important problem to you to change right now, but that's just me, and I want you to know that we can change that easily, and it probably would be useful, and yet that's just me. You, however, really know what's most fundamental, and what change will actually create the most powerful effect in the broadest area to completely transform the individual's whole life." (At this point you should be getting strong
signals.) "So, you know what situation it is that's most important to the individual right now?" (Signal) "Great!"

9. IDENTIFY THE FIRST PLAYER: "Do you know which part it is that does the thing you're most concerned about?"

10. TALK TO THE PART: (Still include the unconscious mind.) "I'd like to talk to that part, and if that part could come out on the hand, and let me show the hand how the part could be the most comfortable here (taking hand and turning it over), now."

11. DEMONSTRATE SIGNALS: (See #7)

12. ASK FOR PERMISSION TO CALL IT "PART #1":

13. IDENTIFY OTHER PLAYER: (Still include the unconscious mind.) "Is there another part that is involved in this, or a part that is the reciprocal, you know, the opposite number, the flip side of the coin?"

14. DEMONSTRATE SIGNALS: (See #7)

15. TALK TO THE OTHER PART: (Still include the unconscious mind.) "I'd like to talk to the other part, and if that part could come out on the hand, and let me show the hand how the part could be the most comfortable here (taking hand and turning it over), now."

16. OPEN COMMUNICATION BETWEEN PARTS: "Can you introduce yourself and tell Part #1 what your behaviors are, what you do, how you do it, and what you hope to accomplish with that ([optional] because you know that every behavior is a response to a situation), and so what is it that you're actually doing? What is the ultimate purpose of these behaviors?" (Pause)

17. CHUNK UP: "And as you realize the purpose, what does that in turn do for the individual?"

18. DO THE SAME FOR PART #1: (Follow steps 15 - 16 for Part #1.)

19. CHUNK UP AGAIN: "Now, both parts, noticing what purpose that serves, and in turn what purpose that serves, chunk up, continuing to go up the hierarchy of logic until you can clearly see, hear and feel that your ultimate purpose, your
values, are really quite similar (pause), if not identical (pause), even exactly the same." (Get yes signal from both.)

20. ACKNOWLEDGE SAMENESS AND TELL IMPLICATIONS: "You know, there is quite a lot of (complete) similarity in your intentions, beliefs and values." ([Optional when not integrating parts, only getting agreement:] "I propose an alliance that might be useful to both of you.")

21. INTEGRATE AND PRESERVE: "I'd like to suggest that since there's so much similarity between you that you become as if one, that you become one and preserve the good intentions, wisdom, skill and power that you each have, becoming more powerful as you do to achieve your intention. Integrate and become 1,000 times more powerful." (Signal, hands move together.)

22. CALL FOR OTHER PARTS: "As you are realizing this, you may also begin to notice that you were really just two pieces of what once was a complete whole. (Signal) I'd like you to realize what other pieces of the original whole are missing and bring them forward and put them here." (Suggesting the space between or on top of the hands.)

23. GET AGREEMENT FOR ALL PARTS TO INTEGRATE: "Now, I'd like to have everybody introduce each other, and..." (going to 15) "... until you see, hear and feel that your purposes are the same."

24. THE POOL OF LIGHT: "I want you to go inside and find the pool of light that exists inside in your center: you may have not even been aware of it until I mentioned it, and I want you to have the parts jump into it. Notice that the pool is pure light and energy, and pure love. It is your own pure essence. Bring it out here (outside the body). Now, as the parts jump in, watch them dissolve and become one with the light, (stop talking about parts) and draw this love, light, energy and any other good you need inside the body. Allow your hands to bring the light inside, into your center only as fast as it integrates into the center and watch... (pause) as the light goes out to all parts of the body, (pause) and the body becomes hollow (pause) as the light expands, expands, (pause) expands, (pause) expands to infinity, (pause) Notice that the entire universe is contained inside your body (pause) and that you are the universe, (pause) Now bring it back. Into your body. Make the light into the most useful shape that the new part will be, someone who has the characteristics of what you want your new part to be."

25. FIND TIME LINE ORGANIZATION: "Now what I'd like you to consider is how you store time. How do you, for example, know the difference between your memories... How do you know if you're looking at a memory or an event that is going to happen in the future? Because I'd like you to notice... Can you recall a memory from when you were age five? Notice where that came from. Good. Can you imagine what it's going to be like five years from now, or what will you be
doing a year from now? Can you imagine that? Good. What direction did that come to you from? Over there? Good. So what I’d like you to notice is that your memories are arranged, for want of a better term, it’s sort of a line that stretches from your future through now all the way to your past, and if you could float a little above that line, could you look down on the entire continuum of past, present and future so that you are seeing all your memories arranged in that line? Can you do that now? Do you notice the entire continuum of past, present and future?

IF PROBLEMS HERE: "OK, I know there’s a part of you that likes to do this and a part of you that thinks perhaps you shouldn’t be doing it, and I think that’s OK, and I’m wondering if the part that THINKS it doesn’t want you to or THINKS you shouldn't be doing this is willing to play, explore and discover new ways of achieving its intentions while still allowing you to do this. Could you float above your time line now? I want you to tell that part that it’s all right, that you’ve done this before and that it’s really a simple procedure. And it increases choices and allows parts to achieve their intentions easier, far more easily than they had before this. And if it doesn't want to do that, perhaps it can do it just for purposes of this experiment. Can you do that? OK.

26. HAVE THEM FLOAT ABOVE THEIR TIME LINE: "Good. Excellent. Now, do you notice that all those events form sort of a line in your mind? Excellent. Very good. Very good. Now what I’d like you to do is to imagine that you’re looking down on the events that form your past, present and future, as you float up above all that, so just sort of pretend that you’re floating and that you’re floating right up above your Time Line. And notice how good it feels to be above all that, that you can look down on the entire continuum—past, present and future. Very good. Excellent. Excellent."

27. NOTE THE SUBMODALITIES: Ask him to notice the Submodalities (SMDs), and make sure that the client's experience is that SMds are similar for the past, present, and future. It's OK and quite usual for the future to be brighter than the past. It's not good; it's unusual if there are black holes or missing pieces in the past. If the Time Line is not contiguous regarding the SMds, then change the SMds so that they are the same brightness and approximate color.

28. GIVE THEM AN EXPERIENCE OF POWER OVER THE TIMELINE: "And as you do that, I'd like you to go back on your Time Line to an earlier time, and I'd like you to recall a pleasant memory... when you were much younger, somewhere between the ages of eight and 13. I'd like you to recall a pleasant memory. And I’d like you to notice that the memory has the same characteristics as... any other picture you make in your head, or any other value or belief. I want you to notice that the construction of the memory is exactly the same as anything else. And now I’d like you to float up above it all and feel good being above it all.
Leave that memory behind for a moment and float up above your time line again and come forward to an age more than 21; more than age 21 and less than now, and I’d like you to take an unimportant memory. I’d like you to take a memory that doesn’t matter, and I would like you to take that memory out of your time line. I want you to make sure that this memory has absolutely no significance, it doesn’t matter, and that you can take it out of your time line. I’d like you to take that memory out of your time line and push it far away from you. I’d like you to push it further and further and make it darker and darker so that it becomes a little dot, and now push it into the sun and watch it blow up. Now I’d like you to take that memory or that space, actually, where the memory was, and fill it with something that matters, something that makes you happy. Perhaps it’s a funny time or a time when you felt good about yourself. Or a time when someone else felt good about you. And make it so you smile. So you feel good about it. Excellent. And now I’d like you to come forward to now. Take as much time as you need to complete that before you come forward to now. And when you’re at now, I want you to look forward into the future. Notice how far your time line extends into the future. And I’d like you to go out into the future all the way, but not quite to the end of your time line, and when you do that I want you to turn around and look back. Look back toward now so that the entire continuum—future, present and past stretch out toward you like a line. And I want you to notice as you look back from the future to now to the past, I want you to notice if there are any events there between the future and now that shouldn’t be there or that you would prefer weren’t going to happen. Just like the event you changed a moment ago. You can also manage the memory of the future in the exact same way. I’d like you to make sure that all the events between now and the future, as you look back from the future to now, support you. Support you in becoming the kind of person you want to be. Support you having the happiness and those things that you deserve. I want you to make sure that all those events in the future are of your creation and are those things that help you be the fullest person you can possibly be. And if there are any events in the future that you particularly want, I’d like you to pick one right now.

Pick an event in the future, something that you want to have happen. Move right up to that event, something that you really want, and I’d like you to look at that event in the future, and I’d like you to notice if that event in the future is something that is really compelling, that is, is it something that is really compelling you, something you really want? And what I’d like you to do is, I’d like you, for a moment, to step into the picture. See it through your own eyes, step into your own body and see what you’ll see, hear what you’ll hear and feel the wonderful feelings, and I want you now to turn up the brightness, make it sharper and more focused and closer, make it bigger, make it brighter, whatever you need to do, turn up the brightness on that picture so that it is the most compelling and make it even more compelling so that you really want it. So that you really, really want it. Excellent. Now, step outside of the picture so that you
can see yourself. And put it in the future. Take all the time you need to complete this now, and come back now, float right back to now, and..."

29. COME BACK TO CURRENT THERAPY: "Now, every behavior is a response to a situation, and you know that situation we're dealing with."

30. THE DECISION: Have them go back into the past and find the earliest unwanted experience in the chain. "Find the first or most important time, the fundamental cause of the limits as perceived by the conscious mind, and I want you to find the cause. I want you to go right to what makes this possible. There may be a certain mold that you decided to use long ago—a decision you made. You know, like a nozzle on a garden hose molds all the water that comes out, or like a cookie mold that molds the dough. Like a template. And like a template, a decision used by your unconscious molds all your perceptions and all your experience. Like that, I want you to find the decision that you decided to use long ago that is molding your experience. I want you to find the time you made the decision that is causing this problem. Do you find it?"

31. CHANGE THE MEMORY USING CHANGE PERSONAL HISTORY, PHOBIA CURE MODEL, UNHOOK THE FEELINGS, OR JUST HAVE THEM REMOVE THE MEMORY: If using the Phobia Cure Model, have them run the pattern until the memory is destroyed. Say, "I want you to run it until you can't get the memory back." What you say to the person, if you want that to happen, is much like the way you do the phobia cure, by presupposition. So what you would say is, as when you're doing a phobia cure, 'I want you to run this until you can't get it back anymore.' And he goes, 'Oh, OK.' And you say, 'It might get harder and harder, but I want you to try to get it back.' So he tries even harder, and eventually he won't be able to get the memory back. When you do the phobia cure on a memory over and over and over again, you will eventually destroy the memory so that it will be impossible to remember.

In some cases I erase or destroy the memory, in some cases I don't. It's just a judgment call. I guess the question is, can the person live with the memory, or does it impinge on present time? That won't work. In that case it would have been better to take out the picture. I'd always go for less for more, that is, do less and accomplish more wherever possible. I don't want to take out more portions of a person's memory than I have to.

You can have them take out a whole chain of feelings in the gestalt of the memory by just saying, "If you look in the lower right-hand corner of that picture, you notice that's where the feelings are hooked, you just unhook those feelings, you'll notice the feelings go away." I've had people drop off their feelings just by doing that.
32. **GIVE INSTRUCTIONS FOR GENERALIZATION:** After you destroy the memory you fill it with something new and you say, "I want you to look and notice that memories both before and after that have changed subsequent to changing this memory. Have you noticed that?" And they'll either say, "Yes," and you say, "That's right," but if they say "No," you'll say, "Good, we'll do it again, and it's probable that you just didn't notice; I'd like you to notice it this time." The changes will occur into the future from this particular memory that we're changing. So if you say it that way, they'll change the whole gestalt for you.

Now in the same way, when you put something out into the future, you make it very compelling. You also ask them to notice that they did change the events from now until the future simply by changing that memory. Now, it's my theory that it does. And they only have to notice it. It may also be presupposition. So what happens when you change the future memory is that it changes the whole chain of events going back to now. So when you work with the time line and you work with a single event, you're working with a gestalt.

33. **REPLACE THE DESTROYED MEMORIES:** If any memories have been deleted, replace them. 'I'd like you to replace the holes we've created with new memories that only support your mastery of the new behavior, adopting new beliefs, values and attitudes that totally support your new behaviors.'

34. **LOOP TO 32:** Continue steps 32-34 using the earliest memory available, until the unwanted state or behavior is not accessible.

35. **MAKE FIRM THE LEARNINGS:** What you've learned today "I'd like you to firm up. Keep them as something precious as a treasure, because that's what they are, and you know it."

36. **PAST PACE NEW BEHAVIOR:** Take the new desired behavior and put it in the past, having been performed as many times as necessary. "I'd like you to imagine having done this behavior as perfectly as possible at least 25,000 (as many times as appropriate) times in the past."

37. **FUTURE PACE AND TEST:** "I'd like you to uncover all those events that you buried in the future that no longer support the new you and get rid of them." Replace with new future memories. Make sure that there is a liberal sprinkling of new memories in the future that support the new behavior. "I'd like you to imagine using these new behaviors even into the future, and even as the content of your experience changes, these new supporting behaviors remain operative."

38. **CHECK ECOLOGY:** "Now, we've made a lot of changes today and generated many new behaviors. I want you to make sure that they are all right with all the parts inside."
39. COME BACK TO NOW: Have them float down back into their time line and come to now.

The word decision in language... is a 'nominalization;' it's a process word turned into a noun. Problem with that is that when you turn it into a noun it seems so final. A decision. But actually what decision is, is the process of deciding.

Nominalization—usually a verb or another process word which has been turned into a noun. The test for a nominalization is, "Can you put it into a wheelbarrow?"

Have you ever been in a situation where you did something and then you said you'd never do it? So, you quit and then you went back. You quit and then you went back? And finally you said, 'This is it, this is the last straw, I'll never do it again?" Elicitation of the "last straw pattern developed by Richard Bandler. For a complete description of the pattern, see Change Your Mind and Keep The Change, Steve Andreas, 1987

Reframe—changing the context. Since all meaning is context dependent, by changing the context one can change the meaning of any word, or statement.

Representational System—A way of representing, internally, the external events that we perceive. There are six: Visual, Auditory, Kinesthetic, Olfactory, Gustatory, and Auditory Digital.

Synesthesia—A pattern where two of the major representational systems are "hard wired" together over time, so that one follows the other i

Unconscious—the part of the mind which is not in our awareness,
In-time and through-time

From ‘Get the life you want’ Richard Bandler (father and co-creator of NLP)

The past and the future don't exist except in our minds. When people mentally suffer, they usually do so by feeling bad about the past, feeling stuck in the present, or feeling scared or worried about the future. In language, we talk about "getting over" things and putting things "behind" us. We talk about getting through what's right in front of us. We talk about getting "to" things and looking "forward to" our future. For many, this is an indication of how they actually represent time. In order to change how we think about and process the past and the future, let's explore the concept of time lines.

TIME LINES REFER TO YOUR own ability to code time. We think about time in certain ways. The images of the past will be in a different place than the images of the future. If you think about events in the past and imagine events in the future and notice where they are located in your mental space, you can draw an imaginary line from the past to the future and that will be your time line.

For example, think about brushing your teeth five years ago. Notice where you represent the image. Next, think about brushing your teeth one year ago. Notice the location. Think about brushing your teeth today. Again, notice where the image is. Think about brushing your teeth in one year and then again in five years. When you notice where each image is you can create an imaginary line linking all the images. This is your time line, and it shows you how you think about time spatially.

These are very Zen concepts. Generally, there are two main types of time lines. One is where time is spread out, with the future in front of you and the past behind you and the present inside of you. This is referred to as "in time." The other is when the past is on your left, the present is straight in front of you, and the future is to your right. This is known as "through time." The differences between locating your time line in these two ways are that there is usually a difference about how you approach time. For example, people who code time "in time" generally don't remember the past very much or very often-they put the
past "behind them." People who tend to code time "through time" on the other hand, can usually remember incidents easily and tend to be pretty punctual.

**Discover Your Time Line Exercise** Think of a time when you brushed your teeth five years ago and point to where you represent it. Think of a time when you brushed your teeth one year ago and point to where you represent it. Think of the present moment of brushing your teeth right now and point to where you represent it. Think of a time when you will brush your teeth one year in the future and point to where you represent it. Think of a time when you will brush your teeth five years in the future and point to where you represent it. Draw an imaginary line from five years ago through one year ago, the present, one year in the future to five years in the future. This is your time line. Extend the time line further into the future and past.

Getting over X, going through X, looking forward to X, overcoming X, getting around X, putting X behind us, getting to X, looking back to X, looking back in anger, looking to the future with anxiety, looking back to a time when, … all figurative language revealing ‘in time’ i.e Zen time, or ‘through time’ like me …

In the video Bandler was getting people to physically move along their time line…what was that about? Found ‘master NLP’ books on ‘timeline therapy’, will work through after this book…

The real issue of phobias, anxiety, is that a ‘one step learning experience’ has imprinted a chronic, generalized habit of fear, anxiousness, aversion, avoidance, often appropriate to imprinting / programming incident e.g brutal rape, beatings by parents, huge consequences of original situation, but severely limiting to happiness, functioning, social functioning etc … globalized lesson…applied inappropriately, disproportionately i.e over sensitization to risks, threats so threat analyses out of proportion to everyday, likely threats / consequences e.g ‘die of embarrassment’ is figure of speech…but reflexive of ‘lesson’ learned i.e danger of being ‘exposed’ to ridicule / embarrassment etc… lessons learned in war i.e hypervigilance, traumatic experiences, early imprinting experiences up to age 5 …

Bandler’s NLP approach focusses on how people continue to reproduce original impressions / strategies e.g traumatic experience led to defensive / preventative behavior…doesn’t matter WHAT happened, what matters NOW is how that response is constantly reproduced from moment to moment…and the symptoms e.g of irrational fear, manifest over and over in situations where it is NOT appropriate e.g war vs peacetime, abusive childhood vs current relationships, one dog bite vs world of friendly dogs…so he doesn’t ask about ‘content’ i.e ORIGIN of phobia / limiting belief…what matters is how we constantly re-create the consequences e.g ‘how do we know when to panic?’ …and replace / displace these feelings / impressions / self-talk / mental images etc with ones that are more
appropriate e.g alert Vs terrified, appropriately/soberly cautious vs paranoid
defensive, open to feedback Vs hypervigilant of what imagine people MIGHT be
thinking about us etc…

So don’t need to know HOW became way we are…WHAT happened…but how
keep being that way…what we LEARNED i.e the behavioral responses adapted
at that time…which are now inappropriate, though at time saved life etc…were
necessary to survival…

Replace imprinted / learned habits with new ones…takes same amount of
time…brain learns immediately…develop habit of calm, alert, cheerful openness
vs fear, anxiety, closed-minded, hypervigilance…displace old dysfunctional habit
with new more optimal / generative habits…N.B thank unconscious for the old
habit which WAS functional at the time…or at least the best adaptation to the
situation possible at THAT time…now have more resources, can more soberly
install / develop habits more appropriate to current experience / situation…

We need to find an experience from our own life to use as a new model i.e
positive / optimal response / feelings to replace bad habitual states … if don’t
have in own life, can imagine them…vividly…brain accepts input as if
‘real’….no difference to brain if you model your new global mindset on a
particular personal experience, one you simply imagined, or one you modelled on
how you perceive others to be ‘experiencing’ and ‘feeling’ i.e role model…could
be a totem animal …

MHR Replace global anxiety with global relaxed, alert, calm, positive
expectation … displace bad, negative, fearful feelings / expectations with positive
/ good ones …

If habitually ask self, and then imagine in head, what can go wrong, you are
going to be anxious, even hopeless and despairing…priming self for
hypervigilance to any possible hint of threat, negative feedback, and so the
slightest apparent ‘insult’ or ‘threat’ will trigger a massively disproportionate,
defensive, negative response e.g ‘looked at me the wrong way’, ‘disapproving
look almost killed me’, ‘saw self from unflattering angle/lighting and felt totally
ugly and unlovable’, ‘slight criticism made feel like total failure so gave up’,
‘everyone is laughing / looking at me I want to die’, leaving body in state of
chronic tension e.g migraines, auto-immune diseases i.e dis-ease…prone to
pathogens, giving up…

If learn new habit of asking self ‘what could go right today?’, ‘what great
experiences could I have today?’, ‘look at all those opportunities for happiness,
love, acceptance, approval, satisfaction, achievement, learning, helping others,
giving and receiving…this self talk will generate positive images in head,
positive films and photos…and you will feel good, positive, optimistic, and look
forward to the day to come….to life in general…while still being sober, at ease, calmly alert to threats / negative feedback / realistic expectations…you won’t be devastated by that rejection, set-back, let-down, accident…you won’t set up negative spiraling feedback loops…you will be sober…and positive…and find the good that is there, while taking care of the risks etc…

MHR purposeful action…expectations of realisation of objectives expected to bring pleasure and relief (happiness/joy/success) more powerful than actual attained goals…because can be better than reality in own mind…so more motivating … positively purposeful action most satisfying…

Turn your life around, literally, i.e from past-facing, i.e the traumas, sadness, disappointments, regret, vs look forward to a bright future…i.e self-fulfilling prophecy Vs constantly reliving past negative experiences / affects…

Bandler studied people who had gotten over phobias…modelled their intuitive / learned behaviors until had a model that worked for everyone…following the same behavioral steps identified in the ‘success’ cases…find what was common to them all…what worked…what it was that they did that worked…then codified as NLP phobia cures…learned from other people’s personal insights / hard won lessons…install the same mental processes they had used, in clients…to teach clients to think in the ways that got the desired results…to think differently…different self-talk…different visualisations…to become active thinkers Vs victims of passive thoughts i.e to actively replace old habits of thinking and visualizing / mentally rehearsing, with ones that would bring about the desired affects and behaviors…

Takes Bandler 20 minutes to teach these new, positive, ways of thinking and visualizing…to ‘install’ them…so they replace the old habits …and become the new habits…become habitual…automatic…though MHR like Zen practitioner, will observe self, and note when slipping back etc i.e never become a ‘master’…always a practitioner…

Change how you think and you change how you feel i.e associated affects…like Buddhist on fire is at ease, calm…mind is everything…all feelings are products of the mind…and thus how we think…we can take control of our own minds…become active, lucid, rather than passive, unconscious / trance-state zombies on auto-pilot, at the mercy of our imprinted, unconscious programs…

Thinking in new ways leads to feeling differently / better, more optimal strategies / responses …more options of responses to chose from…rather than knee-jerk, often sub-optimal / counter-productive / destructive / negative reactions …

Good spellers make pictures of the words, with different spellings, then check with the ‘affect’ each alternative produces i.e MHR like my comments on
learning English…trust your ‘feelings’ i.e it feels right / sounds right / looks right…’gut instincts’ rather than grammatical rules…Bandler taught kids to look at a word, and give each letter a different color, then ask them ‘what color was the third letter’ to audit / check that they really were doing what he’d asked i.e forming clear mental IMAGES of the words, rather than the traditional idea of ‘sounding out’ words in their heads i.e phonetics…showed kids correctly spelt word after this, and got them to focus on how it ‘felt’…then showed incorrect spelling, and got them to again focus on how this felt…so came to associate the correctly reproduced word with those certain personal feelings…so could soon say ‘that spelling feels right’, ‘that spelling feels wrong’…FEELS i.e LOOKS right or wrong…becomes an unconscious habit…then become instinctively good spellers, if take care first to visualize the correct spelling (the colors were just an aid to ensuring they were following instructions, like sorting apples for size and damage, when only interested in damage)…

Spelling visually is same as any other mental process…a representation of something ‘out there’ has to be coded ‘in’ the mind … we encode all our impressions as images, sounds, smells, tastes, textures, with all their submodalities i.e adverbs and adjectives of the senses…to recall or construct images we need to ‘access’ this coding mechanism…and the stored / encoded impressions e.g to construct a Pegasus, as David Hume reminds us, we will access the encoded images for ‘horse’ and ‘wings’, and then join them to construct a flying horse, a horse with wings… so the Pegasus is ‘born’…Schopenhauer wrote of ‘the world as will and representation’…we enter the world barely attached to our bodies and sense organs and the world…we have to learn to ‘separate’ and become an individual…learn where our bodies end and the ‘external world’ starts…to encode impressions which we will later come to ‘feel’ and ‘identify’ / ‘define’ as heat, light, sound, objects, tastes, flavors, smells…turning electromagnetic soup into distinct experiences … the ones we have sense organs ‘tuned’ to…from the infinite possible ‘equations’ of 1+/− 1 we construction, mentally, in our minds, all the particular ‘objects’ of our experience…our eyes are ‘tuned’ to a very narrow bandwidth of the electromagnetic spectrum, so we ‘see’ some of that soup. We ‘hear’ other bandwidths as ‘sounds’. We ‘feel’ other bandwidths as ‘solid objects’. We conjoin the bandwidths we ‘see’, hear, and feel into units we call ‘objects’. We use artificial sense organs like television and radio and internet ‘tunes’ to represent other bandwidths…or use them to transport encoded images / sounds, and then decode them into the bandwidths of our ‘natural’ sense organs i.e eyes and ears, so we can transmit and reproduce and store images, moving images, and sounds in formats our natural sense organs could not, themselves, re-decode i.e you can’t ‘read’ a DVD with your eyes, directly. So far. The question of ‘teleportation’ is the question of how to encode the conjoined visual / audio / tactile / sensate construct we call ‘solid objects’, transmit them using bandwidths other than those we ‘naturally’ encode them / perceive them with e.g for
broadcast / transmission on different bandwidths / frequency ranges of the electromagnetic spectrum, and then decode them again, and ‘re-build’ the original bandwidths…in the same way we digitally encode analog audio and visual bandwidths, then store or transmit these along very different bandwidths, and then receive and decode them, to once more REPRESENT them in the ‘natural’ bandwidths we call ‘sound’ and ‘vision’, and ‘texture’, and ‘smell’. We would be duplicating the ‘object’ rather than ‘transporting’ it. Effectively ‘cloning’ it. If we applied this process to sentient beings, we would immediately answer the question about the nature of consciousness. For if consciousness is, as the animists, and myself, posit, universal, then both beings would be sentient, having the experience of being this ‘self’ that has been reproduced. Like parents with their children. The ‘transmitted’ ‘clone’ would be like a ‘perfect copy’ child i.e one that is just like their dad etc…but a ‘new’ consciousness in their own right, beginning to have a unique experience, and thus ‘self’, from the very moment of transmission…exhibiting / realising different aspects of their shared genetic potentials, from the very moment of ‘re-representation i.e re-building a reproduction of the encoded, transmitted data … we already do this with 3D printing…except that our materials are limited i.e we can only REPRESENT certain paramaters / data e.g shape, size, weight … so far … we cannot represent the more detailed elements of an organism…simply because we can decode and encode an organism, to form a representation of it in different bandwidths of the electromagnetic spectrum, but when we come to reception, and decoding, we don’t have the MATERIALS to re-represent the forms…you can’t build organic tissue from plastic…of course if we learn to build up forms from atoms, and to fuse atoms, or simply supply a ‘3D printer’ with all the chemical compounds necessary, we might be able to ‘print’ an organism…at high speed…rather than the typical months and years of more ‘sophisticated’ animals…food, though, might be relatively easily ‘Represented’ in all its elements of texture, taste, smell, optics, haptics…

So if child is taught to take new word, and visually encode it, paying attention to how it ‘looks’ and ‘feels’, and being able to mentally recreate that visual, and feeling, they will have a benchmark for later comparison, when reading, or writing.

Sportspeople and musicians etc encode physical actions…sets of actions…in correct order / sequence…some do this naturally, as gifted athletes, musicians, artists etc…they intuitively / unconsciously pick up on things most of us miss…they are ‘tuned into’ particular visual, audio, etc cues…they can form ‘representations’ of things most of us are blind to, i.e do NOT form representations of…they can see and hear and feel and empathise with what the person they are modelling their own behavior on, consciously or otherwise, that most of us don’t…like how a golf pro holds their stance, their club, how they swing, what they do before, during, and after they hit the ball, follow through
etc…by observation i.e they can ‘represent’ the actions in their own representation systems, and thus reproduce that great swing, and the desired outcome…they can ‘feel’ when their stance, grip etc are correct, and when they are ‘wrong’… other people like me need to interrogate visually and via questions, to ask golf pro what they are doing, thinking, to break down their sequence of actions, to ‘grok’ why and how and what is going on…then lay it out like a exploded view of a gearbox, and then put it back together as best we can i.e using the representation system we have ‘gleaned’, to see if we have ‘represented’ it correctly and fully i.e the gearbox works, our swing is great and we get a hole in one…usually re-iteration is required to ‘hone’ our representation system of the sequence of actions i.e we ‘miss’ things the first few times we observe, and fail to notice key elements, fail to interrogate them…our representation system is not complete…we may think we ‘watched’ and ‘saw’ what the golfer did, but in fact we missed key things…we failed to ‘represent’ them in our minds…we didn’t see them … we learn to focus, attend to the details, and thus ‘see’ them…have those ‘A-ha’ moments…when we ‘see’ what was right there all that time…but which we were not ‘representing’ in our own minds i.e not visually encoding into images / movies / sounds…so a wine connoisseur ‘learns’ to represent much more than the average tippler…it is a form of ‘sensitivity training’…to more finely hone our representation systems…this is where linguists got carried away, claiming that if there was no word for a thing, you couldn’t THINK it…what they meant was ‘WRITE’ it…limiting themselves to a very narrow bandwidth of representation called ‘auditory and visual’ language…you can certainly FEEL things you have no words for, and then make up new words for them…like you make up new words for each type of tree, when it becomes of interest to distinguish more finely between tree types…

We may learn to ‘represent’ more bandwidths, like dolphins can encode, transmit, receive, and decode ‘sonar’ signals, or bats, or how dogs can represent a much wider range of ‘smells’ as distinct and discrete, and speak and read the language of scents much more fluently than humans…etc…

Difference between dysfunctional positive and negative hallucinations, and creative hallucinations e.g imaging new ideas, societies, images, sounds, music, art, stories, technologies and being able to ‘switch off’ i.e negatively hallucinate pain, ugly things etc, is being able to choose when and where to do these things, and to know WHEN you are imagining something and when it is ‘real’(sic). It becomes a problem when you can’t tell when you are positively and negatively hallucinating e.g that you are a bird e.g flights of fantasy Vs believing you can fly, and jumping off a building…or worse, believing you speak to, and for, some GOD…etc…
Also functional to be able to distinguish between real memory, and fantasy e.g. false memory syndrome ... or propaganda and reality...television and reality...fake news and reality...false flags and foreign terrorists attacks...

So Bandler asked people how they decided which memories were remembered, and which constructed...i.e to be able to teach people with mental disorders how to distinguish between their hallucinated experiences and ‘real’ ones...remembered vs imagined experiences ... e.g what is different about each that offers the ‘tell’ to the canny ... what is it that those with problems distinguishing between the two fail to notice / be aware of ... how is the ‘representation’ stored in the mind different ... what are the ‘tells’ ...

Insight is not enough. Just understanding WHY you fear dogs, or are miserable, does not teach you how to NOT fear dogs, be unhappy.

Bandler uses trance to install new habits e.g. of placing black borders around actual memories, so you can distinguish them from ‘imagined’ fantasies. And thus ‘represent’ reality with a black border, and fantasy without. Thus you have a new way of encoding and decoding, of representing the world of fantasy and ‘reality’.

I hypnotized this lady into a deep altered state and had her lift up her arm and go through the fantasies she had made up and put black borders around them. She had to do so with everything from killing her parents to any other fantasy, including the one she had made up in the room for me. I then told her that when her brain had gone through and recoded all this information, she could let her hand come down. When she opened her eyes, I asked her if she’s killed her parents and she calmly said no.

Bandler found that SOMETHING, SOME THINGS ARE TAUGHT BETTER IN A HYPNOTIC TRANCE, RATHER THAN A WAKING STATE...Some clients responded better while in trance.

Most chronic problems are just had habits formed in ‘one step’ learning. So he can replace / displace them with new habits in the same way...in 20 minute session.

Compulsive obsessives use rituals to manage anxiety, but the rituals require increasingly large amounts of time and effort to continue to provide the initial comfort ... like any drug habit...habituation means the ritual / drug becomes less effective...require more of it to produce same initial comfort / relief e.g. of anxiety, fear, depression, boredom ... and in case of anxiety, this symptom was intended to solve some problem e.g avoid some situation / threat / danger / negative outcome, and so the unconscious kicks in each time the person 'beats' it with a ritual (MHR religious rituals offer a socially acceptable outlet for many
people in many societies), the unconscious has to ‘boost’ and ‘ramp up’ the symptom i.e adding more anxiety to prevent / avoid the danger, and so the person has to ramp up their rituals, their ‘dose’ to counter the symptom … the unconscious meant well… it means well… it will continue to ‘outdo’ the attempts via ritual, to squash it… usually clients come in at point where the rituals are taking up so much time and energy it has become untenable to continue, they often simply find it absurd, and this either leads to a spontaneous remission of the obsessive compulsive disorder, or motivates them, in desperation, to reach out to a therapist… if they are lucky they land first time with a talented NLP practitioner… otherwise they often end up here after wasting years and thousands on ‘conventional’ therapies and even drugs…

Some people just realise how crazy their situation is, laugh at the absurdity, and as a resolve of will, finally decide to stop the rituals… leaving the unconscious in a position to be able to ‘ramp down’ the anxiety… but that still leaves the anxiety…

Of course clients sometimes revert to the old bad habits of thinking, and so they may need to come back months later to spend another 20 minutes having the new habits re-installed.

Reality can be sad, horrific, and painful. But the question is how we respond. Will we ADD to our suffering, or get on with our lives, responding creatively, productively, more optimally, to the strings and arrows of outrageous fortune etc… people will be mean, nasty, malicious, bad things will happen no matter how well be prepare, and respond. The question is about limiting the damage done to our belief systems i.e limiting beliefs that add to the suffering, limiting our options, choices, freedom, and joy. We can then respond optimally. Find creative solutions. Recover. Avoid repeating past suffering over and over, forever. Learn how to face challenges, and make important decisions, overcome obstacles to happiness, stop bad habits, stop obsessing on regrets and fears, learn strategies that ‘happy’ people innately follow, or have learned, by being luckier than you in terms of parents, friends, education, mentors, chance insights, positive experiences, natural talents, learned skills, chance observations… etc…

N.B there will be times in life you will feel like chucking it all in. Giving up. Throwing in the towel. Like Hamlet, wondering, seriously, ‘To be or not to be’. You can either use a crisis to motivate you to ‘finally do something’, or become a miserable wretch, hooked on pharmaceuticals, alcohol, other drugs, religions and other cults, and unconsciously and consciously year for death. Your behaviors will reflect this ‘thanatos’. They will come to define the world you create through your every action. For you. For your loved ones. For strangers. For other sentient beings.
Even if you choose death, euthanasia, you will have done so as the result of a generative, open, wide ranging, positive process of interrogation of your life. Your death will be dignified and honorable. And you will be in a ‘state of mind’ ready to take advantage of your next lives.

Key to NLP is to actually follow the instructions. Not just pretend to. Or imagine you are. Like the kids being told to give each letter a color, then asked what color the last letter had etc, therapists are valuable especially in this regard. Trainers and mentors are sensitive to the signals that you are or are not following their instructions via accessing cues, body language, temperature, skin color, lip size etc…when using ‘self-help’ guides, you will have to be as honest with yourself as possible…to ensure you have ‘represented’ every instruction appropriately in your mind, encoded it, and are actually following the instructions and doing what is necessary…which is why TROONATNOOR guides are so valuable…it takes a huge amount of energy, re-iteration, brutal self-honesty, testing etc to write copy that actually represents the sequences of actions in the ideal sequence, explained in the ideal / optimal way, that the representation the writer / trainer / coach / therapist has in their heads is actually represented, and in the optimal manner, so that this representation is actually shared, in the end, in the mind of the reader / client / student…THAT is true communication…most people miss so much in their explanations, because things are so clear and intuitive in their own minds…like talented people cannot explain HOW they do something…what actual sequence of steps they perform…it takes a talented observer..A zen practitioner, to observe, and actually SEE what they are doing…to be hypersensitive to everything…let it speak to them…no mental noise….to see what the talented person is doing…things most people, including the talented person, will never notice, due to their internal mental chatter, imposing their preconceptions, assumptions, prejudices upon the world, rather than actually observing it…representing it…encoding it… without filters, blinders, models etc getting in the way…

Conscious Vs non/un/sub-conscious mind. When we do something deliberately, with forethought, and intention, often with visualisations and internal voices, it is ‘conscious’. Worrying, regretting, imagining, planning, studying etc are all deliberate, conscious acts. However our minds process much more information outside of this conscious action. Sub-consciously. Or unconsciously. Like a computer computing / processing information. See T vol I.

We learn habits quickly, especially bad habits. Racism, sexism, ethnocentrism, species-ism, religious dogma, and other bad habits are usually ‘imprinted’ a.k.a ‘implanted’ in our minds before the age of 5, by significant others like parents, priests, and teachers. Later we learn bad habits like drinking and smoking from television and movies, and peers. We also learn bad habits relating to how we talk to ourselves, how we ‘frame’ the world, and how we think of ourselves, and
life. Habits like depression, hopelessness, despair, self-loathing, apathy, fatalism, anxiety, anger, and stressing out, are also learned, usually non-consciously, from the way our parents and other significant people treat us. Particularly traumatic or simply influential single events can also imprint limiting beliefs about ourselves and the world, often in the form of phobias, or more general free floating anxieties and low self-esteem. We ‘introject’ how others define us, into ourselves, and assume these definitions as part of our self-definition or identity. We reproduce these from moment to moment, reinforcing them, by selectively attending to those parts of our experience that are consistent with our initial conditioning, imprinting, and socialization. We act as if these assumptions are true, and produce self-fulfilling prophecies and nocebo effects.

Trance and other altered states can be induced and employed to bypass the resistance of the conscious mind to changes to these programs. The non-conscious can be directly communicated with, and allowed to seek out alternatives, and test them, then replace existing, sub-optimal responses with them…or at least providing alternatives.

Bandler found that all the typical trance phenomena can be achieved without hypnosis or trance, after modelling the behaviors of the most effective people like Milton Erickson.

Gregory Bateson and Marshall McLuhan had been working with Schopenhauer’s idea that we build mental / internal representations of external phenomena, especially with regards to mental wellbeing. This led to Bandler and John Grinder’s model of 5 main modes of representation i.e visual, auditory, linguistic, tastes, smells, and feelings, and their sub modalities. Basically all the adverbs and adjectives used with these modalities. We represent whatever it is that is ‘out there’, and possibly even our notion of ‘bodies’ themselves, and sense organs themselves, with the 5 senses, and form still and moving images, auditory data, touch, smell, and taste data. All in our minds. That is where our experience of reality is constructed. Perhaps even this idea of a ‘mind’ is itself constructed. And all that exists are thoughts and feelings and emotions, pleasure, pain, relief. See T vol I.

Our internal images are always in a particular position, with a particular size, at a particular distance from us. When we imagine or remember ourselves, we do it either from the perspective of our own eyes, so that we don’t see ourselves, but only our hands, body etc a.k.a ‘associated’. If we can see ourselves, as if e.g floating above ourselves, watching ourselves from outside ourselves, we are ‘dissociated’.

The sounds we make up, or remember, in our head, also have different qualities or sub-modalities.
We also feel feelings in particular parts of our bodies, when we recall or imagine experiences. We even ‘feel’ certainty, e.g. in our mid-section or ‘gut’. A.k.a you can have a ‘gut feeling’ about something. Or sense of ‘certainty’ or ‘confidence’. Or the opposite, a feeling of uncertainty, or mistrust. A feeling often starts in one place, and then moves around the body…. E.g butterflies in stomach, tension in neck/jaw/tongue/face, weak in the knees.

Internal voice is either your own, or someone else’s. Find out whose voice client is hearing in their head. And attend to directionality i.e on RHS or LHS, coming from far or near, LHS or RHS, loud or soft. Attend to changes that occur to this internal voice in the different states e.g conscious, trance, light trance, deep trance.

**Nominalisation** is key to NLP. We tend to turn processes, activities, what we are DOING, what client is DOING, into a thing, as if it is an object. As if we are passive, non-participants in the construction of this thing.

MHR this is the definition of **idolatry** in religion, and the ‘violence of language’ we attend to eliminating in Zen. We feel ‘frustrated’. A client expresses that they feel frustrated. They / We are turning a verb into a noun. A process, an action, into a thing. We have to reverse this process, and discover what we are DOING that is producing this state of frustration. Same for ‘I am terrified’. You cannot be a ‘terrified’. You can become, and remain, terrified. You can do something to become terrified, then continue doing it, to remain terrified. It is an action to become, and continue being, terrified. E.g in case of phobia. Same goes for general anxiety. What are you doing to bring on state of anxiety, and then constantly maintain it, reproducing it from moment to moment?

MHR today ‘government’ has been nominalized. It has become a thing we obey, like a golden idol, rather than process we can engage in actively, to direct ourselves through representative democracy.

I am fearing Vs I have fears. I am terrified of dogs Vs I have (at some past time, unconsciously) constructed a fear of dogs which I have maintained / constantly reproduced, to this day.

Our central nervous system is an extension of, and forms the bulk of, our brain, though we tend to identify thinking exclusively with the grey mass in our skulls. ‘Feelings’ are constructs of the entire brain. We ‘feel’ them in different parts of our bodies e.g heartache, gut-wrenching regret or fear or sorrow.

Bandler gets clients to rotate hand clockwise and anti-clockwise, to see which feels ‘right’ i.e to attend to and identify the direction of rotation of a ‘stuck’ feeling in the stomach or chest area. Once they can define any sort of movement at all, it is possible to change the speed, and direction of this movement. This
then gives them control of that feeling. Now they have the power to change the feeling. They can make it rotate clockwise or anti-clockwise, vertically or horizontally, faster and slower.

The qualities of each of the ‘modes’ of our reference system, the kinesthetic (touch), auditory (sound), visual (sight), gustatory (taste), and Olfactory (smell), the adverbs and adjectives we can use to describe them, are called ‘sub-modalities’. For example a visual can be moving or still. Large or small. Vivid or vague. Bright or dull. Far away or close. Framed or not. Tilted in any direction. To the LHS or the RHS of your ‘mind’s eye’. Moving in a direction, towards or away from you. And most importantly, you can be ‘experiencing’ it as a ‘dissociated’ observer, in which case you can see yourself, such as in the cases of ‘out of body experiences’ where people ‘float’ above themselves, or from your own p.o.v, in which case you will be seeing the visual as if from out of your own eyes, in which case you normally won’t be able to see yourself. It can be like watching a movie of yourself, or of being an actor in the movie.

As Hume reminded us, ‘reality’ is a question of intensity and vividness of impressions, whether these impressions are produced by phenomena external to us, or within our own minds. And ultimately ALL impressions are constructs of our mind, whether it is processing inputs from outside of our bodies, inside of our bodies, or merely imagined.

The more vivid and intense an image, sound, smell, taste, or feeling is, the more ‘real’ it becomes for us. So we can remove all power from a memory, or feeling e.g a fear, simply by changing the representation of it we have. E.g making the image in our mind brighter, more vivid, more intense, bigger, more detailed, or doing the reverse. We can even make it absurd, by changing the speed, fast forwarding or reversing it, changing the pitch of the voice, the size of the actors, or the distance of the image from us. By dissociating or associating as we make a representation more or less vivid / intense / real, we can make a recalled or constructed representation e.g a film of ourselves, more or less compelling, and thus ‘real’ for us. Thus we can give it power, or remove all power from it. E.g a terrible memory. A terrible imagined future event i.e fear / phobia. The power of some past authority figure over us. The power of some remembered event, or feared imagined future event, over us.

The basis of almost every spiritual practice has been to recognise that while we cannot change everything in the world, we CAN change how we think about it, and feel about it. To the point where a Buddhist can set themselves on fire and remain totally calm, and without any form of suffering. Suffering is not pain. Suffering is how we respond to pain. So rule number one in Zen is to avoid adding suffering to any pain you may experience in life. By re-living already experienced pain and thus maintaining it, from moment to moment, reproducing
it. By imagining future pain or possible problems. Being here, now, means you avoid both of these typical forms of suffering that plague us, adding to our suffering, over and above any pain the world has in store.

As all pain and pleasure are ultimately produced in the brain, YOUR brain, if you gain control of your brain, you can effectively turn pain off, and experience pleasure, completely independent of the ‘external’ world. Like the Buddhist monk who sets themselves on fire, but suffers nothing. Or the meditator experiencing absolute bliss. Or the lucid dreamer experiencing full body orgasm. All these states can be deliberately produced. By an effective therapist. Or by someone who has trained themselves to enter the same ‘altered states’, and by regular practice, can easily enter into, and maintain these states, at will.

Pain is just electro-chemical impulses. Feedback from the body and external world that something is wrong. You can chose to ignore these. To ‘block’ them. To prevent them being converted into the experience called ‘pain’. A certain percentage of people can be hypnotized / induced into altered trance states in which a dental or other surgeon can operate on them without any sedatives or pain killers. They will ‘feel’ no pain. They will not convert the electro-chemical feedback into the experience of ‘pain’. They won’t suffer. They won’t react to the cutting of nerves and flesh. They can remain as passive as those Buddhist monks on fire, for hours on end. If some people can do this, then it means it is possible for anyone to learn how to do it. Once the process of entering / inducing these altered states has been modelled, and laid out, like a roadmap, for anyone to follow…this is where Milton Erickson proved the ideal role model for Bandler and Grinder to use to model the processes of trance induction.

As all our ‘worries’ relate to future possibilities that have no happened, they merely exist in our heads. In our minds. In our imaginations. So to eliminate them totally, all we need to do is gain control of our imaginations. To displace and replace the imagined scenarios which we fear, and worry about, with positive, productive, motivating scenarios / imagined situations and interactions and outcomes, which leave us feeling positive about our future, optimistic, hopeful, and motivated to do what is necessary to get the most out of our lives and options. So we can turn fear of the future, pessimism, around. And begin looking forward to life, with the optimal state of mind likely to produce placebo effects and positive self-fulfilling prophecies, rather than nocebo effects, and downward spirals of self-destructive, counter-productive mind-sets and behaviors.

As all our regrets and the sources of all our phobias, low self-esteem etc exist only in the past, in our memories, and thus only exist in our imagination, again, we can totally re-write our past, to give us the experiences we would have
chosen, the experiences that more fortunate people had, with parents, siblings, peers, that lead to the optimal state of mind, attitudes, values, and habits.

This is the closest thing to a potential refutation of Buddha’s pessimism. It is not just Zen, which avoids suffering by attending to the here and now, but a positive step…a generative step…we can not only avoid letting past experiences, and possible future experiences ruining our present happiness, peace, calm, alertness, attention to the present impressions / phenomena…now we can actually re-program our ‘computers’ (brains are computers in the precise sense, as Hobbes described) … we can make our ability to imagine the past and future our best friends…assets rather than liabilities…which they are for the happiest people on earth…those who just happened to be lucky…we can all now have what up to now on the lucky few had…and have it consistently…everyone…

Think of a time when you felt really good. Now become associated. Step inside that time and see through your eyes, hear through your ears, and feel the really good feeling all the way through your body. Make the images bigger, brighter, more colorful, and you’ll probably find yourself feeling even better. Make the sounds louder and crisper, and if there are no sounds, add sounds. Start to intensify the good feeling. Next, find out where in your body the feeling starts and where it goes. Discover the direction it spins inside your body, and spin it faster and faster and, again, notice your feelings intensify. There lies the control you have over your brain to create powerful feelings inside of you. You can then attach these feelings to other thoughts. If you keep spinning this feeling inside your body and you think about your future while it's spinning, you will start to associate the feeling with your future. By doing this, you will start to feel better about your future.

**How to Feel Wonderful Exercise**

Think of a time you felt wonderful. Close your eyes and imagine that time in vivid detail. See the image clearly, hear the sounds loudly, and remember the feelings as they were then. Imagine yourself stepping into that experience and imagine being in that memory as if it's happening now. See what you'd see, hear what you'd hear, feel how good you'd feel. Make the colors stronger and brighter if that helps. Notice how you were breathing back then, and breathe that way now. Pay attention to the wonderful feeling in your body and get a sense of where the feeling starts, where it goes, and the direction it moves in. Imagine taking control over the feeling and spinning it faster and faster and stronger and stronger through your body as the feelings increase. Think of a time in the future where you could use these good feelings. Spin these feelings throughout your body as
you think about the future and the things you are doing over the next few weeks. Don't be too surprised if you find yourself feeling really good for absolutely no reason.

Similarly too, if you find yourself in a negative or unresourceful state, you can change your mood by changing the qualities of the feeling. For example, think about somebody who annoys you, intimidates you, or irritates you. Make an image of him and see him look at you in whatever way he looks at you when he is annoying you. Hear him say whatever it is he says and notice the bad feeling that happens in your body. Next, take this image and make it black and white. Move it far off into the distance. Make it much smaller, one-eighth its size. Place a clown's nose on his face. Hear him say whatever it is he says, but hear him say it in Mickey Mouse's, Donald Duck's, or Sylvester the Cat's voice. This changes the feeling you have toward him and allows you to deal with him with more confidence and effectiveness.

**Changing Bad Feelings Exercise**

Think about somebody who annoys you, intimidates you, or irritates you. Make an image of him and see him look at you in whatever way he looks at you when he is annoying you. Hear him say whatever it is he says and notice the bad feeling that happens in your body.

Take this image and make it black and white. Move it far off into the distance. Make it much smaller, one-eighth its size. Place a clown's nose on his face. Hear him say whatever it is he says, but hear him say it in Mickey Mouse's, Donald Duck's, or Sylvester the Cat's voice. Notice how you feel differently. Then distract yourself for a few moments and think of him again. You will still be feeling differently about him.

PRACTISE these sorts of routines until they become reflex, automatic habits. So that in future they become your new ‘knee jerk responses’, replacing and displacing the more typical negative habits most of us have. Remember there are no Zen MASTERS, only Zen PRACTITIONERS. A few people are lucky to have had the experiences and genetics that lead to behaving this way naturally, without the training we are offering in this guide. The rest of us have to ‘practice’ them consciously and deliberately, at least until they become our new second nature, and we get to join those lucky few ‘born naturals’, or those who ‘learned’ the same lessons from peers, siblings, parents, teachers, and coaches. Usually it was a combination of fortunate genes and nurturing. So for some of us it will come a bit harder, but that only means that WHEN we have gotten where we want to be, we will appreciate it, value it, and enjoy it, that much more.

**Beliefs.** Hume offers us huge insights into human nature, especially in relation to how we come to ‘believe’ something is true. Such as ‘free will’ and ‘cause and
effect’, when in fact these things are imaginary. Literally imagined. Even ‘objects’ are imagined. Impressions exist. But we construct ‘objects’ from them.

Most people don’t change their beliefs after the age of 5. Why? Imprinting. If the first thing a baby chick, immediately hatched, sees, is a snake, it will imagine that the snake is its mother. For us humans that in analogous to religious and political beliefs. Ideas like racism, racial supremacy, ‘chosen people’, religious dogma, gods, political ideologies, etc. This is why those who wish to indoctrinate others seek to ‘get em while they’re young. Up to the age of 12 almost everything you ‘believe’ will have become ‘fixed’ in your noetic structure or ‘representation systems’. Like an idol of wood or gold. Dogma. You will, from this point on, feel ‘certain’ about this belief. Even though it has absolutely no basis in reality. It will ‘feel’ real to you. The best philosopher of all time won’t be able to dissuade you. To ‘free’ you of that belief. To disabuse you of that belief. Unless of course they understand NLP. Which is why I am so excited to be working on this guide. It represents the culmination of my life’s work, and the work of the philosophers over the millennia. With especial kudo’s to David Hume.

Beliefs are traps. This is Zen 101. This is Jesus and Zarathustra and Buddha. They are the ‘idols’ the Old Testament prophets (forerunners to Jesus, critics of their contemporary society and religion) spoke of. Living processes nominalized into dead idols of wood and stone. Dogmas. Manifestos. Ideologies. ‘Last prophets’. ‘Final absolute categorical truths’. The living word of Jesus compared to the written, fixed, dead, lifeless, already decomposing, ‘written word’ of the Old Testament.

Belief is the enemy of all true skeptics. In the Humean sense. The original sense of the word. ‘Seeker’. A skeptic was originally a seeker of truth. Someone who never assumed to ‘know’ anything. And thus their seeking was a process. An activity. A practice. They never got trapped into any way of thinking. They rejected all dogma. They tested every theory continually. They never assumed they knew anything. They never closed their mind. They rejected all notions of ‘final prophets’. ‘Last words’. ‘Absolute, incontrovertible, timeless, facts’. They never idolized any idea, or its promoter. They never idolized any ideology or its prophet. They questioned everything. Always. They acted ‘heuristically’, ‘as if’ something was real, but never assumed it was. They acted as if ‘cause-effect’ relationships existed, but never claimed to be able to prove they did. They thus avoided all the traps and pitfalls of ‘certainty’ and ‘dogma’, while taking advantage of apparent patterns of cause-effect as a matter of pragmatism, convenience, and technological advance. They never believed anything to be certain. They never pretended to ‘understand’ anything at all. They remained dissociated from ‘knowledge’. Never emotionally invested in any idea, ideology, school of thought, religious cult, prophet, or even the impressions formed on their own minds by apparently external phenomena. They were free. Rather than
‘bound’. The term ‘religion’ comes from the Latin Religionare, meaning ‘to bind’. It is one form of mind control. One form of idolatry. One form of nominalisation. Like Grammar, which ‘fixes’ a living language, killing it. Like any ‘belief’ stops the process of open interrogation dead. Conclusion reached, case closed. Brain dead. Zombies arise.

Doubt is the basis of the thinking person’s approach to life. Skepticism. A positive attribute. A positive approach. To doubt everything, even the impressions of your own senses. To be practical, and interact with reality as it appears to be, while always being dubious that it really IS as it appears to be. That things are what they SEEM. And thus never falling prey to ‘belief’ and ‘dogma’ and ‘ideology’ and ‘religion’ and ‘government’.

We tend to selectively notice, attend to, observe, see, hear, and perceive, from all the infinite electromagnetic spectrum, only those elements of it that correspond to what already exists in our ‘model’ of the world, and our ‘selves’.

If you were ‘taught’ that you were dumb, ugly, unlovable, incompetent, lazy etc at an early age, you will tend to miss all the positive feedback in the world that contradicts this. You will only see, hear, and attend to, those signals that reinforce the IDEA you have of your ‘self’. It is an IDEA. So you can CHANGE it at any time you like.

You cannot change your genes. But you CAN change EVERYTHING else. Most people NEVER realise their full genetic potential for happiness, joy, pleasure, satisfaction, and ‘success’. This means there is a HUGE potential for most people to MASSIVELY improve their life satisfaction. In EVERY way.

Your sense of ‘self” is an IDEA. And this idea falls far below the reality, in most people. In other words the REAL potential ‘self” YOU have is like that part of the iceberg you don’t see. You have been pushed down below the surface. LIMITED.

Limited like the speed limiter on a sports car. Limited by BELIEFS you have had implanted in you. By conditioning. Conscious and unconscious conditioning. Some people like your government, priests etc deliberately lied to you. Others, like your parents, often merely, with the best intentions, reinforced those lies, transmitted them to you, without realising it.

Most schools ‘produce’ students to match their parent’s socio-economic status. So dumb-ass kids are conditioned to think they are clever, and entitled, while poor kids are conditioned to feel guilty for wanting anything good, are taught they are dumb, through lack of quality teachers and teaching materials, and an environment toxic and threatening and hostile to any sort of learning, let alone sense of well-being…students existing in fear of other students, and teachers, are
hardly in the optimal state of mind to learn anything but low self-esteem, negative expectations of themselves and life, and a sense of not being deserving of much from life...therefore great slaves...willing slaves...willing soldiers...

It is human nature to accumulate. To build on. To extend. Rather than to start from afresh every moment. This has survival advantages. If you become fully alert any time you hear a rustle in the forest, you are less likely to be eaten by a tiger. But if there are no tigers, and you are constantly ‘on edge’, fearful, expecting a tiger at any moment, and remaining in a constant state of hypervigilance, you will become a nervous wreck. Anxious. Fearful. Unable to concentrate. Unable to enjoy anything. Unlikely to be attending to the here and now. You’ll probably fall over a log and hit your head and die, because all your attention was focused on imagining tigers leaping from the forest and eating you.

People who have become conditioned to expect acceptance, approval, success, by their early childhood experiences, due to loving, caring, accepting, approving parents and others who provided them with all the skills and resources to facilitate success, will be living breathing self-fulfilling prophecies...they will selectively attend to all the positive signals of acceptance, approval, and see only opportunities for success in every challenge that comes their way. They will not attend to signals of disproval, rejection, or focus on the set-backs and little failures that mark any road to growth and achievement.

Most of us experiences the opposite. And have become hypervigilant to negative signals of rejection and disapproval, fear challenges as opportunities to fail, and obsess over our failures, producing living breathing negative self fulfilling prophecies...and then feeling hopeless, helpless...and despairing. We overlook our successes, and the signals of approval and acceptance that life, and others, offer us. These positive signals don’t fit into our model of our ‘selves’ and our world. So we simply overlook them. Like the wanderer who has been told that tigers are extinct, and assumes that that growling it hears in the forest is some harmless, cute, interesting animal they hope will come out to play!

Our models of our ‘self’ and ‘the world’ lead to positive and negative hallucinations. We see things that aren’t there, such as disapproval and rejection in the neutral eyes of a stranger at a party, and fail to see the positive approval and acceptance of that girl or guy trying to ‘catch our eye’ at that same party. Whereas one person assumes that the looks they are getting are looks of approval, another will assume they are critical. Often both assumptions are wrong. But the ‘reality’ of the person will have, in any case, been reinforced by the erroneous interpretation. One will think to themselves, ‘yep, I still got it’, and the other ‘see, no-one wants to be with me’. And of course anyone who has been around the lower socio-economic groups will be familiar with that ‘don’t look at me’ glare many people who’ve had hard and desperate, unrewarding, lives of abuse and
neglect have. They assume you must be looking for something to criticize in them, and cannot bear to be criticized any more. They are hypervigilant to criticism. They will read and hear and see it everywhere. And miss any positive signals of approval and praise. In fact they won’t even believe genuine praise, if all they’ve ever heard is sarcasm from critical parents, teachers, authority figures, peers, and family members.

Doubt is great. Doubt everything you’ve ever been told about yourself and the world. That is Zen. That is Humean skepticism. Those doubts open up opportunities in your consciousness to accept new definitions of your ‘self’ and the world. What I call T. Those doubts can let you cut the ties that bind you. That limit your freedom. That hold you down. That hold you back. That prevent you reaching your full potential for happiness, joy, prosperity, productivity, creativity, etc

Bandler investigated and interrogated what we call ‘limiting beliefs’. What qualities define them? How are ‘beliefs’ e.g. certainty Vs doubt, represented in the mind, and thus the central nervous system which is an extension of it, and which is connected to the organs? Consider the idea of ‘gut feelings’ or ‘gut intuitions’. How someone can ‘feel right’. Authentic. Genuine. Why you trust one person and not another.

Observe someone after you ask them ‘Do you believe X’. Let X be something most people are likely to believe with certainty. E.g. ‘Do you believe the sun will rise tomorrow morning?’ Where is their ‘feeling’ of certainty in their body? Their confidence in ‘knowing’ this for a fact. How is this certainty represented? In which modality? In what submodalities? Do they mentally visualize a sun rising? Check for the accessing cues as to what modalities they are accessing e.g. visual, and kinesthetic are most likely in relation to ‘sunrises’. Get them to locate the ‘gut feeling’. Where exactly does the representation reside? In every case some internal process will occur corresponding to that sense of certainty. A ‘feeling’. There will be a correlation that is made between the question and that feeling of certainty.

If I were to ask you verbally, "Is the sun coming up tomorrow?" where is the picture in your mind? Is it to the right or to the left? How far away is it? Is it life size or is it a small picture? Is it a still picture? Is it a moving picture? Does it have any sound? Is there any voice that says yes? Is there anything that goes on that you hear and, if so, is it on the right? Is it on the left? Take that feeling of certainty. Look at that picture in your mind and double it in size. Typically, when you do this, your feelings will grow stronger. When they do, notice where the feeling is in your body and which way it’s moving. By doing this, you are beginning to pay attention to the submodalities of a strong belief.
Next, think about something you're really unsure about. Not something you doubt utterly but something that "maybe is" and "maybe isn't." Think of something you're unsure of. It could be, What am I going to have for lunch? Maybe a tuna sandwich or maybe a cheese sandwich.

Look at the two choices in your mind. Compare the differences between the two. First, are the images in the same place? The answer is probably no. If the images are in a different location, then are they a different distance? Are they a different size? Is the voice inside your head coming from a different place? Is one on the right, one on the left? One going in, one going out? The only part of this that makes a difference is the part where the difference lies between the two images.

Submodalities: visual, auditory, kinesthetic (feeling), olfactory (smell), and gustatory (taste). Go inside and access the belief of the sun coming up and the other image of what you are uncertain about and go down this list. Only check off those submodalities that are different between what you believe strongly and what you believe less strongly.

**Discover How You Do Certainty Exercise**

Think of something that you believe strongly. (For example that the sun will come up tomorrow.) Notice what images, sounds, and feelings arise when you think about this belief and your certainty about it. Go down through the list of submodalities on pages 23-25 and note all the qualities of the belief. Think of something that you doubt or are not sure of. (Maybe this, maybe that.) Notice what images, sounds, and feelings arise when you think about this thought and your uncertainty about it.

Go down through the list of submodalities and note all the qualities of the thought. Note especially the differences between the strong belief and what you are uncertain of.

**Visual Submodalities:**

Sour
Bitter
Aroma
Fragrance

Pungency (strength of smell)

Your list reveals the differences between how your brain represents a strong belief versus something you're unsure of.

There are probably some things about yourself you want to change, and the first step is to make yourself believe that you can.

Look at your problem in the same place that your belief was and the first thing to do is to look at it and say, I'm tired of this. Over the years, I've discovered that the moment people really change is when they simply decide that enough is enough. Most people are not fed up enough with their problems. They may seem rustrated beyond belief. I've had people with obsessive compulsive disorder whose every moment, every morning, noon, and night, was consumed with rituals designed to find comfort. They had to lock and unlock the door fifteen times and wash their hands a thousand times a day, but they became so frustrated that they finally said, "Enough is enough. I'm just not doing this anymore." This is the moment people really change themselves. But we'll come back to this later.

The first thing we want to do is to take a look at what you want to get rid of and what you want to add. You want to get rid of your self-doubt and add more belief in yourself. You want to get rid of your fears and add more confidence. Whatever it is, when you think about your problem, you probably believed you were going to have it for the rest of your life. When you look at the belief that it is going to be here for the rest of your life, I want you to do a few small things with it.
Literally, push the picture off in the distance and move it over and pull it up into that place of uncertainty so, when you look at it and think, Am I gonna be stuck like this forever? You say, Ehhh, maybe yes, maybe no.

In order to make it stick in any other position, it’s important that you do this very, very fast. To make it so you can place this old, limiting belief inside your uncertainty, you have to take a hold of the image and do something with it. You have to push it all the way off so that it’s twenty feet away, move it across your midline, and pull it up on the other side into the submodality qualities of uncertainty so that what was a strong belief becomes uncertainty.

Then you need to do the opposite. You need to take the image of what you want to believe, such as that you will be free from this problem and happy and well in the future, and push this image out twenty feet, move it over, and pull it up into the position and submodalities of your strong belief.

This allows you to change your beliefs and begin to believe in yourself and in a brighter future.

**The Belief Change Technique (Belief Swish Pattern)**

Think of a limiting belief you no longer want to have. For example, that you will have your problem for the rest of your life, or for quite a while at least. Think of a resourceful belief you do want to have. For example, that you will be free from your problem for the rest of your life and live very happily. Study the submodalities of certainty and uncertainty that you have already elicited. Imagine the limiting belief you want to get rid of firing off into the distance and snapping back into the submodalities of the uncertainty. At the same time, imagine the resourceful belief firing off into the distance and snapping back into the submodalities of the strong belief. Repeat this a number of times, each time quickly. When you have control over what you believe, you can start generating new, resourceful beliefs.

**Putting your problems, bad memories, bad experiences, bad relationships, traumatic incidents, abuse, victimisation, regrets, bad luck etc behind you and ‘get over them’. Let go of the past. Free yourself from your own history. Unbind the chains that bind you, and limit you.**

Whose voice is it inside your head telling you you are inadequate? Unlovable? That you are going to be rejected? Make a fool of yourself? That you couldn’t bear rejection / failure so you can’t take a risk? Your own? Your mother, father, a bully, boss, television presenter, priest, enemy, friend? What does the voice say?

It doesn’t matter where the voice came from i.e original source of this limiting belief e.g you will never be good enough to be loved etc…You can simply take all the power away from that voice.

In Myra’s case, I simply had her turn up the volume of the voice. She turned the volume of the voice up and moved the voice closer. The voice was actually on the left hand side and it sounded as if it was about twelve or thirteen inches away. I had it get closer and louder, and she felt even worse. Then I had her move it further away and off into the distance, and it diminished her feelings. Next, I had her change the tone of the voice because I asked her a question: 'Did you ever hear somebody talk that you absolutely didn't believe, have no respect for, that had no influence on you, no power over you?’ I had her slowly change the tone of the voice to somebody she absolutely distrusted and wouldn't believe. I had her move the voice around to the back of her head so it sounded like it was farther and farther behind her. By doing this not just once, but several times quickly, she got control over what was creating the bad feelings.

It became important not just to give her control over the voice but to change her entire belief because years of experience had taught Myra that she was a worthless, ugly, nothing of a person, and the truth was, that was the biggest lie of all. So she had to think of lies. What I like to do is to ask people to identify the biggest lie they've ever been told. The one that, when they figured out it was a lie, was so much of a lie that even when they think about it now they get angry. I elicit the sub modalities of that just as we did in the inventory part of this book earlier. Stop now and think about something you no longer want to believe. Just like Myra, I want you to go through your list and find out first, where is the voice? Where is the picture?

I want you to take the thing you want to get rid of and I want you to compare it with the biggest lie you've ever been told. Compare it with the one you're the most angry about. Go back and forth and notice the differences in the locations of the images. Notice the difference in the size of the pictures. Whether they're movies, whether you see yourself in them-all the same distinctions that we went through in the inventory.

When you find the difference, I want you to take the thing you no longer wish to believe and push it all the way off into the distance, then move it over and pop it up on the other side so that when you look at it you know it's a lie and you're angry about it.
Then it's time to build a new belief. What would you like to believe? If you build a belief that you, like every other human being, are entitled to be happy, and are entitled to make friends, that will be much more useful. You still have to have a reference structure. You have to look at yourself and see yourself the way you'd be if you had grown up with this useful belief.

What if you were cheerful? What if you were happy? What if you realized you were pretty? Look at all those things so you have a direction to go in. You have to change that image and change the way you sound. You might have to change the way you walk and the way you look, so much so that when you look at it, you feel intense desire. You need to have desire for the future. You need to look at the past and decide the best thing about it is that it's over.

I'm going to say that over and over again. This is because through the years, I've gotten people to believe the best thing about the past is that it's over.

When they look at it, they may be angry about how silly they have acted and about the beliefs they had - how they learned them and who taught them - but this is still not going to help them to go into the future. What helps you go into the future is to leave the past behind and to create such strong desires that you want to move toward them.

Once Myra saw herself, I also gave her some suggestions. I suggested that she seek help buying more stylish clothes, stylish for the truly beautiful person she was inside and out, and that she go out and look at people who appeared to be happy, see the way that they acted, and adjust the images in her mind until she built a whole repertoire of possibilities for herself.

Overcoming Negative Suggestions Exercise

Think of something negative someone has told you or something bad you say to yourself. Think of someone you distrust who has told you a lie and remember how they told you the lie. Notice the sub modalities of the lie and the negative suggestion. Move the negative suggestion into the submodalities of the lie and snap it into place so you think about the suggestions in the same way as the lie.

Differences of Submodalities:

**Building Better Suggestions Exercise (Changing Personal History)**

Think of a more useful suggestion that you want to believe. Imagine yourself floating back in your time line to when you were very young and imagine hearing someone very convincing, who you really believed, saying this useful suggestion to you.

From inside this experience (associated) in the past, imagine yourself going through your time line, through every experience from this past experience to the present with this new belief in yourself, and notice how things change and how differently you feel in the light of this new belief.

When you get to the present day, you can repeat this with different suggestions and notice how, each time, you feel better about the past and who you are in the present.
MHR life is just a story. You can re-write it. It was random shit that happened. It wasn’t ‘to’ or ‘for’ some purpose. It wasn’t ‘karma’ or ‘punishment’ for some past life misdeeds. It was just shit that happened. To you. And you didn’t realise you had the power to rewrite your personal history, so that the new history you write offers you all the experiences and resources that more ‘fortunate’ people just happened to have, that you missed out on e.g loving parents, good honest friends, tutors, coaches, guides,… be your own guide / guru, using your newfound wisdom and understanding to go back and rewrite your history, so that it becomes the story you’d wished it had been…it is YOURS…fuck, the history of entire nations, like Germany, has been rewritten by the ‘victors’ of WWI and WWII, and the Jews. So you are entitled to rewrite YOUR history too. This must be the MOST empowering act you could do, now that you understand how limiting beliefs are imprinted / installed / learned, so quickly, and so randomly. Like life programmed you to survive long enough until you got to the point you are at today, right now, where you are empowered and able to program yourself…program your ‘self’, yourself. Re-imprint, un-install old limiting beliefs and install new, generative beliefs…positive and productive, more optimal…you can disabuse yourself of all the lies of bad parents, malicious teachers and false-friends, siblings, enemies, priests…the historians…all that shit…re-define YOU and LIFE based on your newly found wisdom i.e T ... read my books you fucking wild beautiful free fuckers !!!

You ‘get over it’ e.g a fear…get over a fear…it is something you imagine in front of you…in the future…anticipating some terrible potential risk / outcome…e.g when phobia of dogs, planes, elevators…there is no actual present threat…just the fear of a future outcome…so we are talking about something imagined…an imagined, and feared, outcome or consequence. The elevator or plane or dog has not attacked you or crashed. It is not in the process of attacking you or crashing. And yet you are anticipating just this, with your fear, anxiety. More common is a general sense of anxiety, worry, neuroticism. A generalized fear of future negative consequences / outcomes / misfortunes / accidents. All imagined.

The immediate reaction to a situation or object can be intense, as in a phobia, or gradually building up, as in general anxiety. In both cases the sufferer is doing something to ‘produce’ that affect. They are building images, movies, imagined scenarios, in their minds, and imagining terrible outcomes.

My migraines mostly come from an overactive internal verbalization and visualization of anticipated stressful interactions with people…or simply worrying about ‘is this a good deal / will I have buyers remorse’…so I understand I am building up muscle tension in my neck, jaw, and tongue, and even my ‘internal voice muscles’ and ‘internal vision eyes’. But understanding that tension is a product of my own actions, and processes, does not prevent me engaging in these actions and processes in and of itself. There is another step
necessary. The steps Bandler take which are efficacious, when mere ‘talking therapy’ that identifies a problem, and its source, i.e having breakthroughs and insights, don’t actually solve the problem i.e resolve the issue i.e remove the symptoms e.g migraines, phobic responses, anxiety.

One person out of 100 might be ‘scared’ of flying. But the other 99 are doing something different when they think of flying, or enter a plane. The ‘phobic’ person is imagining, visualizing, and more, all sorts of terrible possibilities. The others are thinking of their destination, of the inflight movie, meals, and drinks. Maybe checking out the flight attendants. Looking forward to what they plan to do at their destination, and the flight itself.

Fear of heights is fear of falling. So if you imagine you are falling, i.e imagine you are going to fall, and visualizing and feeling this terror of falling, you are going to feel scared. But it is a misnomer to call it ‘fear of heights’. It is fear of falling. Or fear of a desire to jump. Either way you imagine you are going to be falling, and so feel what you would if indeed you were falling. This is what is going on in the head of someone with ‘vertigo’ / ‘fear of heights’. They are scaring themselves with these terrifying thoughts and sensations.

A fear of a spider is really a fear of being bitten. You imagine every spider is going to attack you. It is your imagination that is terrifying you, not the actual spider.

Bandler interviewed hundreds of people to find out how they had gotten over their phobias. A common thread was that they had ‘gotten fed up’ with their fear. Bandler modelled the successful self-cures and then streamlined them into the following process.

You specifically pick five times where you felt really stupid about it. Run the first memory, then the second memory, and then the third memory, and then the fourth memory, and then the fifth memory. With each one, make the pictures bigger and closer and brighter and louder until, when you look at it, and when you see yourself in these memories, something happens. I want you to look at it to the point where you just say, "This is ridiculous."

If you run through all five and go back to the beginning and run through all five again and go back to the beginning and run through all five again really, really fast, what will happen is that you will begin to feel fed up. There’ll be a point where something inside you says, Enough is enough.

**Enough is Enough Pattern (Threshold Pattern)**

Think of five times where you felt embarrassed by having your fear. Make a movie of the first time you felt this way. Then the second time, third time, fourth
time, and fifth time. Put all the times together, one after the other, in one continuous movie of you looking ridiculous, being scared with this fear.

Make the pictures bigger and brighter as you run the movie of all five times in a row and you see yourself looking ridiculous. Run the movie over and over again until you feel really embarrassed by yourself. Do this to the point you start to say to yourself, This is ridiculous! Enough is enough.

The next thing you can do is to make a still image of yourself in the situation where you're afraid. Imagine you are sitting in a movie theater with the still image on screen. Then imagine floating out of yourself in the chair so you can look down and watch yourself, seeing yourself being afraid. Then start the movie. It's like you're in a balcony watching yourself in the theater and you're in the film. Now as you look at yourself being afraid, I want you to stay in that third position and in your mind looking at yourself being afraid and say to yourself, That's ridiculous. As you look at yourself being terrified, watching yourself being terrified, something inside you will feel different. Run all the way to the end of the episode, float back down into the theatre, float into the movie, and then run it backward so everybody walks backward and talks backward, and throw in a little circus music so it's as ridiculous as it could be. Then, clear your mind for ten minutes and then go back and think of what you were afraid of You will be amazed to discover that your fear has severely diminished if not disappeared entirely.

Fast Phobia Cure Exercise

Think of a phobia you have. Think of a time when you experienced that phobia (or the imaginary situation that defines your phobia). Imagine yourself in a movie theater, watching yourself on the screen going through the scary experience. Imagine yourself in the projector booth of the theater, looking down and watching yourself looking at yourself in the cinema screen going through the scary experience. Run the movie to the end to where you have successfully survived the experience, and then imagine floating inside of yourself at the end of the movie. As you stand inside yourself at the end of the scary movie, imagine running it backward so that everything goes backwards. You are walking backward, talking backward, moving backward and hear circus music in your mind as you do this, until you get to the start of the movie to the point before you encountered the experience. Then think of the phobia and notice how you feel differently. Repeat steps 1-5 a couple of times. Notice the difference in your feelings when you do this and you think of the phobia, and notice how you don't feel that phobia any more!

You can add a little laughter to that. You can, this time, look at a high place so you immediately go to that height. I took people to the Mandarin Hotel and I tickled them so they giggled a little bit and then I led them toward the edge of the
bridge and had them look down. At first as they looked down, of course, they'd feel a little trepidation, but then I would have them step onto it and take another step and another step, with another tickle and another laugh, because everybody says that you're going to look back and laugh at your problems. My policy is, why wait? If you're going to look back and laugh, you might as well start laughing. Laughter produces endomorphins that are an important part of changing your mind. The more you laugh at what you're afraid of, the more chemicals go into your body. Even if it's artificial laughter, it doesn't matter. If you can stop now and look at the same picture in your mind that scared you and not be afraid, then you're ready for the next step. So, get up from your chair and go out and test it and test it and test it and, bit by bit, it will simply disappear.

Laugh Away Your Fears Exercise

Think of a time when you laughed your head off one of those times when you found yourself laughing and it was impossible to stop. Remember how it felt, what you were thinking and feeling vividly. Start chuckling to yourself as you do this until you are laughing continuously. As you giggle away, start thinking of the thing you used to fear and notice as you laugh how it begins to change in your mind. Notice that, as you laugh, when you think about it, the submodalities of the fear change in front of your very eyes, as does the way you feel about it!

Fear of public speaking...hypervigilance re: impression YOU are making, Vs attending to audience i.e self-conscious Vs conscious of others...focus on THEM to relieve own anxiety i.e take OWN focus off self...attend to reactions of audience i.e cues as to whether they are following you or not i.e is your message being received? When focus on own fear, it spirals and feeds back, producing reinforcing loops, amplifying your fear...

Bandler asks participant ‘Where does that fear start?’ In your fingertips, your forehead, throat, top of your chest? If it ends up as a knot in your stomach, does it spin clockwise or counter clockwise, to the right or the left? Has them put their finger on stomach and motion clockwise, and anti-clockwise, to see which resonates with them i.e which direction. Once know the direction, they can speed up the rate of spin, and feel the fear grow, i.e you are amplifying it like with notch EQ...This is a good thing because now you're in control of your fear.

Once you are doing this, visualize the circle so it's spinning forward or backward, whichever way the fear is moving, and see a set of red arrows moving in the direction in your mind. Once you do this, stop moving the circle in that way, turn the circle blue, and spin it in the reverse direction. As soon as you start to spin your fears backward, they're no longer fears. In fact, it creates a good feeling. You spin it faster and faster and faster. Then you can walk up onto the stage and turn to face people. This isn't just a good way of getting rid of your public speaking anxiety, it's a good step to get rid of that fear of heights. It's a good step
to getting rid of that fear of bees or the fear of snakes. As long as you maintain that spinning direction, and spin it faster and faster and faster and faster, suddenly the brain, at the unconscious level, begins to recode the experience. When you try to get back to having your old fear, you'll discover that it's a very difficult thing to do.

Reversing Anxiety Exercise (Neuro-Ifyptonic Repatterning)

Think of something that makes you feel fearful or anxious. Notice which direction the anxiety spins in your body, and visualize it using red arrows that point which way it moves. Imagine taking the feeling outside of your body, turning it around, changing the arrows from red to blue, and pulling it back in so the feeling spins in the opposite direction in your body. Keep spinning the feeling faster and faster in the opposite direction in your body as you notice yourself feeling differently. Think of something that makes you feel really comfortable. Notice which direction this feeling moves in. Spin this comfortable feeling as you imagine the experience going really well and working out perfectly. As you do this, look at what you can see in front of you in the present moment, what you can hear and what are all of the things in the real world that you can pay attention to.

What would I have to do in my mind in order to create the kind of anxiety that you do?"Then I told him, for example, when I think about talking to an audience, I imagine an audience full of bright-eyed people just ready to learn and excited. I said, "Is that what you do?," and of course the person shook his head and said no. He told me that what he saw was little bodies with great big heads and unblinking eyes, and he literally heard himself stuttering over words, so he planned for how he was going to do badly.

Most bad memories are life-size. When you have life-size bad memories, you can change them by doing the following: shrink them down and put yourself in them so you can see exactly what you were wearing (turn the pictures sideways and then play those memories forward and then backward). This will help you change the way you feel about them. Being able to play these memories forward with circus music and backward with silly music allows the feelings to become separated from the images and the memories will no longer haunt you. The purpose of memories is to learn from them or to enjoy them or to use them as guides for your behavior, and it doesn't help to relive trauma. Over the years, I've helped many, many people whose lives had been crippled by traumatic experiences to get away from the memories. If you're holding on to bad memories, it's now time to look at them and shrink them down. Another thing to do is to freeze frame the memory. I know that sounds crazy at first, but the best thing to do then is to jump to the end, freeze-frame it and literally grab a whiteness knob in your mind and turn it very quickly so that it goes blank-
out white, phhhhhp. Very quickly, so the whiteness literally replaces the memory so you can't see it. It's like taking the brightness knob on an old television and turning it suddenly all the way up or using that white fade-out on your camera. You do this two or three times and then very slowly bring the picture back into focus, only now make it so that it's maybe eight inches by eight inches. Look at the last image and then run it backward to the beginning so that people walk backward, so that the sounds are like playing a tape recorder backwards. In fact, if you can, spin your feelings in the reverse direction.

As I've already talked about, feelings always tumble forward or tumble backward. Remember, sometimes they feel like a knot inside your stomach, but even a knot couldn't remain still or else it would habituate. So if you move your hand in a forward circle, a backward circle, to the right or to the left, you'll find out the direction of the motion that allows you to maintain your bad feelings—and literally freeze those and turn them in reverse, make the pictures move in reverse, make the sounds sound like they're in reverse.

Make it happen very quickly like you're rewinding a movie right back to the beginning and then project yourself outside the image so you can see yourself unhappy. See yourself being tortured, but it's a little picture and then move it off into the distance.

**Changing Your Bad Memories Exercise**

Think of a memory you want to stop thinking about. Notice the submodalities. Freeze-frame it and shrink it in size. Skip to the end of the memory and freeze-frame it, and imagine a whiteness knob and grab it, whitening it out really quickly. Repeat this three times. See yourself in the end of the movie and run the movie backward, seeing the sights backward and the sounds backward and spin the feelings in your body in the opposite direction. When you try to think of the bad memories, the more you do this, the harder it is for you to remember them.

It may take a few tries but over time it will be effective. Go back to the first bad image. Not the life-size one but the little one and push it off into the distance and suddenly pull up the new picture in its place and then make it life-size. Look at how you want to be, and you end up replacing your fears with your desires. It's a mechanical function because you need to talk to your neurology. You need to tell it what you want it to see, what you want it to feel, and whenever it shows you a picture from the past that you don't like, you need to make it an instinct to white it out and put up a picture from your future of how you want to be.

This will instruct your neurology which direction to go in. There is a tendency for some people to look at the past over and over again. Even in therapy, people going through it over and over again instruct the neurology that this is what they want. Until you start to look ahead with desire, it's very hard to get away from the
past. The more you look at the bad things, the more you relive the bad things, the more familiar it gets.

The strongest instinct in human beings is not survival. Virginia Satir said something to me that has resonated with me for forty years. She asked, "What do you think is the strongest instinct?" Like a robot I responded, "Survival." For me, it had always been the strongest instinct. She said, "No, Richard. The strongest instinct in human beings is the need to look at the familiar." People are terrified of the unknown. In fact, sometimes people will rather kill themselves than look at new things.

MHR … validation of your reality is comforting…Vs challenges feel threatening…like fear of going mad!

The techniques I'm describing to you aren't techniques that you just do once, but things that you run over and over and over in your mind till they become familiar, to move away from pain and move toward hope. The more you move away from pain and white out your pain and see yourself in your pain-and the more you look at yourself doing the things you want to do-the more you'll begin to change your direction.

**Feeling Better at the Right Times Exercise**

Think of your timeline and imagine floating above your timeline so you can see your past running to your future. Imagine a time when you felt absolutely wonderful, where you laughed and you felt like everything was going to be all right, that life was wonderful. Remember it vividly and spin this great feeling inside you. Once you have done this, imagine yourself back above your timeline with this feeling in your possession.

Give this feeling a color and imagine having a powerful hose with this feeling in it ready to burst out. Look down at your past. In your past, see your past stretching out to the time you were born and see all the memories you have ever had. Notice the bad memories are all colored black. From above your timeline, imagine firing this feeling through your hose at your past and cleaning all of your experiences, including the black memories, and watch as they change color and no longer look the same.

Imagine floating back into the present, and look toward the future and again fire this feeling all the way through your future so you start to get more and more excited about it and feel really great about what lies in store for you.

Grief is natural and healthy, if of relatively brief duration and is 'gotten over' or 'put behind you'. Enduring grief can debilitate and sap your strength, enthusiasm, happiness. It can become like a phobia of happiness i.e fear of attachment as
Buddha would say, to anything. To happiness itself. For the experience can ‘imprint’ the ‘unenduring nature’ of all happiness, and the necessity of loss, and thus future grief, as the cost of any present joy. You can become a true Buddhist, and reject life, if you chose.

But other options exist. To learn to accept loss and grief as a part of life. To accommodate it, without letting it contaminate your present joy and future anticipated happiness, like a toxic poison.

Loss happened. It belongs to the past. The lessons learned however belong to the present and future. Attending / focusing / dwelling on the past loss deprives you of present attending to present joys, and future happiness. Optimistic people naturally appear to have ‘short memories’, and a focus on the present and future, in which they imagine good things happening to them, around them, to their worlds. This motivates them to put in the effort, sacrifice, and risk required as the ‘seeds’ of future harvests. This allows them to enjoy every little piece of good that comes their way in the present. To enjoy every good they have in the moment, here, now. They focus on the good they have. The joy they have. The positives they enjoy. They learn from negative feedback, as a lesson, without dwelling on the content that brought that lesson, especially when ‘experience is a very expensive teacher’ i.e the high cost of wisdom. They imagine, in all representation systems, the good they enjoy, and expect to enjoy, and produce self-fulfilling prophecies of a sober nature i.e Vs illusion that you can simply imagine being successful and wealthy and happy, without actually investing the time, energy, effort, risk, and sacrifice and ‘attract’ good fortune, as if goods and services are just spontaneously produced the by universe, and that other people are not involved in their production i.e the expectation and entitlement to enjoying the fruits of other people’s labor, effort, sacrifice, risk, which is an abomination. By definition slavery. The law of attraction would more rightly be stated as ‘I am likely to attract success, wealth, happiness, peace of mind, by investing the time, energy, effort, risk, and sacrifice in those processes that produce the goods and services and states of mind I seek’. Just sticking up a photo of a Lamborghini or supermodel and rich pop icon above your bed won’t lead to happiness. That is masturbation. Illusions sold by peddlers of lies, from Madison avenue to fake guru’s and cult leaders, including the Pope, and Karl Marx.

Many people face terrible experiences, such as the loss of a loved one to a painful, slow, death of cancer. Or the sudden death in a car accident. Or the slow death from alcohol and tobacco. All of these are millions of times greater threats to your ‘security’ than any terrorist. But consider the measures put in place at airports, compared to the measures taken to reduce alcohol, tobacco, or even air pollution.
Of course one likely explanation for why we incarnate as animals, in the first place, is to experience emotions, feelings. To have experiences. And experiences can all be reduced down to pleasure, pain, and relief, and the expectation / fear of / hope for, these. So ‘indulging’ in grief can be considered a reason for existence, as much as indulging in excitement, pleasure, satisfaction, anger, even regret. Being ‘self-indulgent’ can of course irritate others, and be counter to their interests. Or they can profit from it. Depending on which, other people’s grief will be entertained and encouraged, as in the mass media and government encouragement of fear of terrorism totally disproportionate to the risks, or on some incident, totally disproportionate to the impacts and significance, or barely tolerated, and actively discouraged and sanctioned. Such as peaceful protestors protesting against the war crimes of their own governments in the U.S, U.K, and E.U.

We have to behave responsibly with grief as much as with the satisfaction of any other drive, urge, or impulse. From sexual pleasure, to intoxication with drugs, to intoxication with the thrill of driving a car hard and fast, to the pleasures of eating, to the desire for wealth, prestige, status, and power. Any impulse can become a hazard to the private and public good if not managed. Ideally self-managed. Otherwise managed by ‘society’. By ‘policing’. The same goes for the masturbatory self-gratification of ‘chosen peoples’ sense of entitlements to rule over, and enslave, others, whether the basis is in some origin story such as the Old Testament / Torah / Talmud, or some other form of racial supremacist propaganda such as Nazism.

Grief can poison our enjoyment of our ‘past’, by clouding out all the good times. Most people would not accept, as the price of losing all their bad memories, the loss of all their good memories. So we need to refocus on the good, and leave the bad to fade. We can speed this process up. Time heals all wounds, naturally. But sometimes it can seem to take forever. So we can add the catalyst of various NLP exercises to speed up the process.

Mental images in which we are associated are more powerful than ones in which we are observing ourselves, detached, as an observer, in a dissociated frame or p.o.v / perspective. It is the difference between being the players in the movies we run and re-run in our heads, and simply watching ourselves from the audience, watching ourselves in the movies playing in our minds eye.

It is the difference between genuine empathy and mere sympathy. Actually feeling the pain and pleasure, like the harmonic resonance of a bridge, or a guitar or piano string, that occurs when you produce a certain frequency of oscillation in the air, or the bridge, or a component of an engine. Compared to merely observing another’s suffering, without genuinely feeling it. We can identify with a character in a movie, or novel, so much that we twinge with fear and pain when
they are struck, or about to suffer some calamity, as if it were happening to ourselves. So there is always a continuum between true empathy and mere sympathy.

So by dissociating from anything, we can become more aloof, rational, calm, and unaffected by what we observe. Even as it is happening to ‘us’ on the screen, in our mind’s eye. We can watch as a neutral, detached observer with much less investment in the outcomes.

[MHR dissociation is often necessary to ‘help’ people. A surgeon cannot empathise with the patient while cutting them, and stitching them. They need to learn to dissociate, to be effective. Empathising with someone, imagining how it must feel to be cut and stitched, will interfere with the operations required to help the patient. Compare this to the sociopath who has no empathy or guilt. Of course the elites of most society’s will claim they are acting in the interests of their ‘client populations’, ‘being cruel to be kind’, and claiming ‘the ends justify the means’, when in fact they are either merely trying to assuage their natural, if numbed down, sentiments of guilt and empathy, or are natural born sociopaths. Sociopaths make up around 2% of the population, and tend to rise to the positions of greatest power, due to their ability to behave cruelly, opportunistically, and brutally, without suffering any guilt or empathic pain, either through conditioning and deliberate numbing, or by virtue of being born a sociopath. Most mass murders a.k.a ‘political leaders’ and ‘kings and queens’ dissociated themselves from the suffering they inflicted on millions of people. It was not ‘real’ for THEM. No more real than watching a movie. No more real than ‘The Holocaust’, which only exists in movies, and never actually happened.]

Constantly reliving bad experiences in vivid detail, large screen format, as David Hume reminds us, is basically the same, from our brains p.o.v, as actually experiencing them over and over again. The mind makes no distinction between vividly imagined experiences and ‘actual’ ones. It is purely a question of how vivid and detailed, and compelling, the ‘experience’, the ‘impressions’ are. All ‘external’ impressions are ‘inputted’, then encoded, then decoded, so that the final experience ALWAYS happens in the brain. In the mind.

Consider how vivid your dreams can be. How real. So real that you orgasm, or can have a heart attack, or wake up with a migraine, or cramp. Everything we experience, ultimately, is constructed INSIDE the brain. So reliving or imagining bad things is exactly the same, for all intents and purposes (I prefer intensive purposes, as a typical working class person I’m told!), as HAVING it ‘for real’.

This is the demon that plagues us, and the angel that saves us. For it means we can become imprisoned and tormented by our imagined and recalled experiences, and end up in despair, feeling hopeless, even suicidal, or we can become
empowered, entertained, pleasured, and satisfied, and thus motivated, by imagined and recalled experiences.

Actually all ‘recollections’ are of course ‘imagined’ too. They are constructs. What REALLY happened and how we experienced it, encoded it, and decode it, and thus ‘recall’ it, are usually very different things. Just ask a dozen ‘eyewitnesses’ to a crime!

What Bandler adds to the whole Zen and David Hume thing is this. YOUR life is just a story written by random events. The content of your past is irrelevant. What you ‘learned’ from it is important. What beliefs about yourself and your world that were imprinted are key. The way these experiences, and how you experience them, conditioned your reflexes, your unconscious, automatic nervous system to react or respond to external stimuli. To ‘interpret’ the world around you. To define yourself and your world. Your ‘beliefs’ are often quite erroneous and unjustified in the sober light of ‘reality’. Of skeptical, scientific, rational, sober, reasonable calculation.

Clearly you have much greater chance of dying of lung cancer or liver cancer from smoking and drinking, than from the results of your governments war crimes against other nations, which rarely, for some strange reason, hardly ever come back to bite the U.S, U.K, or E.U. Sitting as a passenger in a car is much more likely to result in injury or death than swimming where sharks are known to hunt their prey, or flying in a commercial passenger airline. Just try to avoid one slated by the C.I.A / Mossad for a ‘false flag’ attack to be blamed on Libya, or Iran, or Russia, or whoever they want to foment war with.

If we learn from Skepticism (from practitioners like David Hume), and Zen (from practitioners like Eckhardt Tolle), and from Psycho-Cybernetics, we can understand that ‘reality’ is constructed by our minds, actively. WE can have NO knowledge / certainty whether anything other than our own thoughts exist. Science tells us that ‘external reality’ is nothing more than electro-magnetic soup. We take narrow bandwidths of that soup to produce ‘impressions’ in our minds. These impressions include sounds, images, smells, tastes, textures etc. But there is no way of knowing if objects actually exist ‘out there’.

Our eyes are ‘tuned’ to a very narrow bandwidth of the electro-magnetic spectrum. What we call ‘visible light’. The same goes for our ears. And our ‘sense’ of touch. ETC…

MHR often I am distressed / frustrated by being around people I cannot help...though could if they would let me, if I could communicate with them, get them to ‘see’ reality, and what would be best for them...so that, not being able to help i.e respond, but still feeling empathy, and response-ibility without response-ability, I loathe interacting with them...and visualize all the stress etc of an actual
interaction when anticipating having to interact with them...go through scenarios, try to find the ‘words’ to deal with THEM, to reduce negative impact on ME, and try to help them, or at least avoid them damaging / harming / hurting / exploiting me...so suffer migraines etc i.e tension in neck, jaw, tongue, face, tension headaches...so produce what tried to avoid via anticipation / planning / running possible scenarios and how optimally to try to respond positively...etc...expect to be irritated...self-fulfilling as they ‘read’ my irritation, shortness, attempts to avoid them, get out of interactin...free to impute negative motives...when simply self preservation...I’m not willing to sacrifice myself to subsidise their stupidity, arrogance, selfishness, egotism, corruption, sense of entitlement, desire to ‘cut down tall poppies’ as if doing so will help them, and as if it is a crime to be smarter, more conscientious...which it IS to them...who want to pull everything down to their level, so their level feels ‘normal’ i.e assuage own guilt...etc...so work out strategies...Erickson granted his unconscious resources confidence / efficacy i.e didn’t worry about ‘what he was going to say or do’...reminded himself that his unconscious would come through for him...it was one of his ‘therapeutic tales’...

N.B metaphors are ‘Gestalt nodes’ in brain that activate / trigger a whole set of connections / associations i.e ‘loaded’ language...like you see outline of some shape in a window...and the Gestalt / wholistic impression of ‘girl’ is triggered, and the actual information NOT there is added, to complete the assumed Gestalt of ‘girl’, and you ‘see’ a girl in the window, which is just a plant...same happened with a few hanging plants on other side of flat...really felt / looked like someone was standing there, staring at me...took days to shake this off, when light angles / quality changed and I could make out several distinct shapes i.e of hanging plants and window boxes...’Loaded’ language, like metaphors, trigger a whole host of connections not always shared...and often unintended e.g a racial slurs, criticisms, sarcasm, innuendo, sexual meanings...for the interlocutors.

Need to make habit of associating with, and making as vivid as possible, the good memories, and dissociating from, and shrinking, removing to a distance, blurring, removing power of, bad memories. So focus and attend to positive, accentuate the affirmative, motivating memories. Change your history and thus escape it. While retaining the ‘lessons learned’.

Zen and NLP about gaining benefit of experiences as learning lessons, without reproducing / holding / carrying / prolonging the suffering. To gain the benefit of negative feedback that pain represents e.g pull hand away from flame, and avoid putting hand too close to flame in future, Vs constant phobia of anything with a flame, or associated with fire. To ‘feel’ the pain, but not to ‘suffer’ from it any more than required as negative feedback. I.e to learn the lesson pain and other negative experiences have to teach us, to retain that information soberly, without
becoming a victim of chronic suffering e.g. chronic fear, unreasonable, irrational etc…

Any time you vividly recall or construct a scenario, as far as your mind, brain, and central nervous system, and thus the organs of your body, are concerned, it is actually happening right now. You can measure the reality in pulse, heart-rate, breathing, flushing of skin, dilation of pupils, direction of gaze, dryness of mouth and throat, perspiration of skin (especially palm sweat, armpit sweat etc), posture, tension in muscles (preparing for fight or flight), hypervigilance of all senses as keenly seek to identify potential sources of threat (fear) and opportunity (excitement), sexual arousal with increased blood flow to sexual organs and heightened sexual sensitivity of erogenous zones, release of pheromones, adrenalin, and other hormones and brain chemicals, release of endorphins…in other words there is no difference, as David Hume established, and modern science has confirmed, between a vividly imagined (constructed or remembered) experience, and a ‘real’ one. They both ‘occur’ here, now. And so by reliving terrible experiences, you really DO re-live them. If you make a habit of it, you will be living with chronic stress, anger, hate, fear, heart-ache, loss, tragedy, anxiety, hyper-vigilance, numbing, … and suffer all the dis-eases that plague people living in ACTUAL conditions which would justify such reactions. The body is hyped up for flight or fight, but can do neither, as the ‘threat’ is imagined. It can’t be ‘outrun’ or ‘fought’, because it is a phantom. You have to go into your mind to defeat this enemy. To replace it with glorious, joyful, positive, nurturing, relaxing, easing, calming visualisations / fantasies / memories…

And so we can stop fixating and attending to, and reproducing, the bad memories of a person’s death, and replace them with the good memories of their life. And thus deal with the grief of loss. To genuinely honor a person’s memories. (MHR questions of guilt ?)

We all have ways of sorting out where the future is and where the past is. If you think of something that happened six months ago and something that happened a year ago and something that happened five years ago, and literally draw a line in your mind between those memories, you’ll discover that there’s a distance. We all measure time with distance in one form or another. The trick is to take the bad memories and to push them off into the distance, so they go into the past where they belong. If we hold on to memories as if they’re happening to us now, then they WILL be happening no.

The best thing about the future is that it’s in front of you. The best thing about the past is that it lies behind.

**Getting Over Grieving Exercise**
Think of all the memories you have of the person who has passed away. Remember all the good memories about being with them by being associated in the memories. Feel them as if they are happening now. Remember all the bad times by looking at yourself in the image. See yourself going through the experiences in small images, which is like watching yourself on a small, black and white television screen. Take your time line and imagine a line stretching way behind you that represents certain times from your past you have forgotten and never think about. Imagine taking all of the bad times with this person and placing them all on this line way off behind you. Imagine a wonderful future in front of you where you honor their memory by living as fully and as happily as possible.

Decide, first off, to build a new belief that you deserve to have a good life. This is so important, but most people don't do this enough.

I worked in a shelter for battered women. What amazed me most about it was that these women had been beaten up, bruised, and given black eyes yet they were sitting huddled, shivering in the corner with their children, homeless for a time and afraid to go back to the drunken husband who had repeatedly beaten them.

I was also amazed that when I'd say, "You need to divorce him. You need to stay away from him forever and keep your children safe," they would answer, "But I love him." Either that, or they would be sure they were going to leave him, and six months later, they would be back in the shelter, having been beaten up again.

Sometimes people need to learn to fall out of love. MHR any infatuation e.g religious, ideological. And strong desire that is not healthy from a food type, drug, situation, condition, dangerous activity … even desire for success, power, prestige, wealth, revenge, ‘tall poppy syndrome envy’…ability to get over her and fall out of love was just as important as a woman who's being beaten and has to get out of a bad relationship, or worse, any kind of abusive relationship.

They say that some relationships are enabling relationships, where people become codependent with someone. If a relationship isn't built on two people becoming healthier together, happier together, building good memories, and building a good life together, then one partner just drains the life out of the other, one way or another. It either happens that way or, worse, one person ends a relationship and the other just stays in love and pines away.

All of these are examples where people need to learn to fall out of love. Falling in love is important, but people seem to be pretty good at that. However, some of us are very good at falling out of love when it's inappropriate. I've had relationships that didn't even make it through lunch. Yet when I found the right
woman I stayed married for many, many years. When she died, it took me four years to find somebody else. But if I couldn't put her in my past, I wouldn't be able to put somebody new in my future.

It's always sad when somebody dies and you expected to spend your whole life with them. However, there comes a point in time where you have to hold onto the good memories and let go of the bad ones, and look forward and build new, good memories. Some times the person doesn't die, they just don't like you anymore so they leave you. If you stay in love, you deprive yourself of the opportunity of re-aiming your life so you find just the right person.

"I expected to spend my whole life with him." She was angry. She was hurt. She was distraught, and when she looked at me she asked, "Why are you smiling?" I looked back at her and said, "It's really very simple, dear. Most women can't pick a man who lasts for a whole evening. You were able to make good enough judgments to pick one that lasted for thirty years. Now that means, at your present age, you probably only have to find one more. Maybe two if you live to be 100. So really, you're in the position to do a good job but all you need to do is to put him in the past. And I'll tell you the secret beyond secret."

The secret is that when it's time to fall out of love, it's called a threshold pattern. Threshold patterns are just like becoming fed up with being phobic. It's the same pattern. I talked to a lot of women who fell out of love without my help so I could figure out what they did. When women fall out of love, they reach a threshold. I had a couple of my friends who said to me, "I don't get it. I was married for seven years, and no matter what I did, she put up with it. And now suddenly she's just left me and she wants nothing to do with me."

This is an example of somebody falling out of love on their own. I inquired about it because I wanted to know how to help those people who really needed to fall out of love. It turns out that it's really quite simple. If a guy does something unpleasant, or a woman does something unpleasant, you can forgive them. But if they do too many unpleasant things, too close together in time, it builds up the negative feeling and you begin to hear the phrase, "It was the straw that broke the camel's back."

What we want to do is get that straw in just the right place and snap that camel's back on purpose at just the right time. The way to do this is really quite simple. If you have a guy who's been unpleasant to you or a woman who's been unpleasant to you but they just didn't do it often enough, close enough together in time, you do the following: you go back and you take memories, at least five or maybe ten. You take these memories, make them life-size so you see what you saw at the time and you run them end to end, like they're happening now.
You go through one memory from beginning to end and, as soon as it ends, you start the next one. Sometimes, it's a good idea to write down what the five memories are. Make sure you remember where they start. Run through them very quickly so you get them all connected together. Then you go through them in your mind, add sound and take the feelings—all the unpleasantness—and literally spin it faster and harder throughout your body.

Make the pictures bigger than life size and run them from one end to the other so you continuously run through five bad memories, maybe ten bad memories back to back. What will happen is, you'll hit the point where your pictures will flip and your feelings will change. This is because the way in which people stay in love is much like grief in the sense that what you associate with and what you disassociate from determines how you'll move in the future.

When you get to the end of these five or ten memories, you go back to all the good memories you had with this person and see yourself being happy and shrink the picture down so it's small. Run the movie so it runs backward. Start at the end of the good memories and run toward the beginning so that you're deeply in love and then you get to the point that you don't know the person.

Literally, by artificially manipulating the pictures and the sounds inside your head, it changes the way you feel. When you look at the unpleasant memories, you bring them big and close and see what you saw when this person did the things you didn't like. It always helps to add a bad feeling because sometimes people forget just how bad relationships can be. They forget how scared they were or how unhappy they were, so when they think about going back with somebody, they think it's going to be good.

He kept falling in love with the same person over and over again, and the woman would run off with somebody else, hurt his feelings and then, six months later, he would end up with her again. He was really tired of her abuse. I asked him to think of what he thought was the most disgusting thing he had ever seen on planet Earth, and he looked at me and said, "Chopped liver—just the smell of it, the sight of it makes me want to puke." I had him look at a big plate of chopped liver and smell it until he got that bad feeling. In the center of that picture, I had him open up a picture of her smiling face to the point that every time he thought about her, it turned into chopped liver.

Our ability to associate good feelings with things or bad feelings with things should be a conscious choice. When you redirect your own thoughts, when you decide what memories to associate with and what memories to disassociate with, when you manipulate your thoughts deliberately, it is called MHR ACTIVE thinking. We are thinking beings when we think deliberately. When we let our thoughts just happen to us, we lose our
personal freedom. MHR MIND CONTROL … Change your mind, Change your reality.

Falling Out of love Pattern Exercise

Think of the person you want to fall out of love with. Remember all the good memories about being with them by seeing yourself in the memories. See the movies run backward and make them all in black and white and small.

Remember all the times they treated you badly and all the negative feelings around them by imagining yourself looking at them inside the image, fully associated. 4 Take every bad thing they did and imagine all of them, one after another as if played back to back on a movie screen. Run this movie over and over till you get sick of them.

Take something that is disgusting to you and move the image of the person into the sub modalities of the disgusting image. Imagine a wonderful future free of them, and imagine yourself being happy and free and step into that image.

GETTING OVER BAD DECISIONS

EVERY DAY, WE ARE bombarded with thousands and thousands of choices. We are left to make many decisions, small ones and big ones. Some of these decisions won't really affect things that much, and some will completely transform your life. Getting over bad decisions is essential to move on in life. In order for you to do better, you need to make sure you are making better decisions. One factor that is important in making good decisions is the state of your thoughts.

Bad thoughts come in lots of forms. The kinds of bad thoughts I'm dealing with here are the kinds that get you to do things that you really don't want to do. Getting over bad thoughts is an important part of the process. When you think bad thoughts, you feel bad. When you feel bad, you will make bad decisions. Hence, being in a bad mood is something that is not conducive to making good decisions.

Getting past bad thoughts and getting over a bad mood can be accomplished by changing your state and changing your thoughts. When you go inside yourself and notice what you are doing in a bad mood and change it, you will find yourself feeling a lot better. For example, often we say nasty things to ourselves and criticize ourselves continuously. To change this, we can learn to interrupt these negative thought patterns by repeating a mantra. My favorite mantra is "Shut up!" because it works so well.
Eliminating Bad Thoughts Exercise

Notice what kinds of bad thoughts are running through your mind and what you say to yourself that makes you feel bad.

While you are speaking badly to yourself, repeat the mantra, "Shut up, shut Up", over and over again. Each time you are speaking negatively to yourself, repeat this mantra. Start saying nicer, more encouraging things and compliments to yourself in a kind and certain tone of VOIce.

As well as talking to ourselves, we also make images inside our heads. If you change the qualities of the images you make, and you replace them with different thoughts that make you feel good, you will start to feel differently. If you physically move around and get yourself into a very different physiological state, then you will feel differently.

Changing Your Mood Exercise

When you are in a bad mood, three things will be happening. You will be making images that make you feel bad, talking to yourself in a pessimistic way, and feeling bad. Notice the images, sounds, and feelings inside your head.

Thinking about what you want to do, figure out what is the most useful state for you to be in. Move the negative images away and replace them with positive images that make you feel the way you want to feel.

Use the mantra to stop your negative internal voice from saying whatever it says to make you feel bad. Replace it with good suggestions, statements, encouragement, and compliments to yourself.

Notice what direction the feeling is spinning. Spin the feeling in the opposite direction. Change around your physiology. Move about and breathe differently and imagine a time when you felt fantastic. See what you saw, hear what you heard, and spin the feeling strongly through your body.

MHR NLP achieves all the phenomena associated with hypnotic inductions and trance i.e the same alterations in states. Trance induced to bypass conscious resistance/rejection of all the information/arguments presented here...allows person to be more open minded i.e relaxed, at ease, trusting...so gives this information the chance it probably wouldn’t have had otherwise i.e you read this and say’ yeh, but’, ‘nah, won’t work’ etc...when in fact is DOES work, and IS true…but you’ve been conditioned and implanted and imprinted to have a erroneous, faulty, wrong definitions of TROONATNOOR…you are closed
minded to the truth, the facts, as they are ‘alien’ to you…you don’t trust them…they are not ‘conventional’ i.e not ‘normal’ vis a vis your conditioning and thus expectations e.g drug and doctors are needed, this couldn’t possibly work, it is too simple, surely someone would have told me about this long ago etc…i.e naïve trust in authority and transferred authority…discomfort at new / different / alien /foreign i.e it challenges your noetic structures, models of the world…so the hypnosis or trance state frees you of all this luggage / garbaged…takes you out of the box…opens your mind to allow new beleifs to challenge, replace, displace your current limiting beliefs…but if you are open minded, Zen, skeptical by nature or nurture / training / willful practice, you can apply all these methods successfully without a coach, guide, trainer, therapist, etc…

MHR to give clear idea of ‘attending’ and ‘focus’ Vs infinite possible objects of our attention / inputs / impressions…that the ‘external’ supposedly ‘objective’ reality is infinite i.e electromagnetic spectrum can be divided into infinite bandwidths, and each ‘represented’ i.e encoded by an infinite possible range of senses e.g echo-location, sight, hearing, taste, ESP, radio, wi-fi, digital television, and this arbitrarily e.g some people can ‘hear’ what most of us ‘see’, allowing for possibility of a ‘god-sense’ and ‘intuitions’ most don’t have, even perception of ‘ghosts’, ‘other dimensions, extending to communications with ‘dead’, or ‘remote communications with those far away, by means of some bandwidths most people are not ‘tuned’ to, unable to represent in any way, without the intervention of some ‘machine’ or ‘technology’ e.g the encoding, transmission, and decoding, into the bandwidths we CAN represent, as radio then audible waves, as digital and then ANY format e.g visual, audio, haptic, movement… to make it clear that our ‘perception’ of this infinite range of bandwidths of electromagnetic vibration / radiation is very selective, start listening to an audio book on your laptop or headphones, and attend to it…then open a novel, and begin reading that novel, and notice how soon the audio book fades into the background, out of your ‘conscious’ awareness…as you attend to the book, actively visualizing and vividly constructing the situations, scenarios of the novel in your mind’s eye…clearly the audio is ‘REAL’ and ‘objective’…we can measure it with a dB meter…and ‘prove’ it is ‘real’…but as far as the active reader’s consciousness is concerned, it is the fabulous, fantastic, subjective world that is constructed by the author, and the reader, in collaboration, which is the more REAL. This accounts for ‘false memories’, and confusing imagined past experiences with ones that took place ‘in the external world’, rather than in the person’s own mind…and of course as true ‘seekers’, we make no assumptions that the notion, the ‘representation’, the clear, concrete, certain, confident, compelling, apparent ‘reality’ of our own bodies, and brains, is any more or less ‘real’ than the constructed fantasy of the novel as it is played out in the reader’s ‘mind’…as I
have compellingly argued in TROONATNOOR vol I, all we can say with any confidence is that ‘thoughts exist’, including the very ‘thought’, notion, idea, of an ‘I’ that is having them. ‘I’ reduces to the very thought / notion / idea of ‘I’.

While at the same time we act as heuristically as a David Hume, in our daily lives, perhaps ‘tricked’ by ‘pain’, which is after all constructed in our minds, by our minds, and is thus merely a ‘representation’ of some impression e.g. excess heat / cold / sharpness / bodily dysfunction / lack / excess the mind has deemed ‘negative’ in the sense of decreasing the odds of the organism surviving, and more importantly, reproducing, to ‘endure’ through time as a species … with survival being less important than reproduction, due to the apparent built-in program for ‘death’ within the Genome itself…so that reproduction is more important for a species than the survival of any one member … for if every individual survived as long as its genome was programmed to allow it to, and avoided predation or accident up until its heart was programmed to stop pumping, the entire species would become extinct in one generation… a very bad investment of the billions of years of evolution that preceded the organism… so this can account for why sex is the most pleasurable act to most animals, and possibly even plants, and why the maximum investment is made in attracting sex partners, in terms of decoration, plumage, and in humans, the amount of time, energy, risk, effort, and sacrifice devoted to being ‘sexually attractive’, and especially in the case of males, spending large amounts of their time and money on seeking sex… with eating and drinking coming next on the list with most people, or even above sex, for those who have ‘failed’, in their own expectations, of gaining access to the sex partners they consider worth the effort and cost of attempting to attract… then comes other pleasures like the arts, music, fashion, architecture… But most young people will take huge risks, and spare little costs, in attracting the most ‘desirable’ sexual mates they possibly can… investing huge amounts of time, energy, risk, and money in getting ‘fit’, becoming ‘attractive’, dressing their bodies and hair, wearing make-up, and in the case of men, engaging in very risky behaviors in order to secure the financial resources necessary to attract the most ‘fit’ females, the most ‘attractive’ and ‘beautiful’ and ‘sexy’. Of course both sexes often engage in risky behaviors such as under-eating, the use of steroids, plastic surgery, over-exercise, etc…

Decisions… how we represent contradictory impulses e.g. to be or not to be, to do or not to do, to repeat or not to repeat, to eat or not to eat, to smoke or not, to drink or not, to exercise or not, to express ourselves or not, to defend ourselves or not, to act on destructive impulses or not, to act on malicious (the desire to harm others) impulses or not, to act on beneficial (the desire to benefit others) impulses or not… can be ‘inventoried’ in all their modalities and submodalities… to compare decisions that turned out, in our experience, and other’s to be ‘good’, or ‘favorable’ re: their outcomes / consequences for us and
others, and those that turned out to be negative / sub-optimal / destructive / imposed costs greater than benefits, on us and others…this is Bandler’s approach to preventing ‘recidivism’ e.g. returning to bad habits / addictions / past behaviors and attitudes / ways of thinking and being … Problem of immediate benefits / freedoms / satisfactions / pleasures / gains Vs longer term costs / suffering / restrictions … Clearly need to ‘anchor’ self vividly in future at time of making decision, so that the costs become more ‘real’ and ‘vivid’ and ‘compelling’ than the immediate / shorter term ‘advantages’… the internal ‘film’ of the immediate benefits / pleasures if often very vivid, compelling, attractive and short and clear… that ‘hit’ of pleasure from shooting up or smoking or drinking or otherwise consuming some legal or illegal drug, or even excess / unhealthy food or drink, the ‘thrill’ of an exciting but dangerous / illegal activity, the ecstasy of orgasm, are all immediate, and experiences as clear, concrete, attractive ‘goods’. They are thus very compelling. Many animals will continue mating despite the huge risks involved. For during mating predators have the distinct advantage of their prey that is otherwise completely engaged, attending, focused on the sexual pleasure and anticipated pleasure. This may even account for some instances of rape. Romeo and Juliet were willing to risk, and even endure, death, to satisfy their ‘romantic’ urges / impulses / desires.

It is very hard to compete with the immediacy and ‘vivid’ reality of the short-term or immediate benefits. They are presented in the mind with the greatest clarity, vividness, etc and so appear as real as anything… in fact most people feel most ‘real’ and ‘alive’, that ‘reality’ is most ‘real’, when they are experiencing the most thrilling, pleasurable sensations / representations e.g. carrying out acts of extreme danger, sexual acts, or taking drugs which just happen to be, or are designed in labs to be, analogs of the means by which our brains ‘represent’ other ‘natural’ impressions e.g. these compounds either occur naturally, and just happen to be analogs to the substances produced in the brain which are ‘decoded’ i.e. ‘represented’ as ecstasy, calm, peace, joy, pleasure, sense of achievement, sense of acceptance and approval, love, excitement, thrill etc… or these compounds have been engineered in labs to mimic the same naturally occurring compounds produced in nature, or in and by the brain and other body organs themselves… so that it is possible to bypass the need for the ‘external’ source / impression / experience which ‘naturally’ stimulates the body and brain to produce these compounds, which the receptors for them in the brain ‘represent’, in our experience, as pleasure, thrill, excitement, love, peace, joy, etc…

So most people feel most ‘real’ and ‘alive’, that their experience is ‘real’, when experiencing the representations of ‘pleasure’ and ‘excitement’. Each person requires a different level of external stimulation, or its analog in drugs, to feel ‘real’ and ‘calm’ and ‘alert’ and ‘content’, even ‘happy’ and ‘satisfied’, and ‘balanced’.
So we can see the distinct disadvantage the longer term consequences / outcomes / externalities face compared to immediate perceived benefits.

So people engage in all sorts of behaviors that have longer term costs, often deadly, costs. The short term ‘relief’ of a drug of its withdrawal symptoms is more compelling, when deciding to use or not to use, than the longer term costs of avoiding ‘the wagon’, and continuing the addiction, and facing the even more extreme costs of later attempts to do so.

This is partly innate. The immediate need to feed, to survive, and reproduce, being, for the organism and species, the prime directives.

Interestingly, this can account for ‘habituation’ effects i.e the marginal benefits of any source of pleasure tend to decrease… the first times you have sex produce a much greater ‘hit’ of pleasure, the first cup of coffee, the first cigarettes, the first drink of alcohol or ‘hit’ of cocaine / heroine / crack / speed etc than the later ones… after ‘excessive’ use or sex with the same partner, having, statistically and in the natural state, after a few months of sex, at most a few years, reproduced yourself, the ‘species survival drive’ has been satisfied… in the same way as the first bites of a hungry eater provide much more satisfaction than the last, especially if they are eating in the hope of satisfaction and pleasure, rather than to satiate a natural appetite for calories and nutrition… so the first potato chip is a glorious pleasure, and the last often a guilty, depressing experience, totally barren of any authentic joy, satisfaction, or pleasure… taken merely in the vain hope of enjoying the pleasure of that first potato chip…

Key to giving the ‘longer term consequences’ constructed mind-film a chance is to ensure you build it to become as vivid and thus ‘real’ as possible. To experience that constructed scenario associated i.e from the perspective of yourself, suffering the costs… and ideally from the perspective of any other sentient beings who will suffer as a result of your actions e.g other humans and animals… this is key to vegan activism, peace activism, human rights activism, animal welfare activism, and any activism that relates to future states and future costs and costs for ‘others’…

If you deliberately chose to favor the longer term costs over the immediate and shorter term benefits, you can make it easier to ‘give up’ that bad habit, by dissociating when you consider the benefits i.e imagine doing the immediately desired, satisfying, or relieving, action / behavior. To make the pleasure / relief less vivid, and thus less ‘real’. This re-balances the scales between the vividness and ‘realness’ of the costs vs the benefits, and gives your willpower a chance to tip the balance in favor of your longer term health, welfare, wellbeing, in every sense…
Of course the challenge is made even greater by the experts who earn fortunes for tricking you into focusing on, often imaginary, totally constructed by the experts, immediate benefits of consuming some product, or engaging in some activity. The biggest drug pushers are the advertising agencies that ‘push’ the ‘hardest’ and most dangerous, most expensive to the individual and society in terms of short and long term costs, tobacco and alcohol products. They construct a constant barge of appealing, attractive, often subliminal advertising that can overwhelm any attempts at taking longer term costs into consideration when deciding to consume certain products, or acting in certain ways.

Advertisers, and other propagandists, have developed, over the millennia, a host of ‘clever’ tricks to get people to consume, and engage in, very self-destructive behaviors, from excess alcohol consumption, tobacco consumption, animal products consumption, junk food excessive consumption, wars, war crimes, acts of terrorism against their own people (911, Operation Sinaide, Oklahoma city bombing for example).

These advertising campaigns wage a war against the reason of their viewers…and are often targeted at the most vulnerable persons, those least able to weight the costs and benefits of their actions, such as teenagers, poor people, uneducated people, people with low self-esteem (thanks to the unrealistic role models presented to them in the mass media) etc…so tobacco today targets 12 year old girls, alcohol targets anyone with low self esteem and confidence to ‘have fun’ despite their natural inhibitions i.e to overcome them…promising ‘a good time’ and ‘sex appeal’ and ‘success in sexual adventures’ and ‘success in business and life’…

Advertising tricks people into getting into debts to buy junk … false promises of happiness, acceptance, approval, love, joy, satisfaction, security… and encourages people to satisfy any real desires immediately, rather than ‘delaying gratification’ until they can ‘afford’ it…again increasing personal debts…making people slaves to the Banksters…

Why put off a satisfaction till tomorrow, when you can ‘enjoy now’, and ‘pay later’. Whether in terms of financial costs, health costs, the cost of national security, the cost of millions of lives. The cost to the environment. The cost to future people and future animals.

To compete with the innate impulse to immediate satisfactions, combined with those presented by manipulators called ‘advertisers’ and ‘lobbyists’, takes a lot of ‘mind control’. To construct mental images that can compete, in vividness, and just as importantly, repetition (advertising works as much by constant ‘discovery’ and repetition e.g billboards, television, radio, product placements, new forms of ‘peer’ marketing, internet, product endorsements, so that the ‘idea’ is always ‘in your face’ and constantly, from moment to moment, reproduced,
reinforced, and made more ‘vivid’, and thus ‘real’ seeming…you need to become disciplined and consciously practice Zen and NLP … to remain ‘skeptical’ of advertising claims, and dismiss them for the lies they are…and to construct and replay, any time you feel the impulse to commit some act that has short term benefits, but long term costs that outweigh these, very vivid, associated, ‘films’ of these costs playing out in the future…so that the consequences become at least as ‘real’, in the real time, now, here, as the promised benefits / satisfactions / pleasures…

The idea is not to avoid all pleasure and immediate satisfaction, but to have the choice of saying no or yes, fully conscious of the costs you will have to pay…Hemingway was blind to his drinking problem due to it being defined as ‘normal’ to drink so much among his peer group and society, but otherwise he made the point that he’d rather pay ‘upfront’ for his satisfactions … the old German idea of ‘If I can’t afford it, I don’t need it’ i.e the protestant work ethic of ‘delaying gratification’ until AFTER you have paid for it…e.g ‘earning’ a rush of adrenaline by running a marathon or simply the endorphin rush of exercising, achievement e.g socially valuable achievements, success in business, social, educational, or romantic or sexual life…saving up for that new car, and then soberly deciding ‘Yes’, it is worth all I’ve already sacrificed for it…or deciding, hey, it’s nice, but NOT worth that sacrifice…because you have ALREADY paid the price, you are able to more soberly calculate the relative benefit…but if you buy on credit, you don’t full appreciate the cost…it is virtually ‘free’ at the point of sale…and only years later when the debts accumulate, and you become a debt slave, that you appreciate the price you REALLY paid for that flashy car, clothing, holiday, stereo etc…

Sadly, it is not only advertisers, but bar and nightclub owners, drug dealers of all kinds, who prey on people when they are least able to reason clearly, i.e when they are already drunk, high, desperate for sex / companionship / success / acceptance / approval / self-esteem / fun i.e despairing, low, hopeless, sad, depressed, lonely, failing…that they ‘push’ their drug as the solution…in fact poor people are the targets of credit companies, who prey on their need at the time…bar owners sell more alcohol to people already drunk than to sober people…pimps prey on drunken, horny men who might otherwise consider, when sober, the risks of HIV, STDs, or of being ‘rolled’ excessive compared to those few moments of orgasmic pleasure…drug addicts offer ‘relief’ to the withdrawal symptoms of tobacco addicts, alcohol addicts, heroin addicts, speed addicts etc…in fact it is almost impossible for a smoker, determined to endure the ‘withdrawal symptoms’ to avoid the barrage of scientifically constructed propaganda targeted at keeping them as ‘users’…the same goes for alcohol…until the advertising of both these products is banned, we as a society will continue to pay the HUGE social costs of them…as the individuals closest to the users also suffer e.g themselves, their families, their friends, whom they force
to ‘passively smoke’, and who suffer the mood swings, and often violence and neglect parents who are users inflict on their spouses, and children…the victims of drug related crimes like burglary, and worse, physical assaults / muggings …

Of course to prove that it is a lie that ‘Jews’ have excessive power and influence over the media. Legislature, and government, ‘Jews’ use that power to ensure laws are put in place that fine and imprison anyone who argues that this power is real. ‘Jews’ prove that any such claims that anything critical of ‘Jews’ is censored, by censoring anything that is critical of ‘Jews’, and defining the very act of making this claim as ‘hate speech’ and thus a criminal act.

Of course advertisers, especially of alcohol and tobacco, claim that rather than increase demand for tobacco, and alcohol, they mere advertise to gain a ‘market share’ of an already ‘natural’ and ‘pre-existing’ (predating their advertising campaigns) market demand. So they define their attempts to get new addicts as merely attracting existing addicts to their particular brand i.e ‘branding’.

Of course every capitalist will refer to Adam Smith when it comes to regulating their products and markets, while conveniently overlooking the key points Adam Smith himself made about the NECESSITY of regulating free markets to ensure conspiracies, collaboration etc between business people, against the interests of the public, against the public good…the NECESSITY of always and everywhere being skeptical of the claims of businesspeople as to misrepresenting their own, narrow vested interests as ‘public interests’ and their own personal profit and ‘good’ as ‘the public good’…in fact of being continually highly suspicious of any plans they promote, and any activities they engage in…as they have a natural shared interest which they will at every opportunity conspire to act on…in the lobbying of governments and officials, by secret trade agreements, with a view to profiting at the expense of the general public welfare and wellbeing…while using their shared power to ensure the public are ‘duped’ by their claims, and never made aware of any collaboration/ conspiracies among themselves…focusing the mass media upon any attempts by the mass of labor to organise and seek their collective self-interests, and demonise it as against the public interests…and lobbying of governments to enforce the self-interests of the business people through the use of state violence e.g police and army, and law courts… so that business people, can conspire in ways that harm the public interests, and the interests of their customers and clients.

N.B all habits have withdrawal symptoms…if you decide to quit, you only suffer them ONCE … if you don’t, you will probably run out of money, or a supplier, or end up in prison, and either way, end up going through withdrawal symptoms at multiple times, places, and in situations and conditions not of your own choosing, not under your control, and thus repeatedly suffer worse than you could chose to suffer this once, at the time, place, and under the most suitable /
convenient / optimal conditions...at a much lower cost in terms of suffering, and all the collateral damage done to you and others of drug addiction, or other habits that threatened your own, and others, wellbeing, even lives. E.G drink driving. Speeding. Dangerous driving. Unprotected casual sex. Compulsive eating, or shopping. Pedophilia. Lust for power (politicians and lobbyists and wars etc).

Bandler recommends what I always do naturally, I add up the long term costs i.e I don’t think of ‘one cup of coffee will cost me this much’, but 10 years, at one cup a day will cost me this many THOUSANDS of dollars. The same with bus fares, telephone calls, internet, haircuts. And so I calculate the REAL long term costs. Most people say, ‘oh, it’s only 1 dollar’, each of the thousands of times they repeat that decision. ‘It’s just one more beer, one more pack of chips, one more cigarette etc.

If you look at it as just, Oh, well, I’m feeling a little anxiety, if I eat a little chocolate cake I'll feel better, that might not help. But if you make it not one piece but a thousand pieces of cake, and you feel yourself ballooning up and people laughing at you everywhere you go because you’re so overweight, that will help you feel differently. If you imagine being depressed every night and being lonely and miserable, having regrets about everything you’ve eaten in your whole life, and dieting and losing weight, and gaining it and losing weight, and gaining it and then you decide: Should I eat this one piece of cake? The answer will be different if you say, Oh, well, it'll make me feel better for five minutes versus, and Will it make me feel better for the rest of my life?

N.B operators of poker machines, and bars, both take advantage of people ALREADY drunk, and unable to make good decisions. In fact serve FREE drinks, or ‘First drink free’, or ‘Happy hour’ for first hour, to get them in state of mind in which they are likely to make bad decisions e.g keep gambling...gamblers end up in ‘zone’ i.e ‘trance’ state...need to decide while still sober, how many drinks, and how many dollars, going to gamble...should make it a law to have people decide while sober, buy a ‘credit’ card with that much on it, for use for that purpose e.g entitles them to this many drinks, this many gambling tokens, and then that is it...the limit is reached and they must be refused service...of course clubs and bars and casinos would HATE such laws...so you need a reliable, sober person to say ‘enough is enough’, ‘that’s it’...

You can model your own, or other people’s, good decisions, by eliciting / noting all the modalities and sub-modalities that helped them e.g give up drinking, smoking, overeating, dangerous activities, overspending, getting into bad situations, getting out of bad relationships, avoiding bad relationships etc...how did they finally ‘break the habit’ and change their behavior, and stick to it?
N.B. Bandler was quite obese/overweight, though claims to have secret to breaking bad habit of overeating?

Failure at breaking any bad habit can produce the limiting belief that breaking any bad habit is impossible, for them. So need to give history of successes. Find own successes, or imagine them, and imagine future after success, all vividly, to trick mind into ‘experiencing’ them as real.

Creative thinking will allow you to identify many successes e.g. every time you feel urge to do X, or Y, and you don’t, you have proven your ability to control your impulses urges, and you can employ that same self control to stop smoking, overeating etc… e.g. every time you feel like screaming at someone, telling your boss off, hitting someone when you are mad, telling someone what you really think of them, but don’t … because of the consequences… what do you do THEN? What stops you? How do you succeed in self-discipline at THOSE times? What are the modalities and sub-modalities of these decisions NOT to fall prey to an urge / impulse / desire? E.g. you don’t rape every woman or man you fancy, do you? Or steal everything you want? Or attack people you despise? Or tell everyone what you REALLY think of them, and would LOVE to tell them? do you? These are all proof of your ability to control your own mind, and reject impulses / desires based on what? Find out that WHAT, and apply it in typical NLP fashion to the habit you are having trouble with right now.

Notice the submodalities. The picture is in a certain place. It's a certain size, a certain distance. It's got sound, maybe a voice that says, You better not do this! It comes from a certain place, and it builds a certain feeling that gets you to stop acting on your desires. Notice in which direction the feeling moves. Then take the image of cigarettes and stick it in that place.

Again, swish it over so you move the image into just the right place and replace it with that picture of yourself, turning down cigarettes, not picking up cigarettes, doing all the things you need to do so that you simply don't smoke. When I get people to quit, I don't have them throw their cigarettes out. I have them put their cigarettes in front of them. I have them light one and put it in the ashtray and stare at it, then mentally make sure they're able to go into the state of overcoming their desire. As bad as they feel, as hard as it is to go through the withdrawal of the nicotine, for all those cravings that are there, they have control. They look at that cigarette and they struggle with it, but they still know that they cannot act on desires.

**Believing Yourself a Nonsmoker Exercise**

Think of a strong belief and elicit the submodalities. Think of something you desire but you don't act upon and elicit the submodalities. Think of being in a situation where you had the option to smoke in the future. Move that image away
and pull it up in the same submodalities of something you desire but don't act upon. See yourself not acting upon it and being a happy, healthy nonsmoker from now on.

Take this image of you not acting upon the craving and being a happy, healthy nonsmoker from now on and move it off into the distance and snap it back into the sub modalities of the strong belief. Repeat steps 1-4, quickly each time.

The next thing to do is to build desire. Desire works in a specific way. If a person smokes and they think about cigarettes, their body would often say, I want them! So if you finish a meal, if you look down at a pack of cigarettes, if you see somebody else lighting a cigarette, something inside you creates desire.

In order to quit any habit, there is a way to change this desire. Let's stick with the smoking example. Stop now and make a picture of your brand of cigarettes—or what you would see if you were in a situation where you saw somebody else light up, or where you put down your fork at the dinner table and lit up—whatever it is that would trigger your wanting to smoke a cigarette.

When you look at that image and you feel that you want a cigarette, stop and make a picture of yourself not smoking. See everybody else lighting up and you're not lighting up. When you see that image, adjust it, so that you look at it and you desire that. The trouble is most people don't realize when they look at themselves going to where they want to be, they need to see themselves inside the image. They're not there yet. When you look at the things that trigger bad habits, you need to see what you'd see if you were actually there. So, instead of seeing yourself smoke, you want to see the things that make you feel like you want to smoke. Then the trick is to swap them, because what you need to do is change them around, whether you do it with size or you do it with distance. I like to do it with size to start with and make a small picture where you see yourself the way you'd like to be. Make a big picture of what triggers your wanting to smoke. Then you take the big picture of your own pack of cigarettes, or seeing other people smoke, and you simply turn it so that it turns completely and totally white, and then take the little picture and pop it up all at once so you tell your mind not this ... this! Not cigarettes ... being a nonsmoker. You keep doing this, so you take that little picture and pop it up into a big picture and replace the desire for cigarettes with the desire to be a nonsmoker. This builds the foundation.

The truth is that if you just don't smoke for three weeks, and if every time that craving comes up you put it out of your mind, it will make everything easier. It will work when you do the things that it takes to remain determined and you do the things that it takes to get through it. Getting through something isn't a one-time deal, it means that for a couple of weeks, you work to build a new habit. Then every time you get that craving feeling in your body, you stop it and you
spin it backward, then replace it with the feeling that you can control your desires.

**Switching Your Craving (Swish Pattern) Exercise**

Think about whatever trigger makes you crave something you want to stop. Imagine the movie starting from this point and immediately white it out. So start the craving image and immediately white it out. Replace the image immediately with an image of yourself engaging in a new behavior, looking happy and being free. This will allow you to attach the craving to the thought of you being free from the habit. 4 Repeat steps 1-3 a few times and notice yourself feeling differently about it.

We repeat some habits unconsciously, automatically, without thinking, realising we are doing them as we are in the middle of doing them.

Some habitual actions begin with a conscious craving which compels us to satisfy it by repeating that habitual action e.g. taking hit, smoke, drink, snack, or whatever it is we turn to for relief from the dis-ease of the craving, or the satisfaction of the urge / impulse / desire.

Obsessive compulsive disorder is the highly dysfunctional end of the spectrum from slight desire to obsession, and an inability to NOT perform the habit, to such a degree that it interferes with a person’s functioning e.g. as a worker, parent, student. Of course of most interest to ‘society’ as those compulsions considered ‘anti-social’ or ‘destructive’ of value, of property, and of a person’s own health and well-being.

Traditional quest to identify the origin / etiology of the symptom i.e. insight into how the habit originally became manifest, and then established e.g. psychotherapy, much less effective than NLP as the point of a habit is its RE-PRODUCTION rather than its original PRODUCTION. The problem isn’t that it was once produced by some traumatic experience, as a response to it, often a solution to some traumatic condition / situation, or some misunderstanding, but that it has, since then, been repeatedly RE-produced by something the person continually DOES. The thing that lead to the behavior is in the past. It cannot be responsible for the constant iterations of it. The person must be doing something, actively, to reproduce that initial response. It makes no difference, to alleviating the symptom / problem i.e. displacing and replacing the sub-optimal habit with more optimal habits e.g. self-control in relation to satisfaction of urges / impulses / desires with an eye on the externalities for self and other, in the shorter and longer term, what the original motive / source / etiology / situation / condition was. That said, the deliberate attempts by advertisers and other propagandists to reproduce bad, destructive, sub-optimal habits e.g. overconsumption of food,
drink, alcohol, war, fear, hate, are sources of bad habits and limiting beliefs that can be targeted and eliminated.

MHR ideal ‘food experience’ is a product with a 50-50 split, in terms of calories, between fat and sugar…a balance rarely existing in nature … but which producers of ‘addictive’ foods scientifically produce, one they learned the ‘secret’ of why chocolate and similar products like clotted cream are so deliciously addictive.

Understanding of itself does not lead to change. Poor Socrates himself discovered this, to his own destruction. Aristotle left Athen to avoid the same consequence. Insights are illuminating, but rarely have the vivid compelling nature able to impact the ‘reality’ of people. Existing habits of mind produce more compelling, vivid, and thus motivating, ‘realities’ at an unconscious level that are consumed by the mind as ‘reality’ in preference to ‘intellectual understanding’. Like KNOWING something is not dangerous e.g sitting in a 3D cinema, but still physically reacting to the scenarios playing out on the screen, as if they WERE dangerous. Or knowing tobacco kills and still smoking, due to the addiction and advertising. Or eating too much, spending too much, investing too much in satisfying sexual impulses etc. You can ‘know’ something, and be able to articulate all the reasons you should NOT do something, and yet when it comes to the point, you will be ‘guided’ less by this understanding than the ‘vivid reality’ presented in your mind of the benefits … immediate short term pleasures…which are much more compelling, unless you have habits in place that deliberately FORCE the longer term consequences, externalities for you and other sentient beings, to appear vivid, and more REAL than the images etc of immediate gratification that automatically arise in association with thinking about doing X, consuming Y etc…

I treated a woman some years ago who came to see me with her husband. She began to tell me that she obsessively cleaned drawers. Toilet bowls. She vacuumed the carpets. She put down little plastic sheets on her carpet so that when you walked across the carpet you didn't actually step on it.

She made her husband and her twelve-year-old son strip naked in the garage, put on disposable clothing to enter the house (including slippers like a surgeon would wear) and walk through the house so that when she looked at the house, it was never ruffled. No one could sit on the living room couch; her son could go to his room, but if there was anything out of place in the room, she would scream and yell at him to the point where her husband was ready to leave.

"When you leave here, you're going to leave here with a bag of dirt, when you get home you're going to throw it on the carpet because if she can't deal with that, you're in big trouble!" She looked at me and said, "If he does that, I will go insane!" I said, "Better you go insane than your son and your husband go insane,"
that's the way I think about it. You've got a problem, you've gotta learn to deal with it." I asked her to close her eyes and look at her house, then move from room to room, and from drawer to drawer, and to see it absolutely sterile. Not a bump in the carpet, not a footprint, not a piece of underwear out of place, so that it was perfect.

As I looked at her, she sat there smiling with absolute delight on her face, and I said to her, "As you look over the absolutely perfect house, I want you to realize that there is no indication of any kind that anyone lives there. In fact, a house that is this clean is a message to you that you're going to end up utterly, completely and totally alone. Your husband will leave you, your son will never talk to you, you won't have friends and, since you're such a persnickety person, you won't even be able to have a cat! You'll die one of the loneliest people on the planet. But the empty drawer will be sterile and clean."

She opened her eyes and looked at me, and a tear dropped from her eye. At that moment, I said, "Now, close your eyes again, and look at your carpet and see some footprints across it. Look in your son's room and see a piece of underwear on the floor, and realize that what this means is that you're no longer alone. The people you love are around you. Everything that's a little out of place, a magazine turned, a page crinkled, has a different meaning to it. So if you love your son, and if you love your husband, and if you love indications that they're around you, that they haven't left you forever, then this will make you happy. Take this feeling and begin to spin it. Because any feeling that's worth having is worth spinning and spinning and . . ."

I got her to think differently about her house being clean so she could see different meanings for her compulsions. Sometimes, when you get a person to see things from a different point of view, it helps them feel differently about it. I also helped her develop another quality that was absolutely essential. All of us have things we have to deal with, and we can't deal with them without determination.

It's not going to be easy for somebody who has been this compulsive about cleaning to give it up. I can get her started by pointing out that she believes it would give her comfort. Anything out of place agitated her, so like any obsessive-compulsive, she built rituals that built comfort. If it's locking the door six times and then unlocking it six times and then locking it six more times, all of these rituals are rituals to build comfort, as opposed to anxiety. Anybody who has panic attacks will understand this. Some people get them if they're in a car. Some get them if they're in open spaces. Some people get panic attacks just by stepping out of the front door of their house. All of them have little rituals they engage in it so they can function in the world. For example, they think, If! don't step on a crack on the sidewalk, then I'll be safe. So they walk funny or they hold their hands in an odd position, whatever the ritual is that builds comfort. What they fail
to realize is that it's what is in the mind that creates the discomfort. It's not the line on the sidewalk, it's the way you think about it.

These compulsions become so automated that they're as automatic as blinking when something starts to fly into your eye. **Humans are learning machines.** A lot of what we learn is extremely useful. MHR computers...non-conscious calculations, data storage and retrieval systems...pattern recognition systems...stimulus-response cybernetic systems...that we ‘experience’ as representations i.e ‘sense’ i.e ‘impressions’ are constructed in mind, mostly unconsciously ... though sometimes we do this deliberately i.e actively construct NEW experiences ourselves, using the parts in a our not-conscious data bases to build new combinations of past experienced things i.e exchange contexts, different elements, to for e.g a Pegasus or a ‘god’.

**Become More Determined Exercise**

1 Think about something you feel very determined about. Find out the submodalities for determination for you. Notice the feeling of determination and which way it spins in your body. (A) Stop this and think of a habit or compulsion you want to change. Find out the submodalities of it. (B) Imagine a small image of changing in the corner of this image of determination, (B) in the corner of (A). In a split second, imagine this small image growing into and replacing the bigger image so you start to see what you want to be determined to do in the same place and sub modalities of what you were determined to do. (B) replaces (A). Spin the feeling of determination faster as you think about changing. Repeat steps 1-5 a few times and notice yourself feeling more determined about changing this habit or compulsion.

MHR take the modalities and sub-modalities of a compulsion or successful campaign of determined discipline, and introject them into the wavering, weak, so far failed campaign e.g how do you stop some habits i.e control some impulses? Like not killing your father and ... or how do your role models succeed at this? i.e adopt their strategies...adapt to own situation.

Bandler, obese, suffered a stroke. So his NLP didn’t work for his own overeating disorder? But luckily the first person who spoke to him, a doctor, said "Can you hear me?" I remember looking up at him and he was blurry to me as the sedatives were settling in. I said yes and he said, "No matter what anyone says to you, no matter who they are, I am telling you, you can make a full recovery."

It stuck in my mind because it wasn't more than a few days later with tubes coming out of my arms and painkillers drilling through my body—that the first person came to me and told me that I had had a stroke and that the stroke would paralyze me for the rest of my life. Then I remembered what the doctor had said to me, No matter what anyone says to you, you can make a full recovery.
The truth is, it happens all the time. Even with the worst strokes, it can't be explained why some people recover and some don't. When it happens to you, it seems overwhelming and impossible, like you will never be whole again, but this is the time to build up a big belief in what you can do.

There are cases of spontaneous remission, where people for no reason under the sun just get well. There are filing cabinets full of cases of spontaneous remission. I discovered the trick to what helped me to have a full physical recovery. Whether or not they decided I was never going to be able to walk again, I decided I was going to be able to walk. I would focus every fiber in my soul in being able to first move my toes and then my feet and then my knees, and then being able to stand and then being able to walk. This requires that you push yourself harder than anyone else does. This also means you have to be insulated from disappointment. Disappointment always requires adequate planning, and it's always added to if you have help from others. People look at you and say, "Don't be discouraged, don't be disappointed, don't be frustrated." The unconscious part of your mind doesn't process negation so, of course, it's like saying, "Don't think of blue." Immediately, you think of blue, so it's always useful to have a part of you that abreacts. Abreaction is about having a polarity response. The more people tell you that you can't do something, the more you want to do it. How do you build this into yourself? You build desire in the right direction.

When it's time to get yourself to stick to an exercise program, let alone a recovery program, this is the time when you want absolutely, overwhelming determination and resolve that turns itself into behavior. So the more difficult things get, the more you apply yourself. Most of the great minds I have met had this built into them when they were young.

MHR Rocky’s famous ‘fight harder’.

Everything I succeeded at, I had people telling me couldn't be done. It's amazing how many people were able to predict that I wouldn't be able to X and Y…

When you become fully determined, and when you only measure the degree of success that you get, you will be amazed at what's possible. The problem is that if you measure where you are not, then you say, It's time to feel failure. However, on the other hand, if you only measure what you are succeeding at, it starts to work. MHR accentuate the positive, latch on to the affirmative, eliminate the negative, don’t mess with Mr in between. (old song from t.v series). Have to build up history of successes, to program not-conscious mind for expectation of success, further success, basis of optimism and motivation and achievement of ‘all you can be’ i.e realisation of genetic and social potential, beyond limits of existing ‘limiting beliefs’ you have accumulated in process of living and learning, often unconsciously i.e role models, traumatic events, repetitive social conditioning…way to escape history…
You have a little feeling in your leg, then you have more feeling. If you figure out how much better you are today than you were yesterday, and you keep doing it each day, then little by little, you push yourself through whatever experience you're going through. The truth is that if you're going down one long road and you make just the smallest turn, you actually get further from where you would have been. Two weeks down the road you are in a completely different state than you would have been in if you had kept going straight.

The way you get through things is by building resolve. I know that you, at some time, have resolved to do something that seemed impossible. When kids learn to ride a bicycle, it seems they will never be able to do it. Then, mysteriously, they learn balance. They use training wheels, whatever it takes. Eventually, all of these things are put into the behavior of riding a bike. Whether it's learning to play an instrument, learning to write with a pencil, or learning to type on a keyboard, all of us have been determined because we have wanted something so bad that we were able to get through that stage where it was awkward and find the resolve that kept us doing it until we got where we wanted to go.

If you go back in your memory and find this powerful example where you were resolved, this is the beginning. It may be back in your childhood. If you think about something and think about what it was like at the time—see what you saw when you were there, hear what you heard, and feel what you felt—you'll be able to bring back the feeling of resolve. If you remember struggling through it and failing at it and getting back on and doing it again until you succeeded, it will help you greatly. This is an important part of learning. All children do it. They stand up and they fall down. They stand up and they fall down, but they keep standing up till they get to the part where they can walk, where they can run. That ability doesn't disappear because you have a stroke or because you are older. Having resolve is what gets you through the really hard stuff.

MHR so anyone who learned to walk, etc, has a reference model, a history of success to build on...just have to realise it, and expand/build it up...

**Resolve to Recover Exercise**

1 Imagine yourself fully recovered. See what you would see, hear what you'd hear, feel how good you would feel. Really imagine it vividly. Recall any bad suggestion that anyone gave you about not recovering and hear them say it in a voice that you do not trust or believe. Promise yourself in a certain tone of voice that you will recover fully. Remember all the times you got through tough situations and you were a better person as a result of it. Remember how it felt to be determined enough to get through anything. See what you saw, hear what you heard, feel what you felt. Spin this feeling as you promise yourself again with this determined feeling and imagine yourself getting through it, recovering, and each time you feel like giving up spinning this feeling even stronger. Imagine yourself
continually focused on getting better and enjoying the challenge of recovering and dealing with the tough times and situations with this spinning feeling of determination and resolve.

There are times when we no longer have the will to go on. When all we feel like doing is resigning to fate and giving up.

Key to ‘resolve’ is key to Zen…to realise it is a practice…a set of habits…not something you can ‘master’ and ‘perfect’…the point is you WILL fall back into bad habits, of mind, of behavior…you will hate, envy, desire, lust, self-loathe, fall off the wagon, give in, give up in moments of desperation…but if you PRACTISE Zen, then the moment you REALISE you have / are doing any of these things, you will also have control returned to you…because the fact of you realising you have ‘fallen by the way’ is proof that you are in charge…because Zen is about practicing zen, not achieving some state of perfection from which you could never fall again…it is a practice…a habit…a process…not a thing, an idol, an object…NLP is very Zen…it is a practice…you practice and repeat all these exercises of Bandler’s as the situation applies…like the Zen practitioner who suddenly realises their mind has wandered to and is obsessing over, some past regret, guilt, failure, pain etc, or wandered into negative and fearful speculations about the future…and thus realising they have ‘strayed from the path’, returns back to it with deliberate resolve…applying meditation etc…

Zen assumes you WILL, at least now and then, ‘fall back into bad habits’. Zen does not promise you a ‘final cure’. It is a process. An active process you apply to your life, to continually bring you back here, now. Attending to the here and now. Enjoying the here and now to the full.

You WILL fall off the wagon. Break the diet. Do something ‘stupid’ you didn’t want to do. Fall victim to an urge or impulse. None of us are infallible. We are not literally programmed machines. And even the best programs have ‘bugs’ and ‘errors’. But as cybernetic systems we have ‘routines’ in place to ‘correct’ them, and move back onto the ‘correct’ path. This is how A.I robots operate. Cybernetic feedback systems. What to do to avoid falling over. But more importantly, what to do WHEN you’ve fallen over. You are going to fall over a lot. So you’d best acclimatize to that fact, and work out a strategy to immediately put in place when you do. Then you won’t waste time crying and complaining and having negative thoughts and giving up…instead you will feel empowered by the strategy…it will be proof that you know what to do, that you are in control…you saw this coming, and planned ahead, and now you will prove your mettle by overcoming it…you will prove you are in control by responding efficaciously…as Rocky said, when life knocks you down you get up and fight harder…every kid learning to walk falls, over and over, but if focused on the end-game. ‘I’m a human, and humans walk’. They focus on what they want to achieve, not on the failures. They have a
clear vivid real compelling image in their mind of the objective, and this is much more real to them than the falling over.

So plan what to do when you begin practicing Zen, and end up worrying about the future, or looking back in anger. Or when you begin a diet, and find yourself, at 2a.m, gorging on chocolate ice-cream. Or falling back into any other bad habit you have resolved to break. Because odds are you WILL find yourself in these situations. That is not a question of discipline. That is human frailty. What distinguishes successful people from ‘failures’ is their resolve to return to their path after falling. After setbacks. After ‘failures’. Many luckily had role models, mentors, and life experiences that naturally implanted the optimal strategies and responses in them. They do this stuff ‘naturally’ and ‘intuitively’ and ‘unconsciously’. As a matter of automatic routine and habit. Most of us didn’t. We have to learn them. And practice them consciously. Be vigilant. Employ our strategies every time we fall off the wagon, stray from the path. And in fact each time we do this we strengthen our wills. We come closer to perfection. We heighten our resolve.

The trick is to look into the future and say, I am going to falloff my diet ten times, and each time I fall off it I am going to become more determined to get back on it and do it even more.

**Getting On and Getting Back On Exercise**

Think of something you want to be motivated and disciplined to do, for example, going on and sticking to a diet. Think of how much you want to be healthy and fit and develop your ideal body by dieting. Really imagine it in vivid detail until you feel really motivated and determined to go on this diet. Amplify the feeling by spinning it faster. Imagine yourself going on the diet as you spin this feeling. Then imagine yourself falling off it at some point in the future and spin the feeling faster as you imagine yourself getting straight back on. Imagine being on the diet and falling off and then bring the feeling of determination back again and spin it as you imagine going straight back on the diet again.

The only time you really fail, is when you give up. Failure is a process, not an event. You didn’t ‘fail’. You continue ‘failing to try again’. It is not a fait accompli. At any moment you can pick up where you left off, and continue. It is not doing this that constitutes the fail-ing.

MHR our education systems, bankruptcy etc, all produce ‘failures’ by enforcing arbitrary time limits on learning a particular skill or ability or information, or achieving some goal. Take away this arbitrary time limit e.g forced ‘age progression’ in school, or ‘due by dates’ with bills etc, and you stop nominalizing ‘failure’ as an event that is past, over, complete, done.
We have to focus on the successes. Go back to when you were last doing well / on track / on the wagon, and continue on from there. That was L Ron Hubbard’s ‘Scientology’ method. Not focus on the next step which was frustration, falling off, falling down, falling by the way, the test you didn’t manage to pass yet, the skills you didn’t acquire in the set time, under the particular conditions (espresso course great example, and ‘late bloomers’ and ‘slow learners’ etc)…

You motivate yourself by focusing on the positives of what you want, and your successes…blow these up in your mind until they are vivid and compelling and ‘real’ to your not-conscious mind / computer…and do the opposite with the ‘bad’ experiences and so-far-not-positive (traditionally called negative) outcomes…make them small, vague, blurry, very un-compelling and un-real to your not-conscious mind…so you send the right messages to your cybernetics system…what I want is THIS…go for it…get it for me…facilitate it…and it will produce all the phenomenon we call ‘motivation’ i.e the heart rate, physiological phenomena, etc…associated with motivation, enthusiasm, commitment, optimism, resolve, discipline… always think of yourself as a badly written book, novel, screenplay, or computer program that you CAN easily re-edit, re-write, re-do, and re-program…a blank slate … a master computer you tell what you want…and rely on…i.e ‘trance ratification’ self-fulfilling prophecy belief in efficacy of not-conscious mind in producing desirable outcomes.

Every failure is something that you should ignore, and every failure should mean you should try even more. The more you don’t do it, the more you apply yourself. That’s how all great people succeed. When I studied great athletes.

MHR what is motivating is the process, the expectation of success, more than the final objective…the feeling of being closer and closer is the most rewarding. The feeling of being headed in the right direction, and the confidence that you will get there. This is why most ‘high achievers’ are always moving onto their next objective even as they are completing the last…it is the process that is rewarding, more than the actual end. Thus the notion of ‘the ends justify the means’ is totally blown out of the water by reality. The means are all. The process is what counts. The ‘ends’ are illusory. Nothing ‘ends’. There is no perfection except oblivion. All is flux. Experience is process.

If it feels bad to practice things, or if it feels bad to diet or exercise, then you’re not doing it right. You need to go back, create a good feeling, spin it in your body and then apply the activity. The more you do it, the more you spin the feeling.

**Doing an Excellent Interview**

Think of a time when you felt confident and focused. See what you saw at the time, hear what you heard. Feel how confident and good you felt, and amplify the feeling by spinning it faster. Imagine yourself going to the interview and arriving
at it spinning the confident feeling, and imagine that feeling amplifying as you walk in the door and meet the interviewers. Imagine being in the interview and stand or sit as you will be in the interview. Imagine being asked each question, spin the feeling as you respond with confidence and this feeling keeps spinning. Imagine being asked a question you weren't expecting, but as you keep that feeling spinning you respond with confidence and clarity in the moment. Run right through this process over and over again and when it is time to go to the interview, you will find yourself feeling really confident about it.

Why people have trouble with exams. They study and they're calm, and then they go in and they're nervous in the tests. They can't get to the answers because the answers are associated with the calm state. So either be nervous when you study and be nervous when you take the test, or else be calm when you study and make sure you're calm when you take the test. Recreate your studying state before starting to answer the questions. Hallucinate the room etc you studied, in, and even the textbooks and notes, and then ‘read’ these hallucinated texts.

**Getting through Exams**

Before you study, organize your study so you make it similar to the kinds of circumstances you'll face in the exams. Remember a time you felt confident, excited, and superbly focused. See what you saw, hear what you heard, and feel how you felt. Amplify the feeling. As you study take time to look at particular notes you have and practice hallucinating them in different locations around the room. Do so until you can see them anywhere you put them by imaging them vividly. 4 When you go into the exam, bring about the same state of confidence, excitement, and superb focus again and spin the feeling. Begin to answer each question but imagine being back in your room and hallucinate the answers in front of you in the same way. See yourself vividly and notice the way you are smiling, breathing, standing, and moving. Move in that way.

Whatever the event is, people can make things worse or better by how they think about it in advance. Events themselves are not necessarily good or bad. Our response to them is good or bad. MHR Hamlet, ‘A thing is neither good nor bad, but thinking makes it so’.

Riding at 160 and slowing to 60, feels like walking…it is all about relativity…boring things seem to take forever…but if you imagine, before cueing, the cue moving ten times slower than it is usually does, compared to this imagined time, the actually time spent waiting in line, will SEEM really small, and the time will seem to go very fast.

**Speeding Up Time Exercise**
Think of a situation where you would like time to go by quickly. Imagine the situation happening and whatever it is that is happening that makes it seem like time drags, then see that event happening in front of you going really slowly. Imagine everything else around you is going really quickly and flying by like in a Charlie Chaplin movie. For example, if it involves talking to someone, you will see them in the center of the movie talking really slowly while the rest of the background of the movie all runs around very quickly. Continue to see the event go slowly while everything in your peripheral vision moves really quickly. When you actually arrive and begin the event, whether it is standing in a line or talking to someone or watching something, you will find it goes by far more quickly than you expected. You can also go through this process while you are experiencing the event, and it works just as effectively.

There are also things you can do if you want time to move in the other direction. Sometimes, it's a good idea to make time move more slowly. You can do exactly the opposite and practice making some things seem fast and some things feel like they are going by far more slowly. You can also make things more funny and make things more serious. These are all distinctions that can be made with the model of submodalities because when you use the model of submodalities, you can do a lot. You can look at the things you really enjoy and the things that you have to do because they are socially required of you and notice the differences. I remember going to parent/teacher nights for my children and listening to a second grade teacher explain to me how things were made with construction paper. It would have been very easy to pull my hair out, but that's the time when you want to be able to grab a hold of the time throttle and speed things up, so you're imaging things moving slower than they actually are. The reason things are excruciating is because people in their minds think it could be going by faster and they imagine it going by faster; when it's not, they feel the disjointed nature of it. When you realize somebody could be telling you something ten times faster than they are, then of course it seems even slower. However, if you imagined it coming out even half a syllable at a time in slow motion then they'll seem like they're going faster. The more you create disparity in time deliberately in the right direction, the more it'll work for you.

You can look at something you enjoy and amplify it. You can make it so that you not only enjoy it but also so the feelings associated with it get stronger. This can be done easily by the process of amplification. This means that you take the image of the thing you enjoy in your mind and, when you look at it and feel drawn toward it, double the size of the picture. You turn up the brightness, and you speed up the image. You adjust the sounds so the feelings get stronger.
Once they are strong enough, you literally spin them faster and you even them up so they are centered on your midline, or the middle of your body. You make it so they go all the way down to your toes and all the way up to the top of your head and down through your nose. You imagine all of this vividly. The faster you spin it, the stronger your feelings get. Then, as you do this, you pull up the thing you want to be more motivated to do, the thing you want to be fun, the thing you want to get to, and get to soon.

Making Things Fun Exercise

Think of something that you enjoy doing a lot. Notice the submodalities. Go through and amplify the feelings of enjoyment. Do this by playing around with the sub modalities and adjusting them so the feelings get stronger and more intense. Spin the feelings throughout your body and keep increasing them. Then imagine something you want to enjoy more and think of it vividly as you keep spinning the feeling faster and faster throughout your body.

Better Sex Exercise

Think of your loved one. Remember when they were at their sexiest and you felt most attracted to them. See what you saw, hear what you heard, and feel what you felt. Notice the feeling of lust and spin it right through you faster and faster. Smile at them and seduce them. Aim to make them feel as good as they possibly can. Recall every amazing experience you have had with them and spin the feelings as you are with them.

Take parenting and other personal relationships seriously, as you would any other commitment e.g business / work / education / training.

Prioritize your time, and decide how much time you will commit to e.g ‘worrying’ about your finances, job etc, and do not exceed that time. Devote more time to joy, happiness, love, relationships, your family, your spouse, your lover, your friend. Give each your full attention. Don’t be with your kids, but mentally elsewhere, etc. Bed is for sleep or love making, not for worrying, regretting, arguing. Set aside time for these, attend to them fully during that time, then attend to the next thing you have planned / managed time for. Don’t get them mixed up. Be very zen. Here. Now. And if you have to be in the past or future, then limit the time strictly. Be there, then, and then return to the here and now, and the people you are with. Don’t trance out / mentally disappear…that’s how car accidents etc happen…distractions…attend to the here and now and the people you are interacting with…not lost in your thoughts / distracted / zoned out / elsewhere in your thoughts … even on phone while driving you are NOT mentally there, then…here now…at a time you are responsible for many lives, as the director of a projectile of several tonnes, travelling at high speed, and capable of a great deal of death and carnage, and long term misery. Is that telephone call
worth killing a child, a mother, a father, a family, leaving your own family without you, leaving you or others in a wheelchair for life?

When you interact with family and friends, actually be there, with them, physically and mentally...look at them, intently, pay attention, really listen and watch for body language, accessing cues etc...really listen...to them...not the voice in your own head...don’t anticipate or predict...be Zen...let them speak to you...imagine your life without these people in it...alone...lonely...miserable...appreciate them, in all their imperfections...reframe the things that irritate you about them...imagine like in a movie having lost them...and longing to find the toilet see up, or the mess in the kitchen, or the nagging about smoking or drinking, because it would mean they were still with you...now you have the perfectly tidy kitchen, the toilet seat is down, and you are alone...imagine this...it is a typical movie scenario, where a person misses someone and would give anything to be irritated by them, by their irritating behavior, for one more day...

To fully appreciate them now, before such a tragedy, or you do something stupid like break up, divorce etc, something you can’t undo, use the exercise for ‘falling in love’, focus on all the good times, make them vivid and real and compelling, and relive them...as if happening...line them up in a row, and binge on them...till you are once more glowing with the feelings that brought you together... or to ‘wean yourself’ off someone you shouldn’t be with e.g violent, abusive, neglecting etc, do the opposite...focus on the bad etc...

**Falling More in Love Exercise**

Think of your loved one. Remember the first time you felt in love with them. Imagine it like it was yesterday. See what you saw, hear what you heard, feel how good you felt. Spin the feelings of love right through your body. Think of anything that bothers you about their behavior and disassociate yourself from the behavior and memories so you see yourself in them. 4 Immediately bring up all the memories of times when you loved being with them and associate into them so you are seeing what you saw and feeling what you felt at the time. Run through all of these wonderful experiences and amplify the feeling of love and spin it throughout your body. Then look at them and notice yourself feeling like you did the first time you fell for them.

Decide to tell someone you love them e.g spouse, kids. Or give them positive feedback. Then use this exercise.

**Make a Decision to Follow Through** Think of a time you made a really good decision that you followed through on (A). Elicit the submodalities. Think of a decision that you want to make, for example, telling your loved ones you love them (B). Elicit the submodalities. In a quick motion send the image of the
decision you want to make (B) way out into the distance and bring it back up in the position and submodalities of the decision you followed through on (A). Repeat until you know you will make this decision and follow through on it.

Vividly imagine yourself being how you want to be, with your spouse and kids e.g. more patient...imagine vividly them ‘playing up’, but you being very patient...role play in your mind how you want to behave / respond, the qualities you wish you always demonstrated...find role models...find examples in your own past...vividly imagine yourself possessing these traits in future interactions...spend time learning / training / practicing new skill sets / behavioral responses etc and developing new habits, new ‘automatic’ knee jerk responses that are constructive, positive, loving, caring, helpful, productive etc...displace behaviors / habits you don’t want to possess and display with more optimal ones...the YOU you want to be...even go back into your past and re-live situations you didn’t demonstrate these, but this time have yourselves being the best you you can be, and getting the outcomes you want, that you wish you had gotten back then...including the reactions from others you failed to elicit...

**Become More 'Tolerant Exercise**

Think of a time when you felt really tolerant and patient. Notice the feeling, which direction it spins in, and spin it throughout your whole body. Think of something you want to be more tolerant of and patient with in the future. Spin the feeling of tolerance as you imagine waiting for and doing this activity. Repeat this with different examples until you feel more tolerant about all of the experiences.

Love is also a verb. Love is what we do, so in order to get to more love, we need to do it more often. The actions that make love love.

**Become More Motivated Exercise**

Think of a big image of something that you crave or that really motivates you. Notice the submodalities. In the corner of this image, imagine a small image of what you want to be motivated to do. In a split second, imagine this small image growing into and replacing the bigger image, so that you start to see what you want to be motivated to do in the same place and submodalities of what you craved. Repeat steps 1-3 a few times and notice yourself feeling the motivating feelings for the new behavior.

Go back and remember the last time you were at a party and you felt nervous, and notice how the feelings spin inside your body. Literally freeze them, and reverse them and have them spin in the opposite direction. Then look around the room and see who the most nervous person in the room looks like." She said,
"Me." I said, "Step inside yourself so that you can only see others. Look around the room. Pick the nervous person and then walk up and talk to her reassuringly, with jokes. Make her feel at ease, and then move on to the next one and the next one." We did this until she had gone through three people and was still feeling new feelings and spinning them in the reverse direction to her original feelings. The opposite of feeling nervous, of course, is being at ease. It's not being calm, it's about being at ease and really starting to be concerned with the well being of other people rather than being concerned about your own stomach.

The more you see, hear, and listen to other people while they talk and watch their expressions and notice whether they're at ease, the more you can spend time doing things to make them like you. The reason to do that is because the more they like you, the more likely it is they'll promote you. The more likely they are to invite you to another party. The more likely they are to introduce you to their friends. It's important for you to do things that make them feel good. The more you focus on the outside and others out there, the less you'll focus on the inside.

**Being at Ease with People Exercise**

Think of a time when you were at a party or social gathering. Notice the feeling of nervousness and which way it is moving. Imagine taking the feeling and reversing it so that it moves in the opposite direction. Spin it faster and faster in the opposite direction. Become aware of the nervous voice inside your head and change it so that it says whatever it says in a very relaxed voice.

Move any images you have of you being rejected or looking nervous far away in the distance and, instead, replace them with images of the people you talk to looking at you as you are feeling relaxed and at ease. Imagine going from person to person, feeling at ease and making them feel good. Imagine making them smile and feel better about themselves and enjoying the whole event.

**Tips on Flirting**

When you see someone you like, smile at them. Imagine yourself approaching them and feeling confident and at ease. See yourself speaking enticingly to them and then step into the movie. Imagine two different scenarios. In the first, they reject you and you walk away confidently smiling and feeling glad you didn't waste any time on them and that it's their loss. Imagine then scanning around for someone else nice. In the second, imagine them smiling back at you and accepting you and talking with you. Imagine making them smile and laugh and enjoying yourself with them.
If you are desperately alone and unhappy, then maybe it's time you stopped worrying about it and started looking for one of those other six billion people out there who are feeling the very same as you. I meet so many people who claim they want to meet somebody, but they never go out and talk to anyone. These things are contradictory. You plan what you want. You plan how to get it. You think about it practically. If you don't make contact with lots of people, then it's going to be more difficult to find that one, right person.

MHR it’s a numbers game. All ‘players’ understand that the secret to getting laid is to approach as many women as possible, ideally without any other woman noticing / realising you are approaching so many, so they all feel ‘special’ i.e appeal to their ego, as irrational as it is i.e of course there are thousands of potential love matches for any individual…but people want to believe they are unique etc…someone feel cheapened…very unfair on the sex that is expected to be the ‘chaser’ i.e take the risks, fork out the money etc…put themselves out on the line…as if they should feel guilty…etc…the ‘player’ takes rejection lightly…invests little until something serious evolves…which seems to make girls more interested i.e someone too ‘keen’ makes them suspicious…and jealousy works in favor of the suitor i.e women compete with each other if it seems some OTHER girl wants you, they want you…at least makes them curious as to WHY other girls like you / are with you etc >>>desperation is unattractive…looks weak…reduces you value in other people’s eyes i.e how you value yourself impacts their evaluation…puts too great pressure on people i.e if you appear dependent on them …almost an act of violence on their empathy / compassion …more casual at start is best…no pressure…no desperation…therefore won’t invest so much emotionally or financially…takes pressure off everyone…stops abuse of power … stops frustration / anger / violence spilling over as result i.e ‘I bought you dinner, you’d better put out’ i.e as if a transaction implicit…I paid…I performed my part of tacit agreement, and then she reneged on hers…etc…sort of ‘social contract’ implicit in ‘I show here a good time, she shows me a good time’ i.e quid pro quo…how many guys love spending huge amounts on dinner and dancing, and wouldn’t rather be home watching t.v relaxing?

Tips on Flirting

When you see someone you like, smile at them. Imagine yourself approaching them and feeling confident and at ease. See yourself speaking enticingly to them and then step into the movie. Imagine two different scenarios. In the first, they reject you and you walk away confidently smiling and feeling glad you didn't waste any time on them and that it's their loss. Imagine then scanning around for someone else nice. In the second, imagine them smiling back at you and accepting you and talking with you. Imagine making them smile and laugh and enjoying yourself with them. Focus on making them feel really good around you
rather than on having them like you. The better they feel around you, the more they will want to spend time with you. Meet as many people as you can. As Gatsby put it / F.Scott Fitzgerald ‘Make others feel like they have made the best possible impression on YOU that they could dream of’. This feeling is addictive. Your approval and acceptance, and rapport, become their supply of ‘feeling good’, and so they’ll want to keep your around. But never appear desperate, clingy, demanding, stalker-ish, or put yourself down…false modesty just makes your approval / acceptance of less value to them…focus on THEM…boosting THEM…don’t put yourself down in any way…accept any praise genuinely…find something to praise them for, that is genuine, and not fake, so they can easily accept it as genuine e.g if they really have great taste, if their hair looks great, anything that is real and not faked…once you fake it, you lose rapport…you need to mirror and lead…rapport…

People never wait to procrastinate. Again, we have another paradox. Since people don’t wait to procrastinate, everybody reading this book can do some things immediately and can put others things off forever. Some people put off taking a vacation forever. As I already mentioned, some put off telling their children that they love them. They wait until they are too grown. In order to end this cycle and get to the task in hand, we need to learn about how motivation works.

Spinning feelings isn't just something I made up, it is something I found client’s doing. i.e client actually put hand on stomach and span one direction for something motivating i.e cooking and eating a meal, and other way for something he kept putting off e.g learning his lines for and opera. Even spinning faster and slower, making still or moving images, of different sizes, in different locations, and spinning in different directions at different speeds… etc. When people spin feelings faster and faster, of course their feelings get stronger and stronger, as long as they keep the ideas in their mind.

**Changing Your Feelings About Something (Visual Squash)**

Think of something you feel motivated to do. Notice the submodalities (A). Think of something that makes you want to be motivated to do but you have struggled with. Notice the submodalities (B). Take the image of what you want to be motivated to do (B) and send it off in the distance and back up into the position and submodalities of something you feel motivated to do (A). 4 Again, make an image of you struggling to do the activity or task in your mind and imagine it in your left hand. Imagine associating a color and a shape with it. Make it a still image (C). In your right hand, think of you completing it and feeling really good
about it. Give that a color and a shape. Make it a still image (D). Crank up this positive, good feeling, and imagine the color and shape in your right hand getting bigger and stronger and more powerful. Turn up the feeling more and more until it’s really intense. Imagine between both hands are the different images of the different steps that need to be taken in order for you to go from the (C) image of you struggling to the (D) image of you enjoying the activity. Take the image in the left hand and right hand and all the images in between and smack them together, filling the old feeling in the left hand with the positive feeling in the right hand so all of the images come together. Put your hands on your chest and imagine all of the feelings inside your body.

If you can take the image of what produces intense desire in you, and you move the image of you doing taxes into that place, then you will start to feel like doing them. It really is that simple. You have an incredible ability inside your head to manifest the kinds of feelings you need when you need them.

**Getting to Your Taxes Exercise**

Think of a big image of something you absolutely love doing and just the thought of it makes you drool with desire. Notice the submodalities. Imagine a small image of you doing your taxes in the center of this image. In a split second, imagine this small image growing into and replacing the bigger image so that you start to see yourself doing taxes in the same place and submodalities of what you drooled with desire for. Repeat steps 1-3 a few times and notice yourself feeling the motivating feelings when you think about doing your taxes.

People often motivate themselves through anxiety. They wait until the fear of something compels them to, e.g write their essay / study for exam, at the last minute i.e use fear to motivate. Better to fear failure at start of term, and work hard at start, then relax before exams, having done all you can do already. You are going to experience stress either way, so better to get it over with, rather than put it off. i.e Delaying gratification but bringing anxiety / fear forward. Pay now, enjoy later. Vs enjoy now, and pay later. Anticipation is all, so you suffer more by putting something off i.e all the time you spend worrying about it …when getting it over with leaves you free of it.

Motivate yourself by placing pleasure in front of self, rather than fear / anxiety…put that behind you i.e the work…

It’s as simple as seeing yourself doing something and then watching yourself do it happily and successfully and then stepping inside the picture so you have the feelings. You can them spin them faster and faster and get on to it.

**Getting to Study Exercise**
Imagine something you are really motivated to do and create the feeling and spin it inside you to intensify it. Imagine yourself studying and doing really well in the exams. Spin the feeling of motivation faster and faster as you think about studying and doing exams. 4 Think about not having enough time to study and spin the urgency. 5 Think about studying again and doing well in the exams as you spin the urgency and feeling of motivation faster and faster.

The point is you are drawn to the good feeling of success, and practice, study, write etc not out of fear of failure, but joy in the anticipated success.

Somebody who claims to me they have no discipline gets up every morning and showers and shaves. That's just contradictory to me.

You need to build propulsion systems, so the more you don't do something, the more unpleasant it becomes, and the more you start to do it, the better it feels. A propulsion system simply means attaching powerfully positive feelings to doing something and attaching powerfully negative feelings to not doing something.

Getting control over which direction your feelings move is one of the best things about the sub modality model. You can change how you feel about something, so that instead of making it something you should do, it's something you really desire. MHR so you associate desire / pleasure with the activity, rather than guilt / aversion / loathing / avoidance / dislike / anxiety / fear.

**Motivate Yourself with Words Exercise**

Think of something you find yourself easily motivated to do. Notice the tone and rhythm of your inner voice that you use when you talk to yourself about these activities. Become aware of the different words that work best to motivate you out of the following choices: I WISH I WANT I NEED I HAVE TO I'VE GOT TO I MUST I SHOULD I CAN I AM DOING I WILL I'M GOING TO You will notice that some of these words work better for you than others and motivate you more than the others. Use the words and the tone and rhythm of the words and voice that motivates you.

If you notice the sub modalities of something you feel desire for and something you want to feel desire for, move what you want to feel desire for out into the distance and pull it back up in the submodalities of what you do desire. Then you will start to feel desire toward the new activity. This is called a **swish pattern**. If you can use a swish pattern to build strong desires for any activity, the closer you get to that activity, the stronger your feelings get. The more you don't do it, the worse it gets. It will propel you in the right direction.
Most people try to get themselves to do things by feeling so bad that they finally do it. That doesn't work with doing things every day. People don't shave because they feel terrible. They shave because it's time to shave. They build a good habit, and they stick with it. It's not about creating great relief. It's about it feeling right. You make it so that something feels so good to do that it just feels right. That's why you just get up in the morning and brush your teeth. If you walk out of the room and realize that you haven't brushed your teeth, you just walk back in and do it. It becomes second nature. You have to go inside and make it so that the more you think about it, the more you want it. You have to make it so the more you see yourself getting on the machine and being happier, and step inside that picture, the easier it's going to be.

**How to Exercise Regularly**

Think of a habit you have and do every single day such as brushing your teeth or taking a shower. Notice the submodalities. Think of exercising regularly. Notice the submodalities. Think of how awful it will feel to be overweight, lazy, lethargic, and unfit. Attach this to the thought of not exercising. Think of how you will feel if you do exercise regularly and how good it will be to look great and feel great. Take the image of you exercising and move it out and back into the image of you engaging in the habit that you do every day. Do this a few times quickly as you attach the good feeling. Do it until exercising feels like second nature to you.

MHR why I felt powerless, and helpless...what is confidence? What is fear? How do you become scared or confident? In one case you amplify, make as vivid, and attend and focus on, the anticipated costs / damage / pain / failure i.e vividly see yourself being hurt, defeated, crushed, humiliated, unable to defend yourself, unable to fight back, and imagine horrific injuries...so this 'reality' you are transmitting to your unconscious produces fear i.e fight or flight...but because of your conditioning i.e social stigma etc, you are paralysed i.e not seen as option to run away, and unable to fight, paralysed by fear...even running, as in nightmares, doesn't work, as you find you cannot move, or put any distance between your follower / chaser... Vs the confident bully makes a vivid impression in their mind of satisfyingly crushing and harming their victim...they assume they will 'win' the fight i.e rarely pick on anyone they imagine might fight back...someone socially isolated or physically weak...so they are motivated by the desire / pleasure of victory and harming others / imposing their wills... they see glory / pleasure i.e their 'carrot'...while their victim is obsessing on the 'stick'... in most cases the victim has no motive to fight...it is not their agenda...there is no 'carrot' there...so to turn tables have to go back to start when fear or confidence are 'stimulated' / produced ...i.e what 'reality' data are
you constructing i.e unconscious computer computes, doesn’t make value
ejudgements…those YOU make for it…actively / habitually construction vivid
images etc…effectively communicating ‘reality’ to your computer…it just
crunches numbers, runs algorithms, based on the info / data you enter i.e via
imaging different outcomes, focusing on different possible
outcomes…confidence is a set of biological / physiological elements..which we
can observe a.k.a cues / tells / access cues …i.e flush of skin, moisture of hands,
dilation of pupils, body posture, dryness of mouth and throat, tension in neck /
tongue / jaw / face / back etc…we create self-fulfilling prophecies by the
‘movies’ we play in our minds BEFORE and during an experience…set
ourselves up for failure or success…basically computer computes how to create
the visualization, make it real…it acts as if what you imagine is real…it takes
imagined realities as real as any other inputs …so if it computes that you
SHOULD be scared i.e run away, it will produce all the physiological impulses /
reactions necessary to, and likely to compel you, to run e.g from a tiger or armed
soldier…because you have ‘spun’ (literally interesting term ‘spin’ I thought from
baseball / cricket / tennis is make ball move in different direction, but could be
more what Bandler found i.e client who ‘span’ the internal reality faster / slower/
different directions i.e client very sensitive to, conscious of this spinning)…the
relatively harmless bully into a tiger…totally overestimated the REAL
risks…and the REAL possibilities of self-defense…like a possum, calculated you
can not defend, so best to submit, or run away, and then in future avoid i.e phobia
/fear / anxiety…

MHR motivation based on expectation of success…which is based on perception
that you have the resources / skills required, or can attain them…and a history of
having done so…i.e successes…revisit expectations theory etc i.e previous T stuff
…this book will be fruition of all that, bring all previous together…to produce
people able to reach their full positive potential, and defeat the n.w.o and any
other group that seeks to enslave them, trick them, con them, bluff them…

First you chose to defy or submit, based on sober reality check. Vs irrational fears
and oberblown calculations i.e what enemy pretends to be and what is…what you
imagine their power to be and what they are…then once decided to defy, have to
start programming yourself for the confrontations, so in optimal state of alert
calm anticipation, with caution Vs fear, able to take the hits, but alert to avoid
most of them, and be prepared with defensive moves, and counter-moves…i.e no
desire for harm, but sober, calculated responses…

I always over-exagerated my inabilities, and my victimisers abilities, focused on
the damage I might suffer (and later do to them i.e empathy)…based on life as
victim of people I had no way of defending against i.e father, mother, older
siblings…so imagined the damage to be suffered…imagined I could not defend
myself efficaciously i.e zero experience of this potential…no desire to harm so
never bully...no logic in suffering for mere 'status'...but was never really confronted by a bully at school who was really my superior physically...just socially disempowered as 'outsider' and 'bad dresser', bad hair cuts, no money, second hand clothes, few sporting abilities...and smart / clever / bit of a loudmouth clown...could easily have defeated any and all of those I allowed to push me around...lived in fear of...and when finally realised, felt sorry for them when saw fear in their eyes, when they encountered me without their social network of psychological support...and so never confronted them...no desire to harm anything / anyone...

Difference between mentally ill hallucination and daily hallucination is social acceptability of hallucination, whether there is a social tradition for it, whether it is dysfunctional for elites / masters and self, e.g nationalism is a hallucination, like Judaism, chosen people, religion, gods, angels, manifest destiny, fate, destiny, and of love, and most status goods and status positions...all positive hallucinations...these not 'mental illness'...real difference is whether you can tell difference between what you positively hallucinate i.e imagine, and what is there, or more precisely, other people hallucinate with you i.e consensual reality / social reality / subjective reality...no need for any 'objective reality' to exist at all to account for all our experiences...

Many people suffer negative hallucinations, NOT seeing what IS there, or what others consensually see ... numbing is a common form of negative hallucination, where we ignore the suffering we are inflicting on other sentient beings, from humans to farm animals. ... or when trying to convince someone of a documented fact e.g 'the holocaust' is a fake, as is manmade global warming, possibly even 'the earth is a sphere / globe'.... You can offer compelling arguments, facts, figures, and experiments, and people just do NOT / will not, can not, see them / compute them / digest them / grok them / accept them...

If you can't see how central banks.... Or how propaganda ... or how priests...or how bullies... or how marketing pros...or how spin doctors... you are experiencing negative hallucinations... you are not processing data from the 'external' world ... you are not 'entering' that data, so your computer continues to process / compute based on faulty / limited / defective / insufficient / dodgy / corrupted etc data...

Thought crimes make 'correcting' and 'revising' data a crime...ask yourself why it is a 'hate crime'...who 'hates' it?...who benefits and who pays?

Huge emotional affect triggered when you try to challenge a person’s 'reality'...like a fear of going insane / mad ... our worst fear probably...fate much worse than death...have to deal with this fear...when challenging a person’s current 'hallucinations' i.e 'social reality' e.g of 911, Oklahoma etc, N.W.O, holocaust...
MHR mothers milk i.e of any animal, is about the only naturally occurring ‘perfect in terms of delicious’, 50-50 calories from fat and sugar combination…which any food that later is constructed in same proportions will have logical appeal to us…

I was thinking what to write, fearing I’d forget it, but had to take a piss, and of course also feared the new idea / recall on milk would displace other great idea…and it did…and now I can’t think what I wanted to write down so badly…I had considered continuing writing as I pissed…and didn’t, and now can’t recall what I wanted to write…so fucking ironic…wrote milk one first, and that displaced earlier one I feared losing…

Oh, about masturbation…shame…shame used in past to ‘socialise’ kids into not doing some things in public that might make others uncomfortable e.g masturbation…or embarrass them…picking nose, farting, etc…so to ‘teach’ that these things fine, natural, healthy, but point is ‘do you want random people masturbating next to you on the bus or in the class? Maybe some you would love to watch, but as we live in a society, unless you have their prior informed consent, you have an obligation to ‘do unto others as you’d have others, generally, do unto you i.e imagine cases you would NOT like someone jerking off next to you…now imagine that probably there are people who would not like to have YOU jerking off next to them, or farting, or picking their nose, or even just touching you, invading your personal space…same goes for driving a car…we have to make social rules for the general situation…that will satisfy the most people…what you do in private is NOT society’s business e.g pick nose, fart, masturbate…as it has no ‘externality’…(jews invented idea of social guilt i.e that if I don’t stop you wanking we will all be punished etc)…it imposes no cost on another…Vs taking drugs does, if you leave your home, or are a care giver in the home, or if it increase your odds of getting a communicable disease significantly… i.e balance of private freedoms with social obligations i.e to limit negative externalities…you can give your informed consent to a risk, but those around you cannot withdraw theirs, when they have no consent i.e YOU have taken the decision out of their hands, and forced an externality upon them…maybe one or two would want to watch you masturbate, maybe many, but those who do NOT, have not been given a chance to decide…you have decided for them…so safest to assume they DON’T want you doing some things…of course those who ASK, or agree, freely, and give their informed consent e.g an orgy, etc, free you to do as you all please…

What leads to avoidance? We imagine the bad things about something, make them very vivid, compelling, real…often amplify them…or view them in ways that makes them appear overwhelming e.g how to save 100,000 dollars. If you don’t break that down to 5,000 dollars per year, you will simply give up / feel hopeless / the task appears impossible and doomed to failure…chunking…break
down into achievable units...then focus on each in turn...until have a series of successes...and soon the next step is anticipated with joy, you look forward to your next achievement...and one day, a dozen or so years later, you have achieved that aim of 100,000.

Avoiding taking the necessary steps defeats you. Sabotages you. The bad feeling associated with confronting the problem stops you ever confronting with it, and dealing with it. So need to reverse the process that usually leads to this avoidance, using typical NLP strategies / exercises / practices / habits.

MHR recall Bandlers client...marriage or nothing ... i.e see no continuum of possible relationships...me...fear hurting as have no intention of kids, typical life, entertain, just avoid relationships i.e seem doomed to hurt other, disappoint, and so why invest much in something doomed to failure from start...plus high cost of investment even just in 'sex'...not worth it if it is just short term i.e have to keep repeating ‘groundwork’ over and over, as relationship has no hope of enduring...when in reality different women seeking different things, and might be happy with me as I am, for years even, or longer...though I don’t believe that i.e my limiting belief leads to all or nothing, and thus nothing...no point going out etc if don’t expect to get what looking for...so much effort / cost ... if don’t believe women want me...would want me...or that without the ‘follow through’ to offer i.e typical what men ‘pay’, or naturally enjoy giving? I don’t / won’t...so why go through all that effort and expense, with no follow through? So I feel guilty even about girls who do appear to be very interested in me...I assume I will disappoint with my lack of ‘follow through’ i.e the usual resources guys offer i.e to entertain, social life, car job home children...why put woman through that? I feel obliged to state upfront...as if not doing so is misleading them i.e I am not like other guys...problem of too much empathy and imagined power i.e fear of hurting...as if I could...fear of not trying to save world, as if I could...its one of my syndromes :D

Bandler notes that producing better order usually involves an immediate increase in chaos, as you go through the process of bringing order...order through chaos?...

You have to set aside time to do it. You have to set it up so there are incremental tasks you can actually accomplish. If you tear your closet apart and then you have to go to work and you come home and your whole house is upside down, it'll just make you crazy.

You have to do it in pieces and make sure that it fits in with your own life. You have to set aside time and decide at the end that it is going to feel wonderful and make every day easier. Then you have to look at yourself living in that universe where your closet stays clean and where you put your shoes back where they belong and see what it looks like.
You have to see whatever kind of order you want to create in your life. Then you have to back up and decide, In order to get to that place, I have to create this much chaos and it's going to take this much time, so you see yourself going through the chaos. If you don't think you look like you're enjoying the process of pulling everything out because you're thinking about the fact that you could be playing tennis or going to the beach then, of course, you're going to suffer.

However, if you look at it in steps so you break it into pieces-you have a piece that you can accomplish and you make sure that the closer you get to the end of it the better you feel-then it will be different.

Some people are too organized. There are some people who end up being clean freaks to the point that if one fork is out of place, they go ballistic. They overplan things. Whenever you overplan or underplan, you haven't really got a useful plan, so what you need to do is to be able to create a realistic plan. It is a plan that also involves you looking happy and being happy.

The trick is that you look at it so much that you desire it. You move it into the sub modalities of your strongest desire so you feel drawn toward doing it. You make sure every single piece of the plan fits within your schedule and you'll feel good when it's done.

You don't wait till you're stinking or horribly dirty before you wash. You take a shower or bath on a regular basis. You get up and you clean yourself off and you brush your teeth. It's not a struggle. It becomes a good habit. If you plan to have good habits, you will and if you don't, you won't. If you believe it's going to be hard, then it will be, and if you believe it's just the natural order of life, then it'll be easy.

If you plan (vividly imagine etc) on them being difficult, they will be. If you plan on them and believe in them being easy, they get easier.

Money. You can sell more of your hours and make more money. No-one ever got rich this way. You only have 24 hours. So you can get training and education and skills so employers will be willing to pay more for each hour. You seek promotions and different positions that pay more, per hour. Or per week. If you are on a salary, it will be more per year. But unless you are a Bankster, a legal form of criminal, the most you can attain here is middle class. Which is fine for most people. Working class people like myself (well before I was black-listed and black-balled and 'banned' I could find work as a teacher) consider earning 100,000 dollars a year very successful. We consider such people ‘rich’. Maybe in a perfect world very few people would ever expect to earn more than 6 time the most common wage or salary. OR to at least consume 6 times more than the most common consumer. I would never say ‘average’, for reasons outlines in my other books.
If you happen to feel entitled to consume much much more, say thousands of times more, than the typical consumer in your area, and to move to a ‘better’ zipcode, then you are going to have to find a way to get your snout into what Kurt Vonnegut called ‘the money trough’. Become a lobbyist, bankster, advertiser, politician, or other form of ‘social engineer’ a.k.a ‘con-man’ a.k.a fraud, a.k.a ‘legal criminal’. I explain how that works in my essays and other T books.

If you find you don’t have the connections, or lack of ethics, if you aren’t sociopathic enough, if you have too much empathy for the costs your own satisfactions impose of other sentient beings, you will opt to seek honest profits. Buying something, working on it, and selling it for more than you paid for it. Most businesses take the output someone else has produced, find a way to add value to it, and then sell it at a profit. These are one off profits. you get paid for each successful transaction. The difference between the cost of your inputs, and the price you got for your outputs, minus tax, is your profit.

Then there is what is called ‘passive income’. It means that you keep getting paid for something you have already done, over and over. The thing here is that often you will never get paid at all. And if you do, it may take a long time before the effort, sacrifice, and risk you took in producing the book, song, or invention, even returns the minimum wage for the hours you put into it. But then, if what you produced is desired by people, and the Jews don’t prevent you selling it to them (censorship / arbitrary drug laws etc, the sky is the limit. In effect if you take the average income of everyone who attempts this, you will find it is less than the minimum wage. But because only one in a few thousand ever ‘make it big’, the benefits are concentrated and pooled, and go to the winner in this high stakes game. Writing a book or trying to invent something is like buying a ticket in a lottery…with the price being often years of unpaid, stressful, demanding, often risky, blood, sweat, and tears. Of course we only see the ‘winners’, and imagine it is much easier than it appears. So it is best only writing a book, or trying to invent something, if you really love the process. If the end has much more value to you then simply being your possible ‘ticket’ to wealth. That said, people buy lottery tickets simply to have a dream to dream. The dream is itself very valuable. Especially as most people who ‘win big’ end up miserable as a result, rather than happy.

Rent from a house you fixed up and rented out, or profit from a series of houses you are in the process of ‘flipping’, that is, renovating and re-selling. Profit from an honest and fair business transaction. Royalties from a book, song, music, film-script. Patent fees from an invention. The most ‘passive’ ‘investment’ you can make is in Index Funds. I explain what to do, and what not to do, when it comes to the stock market, in ‘Occupied’.
Most success stories started out small, took a long time to grow, before the public became aware of them. Most actually were ‘pushed’ by those already at the money trough. As they say, ‘vitamin C’, it is who you know (connections), more than what you know, or can do.

In fact the myth of success and happiness is constantly constructed and reinforced by those at the money trough, who turn the taps on and off, and decide where the money will flow, to their own personal greatest profit and benefit... From a social point of view, very few people will ever earn more than 6 times the most common income in a community... those who sell the idea that it is desirable and possible are usually the ones profiting from that belief... want to make a fortune quickly? Write a book about how to do that. Set up a pyramid scheme. All wealth ‘creation’ that does not actually increase real production of goods and services of real value IS a ponsy/pyramid scheme... see my T books.

That said, satisfaction can be earned, along with money, and self-esteem, self-realisation, by finding something you are good at, or some service other people are not offering, or doing a lousy job at, and starting small yourself, with your own side-line business. Turn a hobby into a business. Turn a talent into a trade. Try and see. Focus on the intrinsic joy of being of service to others. The joy of producing some good. Of writing. Of helping people. Get rich quick schemes of others generally only make those others rich. If what you are doing is not worth doing, in and of itself, maybe for a little extra cash, don’t do it. Just doing something in the hope of excessive, unearned profits, won’t make you feel good about yourself, and probably won’t end up making you richer at all, in any way. So find something you love doing for the sake of it. For the intrinsic benefits. Whatever it is, you can probably earn some extra money doing it. And it could become not only second income, but your primary income. If making money is your hobby, join the bankster hucksters, they literally print it. Get your snout in the money trough and on your deathbed you’ll be able to look back on all that money you ‘made’, literally. While producing NO real value. Probably even producing disvalue, disease, illness, death, misery, suffering, poverty, war...

If you find your hobby becoming a business, seek the mentoring of someone who has been there and don that. Or network with others in the same position, or who are just a few steps ahead of you on their learning curve, and help each other. As Adam Smith noted, the honest business person thrives among successful business people, even competitors. Ask a retired business-person who loves the game, to advise you, to keep their feet in the water, and their hand in the game. Someone who does it for the love of it. People with skills going unused are often itching to get back in the game. To play. For it is fun to them. Trust your own instincts in the end, but seek the advice of experts for things you don’t understand. Though most of them are peddling nothing more than ‘transferred authority’ i.e
pretending they can do stuff they cannot, or that they know something special i.e.
have degree…but their ‘connections’ can be the most important factor…

If you sit at home and moan, "I can never do this. Nothing's gonna happen," then
you'll be right.

If you believe you can, or believe you can’t, either way, you will be right’.

**How to Make More Money Exercise**

Build a belief in yourself being wealthy. You can do this by going back to the
inventory where you found the sub modalities of a strong belief. Take the thought
of you becoming successfully wealthy in the near future and move it off and back
up into the sub modalities of the strong belief. Do this a number of times.

Focus on making your money based upon what you know rather than something
you don't know much about. Learn everything you need to know about whatever
business or opportunity you are looking at. Research in depth so you are
absolutely clear on everything. Find a mentor who has already succeeded in the
business you are in and ask them all the questions you have about how to make it
work. Always ask how you can be more valuable to the world and prepare to
work more effectively than ever before.

I have lots of exceptionally rich clients who are quite miserable. People somehow
believe that things are easier when you're rich, but maybe the opposite is true-
with unlimited money, you have to make more decisions about what you're going
to do and how you're going to keep it and how you're going to spend it. You have
to be able to decide who to trust and who not to trust.

To decide on a course of action, imagine yourself years after having made the
decision, looking back on your life…all the things you had to do to achieve the
desired ends, and what you got from it …good and bad…to decide if you want to
end up here, and if so, you will see all the steps it took to get there, and then you
will have your plan of action…your steps…sub-objectives…you will know what
to do, how to get there…and can start right now, motivated, confident that each
step is taking you where you want to be, that getting there will be worth the
effort, sacrifice, risk, discipline etc…The more you manifest hope and excitement
about the future, the more motivated you will be … expectations theory etc…

**Have more control over what your brain does. It's essential that you have more control over how you feel and so more control over what you do. If you change the way you think, it changes the way you feel, which changes the way you act.**
When I started out nearly four decades ago, people were looking at things from a psychological point of view. They wanted to know why you had problems and thought if they knew the source of the problems, they'd mysteriously change somehow. The behavioral technology I created was made out of discovering how people did things successfully, how they got over things, how they got through things, how they got to things. Lessons in how to manage your thoughts, your feelings.

This isn't a philosophy. This isn't an ideology. It's not a religion. It is just a set of tools. Your brain runs all the time, and it's either going to run in the direction you want it to go or it's going to run all over the place. If you don't do things to control your thoughts and control what pictures you make, then you won't be feeling as good as you can be feeling. It's important to organize and manage your thoughts, your time, and even manage your sleep so that when you lie down at night you tell yourself that you're going to sleep easily.

Aim your thoughts and you aim your feelings and you aim your conscious and your unconscious desires in the same direction.

When you make great, big goals—whether you get to them or not—the things that happen along the way are what makes life wonderful. The people you meet, the things you accomplish, the more you don't waste time going in circles and fighting with yourself, the more you'll get to do things and try things. Some of those things are going to work out wonderfully.

Calibration: The process of learning to read another person's unconscious, non-verbal responses by observing another's behavior and the relation of their behavior with their internal response.

Congruence: When a person's beliefs, state, and behavior are all fully oriented towards securing a desired outcome.

Gustatory: Relating to the sense of taste.

Hypnosis: An application of NLP as well as a field in its own right.

Hypnosis is the process of guiding a person into a state where they have more direct access to their unconscious mind, which is where powerful changes can be made, deliberately through the use of suggestion.

Kinesthetic: Related to body sensations.

Meta Model: A model developed by Richard Bandler and John Grinder that suggests questions that enable people to specify information, clarify information, and open up and enrich the model of a person's world.
Meta Program: A learned process for sorting and organizing information and internal strategies.

Milton H. Erickson, the clinical hypnotherapist

Neuro-Linguistic Programming: An attitude, methodology, and Technology designed to help people have personal freedom in the way they think, feel, and behave.

**Time lines**: The way that we code time internally. Our images of the past, present, and future are represented somewhere in our immediate space. Some people represent their past to their left and future to their right. That is known as through time. Some people represent the future in front of them and the past behind them. This is known as in time. Many people have a mixture of both of these patterns.

Trance: A state commonly experienced as a result of hypnosis. It is also a state of mind that is characterized by a focus of thought. We live in many different trances depending on what our mind is absorbed in at any given moment (television, driving, eating, etc.).

Unconscious Installation: The process of installing skills, ideas, and suggestions inside a person through communicating with their unconscious mind.

Unconscious Mind: The part of your mind that is working all the time. It is what produces your dreams and regulates your bodily functions such as your heartbeat, breathing, and habitual patterns of behavior. It contains all your memories, wisdom, and perception. It runs the automatic programs of thinking and behaving and therefore is the best place to make changes permanent.

Well-Formed Outcomes: Goals that are set according to well-formed conditions. These conditions are that the goals must be positive, specific, sensory-based, ecological, and maintainable by the individual.
Strategy should be realistic, so don’t doom self to failure. Accept there will be times you will feel an urge very strongly, and plan what to do instead, to displace / replace the satisfaction / relief that bad habit was a ‘solution’ for / provided.
‘Frogs into Princes’ (Neuro Linguistic Programming) by Richard Bandler and John Grinder. 1979. Edited by Steve Andreas entirely from audiotapes of introductory NLP training workshops conducted by Richard Bandler and John Grinder. (before they parted ways!)

Bandler and Grinder modelled the behavior of those rare few clinicians-like Virginia Satir and Milton H. Erickson-who got results to see what they DID, so others could do the same things. They then looked at how more than 100 people got over fears and studied what was common to them all. Bandler says ‘I looked at what worked, no matter how. If a few good therapists "fixed" anybody, I looked at what they actually did. When people got over problems on their own, I looked at what had happened. The result is what is now called Neuro-Linguistic Programming’.

The real beginning of all this work started when we began taking people's words as a literal description of their experience, not just a metaphor. We started communicating back as if they were literally the way they had described themselves, and we found out that was the case. When someone says "When I focus on those ideas they feel right, but I tell myself it wouldn't work," that is a literal description of their internal experience.

We are a lot more willing to experiment against our intuitions than most people. When most people have a strong intuition, they'll follow it. A lot of times when we have a strong intuition, we'll violate it to find out what will happen—especially when we have clients that we have ongoing contact with, and can be sure of being able to deal with the consequences. That kind of experimentation has resulted in many useful patterns and discoveries.
We originally developed reframing by observing Virginia Satir in the context of family therapy. We have developed several other systematic models of reframing.

He then taught that process, and continued interrogating it himself, tweaking it, improving it, streamlining it. Over these decades, Bandler continued refining these steps, actions, what people DO, rather than worry about WHY and HOW it works...end up with models of behavior anyone can copy, if they are willing to become Zen practitioners and go all Great Gatsby on their interlocutors / clients/patients i.e become focused / attentive / sensitive to verbal and non-verbal communication of their interlocutors...to undergo 'sensitivity training' re: accessing cues, and linguistic cues (complete in therapy language usage)...

The visual squash is a visual method of integration using visual anchors. You hold out your hands and see yourself as one part here on your left, and as another part here on your right, and you watch them and listen to them. Then you slowly pull the two images together, and visually watch them merge together and then notice how that image is different. If you like it, then you do the same thing again kinesthetically, and squash the two images together with your hands. Then you pull the integrated image into your body. We just stumbled across this. At first it sounded kind of weird, until we studied a little bit about neurology. It's a good metaphor for what goes on in the metaphor called "neurology." And if you don't think neurology is a metaphor, you are naive, I want to tell you! But anyway, their metaphor and our metaphor were very similar. And if you try it, it's very dramatic. It's a very powerful method.

What we've done as modelers is to figure out what the essential elements are, and what is unnecessary. Every therapy has dissociation. Every therapy has the kinds of sorting techniques we're using here, whether it's chairs or knee anchors or words. What is useful to have in every therapy is some way of doing all that: some way of sorting, some way of dissociating, some way of integrating. The names you use are wholly irrelevant, and most psychotheologies are also irrelevant. There's really nothing that different between what we did and what gestalt people do by taking people back through time. TA people do a process called "redecision." They are all very, very similar. We looked at all those different processes and tried to find out what the essential elements were, and what was extra and unnecessary. Then we streamlined it to try to find something that works systematically.

MHR Often clients do things unconsciously, that the therapy is given credit for, but which is not explicitly part of the therapy, and thus never consciously/explicitly taught/modelled, and so some patients who automatically ‘add’ the missing links unconsciously get results, and the others, who did the same therapy,
don’t, and the therapist has no idea why. The NLP modelling process discovered, by observation, what the ‘extra’ steps carried out by SOME therapists unconsciously, and by some patient’s own unconscious, were, and described them explicitly, modelled them, so others could employ them consciously.

All methods work for some people and with some problems. Most methods claim much more than they can deliver, and most theories have little relationship to the methods they describe. When I was first introduced to Neuro Linguistic Programming I was both fascinated and very skeptical. I had been heavily conditioned to believe that change is slow, and usually difficult and painful. I still have some difficulty realizing that I can usually cure a phobia or other similar long-term problem painlessly in less than an hour—even though I have done it repeatedly and seen that the results last. Everything written in this book is explicit, and can be verified quickly in your own experience. There is no hocus-pocus, and you will not be asked to take on any new beliefs. You will only be asked to suspend your own beliefs long enough to test the concepts and procedures of NLP in your own sensory experience. That won’t take long; most of the statements and patterns in this book can be tested in a few minutes or a few hours. If you are skeptical, as I was, you owe it to your skepticism to check this out, and find out if the outrageous claims made in this book are valid. NLP is an explicit and powerful model of human experience and communication. Using the principles of NLP it is possible to describe any human activity in a detailed way that allows you to make many deep and lasting changes quickly and easily.

A few specific examples of things you can learn to accomplish are: (1) cure phobias and other unpleasant feeling responses in less than an hour, (2) help children and adults with "learning disabilities" (spelling and reading problems, etc.) overcome these limitations, often in less than an hour, (3) eliminate most unwanted habits—smoking, drinking, over-eating, insomnia, etc., in a few sessions, (4) make changes in the interactions of couples, families and organizations so that they function in ways that are more satisfying and productive, (5) cure many physical problems—not only most of those recognized as "psychosomatic" but also some that are not—in a few sessions. These are strong claims, and experienced NLP practitioners can back them up with solid, visible results. NLP in its present state can do a great deal, but it cannot do everything.

It's the structure of experience. Period. When used systematically, it constitutes a full strategy for getting any behavioral gain. There are lots and lots of things that we cannot do. If you use it congruently you will find lots of places that it won't work. And when it doesn't work, I suggest you do something else.

The same principles can be used to study people who " unusually talented in any way, in order to determine the structure of that talent. That structure can then be
quickly taught to others to give them the foundation for that same ability. This kind of intervention results in generative change, in which people learn to generate and create new talents and behaviors for themselves and others. A side effect of such generative change is that many of the problem behaviors that would otherwise have been targets for remedial change simply disappear.

There have always been "spontaneous remissions," "miracle cures," and other sudden and puzzling changes in people’s behavior, and there have always been people who somehow learned to use their abilities in exceptional ways. What is new in NLP is the ability to systematically analyze those exceptional people and experiences in such a way that they can become widely available to others. Milkmaids in England became immune to smallpox long before Jenner discovered cowpox and vaccination; now smallpox—which used to kill hundreds of thousands annually—is eliminated from human experience.

Steamship owner received a bill for $1,000 he complained that the boilermaker had only been in the engine room for fifteen minutes, and requested an itemized bill. This is what the boilermaker sent him:

For tapping with hammer: .50
For knowing where to tap: $ 999.50
Total: $1,000.00

What is really new in NLP is knowing exactly what to do,

MHR communication requires sharing of idea, and ratification that the sharing has occurred…this ratification provides feedback loops i.e whether message ‘received’ in full or not…need to learn to ‘decode’ the unconscious feedback listener / interlocutor’s offer…do they REALLY ‘grok’ it?...(often unconscious) accessing cues provide additional (often much more, and of greater quality / trustworthiness) feedback to more limited, often untrustworthy (honest and selfware) conscious linguistic feedback i.e spoken responses…

Sequence of events i.e syntax, is key to valid ‘grokking’ e.g MHR if arrive after X has hit Y, and thus the first thing you ‘see’ is Y retaliating, and X complaining of being the ‘victim’, you are likely to jump to wrong conclusions…and if the ‘attack’ made on X is unobtrusive e.g many forms of violence e.g threats and actual attacks not always obvious, form ‘background’ i.e ‘context’, and has to be brought to ‘foreground’ and made explicit and obvious e.g mobbing, victimisation, verbal abuse, financial violence, i.e very subtle forms of violence exist…often chronic, long term, that ‘explode’ in obvious, clear physical retaliation which can appear to be unprovoked …

When therapists begin to do therapy they look for what’s wrong in a content-oriented way. They want to know what the problem is so that they can help people find solutions. This is true whether they have been trained overtly or covertly, in academic institutions or in rooms with pillows on the floor. This is
even true of those who consider themselves to be "process oriented." There's a little voice somewhere in their mind that keeps saying "The process. Look for the process." They will say "Well, I'm a process-oriented therapist. I work with the process." Somehow the process has become an event—a thing in and of itself.

**MHR everything is process…we nominalise / reify processes as ‘things’ / ‘objects’ … this is a form of / expression of our common process of idolisation … making ‘fixed’ and limited idols of processes …**

There is another paradox in the field. The huge majority of therapists believe that the way to be a good therapist is to do everything you do intuitively, which means to have an unconscious mind that does it for you. They wouldn't describe it that way because they don't like the word "unconscious" but basically they do what they do without knowing how they do it. They do it by the "seat of their pants"—that's another way to say "unconscious mind." I think being able to do things unconsciously is useful; that's a good way to do things. The same group of people, however, say that the ultimate goal of therapy is for people to have conscious understanding—insight into their own problems. So therapists are a group of people who do what they do without knowing how it works, and at the same time believe that the way to really get somewhere in life is to consciously know how things work!

We call ourselves modelers. What we essentially do is to pay very little attention to what people say they do and a great deal of attention to what they do. And then we build ourselves a model of what they do. We are not psychologists, and we're also not theologians or theoreticians. We have no idea about the "real" nature of things, and we're not particularly interested in what's "true." The function of modeling is to arrive at descriptions which are useful. MHR this often challenges ‘accepted wisdom / assumptions / beliefs’…

We know that our modeling has been successful when we can systematically get the same behavioral outcome as the person we have modeled. And when we can teach somebody else to be able to get the same outcomes in a systematic way, that's an even stronger test.

Typical problem is that ‘can do, and repeat, but never conscious of what doing enough to be able to break it down into skills / knowledge other people could learn from…can demonstrate, but not explain what ‘intuitively’ doing…the systematic process can’t be expressed consciously and linguistically, so that others can ‘grok’ it…except by ‘student’ learning it equally intuitively / unconsciously… MHR my ‘guides’ all about making implicit / intuitive explicit and able to be copied / communicated / shared / replicated …without the ‘magic’ intuition the original expert was fortunate to possess…
Transformational linguists claimed to be able to identify the ‘rules’ of grammar and syntax... lots of money and prestige, but failure... MHR when I explain ‘phrasal syntax’ so simply... i.e ‘well formed’ is simply reflexive... a pattern... evolved into different languages each with their own relatively arbitrary syntax, which once ‘formed’ ‘feels’ ‘well-formed’ if conformed to... and not if not... but these ‘rules’ evolve... so no ‘innate grammar rules’ i.e universal ‘rules’... except ‘does this allow person to communicate... share information / understanding / emotions verbally / linguistically....

‘Well formed in therapy’ expressions... i.e syntax, word sequence, expressing ‘full’ meaning the person attempting to express (or unconscious suppress)...

MHR Once ‘learn’ something if ‘feels’ intuitive i.e forget HOW learned... or unconscious of how ‘learned’ i.e long term conditioning of experience... and natural talents for empathy, observation, Zen practitioner... reason by religion and ideological ‘beliefs’ are so powerful and feel so ‘natural’ and ‘intuitive’ and ‘self-evident’... we didn’t pay attention to how they were ‘implanted’ by experience... both random and deliberate efforts by ‘educators’ from family, to formal schooling, to mass media, to friends... sensitivity training makes you more aware of things would otherwise have overlooked, not paid attention to... e.g violence of sexist / racist etc language... impacts of own actions and words on others... even health effects of smoking / drinking etc... TROONATNOOR a form of full spectrum sensitivity training a-la ‘Zen’ practitioner training... Humean skepticism training... critical reasoning... most importantly in learning how to identify assumptions, and then learning how to de-construct the levels of composition of any ‘assumption’ i.e ‘belief’... and giving emotional courage to do so i.e motivations... explain consequences of not facing these emotionally challenging renovations... like soldier at front fearful of facing the enemy is offered dishonorable death of themselves, and punishment of their families, as the even worse and clear and immediate threat / fear... though so hard due to full spectrum propaganda e.g ‘noble lies’ and stubbornness of people / resistance to admitting wrong... denial... self-deception... constant reinforcement of lies / propaganda... rewards and punishments for straying from ‘orthodoxy’... and typical ploy of the beneficiary classes to constantly provide ‘false friends’ and ‘controlled opposition’ to fill any potential niches for truth, with a different lie, and thus ensure everyone deluded as to TROONATNOOR...

Most skills consciously learned, later become automatic / unconscious / muscle memory... often at this stage forget HOW learned i.e steps, and thus the best practitioner, especially for whom it came so ‘naturally’ and to whom it is so ‘intuitive’, has no way to teach it to others without these gifts / natural talents... so is often worst teacher, though most popular because people associate success of teacher / trainer with efficacy of transfer of skills / knowledge... like being in their presence will let it ‘rub off’ on them... whereas the best teacher is
the one who is conscious of HOW they learned, remembers the false-steps they took, the mis-understandings etc, and can formulate a means of sharing their newly gained skills / insights / abilities explicitly…is CONSCIOUS of the series of actions e.g throwing a javelin, that are required, rather than just being about to DO it… and actually feeling it to be ‘easy’…and when students fail, blame them…they just are not ‘naturals’…” this stuff can’t be taught’…when in fact a great modeler can observer, and interrogate the ‘expert’ openly and covertly, asking questions, and interrogating actively…pushing hard for answers, helping expert work out HOW they do what they do…observing…breaking down process expert intuitively employs…revealing to expert themselves what they are doing, when, in which sequence…often surprising ‘expert’ and providing ‘expert’ with as much insight as the modeler and future students of their models will gain…and thus offering chance at improvement in expert as well…

Muscle memory examples include driving a car, riding a bike, playing an instrument, learning a martial art or sport…lucky people began developing the skills from early age, and have no real memory of the steps involved…appear to appear fully competent at some point, and call it ‘intuition’ and ‘talent’…though people have different potential for ‘learning’ different skills, it is more about ‘exposure’ to the ‘right’ learning situations / conditions at the right time in the right frame of mind e.g playing with parents and friends, exposure to ‘talented’ people who passed on tips, consciously and explicitly, or unconsciously by unconscious modelling of their behaviors e.g golf swing of dad, empathetic listening skills of mother, etc…

MHR point is that ‘talent’ and ‘intuition’ are much more widespread than most people’s experience have allowed to ‘blossom’…so person who has limiting belief that ‘I’m not good at sport’, or ‘I’m not smart’, or ‘I can’t make friends’ etc, is victim of limited exposure to right conditions / situations / ‘trainers’/teachers/mentors…so most people have a huge untapped potential…

MHR language is great example of what I wrote about in my first University essays about functionalism and interactionism…via interactions language, or any other social organisation, emerges, and over time becomes ‘institutionalised’ as a particular formal grammar / institution i.e institutionalized set of interactions…arriving on the scene after the institutionalization has already occurred, it appears that institutions / grammar exist to serve a purpose, rather than having evolved out of interactions…and still being a process…i.e avoids notion of functionalism i.e form follows function, when in fact other way around…function follows form…i.e grammar emerges, is flexible, will continue to evolve…like any other institution … so grammarians like Chomsky worshipping idols i.e ‘innate grammar centers in brain’…SOME sort of syntax will emerge, and become codified / formalized … many DIFFERENT forms have done, and will do…the form they take will depend on their intended
functions… many different syntax forms will serve same function… some more
elegant, … etc… but more about power politics … i.e syntax imposed, like any
other institution, on ‘conquered’ and ‘occupied’ peoples…

MHR All we do in order to understand whether our description is an adequate
model for what we are doing is to find out whether it works or not i.e ‘heuristics’
key to Bandler’s approach i.e like Hume… does it work? Reliably? And like
Hume and Zen, don’t pretend to ‘know’ things we can’t possibly know i.e
pretend we know… like Fuakoka… human mind so limited… pretending to ‘know’
things, then arguing about who’s ‘knowledge’ e.g theory / assumptions e.g of
cause and effect are ‘right’ and ‘true’ is silly… usually theories overthrown over
time… ‘facts’ change… official institutionalized ideas evolve / change / are
replaced / displaced … like the ‘institutions’ in concrete which reflected them i.e
were reflexive of them…

Key to rapport / trust / mirroring and leading, is to observe main representative
system client using e.g words / expressions like ‘heavy’, ‘weight’, ‘burden’,
‘broken’, ‘rough’, ‘I feel’, ‘gut wrenching’, ‘dragging’, I can’t seem to get a grip
on… / come to grips with / get a handle on’, ‘Things are going at all smoothly’…
indicate kinesthetic dominant Vs ‘I see…’, ‘glum’, ‘dark’, ‘I can’t see’…, ‘it all
LOOKS bleak, dark, pointless, empty, hopeless’, I can’t see any future…’
indicates visual dominant Vs ‘I’m hearing …’, ‘sounds terrible’, ‘the voices in my
head’, ‘people say’, ‘that rings a bell’, ‘that sounds about right’, ‘I hear what
you’re saying’, ‘doesn’t sound good’, indicates Auditory… Over time become
sensitive to this language to the point that you can intuitively respond,
automatically, without consciously focusing on it deliberately … So begin
behaving like the best model therapists … what THEY do, mostly unconsciously,
that brings the results THEY get / got… i.e development of rapport / trust required
to start effective positive intervention / interaction with client…

‘Hacks’ respond to visual client with ‘I hear you’ , and thus fail see things from
their clients perspective and thus fail to gain initial rapport / trust … i.e mismatch
language … attempt to impose their own dominant representative system on
client… assume this is shared… thus fail to communicate effectively… like using
different language … language of visual Vs client’s language of kinesthetic…

Virginia Satir, Bandler and Grinder discovered, by observing her, and comparing
her efficacious behavior with other unsuccessful therapists, MATCHED her
client’s representative system, whereas the others did not.

When psychologists compared rat and human behavior in mazes, one stunning
observation was made… after the incentives i.e cheese, and money respectively,
were removed from the maze, the human motivation to continue looking for the
‘rewards’ continued long after the rat’s, after these were removed from the
maze… MHR shows power of early conditioning for ‘rewards’ from authority figures long after these are clearly no longer present...

Most therapists / people continue doing same old thing, trying harder, doing it longer, repeating it more often, rather than seeking a DIFFERENT approach i.e ‘trying something else’. Blame clients for being ‘resistant’ MHR or ‘hostile’, like others blame ‘conditions’, ‘circumstances’, some other ‘scapegoat’ … rather than admitting they should try something new…the ‘old’ simply isn’t working…not a question of trying harder, client’s not co-operating, reality no co-operating with you…your approach is wrong…needs to be changed…e.g voting in elections clearly has NO impact on policies…but people still go back and repeat same shit every 4 years, imagining ‘this time will be different’ …

In linguistics there’s a distinction called nominalization. Nominalization is where you take a process and you describe it as if it's an event or a thing. In this way you utterly confuse those around you, and yourself—unless you remember that it is a representation rather than experience.

Bandler says that the beginning for NLP was really this recognition i.e of representation systems, and failure of most therapists to consciously or intuitively MATCH their client’s use of language / representation system/s.

Predicates are verbs, adverbs, and adjectives…each representational system has its own predicates… e.g see, hear, feel, and ways of seeing, hearing, and feeling i.e words describing the actions of seeing, hearing, and feeling, and the things seen, heard, and felt.

To ACCESS the MEANING of any arbitrary but institutionalized utterances e.g the word ‘comfortable’ in the question ‘Are you comfortable?’, you have to employ your representational system…to answer the question…you do this automatically / unconsciously…client will do this…talented therapist intuitively notes the representative system being employed and adapts the same sort of language / analogies / metaphors as the client…others can learn to increase their sensitivity by paying conscious attention the language used, and then employing CONGRUENT i.e MATCHED language. The utterance ‘will lead to some people recalling an instance where they ‘felt’ comfortable, i.e a bodily feeling, others will recall hearing the sound of a bubbling brook / flowing water/ the sound of a breeze in the trees, others will recall a visual image of a time and place they were comfortable e.g see a soft, luxuriously padded bed, self sitting in armchair with book in front of fire or in the sunshine, or laying on beach in warm sunshine etc…

MHR The utterance ‘comfortable’ will be associated with sets of images, sounds, and feelings in each person, with one representational system usually dominant. ‘Transderivational search’ is the mental process by which an utterance is ascribed
meaning, by association with some memory. If you speak English. Otherwise it is just a meaningless utterance. A vocalization no different to any other animal makes. But the utterance can become associated with some visual, audio, or kinesthetic impression, and thus ‘learned’. In the same way small children ‘pick up’ language, and syntax. First individual words, then phrases, from which a ‘syntax’ soon becomes apparent, and soon ‘feels’ natural. This is the ‘feeling’ that language learners need to find, and will find, if allowed to learn language naturally, by association of utterances with nouns, verbs, adjectives, adverbs, and common phrases. The ‘syntax’ implicit in a phrase or sentence will be reproduced by mimicry. Some people will only ever learn to mimic sentences they have heard, and will not become poets, wordsmiths, writers. Others have a natural affinity / talent for intuiting the structure of language, and confidently go on to ‘invent’ / ‘coin’ new words, phrases, and sentences, that follow the same ‘grammatical’ / ‘syntactical’ structure …

Words are association triggers…at first conscious, then later a mix of conscious searching, and unconscious and automatic association…stimulus response…the word stimulates a response i.e the ‘imagining’ of some object, place, action, person, along with descriptive details…

When language is first emerging, and later evolving, there will be words for the things people have a need or desire to ‘speak’ about … human perception of colors, pitches, sound pressure levels, brightness, temperature etc will determine how many ‘distinctions’ will be made, and thus encoded into ‘language’. First plants, then some are trees, then each ‘type’ of tree receives its own name, to distinguish it from other ‘types’ of tree, as the uses for ‘trees’ become more varied and precise. E.g as firewood, nuts, berries, fruit, and then different types of building wood, then different types of furniture wood, and different ‘aesthetic’ qualities …

Language first relates to seen, felt, heard objects and subjects. Then later it ‘invents’ unseen, unheard, non-physical ‘ideal’ objects like ‘forces’ which are experienced indirectly e.g heat, cold, and then (or maybe even at the start of a language), things that exist only in the thinkers thoughts / mind e.g ghosts, spirits, and gods. Later this extends to ‘notions’ and ‘theoretical objects / forces’. Relationship words appear to ‘relate’ things to each other early on e.g ‘on top of’, ‘distance’, etc…

A carpenter will have more words for ‘wood’ than the average person. An Eskimo or ski-ing enthusiast will have more words for ‘snow’ than the average person. There are a huge number of possible ‘qualities’ that can be categorized in the world. Based on our ability to perceive differences in these qualities. Such as loudness, pitch, brightness, color, temperature. We see a maximum of 24 frames
per minute, and ‘blur’ images if they move ‘faster’ than we ‘sample’ them in space and time. Below and above certain frequencies and SPL, we hear no change. We can only ‘see’ a limited bandwidth of the electromagnetic spectrum. We can ‘measure’ some things only using specialized equipment that extends in reality, or theory, our ability to ‘perceive’ beyond the limits of our 5 senses. The differences in ‘qualities’ of different types of snow or wood are important only to some people, whereas to others there are just ‘trees’ and ‘wood’, and ‘snow’. An interior decorator is more ‘attuned’ to color differences than a coal miner. They have undergone different ‘sensitivity training’ by life, and formal education. They will make much finer distinctions between ‘shades’ of green or blue than most of us ever would. They have a much larger ‘vocabulary’ to associate with these fine differences of ‘hue’, ‘shade’, brightness, and so on.

**Primary and secondary representation.** Some ‘utterances’ have no immediate sensory referents such as ‘justice’ and ‘fairness’.

We tend to ‘talk past each other’, assuming an utterance has the same meaning for everyone else, as it has for us. We often end up arguing when in fact we agree. Shared experiences, cultural backgrounds etc make it more likely we share the same ‘utterance’-associations. But we should never assume the meanings of utterances are shared. Especially the more important non-verbal communications e.g can be totally different e.g nodding up and down for yes, and side to side for no, in some cultures inverted meanings.
Accessing Cues

Visual accessing cues for a "normally organized" right-handed person. i.e typical eye movements associated with recalling/constructing internal experiences

**Eyes move to top right:** Vc Visual constructed images.

**Eyes move to top left:** Vr Visual remembered (eidetic) images.

**Eyes defocused, not moving:** (Eyes defocused and unmoving also indicates visual accessing.)

**Eyes level to right:** Ac Auditory constructed sounds or words.

**Eyes level to left:** Ar Auditory remembered sounds or words.

**Eyes move down to right:** K Kinesthetic feelings (also smell and taste).

**Eyes move down to left:** A Auditory sounds or words.

How do you know when you are having an intuition?" (She looks up and to her left.) Yes, that's how you know. This is an example of an ‘ACCESS CUE’…an unconscious behavior associated with ‘accessing’ (recalling) a visual, audio, or kinesthetic memory, or constructing a visual, audio, or kinesthetic experience. E.g what does ‘intuition’ feel like? Look like? Sound like? From memory, or from actively constructing an example.

You will always get answers to your questions insofar as you have the sensory apparatus to notice the responses. And rarely will the verbal or conscious part of the response be relevant. If you clean up your sensory channels and attend to sensory experience, when you make a statement or ask a human being a question they will always give you the answer non-verbally, whether or not they are able
to consciously express what it is. When people ‘go inside’ their ‘mind’s eye’, to access information, they make typical gestures.

You ask somebody a question. They say "Hm, let's see," and they look up and to their left, and tilt their head in the same direction. When people look up, they are making pictures internally.

A learning strategy, i.e., sensitivity training for accessing cue recognition. Simply clear all your internal experience. Quiet the internal dialogue, check and make sure that your body is in a comfortable position so that you can leave it there for a while, and don't make internal images. Simply notice with your sensory apparatus what relationship you can discover between the questions I'm going to ask of these three people and the responses they make nonverbally. I would like you to pay particularly close attention to the movements and changes in their eyes. There are lots of other things going on which will be useful for us to talk about at some other time. At this time we simply want you to pay attention to that part of their nonverbal response.

I'll just ask the three of you up here some questions. I'd like you to find the answers to those questions, but don't verbalize the answers. When you are satisfied that you know what the answer is, or you've decided after searching that you don't know what the answer is, stop. You don't have to give me any verbal output; you keep the answers to yourself. In the United States there's an interesting phenomenon called "traffic lights." Is the red or the green at the top of the traffic light?... When you came here today, how many traffic lights did you pass between where you started your trip and arriving here at the hotel?... What color are your mother's eyes?... How many different colored carpets did you have in the last place you lived? (Fran stares straight ahead in response to each question; Harvey looks up and to his left; Susan looks up and to her right, or sometimes straight ahead.) Now, have you noticed any movements in their eyes? Do you see systematic shifts there? OK. Store that information for a moment. These are complex human beings, and they are giving more than one response. However, notice what is common about the responses they gave to that set of questions.

I'm going to shift the questions a little bit and I want you to notice if there is a systematic difference in the way they respond. Think of your favorite piece of music..., What is the letter in the alphabet just before R?... Can you hear your mother's voice? (Fran and Harvey look down and to their left as they access information after each question; Susan looks down and to her right.) Now, there was a difference between the last set of responses and the previous set. Now I'm going to shift my questions again. Do you know the feeling of water swirling around your body when you swim?... What happens in winter when you are in a nice, warm, cozy house, and you walk out into the cold air outside?...
Harvey look down and to their right while accessing the answer to each question; Susan looks down and to her left. Can you make a connection between the classes of questions I was asking and the kind of movements that you were seeing? What did you actually see in your sensory experience when I asked the questions? Man: I noticed especially that when it seemed like Susan was picturing something, she would look up. And then there were times when she would look straight ahead. OK. I agree with you. How do you know when she was picturing something? That's an assumption on your part. What were the questions that I was asking that those movements were responses to? Man: The color of eyes. How many lights—like she was picturing the intersections. So the questions I was asking demanded visual information by presupposition. And the responses you noticed were a lot of up movements. Did you notice any preference as to side?

Susan, do you know what you would look like with long flaming red hair?... Do you know what you would look like if you had a beard?... Do you know what you look like sitting right here?... (Her eyes move up and to her left.) Which way did her eyes go that time? Distinguish left and right with respect to her. You said that she typically went up to her right in answering the previous visually-oriented questions. What movement did you see with her eyes just now, in response to the last questions? This time her eyes dilated and moved up to her left and back. So she doesn't always look up and to her right. She sometimes looks up and to her left. There's a systematic difference between the

21 kind of questions I asked just now, and the kind of visual questions I was asking before. Can you describe the difference? Woman: The first questions had to do with experiences she was remembering, and the second group she had not experienced and was trying to visualize. Excellent. The first set of pictures we call eidetic or remembered images, and the second set we call constructed images. She's never seen herself sitting here in this chair in this room. It's something she has had no direct visual experience of, therefore she has to construct the image in order to see what it is that she would look like. Most "normally organized" right-handed people will show the opposite of what we've seen with Susan here. Susan is left-handed and her visual accessing cues are reversed left to right. Most people look up and to their left for visual eidetic images and up to their right for constructed visual images. However, lots of normally organized right-handers will look up and to their right as they respond to questions about visual memory. Barbara, here in the audience, looked up and to her right to recall something a few moments ago. Do you remember what it was you saw up there? Barbara: No. Do you remember one of the houses you lived in as a child? Barbara: Yes, I do. She just went up and to her right again. What did you see, Barbara? Name one thing you saw. Barbara: I saw the living room. I'm going to predict that the living room that you saw was peculiar in a specific way. I want you to check this and let me know whether my statements
are accurate. The living room you saw was suspended in space. It wasn’t bounded in the way it would be bounded visually if you were actually inside of that living room. It was an image which you had never seen before because it was a fragment of a set of images you’d seen lots of times in the past. It was not a visual input that you’ve ever had directly. It was literally extracted, a piece of a picture extracted from some part of your experience and displayed separately. Is that accurate? Barbara: Yes. When you ask visual memory questions and a person looks up to their right, you cannot conclude that they are left-handed or that their accessing cues are reversed. All you can conclude is that they looked up and to their right. If you want to explore it further, there are a couple of possibilities. One is what’s true of Susan—namely, that she has reversed cerebral organization. The other possibility is that they could be constructing images of the past, as is true of Barbara. If that is so, the images will not have the color, the detail, the contextual markers, or the visual background that an actual eidetic remembered image has. That is an important difference. When Barbara recalls images, she recalls them outside of context, which is characteristic of constructed images. By the way, she will argue about the past with people a lot—especially with someone who remembers eidetically. Sally: I didn’t see Fran's eyes going up or down, just straight. OK. Was there any marked difference between the way she was looking straight at me before I asked a question and the way she continued to look straight at me after I’d asked the question? Did you notice any change? Sally: Yes. She looked more pensive then. "Pensive." What looks like "pensive" to you and what looks like "pensive" to me may be totally different kinds of experiences. "Pensive" is a complex judgement about experience; it's not in your sensory experience. I’m sure that "pensive" has appropriate meaning for you, and that you can connect it with your sensory experience easily. So could you describe, so that we could agree or disagree, what you actually saw, as opposed to the judgement that she was being "pensive"? As we said before, all these questions are being answered before the verbalization. So if you have the opportunity to watch anyone we're communicating with directly, you will always get the answer before they offer it to you verbally. I just asked Sally to describe something, and she demonstrated non-verbally what she saw. She mirrored in her own movements what Fran was doing.

Sally, do you remember the feeling of what you just did? Sally: My eyes kind of closed a little. So your eyelids dropped a little bit. Is there anything else that you could detect either from what you felt your eyes doing or from remembering what Fran was doing?... Have you ever had the experience in a conversation that the other person's eyes are still resting on your face but somehow suddenly you are all by yourself? You are all alone? That's what was going on here. In 23 both of these cases the pupils dilated and the facial muscles relaxed. If you have trouble seeing pupil dilation, I believe that's not a statement about pupil dilation; it's a statement about your own perceptual programs. And I'm not talking
about whether you have 20/20 vision or 20/2000 vision with corrective lenses. Your ability to perceive is something that is learned and you can learn to do it better. Most people act as if their senses are simply passive receptacles into which the world dumps vast amounts of information. There is a vast amount of information, so vast that you can only represent a tiny fraction of it. You learn to actively select in useful ways.

There's a tendency for you to repeat some set of interventions that you've made in the past which were successful, hoping for success again in the present. I think one of the most dangerous experiences human beings can have is success—especially if you have success early in your career—because you tend to become quite superstitious and repetitious. It's the old five-dollar bill at the end of the maze.

Bandler used word ‘lie’, but means ‘suspend judgement’, make no assumptions about truth or otherwise, but see what actually works…don’t bother pretending to understand fully why or how…but determine what actions / steps lead to desired outcome…without ‘idolising’ this awareness into ‘knowledge’ or claiming to ‘know’ anything, or ‘understand’ more than you actually do i.e remain Zen, Humean Skeptical…no ‘cause and effect’ postulations, just practical heuristics…to avoid dogma, and defending positions once made i.e losing face…if make no assumptions as to ‘knowing’ then don’t have to worry about defending these i.e becomes more fluid…no ‘loss of face’…when move on, forward, …especially as some things work with some people on some symptoms, and not on others…so move on…try something ELSE, rather than worry about ‘knowledge’ and ‘positions’ and ‘theories’…

You have been speaking to people your whole life and they've been going "Well, the way it looks to me..." (looks up and to his left), "I tell myself..." (looks down and to his left), "I just feel..." (looks down and to his right)—and you haven't consciously noticed that. People have been doing this systematically through a hundred years of modern psychology and communication theory and you've all been the victims of a set of cultural patterns which didn't allow you to notice and respond directly and effectively to those cues.

MHR interesting how ‘insight’ suddenly brings conscious awareness i.e Zen observation skills…sensitivity training…required to make ‘reality’ observable…otherwise do not ‘attend’ to …always question in science…which, of all the innumerable variables, e.g color, temperature, humidity, metal, etc etc i.e which of the factors interacting are responsible for the outcome observing / desire to attain…WHAT is relevant? i.e necessary and sufficient…Vs what is mere background…NLP brings to foreground what was, for those without the intuitive gifts or intuition bringing experiences of a Satir or Erickson…they may
never have ‘explicitly’ noticed, let alone ‘explained’ to anyone, what they were
doing, as it was, or had become, automatic, intuitive, muscle memory, etc…

Calibrating accessing cues for individuals to see where they conform to, and
der from, the ‘typical’

Start out by asking Then Then ask The cues that the person will offer you
non-verbally will be systematically different from the cues they offer you to
the previous sets of questions.

Visual accessing cues for a "normally organized" right-handed person. i.e
typical eye movements associated with recalling/constructing internal
experiences

Eyes move to top right : Vc Visual constructed images. To calibrate / test /
ratify for individual ask them questions about things that the person has not
seen and will have to construct: How would you look from my point of view?
How would you look with purple hair? How ‘would’ I look with green hair?
Or in a suit? Or lying on a beach?

Eyes move to top left: Vr Visual remembered (eidetic) images. To calibrate /
test / ratify for individual ask them visual eidetic questions: What color are the
carpets in your car? What color are your mother's eyes? What shape are the
letters on the sign on the outside of this building? All of those are questions
about things that people here have seen before.

Eyes defocused, not moving: (Eyes defocused and unmoving also indicates
visual accessing.)

Eyes level to right: Ac Auditory constructed sounds or words. Have to ask
something they haven’t heard before, but have to construct for first time, or
‘imagine’ in their own head...e.g Pretend X is giving you praise. i.e
something ‘hearing’ for first time i.e product of own imagination

Eyes level to left : Ar Auditory remembered sounds or words. Do you
remember that song ‘X’ by the XYZ? What does your cat sound like? What
about the sound of a growling V8 in ‘Mad Max’?

Eyes move down to right: K Kinesthetic feelings (also smell and taste). What
does cat fur feel like? What does it feel like to take a cool shower on a hot day, or
a slip into a warm bath on a cold winters day?

Eyes move down to left: A Auditory sounds or words. Could be constructed or
remembered. e.g when trying to spell phonetically, by sounding out the word
(which at least for English is absurd due to the multi-lingual vocabulary e.g. French, Latin, German, Nordic ‘borrowed’ words)

Be precise with language i.e. don’t confuse client by asking them to ‘imagine’ a sound … ask them to ‘create’ (?) a sound in their head, or ask in a way that presupposes they will have to do this i.e. ‘Imagine you are hearing X sing ‘happy birthday to you’ i.e. something they are unlikely ever to have heard and therefore must construct in their minds ‘ear’. Vs something they are likely to have heard in real life before, and thus are likely to re-access the memory of…

You will also get confusing responses if you say "Do you remember the last time you felt the feeling of swimming through the water?" You’ve asked them to do two things. You’ve asked them to remember and then to feel. They may remember visually; that is, they may search or scan visually, they may repeat it auditorily, or they may do it directly kinesthetically. However they do it, you are going to get a two-step process. One will be the remembering portion, following your instructions, and the other will be actually recovering those feelings of swimming. If you get responses which do not make any sense to you, ask the person what they did internally. Your job is to correlate what you can observe on the outside with the questions you ask. Correlate the relationship between the kind of information you are asking for and the non-verbal eye movement responses you're getting from your partner. If you don't understand it, ask. "I saw this on the outside. What does that correspond to in your internal processing?" If they don't know, ask them to guess. If you're not getting the kinds of eye movements we were talking about, make the question more difficult. "What color shoes was your mother wearing the last time you saw her?" If you ask "What color are your mother's eyes" and you don't see any movement, make the question more complex. "Your eyes are blue, too. Is the color of your eyes brighter or deeper in color than your mother's eyes?" That's a more complex, comparative question. She will then have to form an image of the color of her eyes and her mother's eyes and then make a visual comparison. After four or five minutes of asking your partner these sets of questions, you should have an idea about what eye movements you can see which indicate unequivocally which of the internal representational systems that person is utilizing at that moment.

We are offering you generalizations, and every single generalization anyone has ever offered you is going to be false at some time and some place. The generalizations are only tricks—as most of what we will do here is—to get you to pay attention to your experience, to notice a certain dimension of sensory experience which culturally you’ve been trained not to notice. Once you notice it, it constitutes a really powerful

27 source of information about the other person's unconscious processes. You will find people who are organized in odd ways. But even somebody who is
organized in a totally different way will be systematic; their eye movements will be systematic for them. Even the person who looks straight up each time they have a feeling and straight down each time they have a picture, will remain consistent within themselves. The important thing is that you have the sensory experience to notice who is doing what. Go ahead now and discover what, if any, patterns you can discover.

In the same way you can anticipate what your interlocutor is going to ask you next, by THEIR eye movements. They will show the same sort of accessing cues or 'tells'.

Note one person will 'visualise' music (someone who reads and plays sheet music or watches music videos) where another will ‘hear’ it, unless you are more precise e.g ‘what are the first 4 notes of Beethoven’s fifth symphony’ (dah dah dahhhhh).

Be careful i.e words have different meanings to different people i.e many ‘loaded’ with meanings not shared between interlocutors…never assume an utterance has the same meaning, or even any meaning, for everyone interlocuting.

We've got to make a distinction now. The predicates, the words a person chooses to describe their situation—when they are specified by representational system—let you know what their consciousness is. The predicates indicate what portion of this complex internal cognitive process they bring into awareness. The visual accessing cues, eyescanning patterns, will tell you literally the whole sequence of accessing, which we call a strategy. What we call the "lead system" is the system that you use to go after some information. The 'representational system" is what's in consciousness, indicated by predicates. The "reference system" is how you decide whether what you now know—having already accessed it and knowing it in consciousness—is true or not. For example. What's your name? Ted: Ted. Ted. How do you know that? Now, he's already answered the question, non-verbally. It's an absurd question. Ted understands this, but he also answered it. Do you know how you know? Right now, sitting in this room, if I call you "Jim," you don't respond. If I call you "Ted," you do respond. That's a kinesthetic response. Now, without me supplying any stimuli from the outside, when I simply ask you the question "Do you know what your name is?" do you have an answer? Ted: Yes, I have. Do you know what to say before you actually say it? Ted: No, I don't. So if I say "What's your name?" and you dont answer, you dont know what your name is? Ted: I know what my name is because when someone says "Ted" I have a certain feeling, a response because that's me.

Are you saying "Ted" on the inside and getting that feeling as a way of verifying when I ask you that question? Ted: Yeah. So you have a strategy to let you know, when supplied input from the outside, which is an appropriate response to which, right? "Ted" but not "Bob." But when I ask you "What's your name?" how do you
know what to say to me? Ted: I don't think of it. So you have no consciousness of any process that you use at that point?... OK. Now, did anybody else notice a cue that would tell you the answer to the question even though Ted at this point doesn't have a conscious answer to the question we asked him?... Each time we asked the question, his eyes went down to his left and came back. He heard his name. I don't know whose tonality he heard it in, but it was there. And he knows that the name "Ted" is correct because it feels right. So in this case his lead system is auditory: that's how he goes after the information, even though he's not aware of it. He becomes conscious of his name auditorily; in this case his representational system is the same as his lead system. His reference system is kinesthetic: when he hears the name "Ted" either outside or inside, it feels right. One of the things that some people do when you ask them questions is to repeat them with words inside their head. Lots of people here are doing that. I say "Lots of people repeat words" and they go inside and say to themselves "Yeah, people repeat words." Have any of you had the experience of being around somebody whose second language is the one you're speaking? Typically the first eye movement they will make as they hear something is to translate it internally, and you'll see that same auditory cue. Some people take forever to answer a question. What they usually have is a complex strategy in consciousness. For example, one guy had a fascinating strategy. I asked him "When was the first time you met John?" And he went inside and said "When was the first time I met John?" Hmmmm. Let's see," and his eyes went up and he made a constructed picture of John. Then he looked over to his left and visually flipped through all the possible places he remembered, until he found one that gave him a feeling of familiarity. Then he named the place auditorily, and then he saw himself telling me the name of that place, and imagined how he would look when he did that. He had the feeling that it would be safe to go ahead and do it, so he told himself

30 "Go ahead and do it." There's a whole set of advanced patterns we call streamlining which you can use to examine the structure of a strategy and streamline it so that all the unnecessary or redundant steps are taken out. It involves examining strategies for loops and other kinds of restrictions and problems, and then streamlining those out so that you have efficient programs to get you the outcomes you want.

Let's take an example from therapy. Somebody comes in with the problem that they're very jealous. They say "Well, you know, I just... (looking up and to his right) well, I just (looking down and to his right) really feel jealous and (looking down and to his left) I tell myself it's crazy and I have no reason to, but I just have these feelings." He starts leading visually; he constructs an image of his wife doing something nasty and enjoyable with someone else. Then he feels the way he would feel if he were standing there actually observing it occurring in the room. He has the feelings that he would have if he were there. That's usually all he is aware of. Those feelings have the name "jealousy" and that's the
representational system, kinesthetic. He leads visually, represents kinesthetically, and then he has an auditory reference system check which tells him that his feelings are invalid. So all three different systems are used in different ways.

Woman: So in that situation you're suggesting that if you were working with that person you would tie in with the feeling system, the representational system? It depends on what outcome you want. Our claim is that there are no mistakes in communication; there are only outcomes. In order for us to respond to your question you have to specify what outcome you want. If you want to establish rapport, then it would be useful to match the representational system, indicated by the predicates. Unconscious rapport, is the most important one anyway.

Strategy would be to replace the images / feelings / sub-modalities with more positive ones i.e construct images of what WANT to be true, then imagine ways in which you can realise THOSE outcomes / states e.g imagine ‘seducing’ your wife and having great sex, rather than imagine her cheating on you and having great sex with some other guy …etc… i.e apply same automatic processes that lead to jealousy / fear of cheating / anger / frustration / despair etc, to a new set of ‘constructed’ states i.e employ natural talents leading to despairing angry jealousy to constructing a great relationship for client and their partner…

i.e motivation towards new behaviors will have same structure as one currently using to produce jealous rage / envy / despair… employ same talents for doom and gloom to generate new behaviors / mindset / beliefs / automatic responses e.g from negative/destructive/angry to positive/productive/caring…

i.e make vivid impression of what feels good, that you want, then imagine the steps necessary to realise these desired state (therapist has tools, tips, resources, and brings out own unrealized resources of unconscious mind)…

As far as I can tell, there is no research to substantiate the idea that there is eyedness. You won't find any research that is going to hold up. Even if there were, I still don't know how it would be relevant to the process of interpersonal communication, so to me it's not a very interesting question. Your eyes are split so that half of each eye is connected to each hemisphere. The tendency to look in a microscope with one eye or another has been noted as statistically significant; however, I don't know of any use for that information right now.

Linguists claim that right / left hand dominance occurs somewhere around four and a half. I have no basis on which to substantiate that. Handedness is a dimension of experience which I know exists in the world, I have never found any useful connection to communication.

There is an infinite amount of sensory experience available right here in this room. We consistently make unconscious choices about what we sample. If we didn't, we'd all be "idiot savants," who can't forget things; they can't not know
things. When you ask them about anything, they have to give you a complete "dump" of all the information they have ever had on that particular topic.

Most therapy is founded on the presupposition that if you know how things came about, the roots where it all originated, that will give you a basis from which to change it. I believe that that's an accurate and limiting assumption. Yes, that is one way to go about changing, but it is only one out of an infinite number of ways to understand behavior.

Many "learning disabilities" are really functions of the educational system. For example, I was given a bunch of children who fell into the classification of "crossed hemispheres" and they told me that this was something that existed in the world. They wanted me to find out if there was any difference between these children and the rest of them, given accessing cues and so on. What I discovered is that they were all children who were trying to spell auditorily. When I said "How do you spell the word 'cat'?" they went inside and their eyes moved down and to their left. I asked the children what they were doing and they said "Sounding the word out," because they were taught to spell phonetically.

Spelling Bee champions i.e good spellers, visualize words i.e remember eidetic images of the correctly spelled word, so show visual accessing cues…can ask child to ‘spell school’ and observe for auditory Vs visual accessing cues…test with other questions before concluding they are accessing visual or auditory…then teach auditory accessing kids the ‘secret’ i.e to imagine the word printed on a page etc… Of course when teaching VERBAL language skills, will need to do opposite i.e have them ‘hear’ the word from some contextual memory, or own association i.e reading out loud, then memorizing the ‘set’ i.e the visual memory and the auditory memory, then accessing each depending on the need e.g to write, or to speak…

Modellers would ask spelling champs what they did, and observe their behavior i.e accessing cues, to either verify what the self-aware spellers said, or to get their actual answers, in body language form, from those not conscious of the process that lead to their success…as in all ‘modelling’ … NLP assists us in working out what people REALLY do, compared to what they think they do, or their inability to actually explain i.e ‘intuition’ or ‘innate gift’ or ‘natural talent’ would be THEIR response if unaware of the unconscious / automatic processes they performed / performed unconsciously …

No matter what language we’ve operated in, what country we’ve been to, no matter what the language is, good spellers have exactly that same formal strategy. They see an eidetic, remembered image of the word they want to spell, and they know whether or not it's an accurate spelling by a kinesthetic check at the mid-line. E.g shoulders roll forward, head tips back, ‘wincing’ of stomach. There was
a change in her feelings right here at the mid-line of the torso. All the people who tell us they are bad spellers don't have that strategy. Some bad spellers make eidetic images, but then they check them auditorily. Others make constructed visual images and spell creatively.

Take the child who is a bad speller and teach him to use the same strategy that a good speller uses i.e teach to spell visually with a kinesthetic check. When you do that, you will never need to teach children to spell. They will learn automatically if you teach them an appropriate process, instead of content.

In fact everyone uses all the representational systems, they are all processing information at the same time, but only part will be conscious i.e the ‘dominant’ audio, visual, or kinesthetic representation…

Rather than thinking of yourself as being visually oriented, kinesthetically oriented, or auditorily oriented, take what you do best as a statement about which system you already have well-developed and refined. Realize that you might put some time and energy into developing the other systems with the same refinement and the same fluidity and creativity that you already have in your most developed system. Labels are traps, and one way that you can stabilize a piece of behavior in an unuseful way is to label it. Instead, you can take the fact that you notice most of your behavior falls into category X, to let yourself begin to develop your skills in Y and Z.

Our claim is that you are using all systems all the time. In a particular context you will be aware of one system more than another. I assume that when you play athletics or make love, you have a lot of kinesthetic sensitivity. When you are reading or watching a movie, you have a lot of visual consciousness. You can shift from one to the other. There are contextual markers that allow you to shift from one strategy to another and use different sequences. There's nothing forced about that

WARNING: These tools are mostly for introspection, sensory experience. They are things to detect in other people. If you use it on yourself, all you will do is confuse yourself.

There is only one group that we know of that is characteristically organized differently: the Basques in the Pyrenees of northern Spain. They have a lot of unusual patterns, and that seems to be genetic rather than cultural. Everywhere else we've been—the Americas, Europe, Eastern Europe, Africa—the same pattern exists in most of the population. It may be a neurological bias that is built into our nervous system as a species.

It's really interesting to me that the percentage of left-handed and ambidextrous people in the "genius" category in our culture is much higher than the percentage
in the general population. A person with a different cerebral organization than most of the population is automatically going to have outputs which are novel and different for the rest of the population. Since they have a different cerebral organization, they have natural capabilities that "normally organized" right-handers don't automatically have.

MHR note that Basque children are taught to write with both hands at school...like I deliberately try to use my left and right hand and foot ... no idea why this occurred to me as important / generative...

As consultants for an ad agency we psychologically "clone" their best creative people. We determined the strategy that one creative person used to create a commercial, and we taught other people in that agency to use the same structure at the unconscious level. The commercials they came up with were then creative in the same way, but the content was totally unique. As we were doing the process, one of the people there even made a change in the strategy that made it better. Most people don't have a large number of strategies to do anything. They use the same kind of strategy to do everything and what happens is that they are good at some things and not good at others. We have found that most people have only three or four basic strategies. A really flexible person may have a dozen. You can calculate that even if you restrict a strategy to four steps there are well over a thousand possibilities! We make a very strong claim. We claim that if any human can do anything, so can you. All you need is the intervention of a modeler who has the requisite sensory experience to observe what the talented person actually does—not their report—and then package it so that you can learn it.

It’s the unconscious processes and parts of the person you've got to work with effectively in order to bring about change in an efficient way. The conscious parts of the person have already done the best they can. They are sort of useful to have around to pay the bill, but what you need to work with are the other parts of the person.

"Conscious" is defined as whatever you are aware of at a moment in time. "Unconscious" is everything else. You can make finer distinctions, of course. There are certain kinds of unconscious data which are immediately available. I say "How's your left ear?" Until you heard that sentence, you probably had no consciousness of your left ear. When you hear me say that, you can shift your consciousness to the kinesthetics of your left ear. That is easily accessible from unconscious to conscious. If I say "What color shoes did your kindergarten teacher wear on the first day that you went to school?" that's also represented somewhere. However, getting at it take a lot more time and energy. So there are degrees of accessibility of unconscious material.

One of the prerequisites of your being effective is to have patterns of communication which make good rapport with their unconscious resources to
assist them in making those changes. To restrict yourself to the conscious resources of the person who comes to you will guarantee a long, tedious, and probably very ineffective process.

Here in this seminar there is no way that you will be able to consciously keep up with the rapid pace of verbalization that will be going on. That is a systematic and deliberate attempt on our part to overload your conscious resources. We understand that learning and change take place at the unconscious level, so that's the part of you we want to talk to anyway. The part of your functioning which is responsible for about ninety-five percent of your learning and skill is called your unconscious mind. It's everything that's outside of your awareness at a point in time. I want to appeal directly to that part of you to make a complete and useful record of anything that happens here, especially the things we don't comment on explicitly, which it believes would be useful for you to understand further and perhaps employ as a skill in your work as a professional communicator—leaving you free at the conscious level to relax and enjoy your experience here.

Identifying accessing cues and representational systems. What do you use it for? One way I can use this information is to communicate to you at the unconscious level without any awareness on your part. I can use unspecified words like "understand" and "believe" and indicate to you non-verbally in which sensory channel I want you to "understand." For example, I could say to you "I want to make sure you understand (gesturing down and to the audience's left) what we've done so far." My gesture indicates to you unconsciously that I want you to understand auditorily. You can also use this information to interrupt a person's accessing. All of you make a visual image, and see what happens when I do this. (He waves both arms over his head in a wide arc.) My gesture knocks all your pictures out of the air, right? Thousands of times in your life you said something or asked a question of someone and they said "Hm, let's see," and they went inside to create a visual image. When they go inside like that, they can't simultaneously pay attention to input from outside. Now let's say that you and I are on opposite sides about some issue at a conference or a corporate meeting. I begin to talk, and I'm forceful in presenting my material and my system in the hope that you will understand it. After I've offered you a certain amount of information, at some point you will begin to access your internal understanding of what's going on. You'll look up and begin to visualize, or look down and begin to talk to yourself or pay attention to how you feel. Whichever internal state you go into, it's important that I pause and give you time to process that information. If my tempo is too rapid and if I continue to talk at that point, I'll just confuse and irritate you.

What often happens is that when I notice you look away, I think that you aren't paying attention, or that you are avoiding me. My typical response in stress
during a conference is to increase the tempo and the volume of my speech because I'm going to make you pay attention and drive that point home. You are going to respond as if you are being attacked, because I'm not allowing you an adequate amount of time to know what I'm talking about. You end up quite confused, and you'll never understand the content. If I am facilitating a meeting, I can notice whenever a listener goes inside to access, and I can interrupt or distract the speaker at those times. That gives the listener adequate processing time so that he can make sense of what is going on, and decide whether he agrees or disagrees. Here's another example: If you can determine what a person's lead and representational systems are, you can package information in a way that is irresistible for him. "Can you see yourself making this new change, and as you see yourself in this process, do you have those feelings of accomplishment and success and say to yourself 'This is going to be good'?" If your typical sequence happens to be constructed images, followed by feelings, followed by auditory comment, that will be irresistible for you.

A lot of school children have problems learning simply because of a mismatch between the primary representational system of the teacher and that of the child. If neither one of them has the flexibility to adjust, no learning occurs. Knowing what you now know about representational systems, you can understand how it is possible for a child to be "educationally handicapped" one year, and to do fine the next year with a different teacher, or how it is possible for a child to do really well in spelling and mathematics, and do badly in literature and history.

You can also translate between representational systems with couples. Let's say that the husband is very kinesthetic. He comes home after working hard all day and he wants to be comfortable. He sits down in the living room, kicks his boots off here, throws a cigarette down there, gets a beer from the icebox, grabs the paper, and sprawls all over his chair, and so on. Then the wife, who's very visual, walks in. She's worked hard all day cleaning house so it will look good, as a way of showing respect for him. She sees his stuff scattered all over the living room and gets upset. So the complaint from him is "She doesn't leave me enough space to be comfortable, man. It's my home. I want to be comfortable." What she says to him at this point is "You're so sloppy. You leave stuff lying all over and it looks cluttered, and when it looks cluttered like that I know that you don't respect me." One of the things Virginia Satir does is to find the kinesthetic counterpart of her visual complaint, and vice-versa. So you can look at the husband and say:"You don't understand what she said, do you? You really have no idea what she experiences. Have you ever had the experience that she went to bed first, and she's been sitting there watching TV in bed, eating crackers? And you come in and get into bed and feel all those cracker crumbs all over your skin. Did you know that's what she experiences when she walks in and sees your stuff lying all over the front room?"So there's no fault, no blame. You don't say "You're bad" or
"You're stupid" or anything like that. You say "Here's a counterpart that you can understand in your system."

If you repeat a process a number of times, it becomes streamlined in the same way that learning to drive a car does. It drops into unconsciousness. Consciousness seems to be occupied by things we don’t know how to do too well. When we know how to do things really well, we do them automatically. MHR is why ‘competent’ ‘experienced’ successful people often have no idea what the actual steps are in that process...they tend to skip over many when ‘explaining’, as they do these steps unconsciously now...therefore takes person like me to honestly evaluate any ‘explanation’ i.e with just enough understanding to translate / observer / see what is happening / and intention of ‘expert’, to interrogate, slow down, analyse, break process down into steps that can be taught ANYONE...

Thomas Szasz said "All psychology is either biography or autobiography." Most people are doing therapy with themselves instead of other people. People can access olfactory experience in many different ways. One of the things you can notice, however, is that when people access smells, they will flare their nostrils. That's a direct sensory signal, just as the eye movements we've been talking about are direct sensory signals, to let you know what experience the person is having. They may or may not precede that with a visual, kinesthetic, or auditory access, but you can see the nostril flare.

A, clear your sensory channels and watch your partner’s nose. B, when was the last time you took a good whiff of ammonia?... Now is there any doubt about that? It's an involuntary response. Usually the person will breathe in at the moment the nostrils flare. Let me ask you all to do something else which is along these lines to give you another demonstration. As a child, you had lots of experiences. Maybe you had a grandmother who lived in a separate house that had special smells. Maybe it was some special food, or a blankie, or a little stuffed toy animal, or something else special to you. Pick some object from your childhood and either feel it, talk to yourself about it, or see it in your hands. When you have it in any of those systems, breathe in strongly and let that take you wherever it takes you. Try that for a minute. That's one way of accessing smells.

If you use visual guided fantasy with your clients, there are some clients you use it with automatically and it works fine. Other people you wouldn't even try it with. What's the criterion you use to decide that, do you know? If they can visualize easily, you use visual guided fantasy, right? We're suggesting that you reverse that. Because for people who do not normally visualize in consciousness, visual guided fantasy will be a mind-blowing, profound change experience. For those who visualize all the time, it will be far less useful. The only thing you need
to do in order to make it work for people who don't normally visualize is to join
their system wherever they are—wherever their consciousness is—establish
rapport and then slowly overlap to lead them into the system you want to engage
them in fantasy with. It will be extremely powerful, much more powerful than
with someone who already visualizes.

If you have any fragment of any experience, you can have it all. Let me ask you
to do the following: Roll your shoulders forward and close your eyes and feel as
though something or someone is pushing down on your shoulders. And then take
those feelings, intensify them, and let them come up into a picture. Who or what
do you find there? As you get the picture, I want you to notice some dimension of
the picture that is connected with some sound that would be occurring if that
were actually happening. And now hear the sound. That's the principle of
overlap. You can always go to the state of consciousness a person indicates by
their predicates, and from there you can overlap into any other dimension of
experience and train a person to do any of these things.

Learn to use different / non-habitual representational systems by overlap: by
taking a feeling or a sound and then adding the visual dimension. You can use
overlap to train a client to be able to do all systems, which I think is a benefit for
any human to be able to do. You yourself can notice which of the
representational systems you use with refinement and sophistication, and which
you have difficulty with. Then you can use overlap as a way of training yourself
to be as sophisticated in any system as you are in your most advanced. Let's say
you have good kinesthetics but you can't visualize. You can feel yourself reach
out with your hand and feel the bark of some tree. You explore tactually until you
have a really good kinesthetic hallucination. You can visualize your hand, and
then you look past your hand inside your mind's eye and see what the tree looks
like, based on the feelings—as you feel the roughness, the texture, the
temperature of the bark. If you visualize easily and you want to develop auditory,
you can see the visual image of a car whirling around a corner and then hear the
squeal of the tires.

Visual accessing cues are only one way to get this information. There are other
things going on equally as interesting, that would give you the same information
and other information as well. For instance, voice tone is higher for visual access
and lower for kinesthetic. Tempo speeds up for visual and slows down for
kinesthetic. Breathing is higher in the chest for visual and lower in the belly for
kinesthetic. There are lots and lots of cues. What we are doing is giving one little
piece at a time. Your consciousness is limited to seven—plus or minus two—
chunks of information. What we are doing is saying "Look, you normally pay
attention to other dimensions of experience. Here's another class of experience
we'd like you to attend to, and notice how you can use it in a very powerful way."
I can get the same information i.e regarding what representational system a person is using, by voice tone, or tempo changes, or by watching a person's breathing, or the change in skin color on the back of their hand. Someone who is blind can get the same classes of information in other ways. Eye movement is the easiest way that we've discovered that people can learn to get access to this class of information called "representational system." After they have that, we can easily teach them other dimensions.

Blindness is a matter of degree in all of us. The non-sighted Person who has no chance of seeing has an advantage over most other communicators: he knows he is blind, and has to develop his other senses to compensate. For example, a few weeks ago in a seminar there was a man who is totally blind. A year ago, I had taught him how to be able to detect representational systems through other means. Not only was he able to do it, but he was able to do it every bit as well as every sighted person in that room. Most of the people I meet are handicapped in terms of their sensory ability. There is a tremendous amount of experience that goes right by them because they are operating out of something which to me is much more intense than just "preconceived notions." They are operating out of their own internal world, and trying to find out what matches it.

One of the best ways to have lots of disappointment in your life is to construct an image of how you would like things to be, and then try to make everything that way. You will feel disappointed as long as the world doesn't match your picture. That is one of the best ways I know of to keep yourself in a constant state of disappointment, because you are never going to get the world to match your picture.

Ask people to observe X when ask X ‘what sort of car do you drive, a manual or an automatic’…most people jump to conclusions that when she moves her arm, it indicates she is mentally shifting gears…when automatics have ‘sticks’ too…if they had paid attention instead to her calf muscles flexing, indicating mental use of a clutch, they wouldn’t jump to the wrong conclusions…

If you ask a person a question that involves a motor program, you can observe the parts of their body they will have to use in order to access the information. Information doesn’t come out of a vacuum in human beings. In order for a human being to get information to answer a question, they have got to access some representation of it. And although they may only bring one of those systems into consciousness, they are going to access all systems unconsciously to gather the information.

You all have front doors to the homes or apartments that you live in, whether they are long-term homes or apartments. As you walk into your apartment or home, does the first door open to the right or the left? Now, how do you decide that question? ... All the hands are moving. Let me ask you another question.
When you come home in the evening and your house is locked, which hand do you use to actually open the door? ... Watch the hands.

Eye movements and body movements will give you information about process. The proper domain, in our opinion, of professional communicators is process. If you indulge in content, you are going to unavoidably impose part of your belief and value system on the people you communicate with.

The kinds of problems that people have, usually have nothing to do with content; they have to do with the structure, the form of how they organize their experience. Once you begin to understand that, therapy becomes a lot easier. You don't have to listen to the content; you only have to find out how the process works, which is really much simpler. There's an important pattern that we'd like to talk about next. If I'm your client and you ask me "Well, how did it go this week?" and I respond to you by going (sighs heavily, head down, low tonality) "Ah, everything worked just great this week, (sighing, shaking head "no," slight sneer) No problems." Now, the laughter indicates that there are a number of people here who recognize that there is some unusual communication being offered. The name that we have adopted for that is incongruity. What I offer you in my voice tone, my body movements, and my head movements does not match my words. Now, what responses do you have to that as professional communicators? What choices do you have to respond to that situation?

I might say "Well, you don't look very happy because things are going well." So you would meta-comment on the discrepancy that you've been able to perceive, and confront the person with it. Does anybody else have other ways of responding? Man: I would try to help you express both messages, maybe exaggerate the non-verbal components.... OK, the gestalt technique: amplify the non-verbal message until it accesses the appropriate experience, right? OK, that's another choice. Does everybody understand the choices we're talking about so far? Our job is choice. The notion of incongruity is a choice point which is going to be repetitive in your experience if you are in the business of communication. It makes sense for you to have a varied repertoire, a range of possible responses, and to understand—I hope at the unconscious level rather than consciously—what the outcome will be when you select one of these maneuvers or techniques.

Meta-commenting is one choice, and I think it's a good choice. However, it is only one choice when presented with incongruity. The choice of exaggerating the non-verbal, or of calling them a liar and attacking them, or of ignoring it, or of simply mirroring back and saying incongruently "I'm so glad!" (shaking head and sneering) Or you can "short-circuit" them by reversing the verbal and nonverbal messages: "That's too bad" (smiling and nodding head). The response you get to that is fascinating, because most people have no idea what they verbalized." Either they will enter a confusion state, or they will begin to
explicitly verbalize the message that was previously non-verbal. It's almost as if they take all the conscious material and make it unconscious and vice-versa. Or you might choose to respond with an appropriate metaphor

MHR we are conditioned to act incongruently i.e ‘fake’ ‘masks’ and submit to whims of authority e.g parents, teachers, society … sarcasm is ‘funny’ form of incongruity…but inauthenticity / masks the norm…and ‘authority’ figures don’t meta comment (except in Army I was always being put on ‘charges’ for insubordination, when I never actively / vocally contradicted anyone! that was a form of meta-comment I guess for cowards, and ‘what don’t you understand’ was the response when I stated ‘I disagree, but I will do it as you have said to do it’…authority figures / people in general always avoid the facts/communication i.e side-step the very notion of possibly being ‘wrong’)...

Hyperactivity in children may be related to conflicting messages in language i.e kids need honest, direct feedback, not dark sarcasm, fake positive feedback…brain gets all confused and hypervigilant trying to decode the messages? One thing that children do is to become hyperactive. One hemisphere is registering the visual input and the tonal input, and the other hemisphere is registering the words and their digital meaning, and they don't fit. They don't fit maximally where the two hemispheres overlap maximally in kinesthetic representation. If you ever watch a hyperactive kid, the trigger for hyperactivity will be incongruity, and it will begin here at the midline of the torso, and then diffuse out to all kinds of other behavior.

E.g … teacher / trainer asks students to ‘raise your right hand’, while teacher raises their own LEFT hand… I raised my left hand. So did many people out there! Some of you raised your left hand. Some of you raised your right hand. Some of you didn't notice which hand I lifted. The point is that when you were all children, you had to find a way of coping with incongruity. Typically what people do is to distort their experience so that it is congruent. Is there anyone in here that actually heard me say 'Raise your left hand'? Many of you raised your left hand. Some of you raised your left hand and probably thought you raised your right hand. If you didn't notice the incongruity, you somehow deleted the relationship between your own kinesthetic experience and my words, in order to make your experience coherent. If there are mixed messages arriving, one way to resolve the difficulty is to literally shut one of the dimensions—the verbal input, the tonal input, the body movements, the touch, or the visual input out of consciousness. And you can predict that the hyperactive child who shuts the right hemisphere out of consciousness—it's still operating, of course, it's just out of awareness—will later be persecuted by visual images: dead babies floating out of hot dogs in the air above the psychiatrist's desk. The ones who cut off the kinesthetics will feel insects crawling all over them, and that will really bug them. And they will tell you that. That is a straight quote from a schizophrenic.
The ones that cut off the auditory portion are going to hear voices coming out of the wall plugs, because literally they are giving up consciousness of that whole system and the information that is available to them through that system, as a way of defending themselves in the face of repeated incongruity. In this country, when we have gone into mental hospitals we have discovered that the majority of the hallucinations are auditory, because people in this culture do not pay much attention to the auditory system. In other cultures, hallucinations will tend to cluster in other representational systems.

MHR this is so TROONATNOOR...i.e denial / end up repressing reality, and it finds its own ways of expressing itself...what goes in MUST come out ... what is IMpressed MUST be EXpressed...

There's no formal difference between hallucinations and the processes you use if I ask you to remember anything that happened this morning, or what happened when I said "Ammonia" and all of you went "uhhrrrrhh!" As far as I can tell, there are some subtle differences between people who are in mental hospitals and people who are not. One is that they are in a different building. The other is that many of them don't seem to have a strategy to know what constitutes shared reality and what doesn't. Who has a pet? Can you see your pet sitting here on the chair? (Yes.) OK. Now, can you distinguish between the animal that you have here, and the chair that it is sitting on? Is there anything in your experience that allows you to distinguish between the fact that you put the visual image of the pet there, and the fact that the image of the chair was there before you deliberately put it there? Is there any difference? There may not be. Woman: Oh, yes, there is. OK. What is the difference? How do you know that there is a real chair and there's not a real dog? Woman: I really can see that chair in my reality here and now. But I can only picture the dog in my head, in my mind's eye.... You don't see the dog over here sitting in the chair? Woman: Well, only in my mind's eye. What's the difference between the image of the chair in your mind's eye and the image of the dog in your mind's eye? Is there a difference? Woman: Well, one's here and one isn't. Yes. How do you know that, though? Woman: Well, I still see the chair even when I look away and look back. But if I stop thinking about the dog in the chair, the dog isn't there anymore. The image of the dog isn't as clear. OK, so that's one way that you make a reality check.

MHR i.e sub-modality check to compare what KNOW to be real, and how THAT feels/looks/sounds, and the potential Hallucination ...like in lucid dream interrogation / observation i.e how to know I am dreaming and not awake e.g try to fly, look at hands, look at printed material twice and see if can still read it, try to read digital watch etc... and then check alternate representation systems i.e I can 'see' the dog, but can I 'hear' it or 'touch' it?
MHR we all behave like schizophrenics…question of ‘in what way’ i.e expected to be ‘two faced’ e.g exceptionalism of Mosaic law i.e kill ‘enemy’ in war, but not ‘own people’…to ‘pretend’ ‘to go along to get along’…to wear masks…pretend we agree…pretend we aren’t jealous/envious/malicious/selfish…pretend the boss is not an idiot…pretend we are good communists to get party positions…pretend we care about justice when applying for positions of power e.g politics, when our supporters hope we are biased towards their interests i.e justice for THEM…we are all actors playing multiple roles…only we (some of us) REALISE we are doing this…the problem is when we do NOT realise it…when the roles come upon us without volition…and more importantly, they are not consistent with what is socially demanded e.g O.K to be murderer in war time, if murdering ‘enemy’ women and children, but to do same to ‘own people’ would have you locked up as mentally ill…always question of vested interests / hegemony / social reality …

The difference between somebody who doesn’t know their hallucination is a hallucination and yourselves is only that you have developed some strategy by which you know what is shared reality and what is not. If get enough people to join you, you are ‘sane’ and share a ‘social reality’ e.g Religion …

There are only two distinctions between anybody in this room and an institutionalized schizophrenic: (1) whether you have a good reality strategy and you can make that distinction, and (2) whether the content of your hallucination is socially acceptable or not. Most psychotics just don’t have a way of making distinctions between what’s shared or acceptable social reality and what’s not. And then to be free to CHOOSE to accommodate / enter into the different offered realities i.e change personas / wear masks / play role EXPECTED e.g cold blooded killer when conscripted, then ‘policeman’, then go home and be ‘nice’ again…to be able to note other people’s p.o.v i.e what masks, roles THEY are playing, and what is acceptable in each particular circle of people e.g at work, at a friend’s house, in wartime, at a party, different age groups, etc … i.e to SHARE the social / subjective reality of the people you are among / interacting with, at least enough to function among them e.g most people ‘go along to get along’ rather than challenge other people’s / group’s / nation’s ‘subjective reality’ i.e ‘social reality’.

Projection is a good case of positive hallucination (though can be negative hallucination i.e miss positive feedback etc)

If you can clearly distinguish what portion of your ongoing experience you are creating internally and putting out there, as opposed to what you are actually receiving through your sensory apparatus, you will not hallucinate when it’s not useful. Actually there is nothing that you need to hallucinate about. There is no
outcome in therapy for which hallucinations are necessary. You can stay strictly with sensory experience and be very powerful, effective, efficient, and creative.

You need only three things to be an absolutely exquisite communicator. We have found that there are three major patterns in the behavior of every therapeutic wizard we’ve talked to—and executives, and salespeople. The first one is to know what outcome you want. The second is that you need flexibility in your behavior. You need to be able to generate lots and lots of different behaviors to find out what responses you get. The third is you need to have enough sensory experience to notice when you get the responses that you want. If you have those three abilities, then you can just alter your behavior until you get the responses that you want.

**MHR NLP’s version of ‘ZEN state’**. We know what outcomes we want, and we put ourselves into what we call "uptime," in which we're completely in sensory experience and have no consciousness at all. We aren't aware of our internal feelings, pictures, voices, or anything else internal. We are in sensory experience in relationship to you and noticing how you respond to us. We keep changing our behavior until you respond the way we want you to. Basically ‘The Great Gatsby’.

MHR turning off internal dialogs, becoming totally tuned into inputs entering from external world i.e hypersensitivity to impressions, without any filters, judgements…more or less ‘unconscious’ to internal, and totally ‘listening’ to world … observing sub-modality accessing cues, tone of voice, all sorts of non-verbal cues, and the actual words being spoken…and auto-pilot responding and adjusting own body language, representational system, until gain rapport / mirror / pacing…observing without internal comment, then adjusting own behavior till get desired result i.e rapport / response desired… a Zen trance state … altered state in which totally focused on impressions made by world (turn off all internal commentary, worries, fears, hopes, positive and negative hallucinations, filters, programs etc)

Different response possibilities include change tone of voice, add / change facial expressions e.g raise eyebrows to be sexually evocative / suggestive to unconscious, paraphrase what already said, draw a picture…

Continue with different responses until CLIENT / customer / students look and sound the way YOU want THEM to i.e simply watch them, then ‘hit and miss’ ‘try and see’ what changes lead to THEM behaving how you want THEM to…i.e always focused on them…randomly / auto-pilot hit and miss try and see till get THEM looking and behaving how you want THEM to….i.e totally devoid of SELF-consciousness…not in any way interested in how YOU appear, behave, feel, look…merely seeking the ‘magical’ combinations of words, gestures, body
language, voice tone, word combinations etc that change THEM to look and behave as you want them to…

i.e make THEM the referent for all your actions … keep changing own actions until THEY conform to how you want them to look and act…i.e not about how YOU feel and act, but about how you get THEM to look and act.

i.e Attend to THEM…THEIR facial expressions, body language, accessing cues, and behavior…as THAT is what you want to change / modify / optimize…so sensitive to the direction they are moving in i.e whether current actions are moving them towards the state you desire or not, and whether to continue and expand upon current actions, or to change and try something different…

All a question of eliciting responses from other people…that is UPTIME…when you are focused on THEM…

MHR: Bandler nails it with this i.e my joke about women and THEIR idea of intimacy is listening TO THEM and understanding THEIR FEELINGS rather than true intimacy / sharing.…Woman: If I'm talking to someone about something that I'm feeling and thinking is important to me, then I wouldn't be in uptime, would I? If that is your definition of intimacy, then we have different definitions of intimacy! Woman: I'm saying that it’s part of being intimate; that's one way of being intimate. OK. I disagree with that.

MHR: Remember that the Great Gatsby made YOU feel like YOU had made the best impression…he listened to YOU … didn't try to get YOU to like HIM…he made you feel HE liked YOU…

Uptime Zen ‘Be Here, Now’, and not immersed in past or future i.e internal voice, but only hearing ‘voices’ coming to you from EXTERNAL world i.e let the world speak…be passive listener…attend to here and now which means current impressions that are coming IN, rather than speculating of future, worrying about past, etc…UPTIME is ZEN time…NOW…HERE… and there is NO SELF in the now…that is a construct of past –present-future … there is only external stimuli, appearing in real time…total focus on what happening…what person is saying verbally and non verbally, communicating consciously and unconsciously…

Uptime turns off internal voice re: internal states … focus on EXTERNAL impressions / inputs … NOT internal states…THAT is pure ZEN…

You’re going to have to know what you're thinking and feeling in order to talk about it. But I don't think that will produce connectedness with another human being. Because if you do that you're not paying attention to them, you're only
paying attention to yourself. I'm not saying that it's bad, I'm just saying that it's not going to make you feel more connected with someone else.

You're not going to have more contact with the woman sitting next to you if you're inside making pictures and talking to yourself and having feelings, and then telling her about them. That's not going to put you in contact with her. All that's going to do is tell her conscious mind a lot about what's going on inside you when you're not paying attention to her.

Making a visual image of how YOU want to ‘be’ in an interaction focusses you on YOU, when you need to be focusing on the OTHER PERSON...you have to be ‘here now’, and not off in your own dream world watching the perfect you interacting...need to be totally focused on THEM...receptive to any and all feedback, cues etc...gather information ... get inside of the head of the OTHER person...i.e get ‘into-it’...

Having total sensory experience is a life-long project, and there isn't any limitation to it as far as I know. I now see things, hear things and get information tactually that two years ago would have seemed like ESP to me. That's a statement about my willingness to commit some time and energy to training myself to refine the distinctions I make between internal and external realities, the refinements I can make in every sensory channel, and in every internal representational system.

A lot of our training in our ability to make visual distinctions we got from Milton Erickson. He is one of the most exquisite visual detectors in the world. He can see things that really are "extra-sensory" for other people, but they are there, and they are coming in through the same senses. In the exercise we did, many of you called me over for assistance, saying "Well, this person doesn't make any eye movements." And you finally admitted "Well, there's some slight movement of the eyes." When you say something is slight, that is a statement about your ability to detect it, not about what's going on with the other person.

An exercise to increase your sensory experience, and to distinguish between sensory experience and hallucination.

Experience vs. Hallucination Exercise: Part I We want you to sit in groups of three. One of you we'll call A, one B, and one C. A, your job is detection. B, your job is to practice experiencing different kinds of experience. C is simply an observer, and can also help A and B keep track of what to do next. B, you select, without mentioning anything verbally, three different experiences that you had which were very intense experiences. They can be from any part of your life, but make them distinctive, one from the other; don't take three similar occasions. You can just identify them by dropping inside and finding representative examples, and simply number them one, two, and three. Then hold hands with A and
announce "one." Then go internal, drop out of sensory experience, go back to that
time and place, and have that experience again without any overt verbalization.
Take a minute or two or three to relive that experience fully.... Then announce
"two" and relive it.... Then announce "three" and relive that.... Now there is one
incredibly important factor. For those of you who are very visual, it will be
imperative that you do not see yourself there, but see what you saw when you
were there. For example, close your eyes and see yourself from above or the side
somewhere, riding on a roller coaster, just about to go down that first big drop....
Now step into that image of yourself inside the roller coaster and see what you
would see if you were actually there riding it. Those are very different
experiences. The kinesthetics come in profoundly once you break the dissociation
of seeing yourself over there, and put your perceptual position inside your body
on the roller coaster. As you go back and find these three experiences and re-
experience them, it is important that you do not do it dissociated. You may begin
by seeing yourself; then get inside the picture. When you are inside the picture
and you feel the experience in your body again as you did before, you begin to
squeeze A's hand, thereby cuing them tactually that you are now having that
experience. A, your job is simply to observe the changes in B, as s/he goes
through the three experiences. I want you to watch skin color changes, size of
lower lip, breathing, posture, muscle tonus, etc. There will be many profound
changes in B that you can see visually as B goes through this experience.

Part 2 B will do exactly the same thing as in Part 1: s/he will announce "one" and
re-experience it, then "two" and "three." But this time A will not only watch the
changes but describe them out loud. C's job is to make sure that all the
descriptions that A offers are sensory-based descriptions: "The corners of your
mouth are rising. Your skin color is deepening. Your breathing is high and
shallow and increasing in rate. There's more tension in your right cheek than your
left." Those are descriptions that allow C—who is watching as well as listening to
your description—to verify, or not, what in fact you are claiming. If A says
"You're looking happy; now you're looking worried," those are not sensory-based
descriptions. "Happy" and "worried" are judgements. C's job is to make sure that
A's descriptions are sensory-based, and to challenge any utterance that is not
sensory-based.

Part 3 This time B goes into one of the three experiences without identifying it
by number. You just pick one of the three and go into it. A sits there, again
observing B, saying nothing until s/he finishes that experience. And then A, you
tell B which experience it was: "one," "two," or "three." B continues to run
through those three experiences in any order other than the original order, until A
is capable of correctly naming which experience you are having. If A can't do it
the first time through, simply start over again. Don't tell them which one was
which, or that what they thought was number one was really number three; just
tell them to back up and start over again. It's a way of training your senses to be acute.

**Part 4** This time B goes into any one of the three experiences again and A hallucinates and guesses, as specifically as s/he can, what the content of that experience is. And believe me, you can get very specific and very accurate. In parts 1, 2, and 3 we ask you to stay in sensory experience. In part 4 we're asking you to hallucinate. This is to make a clean distinction between sensory-based experience and hallucination. Hallucination can be a very powerful, positive thing. Anybody who has ever done a workshop with Virginia Satir knows that she uses hallucination in very powerful and creative ways, for instance in her family sculpting. At some point after she has gathered information she'll pause and sort through all the visual images that she has, preparatory to sculpting or making a family stress ballet. She will change the images around until it feels right to her. That's "see-feel," the same strategy as spelling or jealousy. Then she takes the images that satisfy her kinesthetically, and she puts them on the family by sculpting them. That's a case where hallucination is an integral part of a very creative and effective process. Hallucination isn't good or bad; it's just another choice. But it's important to know what you are doing.

The exercise you just did was essentially limited to one sensory channel. It was a way of assisting you in going through an exercise in which you clean up your visual input channel. You also get some kinesthetic information through holding hands. You can do it auditorily as well, and also kinesthetically. You can generalize that same exercise to the other two systems. If you are going to do it auditorily, A would close his eyes. B would then describe the experience without words, just using sounds. The tonal and tempo patterns will be distinctive and since A's eyes will be closed, all he has is the auditory input.

Notice as you are communicating with a client or a loved one that the responses that you are getting are not the ones that you want. If you take that as an indication that what you are doing is not working and change your behavior, something else will happen. If you leave your behavior the same, you will get more of what you are already getting. Now, that sounds utterly simple. But if you can put that into practice, you will have gotten more out of this seminar than people ever get. For some reason, that seems to be the hardest thing in the world to put into practice. The meaning of your communication is the response that you get. If you can notice that you are not getting what you want, change what you're doing. But in order to notice that, you have to clearly distinguish between what you are getting from the outside, and how you are interpreting that material in a complex manner at the unconscious level, contributing to it by your own internal state.
What's going on in the griefstricken person is this: they make a constructed visual image of being with the lost person. They are seeing themselves with the loved one who is now dead or gone, unavailable somehow. Their response called "grief or "sense of loss" is a complex response to being dissociated from those memories. They see their loved one and themselves having a good time, and they feel empty because they are not there in the picture. If they were to step inside the very same picture that stimulates the grief response, they would recover the positive kinesthetic feelings of the good experiences they shared with that person they cared very much about. That would then serve as a resource for them going on and constructing something new for themselves in their lives, instead of a trigger for a grief response.

Guilt's a little different. There are a couple of ways to feel guilty. One of the best ways to feel guilty is to make a picture of the response on someone's face when you did something that they didn't like. In this case you are making a visual eidetic picture. You can feel guilty about anything that way. However, if you step outside the picture, in other words reverse the procedure that we use with grief, what happens is that you will no longer feel guilty, because then you literally get a new perspective. It sounds too easy, doesn't it? It is too easy. Ninety-nine out of a hundred depressed clients that I have seen have exactly the same pattern. They will be visualizing and/or talking to themselves about some experience that is depressing to them. But all they will have in awareness are the kinesthetic feelings. And they will use words which are appropriate: "weighed down, burdened, heavy, crushing." However, if you ask them any questions about their feelings, they will give you an elegant, non-verbal description of how they create their depression. "How do you know you're depressed? Have you felt this way a long time? What started this syndrome?" The exact questions are wholly irrelevant; they are just ways of accessing that process. Depressed people usually make a series of visual images, usually constructed and outside of awareness. Usually they have no idea that they are making any images. Some of you had that experience with your partners today. You told them that they were accessing in a system, and they went "Oh, I don't know about that" and they didn't, because that wasn't in their awareness. Depressed people are running profoundly effective hypnotic inductions by seeing images and talking about them outside of awareness and responding in consciousness with only the feelings. They are going to be bewildered about where their feelings come from, since where they come from is totally outside of their awareness.

**MHR re: target obsession** i.e ‘don't hit the telegraph pole’…Many, many people who have weight problems are doing the same thing. They will have a hypnotic voice that goes "Don't eat that cake in the refrigerator." "Don't think about all the candy in the living room." "Don't feel hungry." Most people have no idea that commands like that are actually commands to do the behavior. In order to understand the sentence "Don't think of blue" you have to access the meaning
of the words and think of blue. If a child is in a dangerous situation and you say "Dont fall down," in order for him to understand what you have said, he has to access some representation of "falling down." That internal representation, especially if it is kinesthetic, will usually result in the behavior that the parent is trying to prevent. However, if you give positive instructions like "Be careful; pay attention to your balance and move slowly," then the child will access representations that will help him cope with the situation.

How does someone know when it's time to be guilty as opposed to when it's not time to be guilty? And we said that an example—and this is ONLY ONE example—of how to feel guilty is to make eidetic images of people looking disappointed, and then feel bad about it. There are other ways you can feel guilty. You can make constructed images or you can talk yourself into feeling guilty. There are lots and lots of ways to go about it. It's important with each individual that you find out how they do it, if you want to change that process to something else. If the way they make themselves feel guilty is with eidetic images, you can have them change the eidetic image into a constructed image. If they do it with constructed images, you can have them change it into an eidetic one. If they talk to themselves, you can have them sing to themselves. If you have the sensory refinements to be able to discover the specific steps in the process that the person goes through to create any response which they don't find useful and which they want to change, it gives you multiple points of intervention. The intervention can be as simple as substituting one system for another, because that will break up the pattern.

One woman had a phobia of heights. Our office was on the third story, which was kind of convenient. So I asked her to go over and look out the window and describe to me what happened. The first time she went over, she just choked. I told her that wasn't an adequate description. I had to know how she got to the point of choking and being very upset. By asking a lot of questions, I discovered that what happened is that she would make a constructed picture of herself falling out, have the feeling of falling, and then feel nauseous. She did that very quickly, and the picture was outside of consciousness. So I asked her to walk over to the window while she sang the National Anthem inside her head. Now that sounds kind of silly, except that she walked over to the window and she didn't have the phobic response! None whatsoever. She'd had the phobia for years and years and years. A man who was a Cree Indian medicine man, a shaman, came to a workshop and we were discussing different mechanisms that worked cross-culturally as far as inducing change in a rapid and effective way. If a person has a headache, an old semi-gestalt thing to do is to sit them in a chair, have them look at an empty chair, have them intensify the feeling of the pain, and have the intensified pain they are feeling develop into a cloud of smoke in the other chair. Slowly the smoke forms itself into an image of someone they have unfinished
business with, and then you do whatever you do. And it works; the headache goes away.

The counterpart for this-shaman was that he always carries a blank piece of paper. Whenever anybody comes to him and says "I have a headache, will you assist me?" he says "Yes, of course, but before I begin I want you to spend five minutes studying this piece of paper in absolute detail, because it contains something of great interest for you." The thing in common about those two interventions is that they both involve switching representational systems. You break up the process by which the person is having the experience they don't want to have, by having their attention riveted in some other representational system than the one in which they are presently receiving messages of pain. The result is absolutely identical in both cases. By studying the blank piece of paper intently, or by intensifying the feeling and making it change into a picture in the chair, you are doing the same thing. You are switching representational systems, and that is a really profound intervention for any presenting problem. Anything that changes the pattern or sequence of events a person goes through internally—in responding to either internal or external stimuli—will make the response that they are stuck in no longer possible.

We had a man in Marin, California, and every time he saw a snake—no matter how far away it was, no matter where he was in respect to it or who was around it—his pupils would immediately dilate. You had to be close enough to see it. He would make an image of a snake flying through the air. This was outside of awareness until we uncovered it. When he was six years old somebody threw a snake at him unexpectedly and it scared him badly. He then responded kinesthetically as a six-year-old to the internal image of a snake flying through the air toward him. One thing we could have done was to simply change the content of that picture. We could have had him make a picture of someone throwing kisses. What we actually did was simply switch the order in which the systems occurred. We had him have the kinesthetic response first and then make the picture internally. That made it impossible for him to be phobic.

You can treat every limitation that is presented to you as a unique accomplishment by a human being, and discover what the steps are. Once you understand what the steps are, you can reverse the order in which the steps occur, you can change the content, you can insert some new piece or delete a step. There are all kinds of interesting things you can do. If you believe that the important aspect of change is "understanding the roots of the problem and the deep hidden inner meaning" and that you really have to deal with the content as an issue, then probably it will take you years to change people. If you change the form, you change the outcome at least as well as if you work with content. The tools that it takes to change form are easier to work with. It's a lot easier to change form, and the change is more pervasive.
Some questions that you ask to elicit the steps in the process that people go through: Ask them to have the experience. Ask them about the last time they had the experience, or what would happen if they were to have it right here, or if they remember the last time it happened. Any of those questions will elicit the same unconscious responses we've been showing you here. Whenever I ask a question or make a statement about something to someone here in the group, if you are alert the response will already be made non-verbally much earlier and more completely than the person will consciously be able to verbalize the answer explicitly. "How do you know when you are being phobic, as opposed to when you are not being phobic?" "How do you know?" questions usually will take you to just about everything. People have a tendency to demonstrate it, rather than bring it into consciousness.

If I'm your client and I say to you "My father scares me," do you have an understanding of what I'm talking about? No, of course not. "My father X's me" would be as meaningful. Because for one person "Father scares me" may mean that his father put a loaded .38 to his head. And for someone else it may simply mean that his father walked through the living room and didn't say anything! So the sentence "My father scares me" has very little content. It simply describes that there is some process—at this point unspecified. The pattern, of course, is to be able to listen to language and know when a person has adequately specified some experience with a verbal description. One of the things we teach with the meta-model is that when you get a sentence like "My father scares me" to ask for a specification of the process that the person is referring to called "scare." "How specifically does your father scare you?" "Know" is another word like scare.

69 It doesn't specify the process. So if I say to you "Well, I think that I have a problem" that doesn't tell you anything about the process. If you say "How do you think it?" initially people will go "What?T But after they get over the initial shock of being asked such a peculiar question, they will begin to demonstrate the process to you, at first non-verbally. They'll go "Well, I just think it." (eyes and head moving up and to his left) Or they'll go "Ah, I don't know. I just, you know, it's just a thought I have." (eyes and head moving down and to his left) The combination of the unspecified verbs that the person is using and the quite elegant non-verbal specification by eye movements and body shifts will give you the answer to the question, whether they ever become conscious of it or not.

If you keep asking questions, usually people will become conscious of their process and explain it to you. Usually people do it with disdain, because they assume that everybody thinks the same way they do, with the same kind of processes. One well-known therapist told us seriously one day "Every intelligent, adult human being always thinks in pictures." Now, that's a statement about him.
That's the way he organizes a great deal of his conscious activity. It has very little to do with about half the population we have encountered in this country.

The word "someone" isn't specified, verbally. We say it's a word with no referential index. It doesn't refer to something specific in the world of experience. However, the nonverbal communication was very specific in that case, and people do the same thing with other non-verbal processes. If you are able to identify things like accessing cues and other non-verbal cues, you can be pretty clear about how something works. People will come in and say "Well, I have a problem" and their non-verbal behavior has already given you the sequence that produces it. So a "How specifically?" question or a "How do you know?" question will usually give you a complete non-verbal specification of the process that the person goes through. Magic / has a very complete specification of how to ask appropriate questions using the metamodel. One of our students taught the meta-model to a hospital nursing staff. So if a patient said "I'm sure I'm going to get worse" or "I can't get up yet," the nurse would ask "How do you know that?"

The nurse

70 would then follow that up with other meta-model questions, to help the patient realize the limitations of his world model. The result was that the average hospital stay was reduced from 14 days to 12.2 days. The whole idea of the meta-model is to give you systematic control over language. When we first took the time to teach it to our students, the result was the following: first there was a period where they went around and meta-modeled each other for a week. Then they began to hear what they said on the outside. They would sometimes stop in midsentence because they would begin to hear themselves. That's something else the meta-model does: it teaches you how to listen not only to other people but to yourself. The next thing that happened is that they turned inside and began to meta-model their own internal dialogue. That changed their internal language from being something that terrorized them to being something that was useful. The meta-model is really simplistic, but it's still the foundation of everything we do. Without it, and without systematic control over it, you will do everything that we teach you sloppily. The difference between the people who do the things that we teach well and those that don't, are people who have control over the meta-model. It is literally the foundation of everything we do. You can be bright and witty and sharp and make the most complex, metaphor in the world, but if you can't gather information well, both internally and externally, you won't know what to do. The meta-model questions are the ones that really give you the appropriate information immediately. It's a great tool for that, both on the outside and the inside. It will turn your internal dialogue into something useful. When you use language with people, they assume that all the stuff they are accessing on the inside is the same as what you said. There's so much going on inside that they have no consciousness of the external form of your communication. You can utter sentences of syntax which have no meaning and people will respond to you
as if what you said is completely meaningful. I'm surprised that anyone ever noticed that some schizophrenics speak "word salad." I have gone into places and spoken word salad and people have responded to me as if I had uttered perfect English. And of course you can embed crazy commands in word salad.

As professional communicators, it seems to me to make a lot of sense for you to spend some time consciously practicing specific kinds of communication patterns so that they become as unconscious and as systematic in your behavior as riding a bicycle or driving a car. You need to train yourselves to be systematic in your behavior, which requires some conscious intervening practice time. So that when you see visual accessing cues and hear visual predicates, you can automatically have the choice of responding by matching, or responding by mismatching, or any combination that you can think of. In other words, you need a good unconscious systematic repertoire of patterns for each choice point that you have that's going to come up repetitively in your work: How do I establish rapport with this other human being? How do I respond in a situation in which they don't have information consciously and verbally to respond to my question? How do I respond to incongruity? Those are all choice points. Identify what choice points are repetitive in your experience of doing your work, and for each of those choice points, have a half a dozen different responses—at least three, each one of which is unconscious and systematic in your behavior. If you don't have three choices about how to respond to things that occur in the therapeutic situation, then I don't think you are operating out of a position of choice. If you only have one way, then you are a robot. If you have two, you'll be in a dilemma. You need a solid foundation from which to generate choices. One way to get that solid foundation is to consider the structure of your behavior and your activity in therapy. Pick out points that are repetitive, make sure you have lots of responses to each of those points, then forget about the whole thing. And add one ingredient, a meta-rule which says "If what you are doing is not working, change it. Do anything else."

Since consciousness is limited, respect that and don't go "Good, I'm going to do all those things that happened in this workshop." You can't. What you can do is for the first five minutes of every third interview every day begin by saying "Look, before we begin today there are a couple of things I need to know about your general cognitive functioning. Would you tell me which color is at the top of a stoplight?" Ask questions that access representational systems, and tune yourself for five minutes to that person's responses so that you will know what's happening later in the session under stress. Every Thursday you can try matching predicates with the first client that comes in, and mismatching with the second. That is a way of systematically discovering what the outcome of your behavior is. If you don't organize it that way, it will stay random. If you organize it and feel free to limit yourself to specific patterns and notice the outcome, and then change to new patterns, you will build up an incredible repertoire of responses at the
unconscious level. This is the only way that we know of to learn to become more flexible systematically. There are probably other ways. This just happens to be the only one we know about now.

In cybernetics there's a law called the Law of Requisite Variety. It says that in any system of human beings or machines, the element in that system with the widest range of variability will be the controlling element.

Frank Farrelly, who wrote Provocative Therapy, is a really exquisite example of requisite variety. He is willing to do anything to get contact and rapport. Once he was doing a demonstration with a woman who had been catatonic for three or four years. He sits down and looks at her and warns her fairly: "I'm going to get you." She just sits there catatonia, of course. It's a hospital, and she's wearing a hospital gown. He reaches over and he pulls a hair out of her leg just above the ankle. And there's no response, right? So he moves up an inch and a half, and pulls out another hair. No response. He moves up another inch and a half, and pulls out another hair. "Get your hands off me!" Most people would not consider that "professional." But the interesting thing about some things that are not professional is that they work! Frank says that he's never yet had to go above the knee. Frank trained a young social worker to behave consistently in a certain way and sent her in. The patient went "Well, I'm Jesus' lover," and the social worker looked back and said wryly "I know, he talks about you." Forty-five minutes later the patient is going "Look, I don't want to hear any more of this Jesus stuff!"

There's a man named John Rosen whom some of you have heard of. Rosen has two things he does consistently, and he does them very powerfully and gets a lot of good results. One of the things Rosen does really well, as described by Schefflin, is that he joins the schizophrenic's reality so well that he ruins it. That's the same thing that Frank taught his social worker to do.

" I say "I can't get angry." And they say "Ah, well, what seems to be the problem?" instead of "What prevents you?" or "What would happen if you did?"

By not having the meta-model responses systematically wired in, people get stuck. One of the things that we noticed about Sal Minuchin, Virginia Satir, Milton Erickson and Fritz Peris is that they intuitively had many of those twelve questions in the meta-model wired in. You need to go through some kind of program to wire in your choices so that you don't have to think about what to do. Otherwise, while you are thinking about what to do, you will be missing what's going on. We're talking right now about how you organize your own consciousness to be effective in a complex task of communication.

Words generalize experience. But you only need to be offended if they apply to you directly. One of the main places that communicators get stuck is on a linguistic pattern that we call "modal operator." A client says "I can't" talk about that again today. That's not possible in this particular group. And I don't
think that you're able to understand that, either." When you listen to content, you get wiped out. You will probably say "What happened?" The pattern is that a client says "I can't X" or "I shouldn't X.". "Won't" and "shouldn't" and "can't" in English are all the same. It makes no difference whether you shouldn't or you couldn't or you won’t, you still haven't.

If you ask "Why not?" they are going to give you reasons and that's a great way to get stuck. If you ask them

"What would happen if you did?" or "What stops you?" you'll go somewhere else more useful. "What prevents you?" or "What would happen if you did?" By not having the meta-model responses systematically wired in, people get stuck. One of the things that we noticed about Sal Minuchin, Virginia Satir, Milton Erickson and Fritz Peris is that they intuitively had many of those twelve questions in the meta-model wired in. Get these from CHAPTER FOUR OF 'THE STRUCTURE OF MAGIC I' The Meta-model i.e sensitivity training re: generalisation, deletion, and distortion…as follows:

**Sensitivity training re:** the linguistic phenomenon / processes of generalization, Deletion, and Distortion, and thus obtain ‘well formed in therapy’ verbal communications from your interlocutors.

To do this we need to identify what is well formed in therapy and what to do when you have identified in therapy a sentence which is not well formed.

The distortions, deletions, and generalisations must be carefully ‘reverse-engineered’ via deeper interrogation and the therapists and client’s insights, while taking care not to project your own, or their, invalid data to ‘complete’ the sentence. (False memories?).

The aim of the interaction / interrogation is to access / re-build the ‘full’ ‘deep’ structure the utterance has emerged, incomplete, distorted, or generalized, from.

The divergence between the deep structure, and the surface structure, must be bridged, to gain the greatest convergence between them.

Be careful what you project a.k.a ‘add’ to the clients utterance. Things the client didn’t say, but which you added. Your assumptions that were not explicitly uttered by the client. To their vague utterance, you probably added very specific details. Language is ‘loaded’ with different meanings for different people. Your associations will often be different to theirs. Thus the meanings will not be shared. So ask the client to be more specific to avoid you imposing your understanding / association / meanings upon their utterance, to supply the ‘missing’ information that enables true communication.
**Deletion** is a process which removes portions of the original experience (the world) or full linguistic representation (Deep Structure). **Deep Structure** is the full linguistic representation of an impression of objective reality. This is one level of composition removed from ‘objective reality’. The initial ‘subjective reality’ of the client.

One level of composition below this is what the client actually utters as an expression of that ‘subjective experience’. This **Surface Structure** often contains deletions. ‘I am confused’ fails to state ‘about what?’ I am scared, deletes ‘of what?’. ‘That hurt’, fails to distinguish ‘how?’ e.g. physically, emotionally, financially, status, prestige, embarrassment?’ and ‘whom / what?’ The window was smashed’, by whom? How? When? I’m scared of confrontations. With whom? About what?

Aim of therapist is to uncover, elicit the missing material, to complete the utterance so its meaning is clear, and the best and fullest representation of the subjective experience / intended meaning of the client.

My parents didn’t want me ??? What is missing? How did I come to this conclusion? They told me, abandoned me, beat me, and withheld all affection and praise, though for their own status / ego they talked about me to others as some ‘golden child’.

Comparatives and superlatives are special cases of deletions. ‘I am less/more the best/worst’ … ‘compared to/with respect to whom / what? ‘X is the best’. At what? For what? ‘That is the hardest’ In what way? How is it hardest? Compared to what? What / Who is the benchmark for comparison? MHR television fake perfection? Marketing images? Facebook ‘best photos’ and ‘misleading images that show only my happiest / most successful moments? ‘

‘Obviously’ and ‘Clearly’ screams out for ‘what criteria are you using to come to that conclusion? What is obvious? Why is it obvious? What assumptions are being made? What evidence is there? Is the assumption valid? On what grounds are they making these claims? To whom is it obvious / clear?

**Logicians use the term ‘Modal Operators’** to refer to implicit assumptions people make, but don’t explicitly state / offer i.e fail to offer well-formed in therapy / logic sentences. These are often generalisations or assumptions / rules implicit in the client’s thinking / expression. e.g ‘You have to / one must / one should … be careful not to hurt other people’s feelings’. Why? What will happen if you don’t? Have you ever contradicted this rule? What happened? What happens when you do/did? Elicit the assumed / experienced consequences of complying with this rule / breaking this rule.
Modal operators of possibility e.g. ‘It's not possible to / you can’t / you shouldn’t / no-one can … love more than one person at a time’. Why? What makes it impossible / wrong ?. What would happened if you did? Have they ever done so? Has anyone ever done so? What reasons do they have for this statement? What assumptions? Bring out the implicit, making it explicit. Or reveal that there is no basis, in logic, for this therefore ‘arbitrary’ rule / belief. What prevents you, stops you, makes it impossible? What is their source for this statement? Who said so? Why do they believe this to be true? What reasons do they have to justify this belief? What is the source / basis for this limiting belief?

These cue words correspond to limits in the client's model of the world. Such limits are often associated with the client's experience of limited choice or an unsatisfactory, limited set of options. Therapist will ask questions to recover all this ‘deleted’ material.

‘I can’t X’. ‘What stops / prevents you from X?’ What makes it impossible for you to X? Why can’t you X?

X could be ‘expressing my feelings’, ‘speaking in public’, ‘riding in elevators’, ‘asking for a pay rise’, ‘approaching women I would like to date’.

Deletions often limit the client’s options / choices, and recovering them, making them explicit, allows us to challenge them e.g. distortions, deletions, assumptions.

Reversing nominalizations assists the client in coming to see that what he had considered an event, finished and beyond his control, is an ongoing process which can be changed.

‘I regret my decision to return home’, treats the decision to return home as a final and unreversible event. In fact a ‘decision’ has to be constantly reproduced, like a belief, or formal set of social interactions (institution). You must ‘keep to it’. You must ‘constantly maintain’ it. This is an ongoing process. This means that at any moment you can decide NOT to reproduce and maintain it. People need to be made aware that they are assuming any decision is final and unreversible, when in reality you can always ‘change your mind’ and revise the ongoing decision to ‘stick to the original decision’. The more precise (well-formed in therapy) ‘I regret deciding to return home’ opens up the possibility of deciding to leave again. Deciding is a process, not an event. It is an open process that can be changed. This opens up options. It removes the limits implicit in an event that is beyond change now. Thus you free the client of a limiting belief / assumption which was implicit, but not made explicit, and thus open to interrogation / debunking.

Nominalisation is the equivalent of reification in religion, and institutionalization in social interaction, and idolatry in religion / philosophy / Zen.
Event words / nominalisations like failed and decided are derived from the Deep Structure verbs failure and decision. You can have an ongoing failure or decision, but failed and decided are beyond change. They are fait accomplis. They are beyond revocation. Beyond change. Fixed. Idolised (as beliefs are often ironically idolized by ‘final’ prophets). Institutionalised. And from now on functionalists will be investing huge amounts of personal energy and public money into working out what functions they serve, and why they must be forever maintained and financed by the taxpayer!)

Reverse / translate any nominalizations discovered back into ongoing processes. Re-open the question. This is the Zen practice. This is science at its most basic. Skepticism. Remaining open minded about everything. Never assuming we ‘know’ anything. Thus avoiding nominalisations. Idolatry. Once we’ve nominalized something, we accept it as ‘self-evident’, and it tends to deflect any further interrogation, no matter what future impressions, sense-evidence, and discoveries indicate. This is how we get ‘stuck’ with faulty assumptions. They become implicit, and are never made explicit. Never challenged in light of more recent data, experience, understandings, findings, insights.

Another typical problem is implicit cause-effect assumptions. ‘Your lack of respect/ X makes me angry’. ‘I can’t accept X / that sort of behavior’. ‘I can’t put up with X’.

What would happen if you reconsidered and decided not to return home? This reminds client that their past decision can be changed, today, simply by revoking it / changing it / no longer maintaining / reproducing it.

Therapist actively seeks to identify violations of one or more of the other well-formed-in-therapy conditions.

**Meta-model training exercise to identify nominalisations.** Use this visual test to train yourself in recognizing nominalizations. Form a visual image from the sentences. See if you can imagine placing each of the non-process or non-verb words in a wheelbarrow. I, a book, an idol, can be placed in a wheelbarrow but a decision, belief, or fear cannot.

You can also put the word ‘ongoing’ in front of your word ‘X’. If you can NOT say ‘An ongoing X’, then X is a nominalisation.

Generalisation are imprecise. they exclude all the finer details which would offer greater freedom of action, choice, and options. A generalisation from one unique experience to an entire class of experiences effectively acts as a limiting belief. Rather be cautious around one type of dog, the person has a terror of all dogs. The ‘lesson’ learned from one particular, narrow experience of a particular dog, is extended to cover all dogs. The lesson learned from being rejected by one
particular girl, is generalized into a belief that all girls will reject you. The lesson learned from the rejection of parents is extended to cover all humans. The coping strategy that might be retrospectively applied to one particular situation i.e that particular dog, is applied to all dogs. The person’s range of freedom of choice when confronted with dogs is thus limited to one strategy. Fear and avoidance. They no longer distinguish between all the different types of dogs. All dogs are now defined as a threat. A global threat is insurmountable e.g god hates me, compared to the threat ‘a particular person calling themselves a ‘priest’ told me I am evil’.

All models / belief systems contain generalisations at some level of composition. Dogma. Assumptions that are not interrogated. They are simply taken as ‘self-evident’, like the ‘Deformed Epistemology’ of Thomas Aquinas. Or the ‘first cause’ of Aristotle. This limits what assumptions will be noticed, and thus open to interrogation, and thus potentially debunked.

‘Everyone hates me’. ‘People don’t like me’. ‘No-one likes me’. May resolve, upon interrogation, to the more precise ‘X and Y hated me / hate me’. This already makes the problem more resolvable. It is specific and concrete and amenable to solution. Then you’d want to know ‘How do you know?’. To find out what client interprets as ‘hate’. What ‘hate’ really means to the client. What they are really trying to express.

So ask, ‘Who, specifically’? The client is then forced to be more specific, and to mentally connect with the deeper structure i.e ‘X hates me’. This avoids the globalization to ‘Everyone’, reminding the client of the source of their limiting belief. That it is in fact very particular. You can now deal with this ‘assumption’. And if it turns out to be true, find strategies to deal with it. While treating the rest of the universe as ‘friendly’, or at least neutral.

Universal quantifiers, e.g no-one, everyone, always, everywhere, everything, have no referential index. The don’t refer to anything specific.

Simply make client aware of one single event that contradicts the global generalisation, ‘So no-one, ever, has NOT hated you?’ to disabuse client of the global, limiting, generalisation. Together you will be able to find at least one example of someone who did NOT hate them.

Nobody pays any attention to what / say. You mean to tell me that NOBODY EVER pays attention to you A T A LL? This form of challenge asks clients if there are any exceptions to their generalizations. The purpose of the therapist's challenge to the generalization is to re-connect the client's generalization with the client's full, rich, detailed experience. Ask the client whether he has had an experience which contradicts his own generalization. Ask the client whether he can imagine an experience which would contradict the generalization. The client
says: C: It's impossible to trust anyone. T: Can you imagine any circumstance in which you could trust someone? Or, Can you fantasize a situation in which you could trust someone? Once the client has succeeded in imagining or fantasizing a situation which contradicts the generalization, the therapist may assist the client in opening up this part of his model by asking what the difference between the client's experience and the client's fantasy is, or what prevents the client from achieving the fantasy. Do you trust me right now in this situation? If the client responds positively, his generalization has been contradicted. If he responds negatively, all the other techniques are available, e.g., asking what, specifically, is preventing the client from trusting the therapist in this situation. (d) In the event the client is unable to fantasize an experience which contradicts his generalization, the therapist may choose to search his own models to find a case in which he has had an experience which contradicts the client's generalization. If the therapist can find some experience of his own which is common enough that the client also may have had it, he may ask whether that experience contradicts the client's generalization. C: It's impossible to trust anyone.

T: Have you ever gone to the doctor (or to the dentist, ridden in a bus or taxi or airplane, or...)? Did you trust the doctor (or dentist, or bus driver, or...)? Once the client has admitted that he has had an experience which contradicts his generalization, he has re-connected his representation with his experience and the therapist is able to explore the differences with him. (e) Another approach to challenging the client's generalization is for the therapist to determine what makes the generalization possible or impossible. This technique is described in the section on modal operators of necessity. C: It's impossible to trust anyone. T: What stops you from trusting anyone? or, What would happen if you trusted someone? (f) Often the client will offer generalizations from his model in the form of generalizations about another person.

For example: C: My husband is always arguing with me. Or, My husband never smiles at me.

Do you always argue with your husband? Do you ever smile at your husband?

If the Surface Structure: My husband always argues with me is accurate, then necessarily the Surface Structure: I always argue with my husband is also accurate.

An example of a symmetrical predicate: If you are arguing with me, then, necessarily, I am arguing with you. A referential index shift reminds the client of this fact, namely that blaming another person for arguing with you is hypocritical. It takes TWO to make an argument.

I have to take care of other people, or they won’t like me.
If you do take care of other people, will they necessarily like you? Always?

Complex Generalization in which one action is assumed equivalent to another, e.g: My husband never appreciates me. (pauses) . . . My husband never smiles at me. The first assumes she can read minds, and know the inner state of another person, without having to ask them. The second requires mere observation, and no mind reading. So you can challenge the first assumption by asking ‘How do you know that not smiling means he doesn’t appreciate you?’ And then flipping it to ‘Do you smile at your husband?’ ‘Does your not smiling at HIM mean YOU don’t appreciate HIM?’.

The therapist should first check to see if the two Surface Structures are, in fact, equivalents in the client’s model. T: Does your husband’s not smiling at you always mean that he doesn’t appreciate you? Here the client is faced with a choice - the client will deny the equivalence and the therapist may ask how the client does, in fact, know that her husband doesn’t appreciate her, or the client verifies the equivalence. If the equivalence of these two Surface Structures is verified, the therapist applies the referential index shift technique: Does your not smiling at your husband always mean that you don’t appreciate him? The therapist may now begin to explore the difference between the two situations: the one in which the equivalence holds and the one in which it does not. The client, again, has re-connected her generalization with her experience. The overall exchange looks like: C: My husband never appreciates me. . . . My husband never smiles at me. T: Does your husband’s not smiling at you always mean that he doesn’t appreciate you? C: Yes, that’s right! T: Does your not smiling at your husband always mean that you don’t appreciate him? C: No, that’s not the same thing. T: What’s the difference?

Draw client out to be more specific in their descriptions of what, where, who, why, when. Get a more detailed, specific representation. This reduces the ‘scope’ of the statement and thus avoids generalisations.

X does Y. In what way? Always? When? What exactly? Challenge every assumption (mind reading etc) as it comes up.

Linguistically, assumptions show up as presuppositions of the client’s Surface Structures. E.g I’m afraid that my son is turning out to be as lazy as my husband. The presupposition is that the husband IS lazy. This is implicit. So ask ‘In what specific way is your husband lazy?’

**Cause and Effect** assumes that one person’s actions / some particular circumstance or experience, must necessarily cause a particular emotion or inner state in another person. That person has no choice but to experience that effect. That emotion or inner state. When confronted with that set of situations / that person’s particular actions. E.g My wife makes me feel angry. In this Surface
Structure one human being (identified as My wife) performs some action (unspecified) which necessarily causes some other person (identified as me) to experience some emotion (anger). Or, Your laughing distracts me. Both are semantically ill formed as they assume cause and effect relationships. They assume that the stated response is caused by the stated action. As if the responder has no choice but to feel angry, sad, or to be distracted, or bored, or insulted.

I'm sad that you forgot our anniversary. I'm sad because you forgot our anniversary.

I want to leave home but my father is sick. Implicit is that the ‘cause’ of ‘I’ not being free to leave home is his father’s sickness. The father’s sickness is forcing him to stay home.

He wants something (the X in the general form X but Y) and some condition is preventing him from getting it (the Y). Or the client does not want something (the X), but something else (the Y) is forcing him to experience it. Both are examples of implied (implicit) causatives.

Therapists have at least the three choices in coping with implied Causatives. (a) Accept the cause-effect relationship and ask if it is always that way. E.g / don't want to get angry but she is always blaming me. The therapist may respond: Do you always get mad when she blames you? The client will often recognize times when she has blamed him and he has not gotten angry. This opens up the possibility of determining what the difference is between those times and when her blaming "automatically makes" the client angry. (b) Accept the cause-effect relationship and ask the client to specify this relationship of Implied Causative more fully. To the client's Surface Structure above, the therapist may respond: (How, specifically, does her blaming you make you angry? The therapist continues to ask for specifics until he has a clear image of the process of Implied Causation as represented in the client's model. (c) Challenge the cause-effect relationship. One direct way of doing this which we have found useful is to feed back a Surface Structure which reverses the relationship. For example, the client says: / don't want to get angry but she's always blaming me. The therapist may respond: 'Then, if she didn't blame you, you wouldn't be - come angry, is that true? or, the client says: / want to leave home but my father is sick. The therapist may respond: Then, if your father weren't sick, you would leave home, right? This technique amounts to asking the client to reverse the conditions in his model which is preventing him from achieving what he wants, or to reverse or remove the conditions in his model which are forcing him to do something he doesn't want to do and then asking whether this reversal gives him what he wants.

If your father weren't sick, you would leave home? This reversal technique has been, in our experience, very effective in challenging the Cause-Effect generalization involved. The client often succeeds in taking responsibility for his
continuing decision to do or not to do what he originally claims someone or something else controls.

Are you saying that your father's being sick necessarily prevents you from leaving home? The client often will balk at this Surface Structure since it blatantly claims that the two events, X and Y, are necessarily connected. If the client balks here, the way is opened for the client and the therapist to explore - how it is not necessary.

Mind Reading. Everybody in the group thinks that I'm taking up too much time. The speaker is claiming to know the contents of the minds of all of the people in the group. If she loved me, she would always do what I would like her to do. I'm disappointed that you didn't take my feelings into account. These two cases of semantic ill-formedness - Cause and Effect and Mind-Reading. Claims that one person is performing some action which causes another person to experience some emotion. The therapist responds by asking, how? Specifically. How does X doing Y cause the emotion Z in A?

In Cause and Effect Surface Structures, the clients feel that they literally have no choice, that their emotions are determined by forces outside of themselves. This is a limiting belief.

In Mind-Reading, the clients have little choice as they have already decided what the other people involved think and feel. Therefore, they respond on the level of their assumptions about what these others think and feel when, in fact, their assumptions about the others' thoughts and feelings may be invalid.

In Cause and Effect, the client may come to feel guilty or, at least, responsible for "causing" some emotional response in another.

In Mind-Reading clients may systematically fail to express their thoughts and feelings, making the assumption that others are able to know what they are thinking and feeling.

The client's assumed ability to read another's mind and the client's assumptions that another can read his mind is the source of vast amounts of inter-personal difficulties, miscommunication and its accompanying pain.

Even less probable from our experience is the ability of one person to directly and necessarily cause an emotion in another human being.

We label all Surface Structures of these forms semantically ill formed until the process by which what they claim is true is made explicit, and the Surface Structures representing this process are themselves well formed in therapy.
The therapist asks for an explicit account of the process implied by Surface Structures of these two classes essentially by the question how?

This process might proceed as follows: C: Henry makes me angry. T: How, specifically, does Henry make you angry? C: He never considers my feelings. The therapist has at least the following choices: (a) What feelings, specifically? (b) How do you know that he never considers your feelings? The therapist chooses to ask (b) and the client responds: C: Because he stays out so late every night. The therapist now has at least the following choices: (a) Does Henry's staying out at night always make you angry? (b) Does Henry's staying out at night always mean that he never considers your feelings? The client's subsequent Surface Structures are subjected to the well-formed-in-therapy conditions by the therapist.
Pacing and mirroring

Get rapport with another person and join their model of the world, as a prelude to helping them find new choices in behavior via pacing or mirroring

Pacing is matching another person's behavior, both verbally and non-verbally.

Mirroring is the essence of what most people call rapport, and there are as many dimensions to it as your sensory experience can discriminate. You can mirror the other person's predicates and syntax, body posture, breathing, voice tone and tempo, facial expression, eye blinks, etc.

There are two kinds of non-verbal pacing. One is direct mirroring. An example is when I breathe at the same rate and depth that you breathe. Even though you're not conscious of that, it will have a profound impact upon you. Another way to do non-verbal pacing is to substitute one non-verbal channel for another. We call that "cross-over mirroring." There are two kinds of cross-over mirroring. One is to cross over in the same channel. I can use my hand movement to pace your breathing movement—the rise and fall of your chest. Even though the movement of my hand is very subtle, it still has the same effect. It's not as dramatic as direct mirroring, but it's very powerful. That is using a different aspect of the same channel: kinesthetic movement. In the other kind of cross-over mirroring, you switch channels. For example, as I speak to you ... I watch ... your breathing ... and I 79... 80 gauge the ... tempo... of my voice... to the rise... and the fall... of your chest. That's a different kind of cross-over. I match the tempo of my speech to the rate of your breathing. Once you have paced well, you can lead the other person into new behavior by changing what you are doing. The overlap pattern we mentioned yesterday is an example of that. You join the client in their representation of the world and then overlap into a different representation.
MHR ‘reality’ is merely your subjective / personal ‘representation’ of the phenomena we call ‘objective reality’, which we can never directly measure. A shared subjective reality is a ‘social reality’, which is shared by the members of a group, to varying degrees. You can share a reality / representation system of the world, a model of the world, with any number of people. If you get a large enough group to ‘agree’ on this reality, then it becomes ‘official’, ‘orthodox’, and ‘real’. Alternatives are dismissed by the group sharing this reality as ‘tin hat conspiracy theories’ and even ‘mental illness’, ‘evil enemies’, or simply ‘ignorant ‘pagan’ fools, or worse, maliciously motivated ‘heretics’ with some underlying, bad, motives. Schopenhauer’s brilliant work ‘The world as will as representation’ and David Hume’s body of work all make sense in the context of NLP and ‘representation systems’. I consider David Hume the earliest ‘psychologist’ and NLP practitioner, while ZEN is the oldest philosophical school underpinning ALL of what we call today call NLP. Bandler, and those he modelled, all have naturally adopted ZEN practices, which Bandler calls ‘uptime’.

Pacing and leading is a pattern that is evident in almost everything we do. If it is done gracefully and smoothly it will work with anyone, including catatonics. Once I was in Napa State Mental Hospital in California, and a guy had been sitting there for several years on the couch in the day room. The only communication he was offering me were his body position and his breathing rate. His eyes were open, pupils dilated. So I sat facing away from him at about a forty-five degree angle in a chair nearby, and I put myself in exactly the same body position. I didn’t even bother to be smooth. I put myself in the same body position, and I sat there for forty minutes breathing with him. At the end of forty minutes I had tried little variations in my breathing, and he would follow, so I knew I had rapport at that point. I could have changed my breathing slowly over a period of time and brought him out that way. Instead I interrupted it and shocked him. I shouted "Hey! Do you have a cigarette?" He jumped up off the couch and said "God! Don't do that!"

In order to pace either of them I'm going to accept their reality. With the college president I'm going to say that "Since he's so intelligent and prestigious he will be able to"—and then I'll say whatever I want him to do. If I go to an academic conference and I'm there with all the people who live in the psychotic reality of academia, I am going to pace that reality. I'll present a paper, because raw experience wouldn't pace their reality. If there was any experience there, it would just go right by them.

81 With the psychotic who believes he's a CIA agent 111 open the door, look back, slip in and close the door quickly, and whisper "At last we got through to you! Whew! I almost got caught coming in here! Now, quick, I only have a few minutes to give you these instructions. Are you ready? We have gotten you a cover as a college professor, and we want you to apply for this job and wait until
you hear from us. You can do that because you've been trained to do it as an agent, right? Do it well, so that you're not discovered and sent back here. Got it?"

When you join someone else's reality by pacing them, that gives you rapport and trust, and puts you in a position to utilize their reality in ways that change it. Non-verbal mirroring is a powerful unconscious mechanism that every human being uses to communicate effectively. You can predict by looking at people communicating with each other in a restaurant whether they are communicating well or not by observing their postures and movements. Most of the therapists I know who mirror do it compulsively. We did a seminar in which there was a woman who was an exquisitely good communicator who mirrored very compulsively. As she was talking with me, I began sliding off my chair, and she literally fell on the floor. If you believe that you have to have empathy, that means that you have to have the same feelings that your client does in order to function well as a therapist. Someone comes in and says "Well, I have this kind of phobic response every time I walk down the street and begin to talk to somebody; I feel like I'm going to throw up, you know. I just feel real nauseous and light-headed and I feel like I'm going to sway..." If you have to mirror, you're going to get sick. How many of you have ever finished a day of doing therapy or educational work and gone home and felt like you took some of the residue home with you? You know that experience. The statistics show about eight years shorter life span for people in therapy than almost any other profession.

If you work with people who are diseased or dying, you don't want to mirror that directly, unless you want a very short career. People in therapy are always talking about pain, sadness, emptiness, suffering, and enduring the tribulations of human existence. If you have to understand their experience by experiencing it, then my guess is you're going to have a really unpleasant time. The important thing is to have a choice between direct mirroring or cross-over mirroring. With someone who breathes normally, pace with your own breathing. With someone who is asthmatic, pace with your hand movement or something else.
ANCHORING (WOW!)

Is there someone here who has a past experience that they think about from time to time, and it makes them have a feeling that they don't want? ... OK. Linda, this is secret therapy. Your task is always to keep the content of what goes on from the people here. Because if you tell them the content, they will become involved. And if they become involved, it will be harder for them to learn. Whenever we ask a person to come and make a change here as a demonstration, we will insist that they keep the content to themselves. Usually we'll say "I want you to pick a code word, a color, a number, a letter for what you want to change." So the person will say "I want to be able to M" or "I don't want to have to three." That has a couple of positive dimensions. If the outcome we're after is to teach people how to do what we do, then we will demand that it be content-free pure process therapy. Then the only things you have available to pay attention to are the pieces of the process. You cannot hallucinate effectively on "number three"—at least not as effectively as you can on "assertiveness" or "love" or "trust" or any of those other nominalizations. In addition it has an extra advantage. If you are in any context in which people know each other, many people are reluctant to work on material which they think might change their relationship with the people who are there. By doing secret therapy you avoid that difficulty because nobody knows what they are working on.

Linda, what do you recall that gives you the unpleasant feeling? Is it a set of images or a voice? OK. She already answered the question nonverbally. If you were watching her eyes, you saw them move up to her left and then down to her right. So she makes an eidetic visual image and then has a feeling about it. Linda, when you see this image you have certain feelings which are unpleasant to you. Now I'd like you to look at the image and find out if you still get the unpleasant feeling when you look at it now. And I'd like you to do a good job of that. You can close your eyes and really take a good look at it. (Pause. As she experiences the feelings, he touches her right shoulder.) And as you can all see by her responses, Linda is telling the truth: when she sees that picture she feels bad. So there is some past experience that occurred, and things didn't turn out quite the way you would have liked them to. That's an understatement if I've heard right. Linda: Right. That's exactly right. So from time to time an image comes into your mind, and when you think about it, you get the same kind of feelings that you had
as a result of that experience. Now, I would like you to think what resource you would have needed back then to have made a different response to that situation, a response which would have given you a much more acceptable outcome if you had made it. Wait a minute, because I want to tell you what I mean by "resource." By resource I don't mean some outside help or anything like that. What I mean by a resource is more confidence, more assertiveness, more trust, more caring—any internal resource. At this point in time, some time has elapsed; I don't know how much, but during that interval you have gained resources as a human being that you didn't have access to then. I want you to select a resource that would have enabled you to have had a wholly different experience back then. I don't want you to tell me what it is. I just want you to think of what it would be. (Pause. As she thinks of the resource, he touches her left shoulder.)

Did those of you watching notice some changes? Let's call the response she gets from the picture Y, and the new resource that she needed back there we'll call X. Now, let's demonstrate. Which of those two responses is this? (He touches her right shoulder.)... Now, you should be able to see the color changes, lip size changes, breathing changes, actual trembling in her body, that we have called Y. Now which response is this? (He touches her left shoulder.)... Now, when I say that she needs this resource X, I have given you as much information verbally as you ever get from your clients when they tell you what they want. If a client says "I want to be more assertive; I want to be more trusting; I want to be more caring, more respectful of other people," they have given you exactly the same amount of information as saying "I need X." In a way they have given you less. Because if they say "I want to be more assertive," you're going to take your meaning of assertive and assign it to their behavior. If they say "Well, what I need is some X," you won't run the risk of misunderstanding them. Sometimes I think it would be easier to do therapy in a foreign language that you didn't speak. That way you would not have the illusion that the words you heard had the same meaning for the person who utters them as they have for you. And believe me, that's an illusion. Now why does response Y occur when I touch her right shoulder? Have you noticed that that occurs? Has anyone in here noticed that? What's going on here? It's really spooko time! Linda, do you believe in free will? Linda: Yeah. (He touches her right shoulder.) Now who tightened the muscles around your mouth? Whose free will do you believe in? Free will is a funny phrase. It's also a nominalization. When you came up here in response to my request, you made a statement about your own free will. I said "I want somebody up here who makes pictures that they don't want to make." That is a statement that someone is making those pictures and it isn't you. It's your unconscious or your "mother," one or the other. Now, what's going on? Did anybody make sense out of that?

Woman: When you were asking her to go deep inside of her and see that image, you put your hand on her right shoulder as she was feeling the bad feelings, so she had an association with the touch. Do you mean to tell me that now every time I touch her on the shoulder like that, shall have that response? (He touches
her right should again, and response Y occurs.) Man: It sure looks that way. I agree with you. How could something that powerful be overlooked by modern psychology? Here you are, adult human beings. Most of you have been to college, and most of you are professional communicators. You've learned about human beings and how human beings work. How do you make sense out of this?

Does the name Pavlov ring a bell? This is straight stimulus-response conditioning. Linda had a certain experience which was her response to an accessing question that I asked her—namely about this experience that she wants to change. As she fully recovered that experience—and I knew when she had fully recovered it by observing her responses—all I had to do was touch her. That touch is now associated with the entire experience that she recalled. It's the same process as the thing that she wants to change. How is it that when she makes that picture she has a set of feelings automatically? She sees a picture, bang!—she has the unpleasant feeling. It's the same process. When a person is in a certain state of consciousness such as the experience Y for Linda, you can introduce a new dimension in any sensory system, such as a touch. We call this an "anchor," in this case, a kinesthetic anchor. As long as I repeat that touch with the same pressure at the same point on Linda's body, and she has no stronger competing states of consciousness when I begin, it will always re-access that experience. It's straight conditioning. It constitutes, in my opinion, one of the most powerful covert tools that you can use as a therapist or as a communicator. It will get you almost everything. About ninety percent of what goes on in therapy is changing the kinesthetic responses that people have to auditory and visual stimuli. "My husband makes me feel bad." "My wife always makes me angry." Now let's demonstrate one—and this is only one way—to use it. What I'd like you to do, Linda, is to go back to this experience. Close your eyes, and go back to that experience. This time I want you to take this resource with you (He touches her left shoulder.) and I want you to see yourself respond in a whole new way. Go all the way through it until you're satisfied.

What she's doing now is reliving it with the new resource available—which wasn't available the first time this happened—until she is satisfied with her response in that situation. We call this process "changing personal history." You go back into your personal history with resources you did not have then, taking them with you this time. We don't know what the content of this is, and there's no need for us to. She is reliving the experience now. After this she will have two histories, the "real" one in which she didn't have the resource, and the new one in which she did have the resource. As long as these are full experiences—and we're guaranteeing that by anchoring—both will serve equally well as guides for future behavior. Linda: (She opens her eyes and smiles broadly.) I love it! OK, now, Linda, I would like you to go back and make the old picture again, the one that made you feel bad, and tell me what happens. Observers, what do you see, X or Y? And this is where the sensory experience really counts. You can do the
therapy but knowing whether or not it worked is the most essential piece. Man: I see a mixture of X and Y. What happens in your experience, Linda? When you see that picture, do you feel the same way you did before? Linda: No, I do not. Don't reveal any content; just tell us how it's different. Linda: Uh, my fear is gone. Now, there's another way to check your work. Anchoring can be used in a number of ways. Now, watch this. (He touches her right shoulder.) Is that the same response that touch elicited before? Woman: Partially.

Partially. Now, if it were to be entirely reversed, I would consider that doing the client a disservice. If you are in the business of choice, you are in the business of adding choices—not subtracting them, and not substituting one rigid stimulus-response circuit for another. If you have a client who feels helpless and small each time he goes to work, and you change that so each time he goes to work he feels assertive, happy, and confident, he is no better off, in my opinion. He still has only one choice about how to respond. And if you have one choice, you're a robot. We think therapy is the business of turning robots into people. That's not an easy task. We all get robotized. Part of your job is to change that situation unconsciously, so that people actually exercise choice in their behavior, whether it's conscious or not. Choice, to me, is having multiple responses to the same stimulus.

Now, we need to do one more thing that's very important. Linda has the choice sitting here in this room. You've all seen that. We want her to also have this choice in other contexts. All of you have had the following experience. You work with a client and you and the client both know that they have new choices. They leave the office and you're happy and they're happy and congruent, and two weeks later when they come back they go "Well, it didn't quite ... I don't know what happened. I knew it... and I uh..." Or worse yet they come back and present you with the exact same problem, with very little memory that you even worked on it two weeks ago! Linda was in an altered state up here. She radically altered her consciousness to go after old experiences, to integrate them with new kinds of resources. The point is—and this was a primary insight of family therapy twenty years ago—if you simply induce changes in an altered state of consciousness known as an institution, or a therapist's office, or a group setting, it's very unlikely that most of your work will transfer the first time. You'll have to do it several times. You have to be sure that the new understandings and learnings, the new behavior, the new choices, transfer out of that altered state of consciousness into the appropriate context in the real world. There's a very easy process that we call "bridging" or "future-pacing" that connects the new response with the appropriate context. It's another use of anchoring. You know what the new response is, and you know that the person wants it to occur in some context, so you simply ask them the following question: "What is the first thing that you would see, hear, or feel, that would allow you to know you are in the context where you want to make this new choice?"
Linda, there are other situations in your present life that are similar to the one that you saw in those pictures, right?—situations in which you respond the same way you responded to that picture, instead of the way you would like to respond. Now, what I need to know is what allows you to know that a context is similar to that one. Is it something about what you see? Is it the tone of someone's voice, the way someone sounds, the way someone is touching you? ... Linda: It's the way someone looks. OK, I want you to see what that looks like. And as you see that, each time you see anything similar, you will feel this. (He touches the resource anchor.) I want you to remember that you have this particular resource.... That's bridging. It takes a minute and a half or two minutes, and it guarantees that your work will transfer out into the real world. The same stimulus that in the past elicited the maladaptive stereotyped behavior, the feeling that she wants to change, now serves as a stimulus for which the resource is a response. Now she will automatically have access to the new choice in the contexts where she needs it—not just in the office, the group, the institution. This is stimulus-stimulus conditioning.

I'd like two people to come up here and role-play a husband and wife.... Thank you. Larry and Susie. Now as a wife, would you give me some complaints. What does he do or not do? Susie: He drinks too much beer. Hell never watch football with me. Hell never watch football with you? And how does that make you feel? Susie: Mad. Deserted. Deserted, so what you want is some attention from him. Susie: Right. And when you try to get attention from him, what—look at that, he went right up into a visual access. Boom! That's what typically happens. The wife says "I feel I want him to touch me," and the husband goes (looking up) "Well, I don't see how that's useful." Right? And then he comes into the house and says "Look, this place is a mess. I can't stand to see a cluttered house." And she says "But it feels cozy this way." Now what I'm going to do here is use anchoring. I say "Well, I find that hard to believe, but let me check it out." So I come over here and ask the husband a few rhetorical questions, simply for the purpose of eliciting responses. I say "Larry, let me ask you a question. Are there some times when you feel like you really want to be close to her, give her some attention and some good feelings and really get close to her? Are there times like that?" Larry: Sure, there are times. (He touches Larry's wrist.) "Now, I know, based on my past experience as a therapist, that couples usually get in trouble with words, because people are not very good with words. They don't train adults to use words; they don't even train children. So what I'm going to recommend to you, Susie, is that you try the following: I'm going to give you a non-verbal signal to try with Larry
for the next two weeks just as a way to find out whether or not he really is open to paying attention to you. What I would like you to do is this: Any time you want five or ten minutes of his undivided attention and some affection, walk up to him and hold him on the wrist like this. OK, and would you do that right now? I want to check and make sure you know what I mean." "Now, Susie, when you do this, look at him and he will nod or shake his head depending upon whether or not he feels this is an appropriate time to spend some time with you. This way he gets a message from you which is unambiguous, because if you come up to him and say (harsh voice, punching his arm) 'Want to watch football?' he might misinterpret that." I can send this couple off and let them try it. I'll tell her "Now, you're only to use this twice a day." Of course she'll be curious and she will try it. And what's underneath the "non-verbal signal?" An anchor. So what will happen? Will he nod "yes" or shake his head "no"?

Now, the first few times when she does this, she will complete the whole pattern. But pretty soon it will streamline. She'll walk in and just start to reach for him and that will be enough. Pretty soon she'll be able to walk in and just look at him and that will elicit the same response. Couples get into trouble because they don't know how to elicit responses from one another. The response they intend to get is completely different from the one they actually get. For instance, say I have a guy here who really wants her to come and comfort him sometimes. So he sits on the end of the bed and stares at the floor. She, of course, assumes that this means that he wants space for himself, so what does she do? She leaves the room. They end up in therapy seventeen years later and he says to me "She doesn't support me when I need support." And she says "I do, too!" He says "You've never done it in seventeen years when I really needed it." I say "How do you let her know you need it?" He says "Well, when I sit on the end of the bed, I show her." And she says "Huh! Oh, I thought you wanted to be alone." That's why we say "The response that you get is the meaning of your communication." (MHR the meaning the person decoded, so clearly you need to change your communication till it results in the result you intended!).

This is a way that you can get the responses that people want connected with their own behavior. Now when Susie here wants affection, she has a direct way of eliciting that part of him. After you give a couple a few anchors, they begin to do it on their own without ever knowing what happened. They suddenly start getting what they want "mysteriously." That's one way of using anchoring with couples. Most couples have simply habituated to each other's behavior, and they cease to do anything new with each other. It's not that they are not capable of it, it's that they are so anchored into rigid patterns of interacting that they don't do anything new. Very rarely do I find any serious dysfunction between couples other than having habituated into rigid patterns. Whenever there are rigid and repetitive patterns or responses that you want to interrupt, you can begin by
anchoring something unpleasant or attention-getting, and fire that anchor whenever the pattern or response occurs.

With a couple I saw once, his whole experience in life was making constructed images of possibilities, and her function in life was responding to anything he said by making an eidetic image of something that was similar and talking about how it didn't work. So he would go "I want to make a skylight in the bedroom" and she would say "We were over at so and so's house and their skylight leaked." They never had any other kind of communication. There was nothing else! I did therapy with these two in my living room. When I came in, I sat down and said "You know, I'm kind of a city kid and living out herein the country I've had some real surprises. Did you know that a rattlesnake came right through my living room, right here, yesterday? Right across the floor. It was the damndest thing." As I said that, I looked down at the floor just behind their chairs and slowly followed an imaginary snake with my eyes as it went across the floor. Then the couple began to speak. Whenever they would start to argue, I would look down at the floor again and they would stop. I began to anchor their terror of snakes to having that conversation. After about an hour of doing that, they didn't have that conversation any more. It was too unpleasant, because after a while their feelings about snakes became associated with arguing. If you're going to talk to somebody and you know that there's even a possibility that you might need to interrupt them, you can set them up like that before you begin the session.

One thing that we have done with couples is to take away their ability to talk to each other. "You can't talk to each other any more until I tell you to. If I catch you talking to each other, I'll give you warts." They have to generate new behavior, and they begin to become interesting to each other, if nothing else. Even if they keep the same patterns of behavior, at least they generate some new content. They have to learn new ways to elicit the responses that they want. He wants her to iron a shirt for him, so he comes in and walks up to her and gestures with his hands. So she goes out and gets a piece of bread and butters it for him and brings it back in, right? Now, in the past, when he'd say "Will you iron my shirt?" and she did something else, he would criticize her. "You never do what I want," and so on. Now when he gets the piece of bread, he can't criticize because he can't talk. In order for him to get what he wants, he's got to change his own behavior. So he tries again. He hands her the shirt... and she puts it on. He's got to keep coming up with new behaviors until he finds one that works. Then I can use that as an example. I can say "Look, even if you do it with words, if what you do doesn't work, try altering your own behavior."

Anyone's symptomatic behavior is a response to something, and the question is, what! If you can change what they are responding to, it's often much easier than
changing their behavior. You don't always have to know what it is, but it's often very easy to tell. You have a "hyperactive" kid with his parents and for the first five minutes of the session he's not hyperactive. Then the father looks at the mother and says "What are you going to do about this kid?" When the kid immediately starts jumping around, it gives you a mild indication of what he's responding to. But you won't notice that if you're inside making pictures and talking to yourself about which drugs you are going to give him.

"What resource would you need as a human being to know that you could go on living and have lots of happiness?" and then do what we did with Linda, the "change history" pattern. Our presupposition is that any human being who comes and says "Help! I need help" has already tried with all their conscious resources, and failed utterly. However, we also presuppose that somewhere in their personal history they have had some set of experiences which can serve as a resource for helping them get exactly what they want in this particular situation. We believe that people have the resources that they need, but they have them unconsciously, and they are not organized in the appropriate context. It's not that a guy can't be confident and assertive at work, it's that he isn't. He may be perfectly confident and assertive on the golf course. All we need to do is to take that resource and put it where he needs it. He has the resource that he needs to be confident and assertive in his business on the golf course, but he has never made that transfer, that connection. Those are dissociated parts of himself. Anchoring, and the integration that occurs with anchoring, will give you a tool to collapse dissociations, so that the person has access to the resource in the context that they need it.

If you use any NLP process congruently you will find lots of places that it won't work. And when it doesn't work, I suggest you do something else.

If you ask a client "How would you like to be?" and they congruently say "I don't know what I want. I really don't. I don't know what resource I would have needed back then," what do you do? You can ask them to guess. Or you can say "Well, if you knew, what would it be?" "Well, if you don't know, lie to me. Make it up." "Do you know anyone who knows how to do this?" "How would you feel if you did know? What would you look like? What would your voice sound like?" As soon as you get a response, you can anchor it. You can literally construct personal resources. For most of the people who come to you, and for all of you sitting here, your personal history is a set of limitations on your experience and behavior in the present. Anchoring, and the construction of new possibilities using anchoring, can literally convert your personal history from a set of limitations to a set of resources.

Another way to answer the question is that if a person hasn't had the direct experience they need as a resource, they have some representation of what it
could be, even though it may be other people's behavior. That is, there is a representation within them which they label "other people's behavior" that they don't allow themselves to have. However, it is a representation that's in them. If you can access it fully, you can anchor it. You can do it directly or covertly. "Well, I can't see the images that you are looking at right now, your representation of this friend of yours who knows how to do this, so would you pretend to be that friend to give me an idea of what we are working toward?"
"Display that behavior for me so that I can get an idea about how Joe would act." "Show me how you wouldn't act." Then anchor it as they do it. That's now a piece of behavior that is as real as any other behavior.

Or you can make them do it. When people tell you "Well, gee, I could never be like that," it's not necessarily true. We had a woman that came in and told us that it was impossible for her to say what she wanted and to assert herself. She couldn't get people's attention. And she was an assertiveness trainer, too, which is interesting. She couldn't go to a regular therapist because it would ruin her reputation. So we told her to wait a second, we were going to go discuss it, and we went out in the living room and read magazines for about two and a half hours until she came flying angrily out of the office "If you don't get back in here, blah blah blah." If you are flexible enough in your behavior, you can elicit what you want right there on the spot. We made the assumption, the presupposition, that this woman knew how to get somebody's attention if a proper context were supplied. We supplied the proper context; she made the move. We just anchored it, and then transferred it to other contexts where she wanted it.

Transactional analysis actually constructs the supposed 'child' 'parent', etc and anchor it, then pretend it was always there...whether or not TA therapists aware of their own complicity and fraud!!! But TA can work for the same reasons the above NLP exercise can work i.e imagine what resources you need vividly, either from imagining an 'ideal self' or using someone else as the model / role model i.e some 'super assertive friend' or 'brave person' or 'confident person' they know...entering into it...becoming it...so now they have these resources themselves i.e anchored by the association / idea / kinesthetic touch on elbow / smell of a particular perfume, sound of a particular song...

With anchoring, you don't have to decide before you begin the session what the legitimate categories of human experience or communication are going to be. You can simply accept whatever comes up without understanding the meaning of any of it. I don't know what X and Y were for Linda, but I know that I can operate at the process level, without ever knowing the content, and assist her in changing. You don't have to decide beforehand how many parts you are going to allow that person to have. You don't have to demand that your clients be flexible enough to reorganize their experience into your categories. You simply accept whatever is offered, anchor it, and utilize it.
We don't always do anything. It's often useful to anchor the response a person doesn't want, and there are several ways to use it. You've all had the experience of beginning to work with a client on a particular problem—especially children, because children are so fluid in their consciousness—and suddenly you discover you are doing something else. The initial anchor that I established stabilized the thing we were going to work on, so we can always go back to it. If I had wanted to go back and find out where it came from in Linda's personal history, that anchor would have given me an excellent way to do it.

In *gestalt therapy* if a client is troubled by a feeling, the therapist will say "Intensify the feeling, stay with the feeling, exaggerate it! Go back through time... and what do you see now?" The therapist is stabilizing one part of the person's experience, namely the kinesthetic component, the feelings that person has. And they are saying "Keep those constant, and then let them lead you back in your own personal history to a full, all-system representation of what we are working on." By using an anchor you can always get back to the same set of kinesthetic responses that you began with, and thereby easily stabilize what you are working on. That's one use.

Another use that I demonstrated is testing. After we had done the integration work, after she had the resource and relived the experience with the resource so that she changed her personal history, I gave her a few moments, and then I reached over and triggered the original anchor. The response I got was an integrated response, thereby

96 informing me non-verbally that the process had worked. I recommend that you never let the client know you are checking your work that way. It gives you a covert, non-verbal way of checking to make sure that your integrations have worked before the person leaves your office. Given our historical development in humanistic psychology, most of you want verbal, explicit, conscious kinds of feedback. That is the least useful kind of feedback you can get from your client.

There is nothing that your client will do that you won't anchor. As long as you are going to anchor it, you might as well know what the anchor is. If the client comes in and says "I'm really depressed" and you just go "umhm," that's as adequate an anchor as touching them on the arm. And since you will be doing that, you might as well know which anchor is which. We recommend to people in the beginning that they practice using kinesthetic anchors for a period of a month. As they do that, they will discover that they are anchoring anyway, constantly, in all representational systems. Most of the time people use anchors in a way that slows down the process of change, because they don't know what they are anchoring or how they are anchoring.

"Negative" is a judgement about experience. It is not experience itself; it's a judgement specifically made by the person's conscious mind. The experience that
Linda had which was unpleasant now serves for her, as well as for everyone else in this room, as a foundation for your learning in the future if you use it that way. If you grew up for the first twenty years of your life without a single unpleasant experience, you would be dull and unable to cope with anything. It's important that you understand that all experiences can serve as a foundation for learning, and it's not that they are positive or negative, wanted or unwanted, good or bad.

Pick any experience that you believe happened to you, and I will guarantee you that on close examination it didn't. The original personal history that Linda relived, re-experienced today as she went through the experience, is as much a myth as the new experience she went through with the resource. The one we made up is as real as the one she "actually had." Neither one of them actually occurred. If you want a demonstration of this, wait two or three months, remember about having been here for three days and then look at that videotape that they are making now. You will discover there is very little relationship between it and your memories of "what happened here." Since your personal history is a myth anyway, use it as a resource instead of a set of limitations. One way to do that is with anchoring.

Those of you who have done TA "redesicion" work as a client: remember all those vivid scenes and experiences that you so well recollected from when you were two years and eight months old? Woman: Well, mine really happened. Nothing ever really happened. The only thing that happened is that you made a set of perceptions about events. The relationship between your experience and what actually occurred is tenuous at best. But they really are your perceptions. Doing a redesicion about an experience that never occurred is just as valuable as—perhaps more valuable than—doing a redesicion about one that did occur, especially if it's less painful, and especially if it opens more choices. I could very easily install memories in you that related to real world experiences that never occurred and could not be documented in any way—that were just bizarre hallucinations out of my fantasy. Made-up memories can change you just as well as the arbitrary perceptions that you made up at the time about "real world events."

You can go back and check up with your parents and convince them of things that never actually occurred. I tried that, and it worked. My mother now believes she did things to me when I was a child that never happened. And I know they never happened. But I convinced her of it. I told her I went to a therapy group and I made these changes which were really important to me, and it was all based on this experience when I was little. As I named the experience, she had to search through her history and find something that approximated it. And of course we had enough experience together that she could find something that was close enough that it fit that category.
If I sit here and say "Right now, as you sit there, you may not be fully aware of it, but soon you will become aware of a sensation in one of your hands." Now, if you don't, you are probably dead. You are bound to have some sensation in one of your hands, and since I called your attention to it, you'll have to become aware of any sensation. Most of the things that people do as therapies are so general that people can go through their history and find the appropriate experiences. You can do marvelous "psychic" reading that way. You take an object that belongs to someone and hold it in your hand. That allows you to see them really well with your peripheral vision. You speak in the first person so that they will identify directly and respond more, and say something like "Well, I'm a person who... who is having some kind of trouble that has to do with an inheritance." And then you watch the person whose object it is and that person goes "An inheritance!" Right? And then he goes "Ummmmmmmm" through all his memories, right? And somewhere in his life there was something that had to do with some inheritance and he goes "You're right! Uncle George! I remember now!" Peripheral vision is the source of most of the visual information I find useful. The periphery of your eye is physiologically built to detect movement far better than the foveal portion of your eye. It's just the way it's constructed. Right now I'm looking in your direction: if there were a trajectory, my eyes would be on you. That just happens to put everyone else in my peripheral vision, which is a situation that is effective for me. As I'm talking, I'm watching the people in the room with my peripheral vision to detect large responses, sudden movements, changes in breathing, etc.

For those of you who would like to learn to do this, there is a little exercise that is quite easy. If I were helping Jane here to learn to have confidence in her peripheral vision, the first thing I would have her do is to walk up to me and stand looking away from me at about a forty-five degree angle. Now without changing the focus of your eyes, Jane, either form a mental image of where you think my hands are, or put your hands in a position that closely corresponds. Now look to verify whether you are correct or not. And now look back over there again, and do it again. Once she can do this at forty-five degrees, then I'll move to ninety. You are already getting all the information you need in your peripheral vision. But nobody has ever told you to trust that information and use it as a basis for your responses. Essentially what you are doing with this exercise is teaching yourself to have confidence in the judgements that you're probably already making by getting information through your peripheral vision. This exercise is a stabilized situation. That's the most difficult. Movements are much easier to detect. If you can get position information, the movement stuff will be easy.
This is particularly important in conference work, or in family therapy. I don't pay attention to the person who is actively communicating verbally; I'll watch anyone else. Anyone else will give me more information than that person, because I'm interested in what responses s/he is eliciting from other members of the family or the conference. That gives me lots of choices, for instance, about knowing when they are about to be interrupted. I can either reinforce the interruption, make it myself, or interrupt the interrupter to allow the person to finish. Peripheral vision gives you much more information, and that's a basis for choices.

Your personal history serves as a foundation for all your capabilities and all your limitations. Since you only have one personal history, you have only one set of possibilities and one set of limitations. And we really believe that each of you deserves more than one personal history to draw upon. The more personal histories you have, the more choices you'll have available to you.

Erickson had a client whose mother had died when she was twelve years old, and who had been raised by a series of governesses. She wanted to get married and have children, but she knew herself well enough to know that she did not have the requisite background to respond to children in the ways that she wanted to be able to respond to them. Erickson hypnotized her and age-regressed her into her past and appeared periodically as the "February Man." The February Man appeared repeatedly throughout her personal history, and presented her with all the experiences that she needed. We simply extended this further. We decided that there was no need to just appear as the February Man, Why not March, April and May? We started creating entire personal histories for people, in which they would have experiences which would serve as the resources for the kinds of behaviors that they wanted to have. And then we extended it from weight problems to all kinds of other behaviors.

We did it once with a woman who had grown up being asthmatic. At this time, she had three or four children who wanted to have pets. She had gone to a very fine allergist who insisted that she wasn't allergic to animals as far as he could tell. If he tested her without telling her what the skin patches were, she didn't come out being allergic to animals. However, if you put an animal in her presence, or told her that one had been in the room recently, she had a very strong allergic reaction. So we simply gave her a childhood of growing up without being asthmatic. And an amazing thing happened: not only did she lose her allergic response to animals, but also to the things she had been found to be allergic to by the skin-patch testing.

We believe that all communication is hypnosis. That's the function of every conversation. Let's say I sit down for dinner with you and begin to communicate about some experience. If I tell you about some time when I
took a vacation, my intent is to induce in you the state of having some experience about that vacation. Whenever anyone communicates, they're trying to induce states in one another by using sound sequences called "words."

A training program in hypnosis is not for your clients. It's for you, because you will discover that somnambulistic trance is the rule rather than the exception in people's everyday "waking activity." You will also discover that most of the techniques in different types of psychotherapy are nothing more than hypnotic phenomena. When you look at an empty chair and start talking to your mother, that's a "deep trance phenomenon" called "positive auditory and visual hallucination." It's one of the deep trance phenomena that defines somnambulism. Amnesia is another pattern you see everywhere.... What were we talking about? I remember one time about two months after I entered the field and started studying it, I was sitting in a room full of adults in suits and ties. And a man there was having them talk to empty chairs. One of them said "I feel foolish" and I burst into laughter. They all looked at me as if I was crazy. They were talking to people who weren't there, and telling me that hypnosis is bad! One of the things that will help people to learn about being good therapists is to be able to look at what they do and listen to it and realize how absurd most of what is going on in therapy is. That doesn't mean it doesn't work, but it still is definitely the major theater of the absurd at this time. And when I say absurd, I want you to separate the notion of absurdity from the notion of usefulness, because they are two entirely different issues. Given the particular cultural/economic situation in the United States, therapy happens to be an activity which I think is quite useful.

BUT we don't ordinarily create new personal histories for people anymore. We have spent three hours doing it. And we have done it fifteen minutes a week for six weeks, and we trained somebody to do time distortion once, and did it in about four minutes. We programmed another person to do it each night as they dreamed. We literally installed, in a somnambulistic trance, a dream generator, that would generate the requisite personal history, and have her recall this in the waking state the next day, each day. As far as I know, she still has the ability to create daily a personal history for anything she wants. When we used to do change work with individuals, a session for us could last anywhere from thirty seconds to seven or eight hours. We have a different situation than you do. We are modelers. Our job is to test all the patterns we have, so that when we do a workshop, we can offer you patterns that we have already verified are effective with all the presenting problems that we guess you are going to have to cope with.

Woman: I have a patient who can't stand to be touched, because of a rape experience. How should I anchor her? You can anchor in any system. But I would recommend that you do touch her, because that's a statement about her
limitations. You can begin by accessing some really pleasant experience in her and anchoring that, and then expanding your anchor a little bit at a time until she can enjoy being touched. Otherwise she's going to respond like that for the rest of her life. If you respect her limitations, I think you are doing her a huge disservice. That's the very person that you want to be able to be touched without having to recall being raped. And of course your sequencing is important. You start with a positive frame. For example, you can start by talking with her, before therapy begins, about a vacation or something else pleasant, and when you get the response, anchor it. Or you can check to make sure that at least some time in her life she had a pleasant sexual experience, and anchor that. Man: Do you have to anchor as obviously as you have been demonstrating? We are being very obvious and exaggerated in our movements as we are anchoring here because we want you to observe the process and learn as the changes occur. If we had brought Linda up here and anchored her auditorily, with voice tonalities, you'd have no idea what we did. The more covert you are, the better off you will be in your private practice. You can be very covert in the way you touch. You can use tones of voice. You can use words like "parent," "child," and "adult," or postures, gestures, expressions. You can't not anchor, but most people aren't systematic.

Anchors are everywhere. Have you ever been in a classroom where there's a blackboard and somebody went up to the blackboard and went—(He pantomimes scraping his fingernails down the blackboard. Most people wince or groan.) What are you doing? You're crazy! There's no blackboard. How's that for an anchor?

We first noticed anchoring as we watched other people do therapy. The client comes in and says "Yeah, man, I've been just down in the dumps for seven years, and ..." The therapist leans over and puts his hand on the client's shoulder and says 'I'm going to put the full force of my skills behind the changes that we will work toward together in this session.' And then the therapist does some really good work. The client changes, and feels really good. Then the therapist says "That really pleases me" and as he does he leans forward and puts his hand on the client's shoulder again. Whammo, that anchor accesses the depression again. I've seen a therapist take away a phobia and give it back nine times in a single session, without having the faintest idea what she was doing. At the end of the session she said "Well, we'll have to work more on this next time."

Hide yourself where you can see your clients make the transition from the street to your office. What happens is a miracle. They are walking down the street, smiling, feeling good. As they enter the building, they start accessing all the garbage that they are going to talk about, because the building is an anchor. You can't not anchor. It's only a question of whether you do it in a useful way or not. We know an old Transylvanian therapist who solved the problem by having two
offices. He has one office in which you come in and you tell him all your troubles. And then he says nothing to you; he just stands up and takes you into the next room and does change work. And then pretty soon he just takes you into the other room and you change; you don't have to go through the personal history which has all the pain and suffering.

When couples have been together for a while they usually end up not touching each other much. Do you know how they do that? Let me show you. Come up here, Char. This is a good way to alienate your loved ones. You're in a really bad mood, really depressed. And I'm your loving husband, so I come up and I go "Hey, it's going to be all right," and put my arm around your shoulders. Then all I have to do is wait until you're in a good mood and really happy, and come up and say "Hey, you want to go out?" and put my arm around you again. Boom! Instead of touching each other when they are happy and making all kinds of great anchors, couples usually anchor each other into unpleasant states. All of you who have done work with couples or families know you can be sitting there and everything is going along nicely and suddenly one of them explodes. If you didn't happen to notice the little sound, or the movement, or the body sway away from the other person, it's baffling. What happened? Nobody knows. The anchors that people are responding to in "maladaptive behavior" are usually outside of their awareness.

Wait until one of those explosions happens, and detect what you think was the cue that initiated the explosion. Then adopt it in your behavior, and find out if you can get them to explode again. If you can get them to explode, you know you've identified exactly the key point in their interaction. Let's say it's a raised eyebrow. Then all you have to do is anchor a pleasant response kinesthetically, and then fire off that anchor and raise your eyebrow at the same time. In the future when someone raises their eyebrow, it won't have that effect any more.

MHR replace / displace negative outcome anchor / trigger with positive outcome anchors/triggers … take trigger and re-associate it … so now it is associated with positive and not negative … or for aversion therapy, associate it e.g cigarette, excess drinking / eating with negative association e.g meat, milk, eggs, tobacco, alcohol, with suffering…

You can also use anchoring in the context of an organization or a corporation. They are just like families, basically. If you know ahead of time that a group of people is going to get together and they've been meeting for years, they're going to disagree in patterned ways. One of the things you can do is to meet with each of them individually beforehand, and establish a covert non-verbal anchor to change the most salient irritating parts of their non-verbal communication. (MHR? Program them to associate OTHER people’s behaviors which currently trigger bad associations in them?) Some people have voice tones
that when you hear them you just feel bad and disagreeable, no matter what they say. Nobody could continue to talk that way if they had auditory feedback loops. If they could hear themselves, they would talk differently. I guess it's a protective device. Bullfrogs do that. A bullfrog makes such a huge sound, it would deafen itself if it heard itself, because its ear is so close to the source of that loud noise. The nerve impulses for the sound, and the nerve impulses from the muscles that make the sound, arrive at the brain 180 degrees out of phase and cancel each other. So the bullfrog never hears itself. And it seems like a lot of people I meet operate the same way.

MHR ‘Oh that the giftee give us, to see ourselves, as others see us!’

Another thing that often happens in a corporate situation is this: Somebody becomes so excited about a point they want to make that he begins to really push and gesture. Suddenly the person on the other side sees the pointing finger and the intense look on his face and that triggers an anchored response in them. Away they go. Their response is partially to this human being in this time and place, and a whole lot to other times and places—anchored by the excited face and the pointing finger. Human beings operate in what we call a "mixed state" most of the time. If I ask you to look around and find someone in this group who reminds you of someone else, I will guarantee that your responses to that person will be a mixture of responses to them here and now, and old responses to whoever it is they remind you of—unless you are very, very careful and clean in your responses to that person. You are all sensitive to that process; it's called a "contaminated" response in TA, and it's a common way that people respond.

Does it make any difference whether you touch the right or left side of the body when you anchor kinesthetically? There are fine distinctions—there's a lot of artistry. But for the purposes of doing therapy, you don't need to know about them. If you want to be a magician, it's a different game. If you want to create artificial credit cards that aren't there, and things like that, there are certain useful kinds of distinctions. But for the purpose of doing therapy, kinesthetic anchors are adequate, and either side of the body will be as good.

*Virginia Satir anchors tonally. She has a certain tone of voice she uses whenever she does change work. She talks in a regular tonality for six hours, and then suddenly she changes her tonality. When she uses that tonality, boom! that's it. The people change. Erickson has a special tonality he uses when he wants people to go into trance.*

A lot of people in trance have their eyes closed. What does Erickson do for anchoring at that point, since he's in a wheel chair and he can't reach around and do kinesthetics? Close your eyes for a moment. I'm going to talk, and as I talk I'm going to move my head back and forth. I want you to notice whether you can
detect the spatial dislocation of my voice, even from this distance. If you can, fine. If you can't, you detected it unconsciously I'll guarantee you, because that's one of the major anchoring systems that Erickson uses with people who have their eyes closed in trance.

All of those will work. The choice you make about what system you anchor in will determine the kind of response you get. If you want to involve the person's consciousness, anchor in all systems. If you want to be covert and go around a resistant conscious mind, anchor in any system that is not represented in consciousness. If the person's predicates and their eye movement patterns give you the information that they are primarily kinesthetic, don't anchor in that system unless you, want their conscious resources involved. If you anchor that same person tonally, they will have no conscious representation of it.

Begin with kinesthetic anchors. They seem to be the easiest to learn, and the most useful. You'll generalize naturally from those.

A, your job is to do the following: Face B, and place your right hand lightly on B's left knee. Then ask an accessing question: "Do you remember the last time that you had a really good sexual experience?" Wait for an appropriate response. You've got to be able to detect a response before you can anchor it. As you begin to see changes, you begin to apply pressure with your hand. You observe the changes in the parameters of muscle tone, skin color, breathing, lip size, etc. As you detect them, let those actually drive the pressure in your hand. When the changes level out, then you just lift your hand off. Then you will have a perfectly timed anchor. Don't anchor initially until you can see a difference in your partner's response.

Your ability to see a difference depends on how forceful you are in amplifying what you are getting. If you do things like this: (low, slow voice) "Have you ever been really excited?" or (high, quick voice) "Have you ever been really sad?" that won't work as well as if you congruently say excitedly "Look, have you ever been really excited?" The more expressively you access, the more expressively they will respond. Then you place your left hand on their right knee, and ask them "What in your experience is the opposite of that?" They will access whatever is the opposite, for them. As the changes occur, again you increase the pressure as you see the changes until they plateau, and then lift your hand off.

Then you have two anchors. What we want you to do is to use one, and notice the changes. Pause, and then use the other one, and notice the changes. It works even better if you distract your partner's consciousness with something neutral, like "Do you remember seeing the lights as we came into the building?" as you use that anchor. See if you can regularly get the same response when you use your anchors. When you are satisfied that you have two anchors that work, and you can see the difference between them, then we want you to hold both
at the same time, for about 30-60 seconds, and watch an amazing i i event, called "integration." Watch your partner's face. You will first see j I half of the face with one of those responses and the other half with the j other, and then they will integrate. Anchors are not buttons; you have to hold them until you see the full response. Once the integration begins, you don't have to hold any more. Now the client has the choice of either ‘representation’ i.e good and bad experience and associated sub-modalities, or a combination of the two. This is what NLP is about. Increasing / generating more choices / options to allow person to chose more optimal responses, rather than be limited to one, limiting, often negative / disempowering / unproductive / destructive / undesirable response (MHR anger management, assertiveness management, self control, addiction / bad habits etc).

Those were two antagonistic, dissociated feeling states in the past. When you anchor each one, you also anchor the antagonistic physiology, muscle patterns, breathing, etc. Then when you stimulate both at the same time, the physiological patterns which are antagonistic literally interrupt each other—you could see that in the person's face, in their breathing, and so on. In the process they become integrated so that the person can come up with any combination of those feelings which were previously dissociated, and respond appropriately in context. The presupposition behind our behavior in this area is that given a set of choices, a person will always make the best choice that they have available in the context. I think it's entirely appropriate for anyone to have the ability both to be fully sensual with another person as well as to be angry, and all the mixes in between. By integrating in this way, using anchoring as an integrative device to break down the dissociations, we make sure that you have a full range of response in that area.

The knee anchors and the integration is formally identical to gestalt two-chair work. Gestalt people use chairs as anchors and when you switch from one chair to the other, your feelings actually change. If you were on the outside as the therapist, you would actually see facial, postural and color changes as the person moved from one chair to the other. Those chairs are anchors. The problem is that it's hard to get integration. How do you push the chairs together? So you have to make people go back and forth really fast.

The "changing personal history" pattern...what response does your partner have now that s/he wants to change? Anchor that to stabilize the situation, and to give you access to it. Now, how would you like to behave, or what resource would you need, to behave in a way that's more congruent with your present resources? When you originally went through this experience, you didn't have all the resources you now have. Which resource would you take back to change your personal history? When have you had an experience of that resource? Anchor the response. Then put the two together. Hold both anchors as your partner goes back and relives the past with the new resource, changing and creating new old
history, until s/he is satisfied. Here your sensory experience is important. Check for congruency. Did you like the way it turned out? If not, do it again. What other resource do you need? Sometimes you have to give people a couple of resources. Or sometimes people think that all they needed is a certain resource and they take it and go back and it turns out to be a dud. The conscious mind has a limited understanding of what's needed back there. The only way you're going to find out is by having them go back to re-experience parts of their personal history. After they are satisfied that they have a new resource that worked back there, you need to bridge, or future-pace. What experiences in your present life are sufficiently similar to that old one to trigger the unwanted response? What is the first thing you see, hear, or feel that lets you identify this kind of situation? Then anchor the new resource to those contextual cues.

A person who has a phobia made a decision, unconsciously, under stress, sometime earlier in their life in the face of overwhelming stimuli. They succeeded in doing something that humans often have a hard time doing. They succeeded in one-trial learning. Every time that set of stimuli comes up again later in their life, they make exactly the same response. It's a remarkable achievement. You change over the years, and despite external contextual changes, you are still able to maintain that stimulus-response arc.

If a person says "I can't be assertive around my boss," they are essentially saying "Somewhere in my personal history I have an experience or a set of experiences of being assertive. I cannot get to that resource in the context of my boss." When a person responds with a phobic response to a snake, that's a similar situation. I know that at other times in their experience, in their personal history, they have been able to be quite calm and courageous. However, in the context of a snake, they can't get to that resource.

Freud set up a rule "You must go into history," so we've decided if you can understand how something developed historically, you can work with it. I think you only need to do that once or twice, though. Given that you understand, historically, how people are capable of creating phobias, you don't need a historical understanding of each and every phobia, as long as you understand that there are similar processes at work. All phobias are going to work in the same way.

**We don't need any content. In fact, we prefer not to have any. Keep the content to yourself. We don't need it. We operate with process.**

**You need to do something to throw them off balance** (MHR very typical ZEN action i.e. shock out of internal voice / reproduction of cycle / so here now and not off in some internal world i.e. attending to the here and now, not past or future etc like ‘whacking with a stick’) — anything to break up their patterns. E.g contort your body and have several different intense expressions pass across your.
face. Any weird non-verbal analogue is good, especially if you get clients who have been in therapy before. Because otherwise they will come in and tell you the same thing they told everyone else. They will come in and tell you a prerecorded message. We once heard a tape recording of a client with the therapist before us, and in the whole first session with us she said exactly the same thing: the same words in the same order. We were fascinated to find out how much she could reproduce. It was almost identical until we intervened in the process. I jumped up and started roaring about God. "God said 'You will change!'" The easiest way to do therapy is to enter the client's reality.

Secret therapy and code words vividly point out the illusion of understanding another person when they use words that do not refer to sensory-based descriptions i.e. get client to label the object/subject/situation with a code word, so no reference to actual content ever necessary. Avoids projection on part of therapist / you. i.e. assumption 'yes, I see / understand / grok you' when in fact do NOT and CAN not... e.g. they use code word 'Orange' to refer to the content of their phobia...limiting belief...But point is to use the non-verbal cues / body language / accessing cues / non-conscious – non-verbal sub-modality expressions of client...THAT is all the info you need...

Now, before we begin, let me ask you something, Tammy. Would you think of a situation in which you expressed yourself with what you regard as a fine representation of your full capabilities as an adult human being, as a mature woman. Sometime in the past few years—it may have been a stressful situation or maybe just a happy occasion—you behaved in a way that you found particularly satisfying. I want you to take your time and find such a situation, and let me know when you have it. Do you understand the request? (She nods.)

I hope you all noticed a distinct change in her face, in her breathing, etc. Those of you who were watching her could see that Tammy constructed a visual image. She searched visually and she went up and to her right. She is a normally organized right-hander, cerebrally. She didn't see the situation from inside of it. She saw herself in the situation. As such, her kinesthetic response was not as strong as it would be if she did the following. Would you make that image of yourself again, and when you see it clearly, I want you to step inside the image so that you are actually back in that situation that represents for you an example of your full capacity as a woman. When you can actually feel in your body again the feelings of competence and strength that you associate with that situation, just reach over with your left hand and hold my hand.... OK. I have no idea what her specific experience is. I do know, however, from the remarkable, dramatic change that Tammy just offered me non-verbally, that she succeeded in carrying out my instructions. And I agree with her. That looks really good. That fits my hallucinations about what competence, etc. is. Tammy, do you happen to know what the original experience was that this phobia is connected to?
Tammy: No, I don't. OK, that's typical. It's typical that the person only knows that in certain kinds of situations they have a very powerful kinesthetic response—in fact in your case I would describe it as an overwhelming response. That response is so overwhelming that in the past when you have been in these situations you literally exercise no choice. You have found it to restrict your behavior in the past, right? Tammy: Oh, yes—in my dream world, too. Most phobic people do not know what their original trauma was, and, indeed, it is not even necessary to know that. I'm going to do it as if (, it were necessary, but it's just part of the mythology. Tammy has succeeded for years in making the same response over and over and over again. She has demonstrated adequately that she knows how to do that. A phobia can be thought of as nothing more than a one-trial learning that was never updated. And it worked, by the way. I will often turn right to the person and say this: I want to reassure the part of you that has been making you phobic all these years that I respect what it has done, and I regard that as a valid response. You're here. You survived. If there hadn't been a part to make that effective response to keep you out of certain situations, you might not be here. My desire is not to take away the choice of being phobic but to update it so that you can also make other responses which are more congruent with your full resources as a fully grown woman. We're going to use that same capacity to do one-trial learning to help you learn to do something else.

In a moment I'm going to ask you to do some time-traveling. As you go back I want you to increase pressure here on my hand at any point that you need to be reminded of your competence as a fully grown, mature woman. This is your connection with the present time and all the powerful adult resources that you have as a fully grown person. Do you know what the feelings of the phobia are? Tammy: Uhm. (He touches her arm.) That's all you need to do to anchor the phobic response. Or you can ask a different question: What is the last time that you had an intense response like that? Tammy: Uhm. (He touches her arm again.) I got the same response that she gave a moment ago when I said "Do you know what the feelings of the phobia are?"—the same facial expression, the same breathing. That's now anchored on her arm. This anchor constitutes a stabilizing factor to help us go back and sort through her personal experience to find the original experience. It's not necessary to do it this way; this is one way to do phobias.

Your holding hands with me constitutes your connection to all the strength and resources you have as an adult woman. There were experiences in your past, namely those connected with this phobia, which we're going to go back and relive, but in a way that involves no discomfort at all, a way that involves total comfort. And I call to your mind the notion of dissociation that we talked about yesterday. We told you during the exercise you did yesterday afternoon to be sure you step inside the picture so that you recover the full kinesthetics. The opposite holds true here. For years Tammy has been exposed to certain kinds of real life
situations and responded with a lot of emotion, a lot of kinesthetic feelings over and over again. To have her go back and relive that experience again and have those feelings again will simply reinforce it. That's ridiculous. And most people's unconscious minds say "Bullshit! We aren't going back there; that hurts!" and they are called "resistant clients," right? Respect that resistance as a statement that says "Look, make some new arrangements so we don't have to go through the pain again."

At some point while you see those images which are connected intimately with these feelings of pinking, I'm going to say "What do you see now?" I would like you to stabilize the image at that point. Likely it will be an image of yourself at a younger age, dressed in some particular way, in some colors, in some context. I don't know what any of that will be and at the moment you don't either, because you don't know where this came from. As soon as I ask you to stop the image, I want you to form a snapshot and just hold it stable. I don't want you to run any movies yet, because we need to make one more arrangement to make you even more- comfortable before you run the movie.

Remember that you can modulate how much of these feelings (He touches the phobia anchor on her arm.) you are going to use to drift back until you see a clear focused visual image connected with these feelings, that represents where this original learning took place. That's right, you draw on all the strength you need here, as you drift back through time, even further, take your time ... even more. There's no rush. Be perfectly comfortable. Now look at that image. And simply nod your head when you clearly see an image of yourself at a younger age.... Tammy: I see myself at a younger age but I'm not in any situation. I'm just— That's fine. Can you see what color shoes you are wearing? Tammy: Black. OK. Now I want you slowly to look at the surface that's right under the shoes. From there let your eyes slowly notice what is around you as you stand there in those little black shoes. Remembering to breathe, remembering to use these feelings of strength and competence. You've demonstrated adequately that you know about those old feelings. Now I want you to demonstrate that you can have these feelings of strength as you watch that image. Remembering to breathe; oxygen is essential for this whole process. That's right. When you have the still image, just nod....

OK. Now, I would like you to hold that image constant, just a snapshot. Relax your right hand—not your left. Your left can be as tight as you need it to be in order to get access to these feelings of strength that you need. And you are breathing nicely now. Continue your breathing. Now, I would like you slowly to float up and out of your body so that you can actually see yourself sitting here holding hands with me, ridiculous as that may sound. Take all the time you need. And when you have succeeded in floating out of your body so that you can see yourself from above or the side or the front or the back, just nod that you have
succeeded. Excellent. Now, staying in that third position, I want you to look past yourself sitting here holding my hand and feeling the feelings of strength and adult resourcefulness. This time, with feelings of strength and comfort, I want you to watch and listen carefully to everything that happened to young Tammy way back there, so that you can make new understandings and learnings about what occurred, and therefore have new choices. You are to do this, watching from the third position, having the feelings of resourcefulness and strength connected with my hand here. Knowing that you did live through that and you won't have to again, let that younger part of you feel the old feelings over there as she goes through that old experience for the last time. When you've seen and heard it all, adequate for your making new understandings, simply nod your head and stay there. You can begin the movie now.... (She nods.) All right, now very slowly I want you to float down from the third position and step back in and reunite with your body, sitting here with feelings of resourcefulness and strength....

And now I want you to do something very powerful and important for yourself. Younger Tammy did something very powerful for you; she went through those feelings again for you, and she let you watch and listen with comfort and strength to stimuli which in the past have triggered overwhelming responses. This time you were able to see and hear those without pinking. I want you to walk over to young Tammy in your mind's eye. I want you to reach out and use all of the adult female resources you have, to comfort her and reassure her that she will never have to go through that again. Thank her for living through the old feelings for the last time for you. Explain to her that you can guarantee that she lived through it because you are from her future. And when you see on her face and in her posture and in her breathing that she is reassured that you will be there to take care of her from now on, I want you to really reach out, take her by the shoulders and pull her close and actually feel her enter your body. Pull her inside. She is a part of you, and she's a very energetic part. That energy is freed now from that phobic response. I would like your unconscious mind to select some particular pleasurable activity that some of that energy can now be used for, for yourself here in the present and in the future. Because energy is energy and you deserve it. Just sit there and relax and enjoy those feelings. Let them spread through your whole body. Take your time. You've got plenty going on inside.

Do you understand the anchors? First, she holds hands with me. This is a "bail-out" anchor, a resource anchor that will always get her out of trouble and says "Here, you're grounded right here." It's also a really exquisite biofeedback mechanism. By temperature and pressure and moisture changes in her hand, I get an incredible amount of information about her complex internal experience. An anchor here on her arm stabilizes the phobic feelings to use as a lead to go back and find some visual experience that will serve as a metaphor for her entire set of experiences called "the phobic response." Once she sees herself at an earlier age
over there, using the feelings to lead her back to something she had never known about consciously before, then I dissociate her a second step—I ask her to float up out of her body. You could see the changes in posture and color and breathing and so forth which indicated which position she was operating from. Once the two-step dissociation has been established, I have her watch and listen with comfort to the old experience. She saw and heard things today which have never been available to her before. Tammy: That's true. She was so overwhelmed in the past by the kinesthetic phobic response that she couldn't see and hear what was going on. (MHR content is displaced by the affect, so only the affect is ‘remembered’ and can be reconstructed?) Consciousness is limited. As she watches and listens to herself at a younger age, the competent feelings of comfort and resourcefulness are being associated with the auditory and visual stimuli from the past.

And when she's gone through the whole thing, then we reintegrate. Every model of therapy, every psychotheology, is built on dissociation and sorting to help people reorganize. Whether you call it "parentchild-adult," "topdog-underdog," using chairs or words doesn't matter as long as you label and sort a person's behavior, dissociating parts of them, one from the other. You have the responsibility as a professional communicator to put your clients back together before the session is over. One easy way to make sure the dissociations that you create are re-integrated before the end of the session is to simply reverse the process by which you create the dissociation.

What we're doing here is **structured regression**. If Primal Therapy really got complete regression, it would be doing exactly what Tammy has been doing with the phobic response up until today. Complete regression simply means that you relive the experience in all systems. If you do that, you reinforce it. Primal Therapy claims to get complete regression back to infancy. If that were true, then Primal Therapy would simply re-inforce the problem, rather than resolve it.

A partial, structured, regression of the type Tammy and I were working with here allows you the freedom to go back and connect new kinds of resources with the auditory and visual stimuli which in the past have elicited old, uncomfortable, kinesthetic responses. It's impossible for her to go through this experience and still maintain that old response because she's done one-trial learning again. Now she doesn't have to be phobic. I haven't taken that choice away. There may be some context in which being phobic in response to something may be useful. I'm not playing God. I presuppose that people make the best choice in context. My job is to make sure that resources which have been dissociated from a certain context become available in that context. I leave it to the unique human being, with all the various needs they have that I don't even know anything about, to make an adequate selection somewhere along the continuum between resourcefulness and terror. And she will. Those resources have been dissociated
in the past, but they are now integrated and they are now both responses to the same stimuli.

Let me give you a way of testing. (He turns to Tammy.) Let me ask you a question. (He touches the phobia anchor. She turns to him and smiles: "Ummh?") That's fine; you answered it. Does that make sense to you, sir? Do you remember that the last time I touched her • there she had a phobic response? I had anchored the phobic reaction there, and then I demonstrated that I had control of her phobia. When I reached over and touched her arm she became phobic. Now I reach over and touch her and what does she do? She looks at me as if to say "What do you want?" That is a far more elegant demonstration than any verbal feedback I could get. I'm not saying don't use verbal conscious feedback, but understand that when you ask for that, you are tapping into the least informative part of the person: their conscious mind. Let me give you another way of testing. Tammy, I'd like you to try something for me. This is just a scientific experiment. Are there any bridges here in town? I would like you to close your eyes and fantasize driving across a bridge, and I want you to do it in a special way. I want you to do it from the point of view of being in a car—not watching yourself—so that you see what you would see if you were actually driving across the bridge. What happens when you do that? ... Tammy: (She raises her eyebrows, looks slightly puzzled.) I drove across the bridge. "I drove across the bridge." What could be a more elegant response? If she had told me "I was so happy driving across the bridge," I'd say "What? Wait, it's just an ordinary bridge." Tammy: But always before when I drove across a bridge, I immediately began to program myself "What am I going to do when the car goes off the side?" And what did she say this time? "I just drove across the bridge." When you associate the strength and confidence with those auditory and visual stimuli, driving across a bridge becomesy'MSf another human activity, the same as the experience that the rest of you have had driving across bridges your whole life. This is also a way of testing our work to find out if it is adequately future-paced. We know what she looked like when she had a phobic response. If the same phobic response comes up, we know somehow the integration didn't happen. We'll find out what happened and re-do it. Her response was "Oh, driving across the bridge." Earlier, with Linda, we were talking about anchoring the new response to a cue from the environment. Here we're testing and we're bridging or future-pacing at the same time.

A friend of mine had a nine-year-old kid who was a lousy speller. I said "Look at this list often spelling words." The kid looked at it, and I said "Now close your eyes and tell me what they are—not how to spell them." He had some difficulty doing that; he didn't have well-developed visualization. However, I said "Remember the Wookie in Star Wars! Do you remember when the Wookie opened his mouth and showed his teeth like this?" And he went "Oh, yeah!" and then he was visualizing immediately. I had him print the words out in the Wookie's mouth. There's always some experience somewhere in a person's
personal history that has the requisite qualities you need. If you combine that experience with the task that you are trying to do—and especially with children, make a game out of it—there is no problem. "What do you think the Wookie would see if he were watching you go through that thing with your dad?" That's another way of getting the dissociation. Children are really fast. As an adult you are a lot slower than a child. You are less fluid in your states of consciousness. The primary tool that we offer people who work with children is to use anchoring as a way of stabilizing what you are trying to work on, to slow the kid down enough so that you can cope. Because kids are really fast. Woman: Why two steps of dissociation? You don't need it. That's just a guarantee; it's insurance that she doesn't collapse back into the old feelings. If we had only dissociated her one step, if she collapsed she would collapse right back into the old experience, and it would be very difficult to get her back out. By doing it in two steps, if she begins to collapse, she will collapse into the first step and it's easier to get back out. You can tell whether she is up above or back down here by the changes in posture and skin color and breathing, etc. Knowing that, if I see her collapse from two to one, I give a squeeze here, or I say "Now let her feel the old feelings over there. You watch from up here." Those are ways of insuring that she doesn't just re-experience the bad feelings.

You asked Tammy to take the feeling and find a picture of herself at a younger age. What if she can't find one? That's a statement about the therapist, not the client. It should be taken as a comment about what the therapist is doing, indicating that the therapist should change his behavior and do it differently. Let me answer your question in this way. I don't believe that Tammy actually had the experience that she watched herself go through. She may or may not have; I don't know. But it is irrelevant. Once a very well-known therapist was visiting with us, and we received an emergency referral, a suicidal woman. The psychiatrist had given up, saying "Here, would you please take this woman over? I'm out of choices." Since this famous therapist was staying with us, we thought it would be an unprecedented opportunity to demonstrate some of the uses of hypnosis Erickson had taught us. Because for that therapist, at that point in his evolution, hypnosis was a dirty word. He thought it was "manipulative." And we told him "There are ways in which Ericksonian hypnosis is far less manipulative than any insight, conscious-mind therapy we have ever run across. Let us demonstrate with this woman." So we began to work with this woman. The visiting therapist was sitting there watching and listening.; About ten minutes into the session, he got a revelation. It was obvious. I said "Do you have something you want us to do?" I had never had a chance to watch this therapist work live before. He took over and started going "Blood... stairway... childhood, younger brother... mother cries... screams." He developed this incredible fantasy, which he then essentially "sold" to this woman. At first the woman would go "Gee, I don't remember anything like that." Finally the woman went "Uuuuhhhh! That's it! I must have done it!" very much like a family reconstruction, if you've ever been through one
of those with Virginia Satir. Suddenly the woman made all these internal connections, and the visiting therapist did all this therapy about this past experience and the woman changed dramatically. Her behavior changed dramatically, and she stayed changed, too. She was a continuing client of ours. Now, when she came back in two weeks, we couldn't resist. We induced a somnambulistic trance, and established an anchor for amnesia so that we could erase anything we did during that session—because she was doing fine and we didn't want to interfere. We just wanted to check and find out what had happened. We asked her unconscious mind if in fact the experience described by the therapist during the session—or anything approximating it—had ever occurred. The answer was unequivocally "No." However, that is no different than what just happened here. If the experience that Tammy generated has all the elements of whatever the original experience or set of experiences was, it will serve as a metaphor which will be as effective as an actual, factual, historical representation. And from my sensory experience I can guarantee that it was effective. If a client cannot produce the desired mental image from a memory, e.g. of age regression to a particular incident, simply ask her to guess, make it up, lie, fantasize; it doesn't matter.

MHR false memories may be therapeutic, but should never be considered as 'real' i.e women confused into really 'remembering' being raped etc by own fathers in famous cases. Age regression is a very easy phenomenon. We said "Go back through time." She had very little conscious idea what we meant by that, but she responded quite easily to it. Man: What specifically were you seeing on her face? The same response that she originally demonstrated when we asked her about the feelings of the phobia. I watched her age regress until I saw a very intense example of it. There was a patch of yellow on her cheek. There was whiteness around the eyes and the side of the face. There was some kind of scrunching of her chin. There was an increase in moisture on her skin, especially on the bridge of her nose. When that became intensified, I said "Now look at an image, that image there." If you tell people to go back through time and they frown, that's also a cue. And you might try something tricky like saying "Well, go forward in time." "Go through time, jump back in time.""Go around time." Anything. It doesn't matter. The specific words you use are wholly irrelevant as long as you get the response you want. Another way to think about it is that everybody with a phobia knows the feelings of the phobia. They have a fragment of the experience, so they can get the rest by overlap. How do you find your car keys when you want to go to the store and you don't know where they are? Woman: I start feeling around through my pockets. Man: I go through the house and look. Man: I search my mind, going back to try to visualize where they are. Woman: I shake my purse so I can hear them. OK. If all else fails, you can go back to the front door and walk in again. Now, if you think about the responses we just got, those include the three main representational systems. If you have any fragment of any experience, you can have it all by overlap. She had the
feelings here. The feelings, once anchored, stabilized her state of consciousness. Everything that she accessed as she closed her eyes and went back in her personal history had that set of feelings in common, guaranteeing that whatever picture she selected would be in the class called phobic experiences.

I used the same principle to help her have a complete focused visual image of herself at a younger age. At first she had only a picture of herself, but no context. I ask her what color shoes she is wearing. I presuppose that she can see her feet and her shoes, and that she can see colors. She accepts the presupposition; she says "Black." Since she can see the shoes, then obviously, "logically," she can see what they are on top of, the surface she's standing on. I request that. When she gets the surface, it blends into walls and into trees, or whatever the rest of the image was. It's a very easy overlap, or intersection, technique that allows me to assist her in recovering the image by constructing portions of it, a little at a time.

What's the difference between this technique and systematic desensitization? This NLP process is straight conditioning. We have simply associated a new set of feelings, namely competence and strength, with the auditory and visual stimuli. We are picking a specific set of feelings and associating it, instead of just trying to wipe out the set that is there. The people that I've observed do desensitization are usually trying to eliminate a certain kind of behavior rather than replacing it with something which is a positive response. They are the kind of people who answer "Not bad" when you ask "How are you feeling?" We claim that every piece of behavior has a positive function. It's the best choice a person has in context. It was far better for Tammy to be phobic about bridges than it was to have no program at all. If you do systematic desensitization, and you don't replace the "negative" behavioral pattern with something positive, it takes a long time because the person will fight. It's their only defense. That's why it takes six months, because a person has to randomly put something else in its place. Man: There is a replacement, though, with relaxation. Sometimes it's done that way, but relaxation is not the resource that everyone is going to need in a phobic situation. If you're driving across a bridge, you don't want to become relaxed suddenly. If somebody is in a situation in which they need to cope and you give them feelings of relaxation, they may not cope! There may be real, genuine dangers in that situation, so one of two things will happen: either the symptom will come back later because it's protective, or the person will get hurt. We got a very strong anchor for confidence and for the resources that she has as an adult woman. We used that; we did not use relaxation. She was very alert during this process. Desensitization was an important step, in that people were able to cure phobias with it. I think that it just needs to be dressed up a little bit. Instead of using relaxation and associating it with everything, try associating other things besides relaxation. There are much more powerful resources in people.
What we've done as modelers is to figure out what the essential elements are, and what is unnecessary. Every therapy has dissociation. Every therapy has the kinds of sorting techniques we're using here, whether it's chairs or knee anchors or words. What is useful to have in every therapy is some way of doing all that: some way of sorting, some way of dissociating, some way of integrating. The names you use are wholly irrelevant, and most psychotheologies are also irrelevant. There's really nothing that different between what we did and what gestalt people do by taking people back through time. TA people do a process called "redecision." They are all very, very similar. We looked at all those different processes and tried to find out what the essential elements were, and what was extra and unnecessary. Then we streamlined it to try to find something that works systematically.

MHR Often clients do things unconsciously, that the therapy is given credit for, but which is not explicitly part of the therapy, and thus never consciously / explicitly taught / modelled, and so some patients who automatically 'add' the missing links unconsciously get results, and the others, who did the same therapy, don't, and the therapist has no idea why. The NLP modelling process discovered, by observation, what the 'extra' steps carried out by SOME therapists unconsciously, and by some patient's own unconscious, were, and described them explicitly, modelled them, so others could employ them consciously.

Some use meters and machines. I am a far more sophisticated biofeedback mechanism than any set of machines. I use really sophisticated sensory apparatus and internal responses as a way of amplifying or diminishing certain parts of the response that I am receiving. That's part of what makes one-trial learning possible in the kind of work we've been doing here with anchoring.

If a client is unable to use visual imagery? It is not essential that people visualize to be able to do the phobia process, because the same formal pattern can be done auditorily or kinesthetically. The pattern of this technique does not require visualization. We wanted to use all systems as a demonstration. We don't need to do it with all systems. You could also first take a little time to teach the person how to visualize, using overlap. Woman: Could you do this process without touching? Sure, you can use a tonal anchor or a visual anchor. You can do it without touching. However, I would recommend that you do it with touching. Kinesthetics is an irresistible anchoring system. When somebody is touched, they feel it. When you make a visual sign at someone, they may look away or close their eyes. Man: So the bail-out anchor could be a certain tone of voice? Yes. Tonal anchors in this society are the most powerful because most Americans do not hear consciously. The number of people in this country who hear is almost nil, slightly more than the number of card-carrying musicians.
In England it's considered important to make class distinctions. In order to make class distinctions, you have to be able to hear different accents and tonalities. So English people are more acute at hearing tonal changes. Anyone who is bilingual or polyglot, and who has learned a tonal language, will have a good sensitivity to those kinds of changes. Most people in the U.S. do not actually hear the sequence of words and the intonation pattern of what they, or other people, say. They are only aware of the pictures, feelings and internal dialogue that they have in response to what they hear. Very few people are able to repeat back, in the same intonation, what you say to them. We hear people literally. We do not add anything or subtract anything from what they say. That is a rare human experience, and for a long time we didn't realize that; we thought everybody heard words.

The real beginning of all this work started when we began taking people's words as a literal description of their experience, not just a metaphor. We started communicating back as if they were literally the way they had described themselves, and we found out that was the case. When someone says "When I focus on those ideas they feel right, but I tell myself it wouldn't work," that is a literal description of their internal experience.

It's easier to operate at the process level with strangers because their behavior is less apt to be an anchor for some behavior in you.

**Understanding fully is to be able to comprehend it in all representational systems**

You can use this process with any unpleasant response, to become familiar with the pattern. This, or the "change history" process will work for nearly any presenting problem that I know of. Anchoring will get you almost everything. When you're done, use bridging or future-pacing to be sure that the new response will be triggered by the context where it's needed.

Here's an exercise you can all do. Get comfortable and close your eyes. Take a couple of deep breaths and relax. Sometime within the last five years, each of you has had a very strong experience in which you learned something of great value for yourself as a human being. You may or may not have a conscious appreciation of exactly which episode in your life history this is. I would like you to allow that experience to come up into your consciousness. Sit there for a moment, with feelings of comfort and strength, knowing you're actually here, now. With those feelings of comfort and strength, let yourself see and hear again what it was that happened to you back there. There are additional things to be learned from that experience. I would like you to allow yourself the treat of seeing and hearing yourself go through that again so as to make new understandings and learnings which are embedded in that experience in your past history....
And when you've seen and heard something that you believe to be of value for yourself, I would like you to pick a specific situation that you know will occur within the next couple of weeks. Notice—again by watching and listening with feelings of strength and comfort—how you can apply that new learning and that new understanding to this new situation that is going to arise in the next couple of weeks. In so doing you are making elegant use of your own personal history, and you are transferring understandings and learnings from one part of your personal history, so as to increase your choices as a creative human being in the present. Take all the time you need, and when you finish, drift back and rejoin us....

Some of you may have a clear, solid, resonant understanding of what you've succeeded in doing; some of you may simply have a sense of well-being, a feeling of having done something without actually understanding in detail explicitly what it was that you were able to do by making use of a particularly powerful experience from your past in a new way.... Now I'd like you to begin to drift back slowly, understanding that if you've completed the process to the best of your conscious understanding, fine.... If you haven't yet finished, you've set into motion a process which can be completed comfortably outside of your awareness as you return your attention slowly here to this room.... Now, what did I actually say? I didn't say anything* Zero. There was no content to that verbalization. "To do something of importance for yourself... certain learnings... unconscious understanding from that specific experience in your past." None of those have any content. Those are pure process instructions. And if you have the sensory experience, you can see the process happening as you do it. That is where your timing is very important.

Let me give you a very different experience. I'd like you to close your eyes and visualize a rope... which is green. How many of you already had a different colored rope? If I give you instructions that have any content whatsoever, as I just did, I am very, very apt to violate your internal experience. I will no longer be pacing you adequately. A skill that all communicators need is the ability to give process instructions: instructions that have no content whatsoever. That's the sense in which I mentioned earlier that Ericksonian hypnosis is the least manipulative of all the forms of psychotherapy I've ever been exposed to. In any communication with content there's no way for you to not introduce your own beliefs and value systems by presupposition. However, if you restrict yourself to process work, to content-free verbalizations with your clients, you are guaranteeing that you are respecting their integrity. If you do secret therapy there's no way that you can interfere with their beliefs or value system because you don't know what they are. You don't have any idea what they are doing, and there's no need for you to, either.

Woman: Why do you have to integrate the negative anchor, instead of just ignoring it altogether? Lots of people go to hypnotists to stop smoking. The
hypnotist hypnotizes them and says "From this point on, cigarettes will taste terrible." And he wakes them up and sends them away, right? They don't smoke any more because it tastes terrible. However, that leaves them with a whole set of dissociated motor patterns. It's the same with alcoholics. Alcoholics Anonymous says "Once an alcoholic, always an alcoholic." That's a statement to me that their program fails to integrate motor programs which can still be triggered at a later date by the presence of alcohol. So all it takes is one drink and they have to continue—binge drinking—or one cigarette later on and boom! that person is a smoker again. Dissociated motor patterns can always be triggered unless you integrate them. If you dissociate and sort someone, make sure you put them back together. Don't leave those dissociated motor patterns lying around. That's one of your professional responsibilities. People have enough dissociations on their own already. They don't need more.

I have never personally met a multiple personality that wasn't made by a therapist. That doesn't mean they don't exist, it's just that I've never met one. My guess is that there might be a few out there somewhere, but I'll tell you there aren't as many as many as therapists keep creating and bringing to me. We became interested in multiple personalities years ago, and wrote to a man who had written a big paper about it. He invited us to come and meet one named Helen. She had about twenty personalities, but the cover name for everyone was Helen. And the fascinating thing was that all of her multiple personalities were more interesting than she was. Her therapist had a very elaborate model of her personalities. She had an organization part: a part that was very organized and did secretarial work and all kinds of stuff like that. So I said "Well, get that one for me." The therapist had this great non-verbal analogue: he stood up and shouted "JOYCE! COME OUT, JOYCE!" and he hit her on the forehead, Bwamm! and she went through all these changes. Brrnnngnnnhhhh! It was right out of the movies; it was really spooky. This guy does exorcisms on the helicopter pad at a Catholic college, and he's considered to be a respectable psychiatrist by people who think we are weird! In some ways he's very effective because he is so expressive, but I don't think he understands the full ramifications of what he is doing. He has anywhere from sixteen to twenty-two multiple personalities in his practice at any time, and he can't understand why the rest of the therapeutic community doesn't recognize the epidemic of multiple personalities that he has discovered! So the organization part of this woman came out, and I introduced myself. Then I said "Most of these parts have amnesia for what goes on in this person's life. Being the organization part, I figure you would have kept pretty good track of it all." "Oh, yes, of course I kept good track of it." I said "Well, how did you end up with so many personalities?" And she said to me "It's as if there were a whole bunch of different parts and there was a round peg that went through the middle. And when I met Dr. So-and-so, he took the peg and pulled it out." That is almost verbatim what she said to me, and this is a woman who does not have a high school education. She didn't think that this was bad, by the way. Her description
was that he pulled the peg out so that they all became more apparent as separate personalities, and now they were going to go back through and make them all into one again. The tragic thing is that when he succeeded in integrating her, she had total amnesia for her entire life, and was a drip as far as I could tell. She had these great parts. She had a sexy part that was just rrrrrrrnhhhhl Another part told jokes and was really corny. Another part was very shy and coy. But when he "cured" her, she had amnesia for her entire life and she had none of the resources of any of those parts. She was just dull.

You can use what we call the "visual squash" with multiple personalities. The visual squash is a visual method of integration using visual anchors. You hold out your hands and see yourself as one part here on your left, and as another part here on your right, and you watch them and listen to them. Then you slowly pull the two images together, and visually watch them merge together and then notice how that image is different. If you like it, then you do the same thing again kinesthetically, and squash the two images together with your hands. Then you pull the integrated image into your body. We just stumbled across this. At first it sounded kind of weird, until we studied a little bit about neurology. It's a good metaphor for what goes on in the metaphor called "neurology." And if you don't think neurology is a metaphor, you are naive, I want to tell you! But anyway, their metaphor and our metaphor were very similar. And if you try it, it's very dramatic. It's a very powerful method. I once cured a multiple personality with only that. I went through all the levels one by one and squashed all the personalities together. I went through the instructions on the phone with him for forty minutes and cured his patient over the telephone. "OK, now tell her to hold out both hands. Tell her to visualize Jane in her right hand and visualize Mary in her left hand. Just take two of them and collapse them together into one image. And then tell her to pull it into her body and integrate it. Then tell her to get the integrated image that she just had, and put it together with another one." So you do them one at a time.

One of the women that I worked with described every single one of her parts as part of the same process. She was really, really visual; she had a picture of them all. There was a couch backstage, in the back of her mind, and all these women sat back there on the couch doing their nails and chatting. Every once in a while, one of them would hop up and walk through the curtains. When k walked through, it would step into her body. Some of them knew about what the other ones did, because they would go and peek out through the curtains. I hypnotized her and went backstage with her and did the visual squash technique and put them all together. That visual squash method is a very powerful way of integrating sequential incongruities by making them simultaneous in a dissociated state. If you have a sequential incongruity, you can never represent both parts simultaneously in any system other than the visual, as far as I can tell. It takes a very complex auditory representation to have two voices going on at the
same time—as opposed to alternating—and people can't pull it off kinesthetically. But you can take sequential incongruities and make them simultaneous by visual/kinesthetic dissociation, and then integrate them by pulling the hands together, and then get the integration in the other two systems. I don't understand the significance of moving the arms when you do the visual squash, but if you do it without the arms it doesn't work. And I have no idea why. I've tried it both ways: **if people don't actually hold out their hands in front of them like this and pull the images together, it doesn't work**. People don't have to hold out their hands to get cured of phobias, but apparently with multiple personalities they have to. That doesn't make any sense to me logically, but it happens to be the case. If I were to make a generalization, I would make the reverse one. But I have found out that's the case in experience.

We are a lot more willing to experiment against our intuitions than most people. When most people have a strong intuition, they'll follow it. A lot of times when we have a strong intuition, we'll violate it to find out what will happen—especially when we have clients that we have ongoing contact with, and can be sure of being able to deal with the consequences. That kind of experimentation has resulted in many useful patterns and discoveries.

One woman had been a homosexual for years, and had fallen in love with a man. She was really stuck in this dilemma. A very strong part of her now wanted to become heterosexual. There was another part of her that was afraid it was going to have to die. She was going through the visual squash with these two parts. She was trying to pull her hands together, and she was wailing "I can't do it! I can't do it! I can't do it like that!" Richard and I were standing on either side of her. We looked at each other, and then we each grabbed one hand and pushed them together suddenly. The changes that occurred in that woman were fantastic! We just went blammo, pow! and rammed it in. She did change; she got what she wanted, and it's lasted a long time; I'm sure of that because I still know that woman. However, I don't know what the side effects were. She isn't totally wonderful in many areas of her life, and I don't know how much of that is a consequence of what we did. She's certainly better off than she was. And at the time we really wanted to know what would happen.

When you start including more sophisticated ingredients in your work and tinkering with them carefully, then you get better, more elegant changes. You can also predict what will happen much more precisely. Sometimes you get much more pervasive change, too, which I think is very important. If you can do just one little tiny thing and get the outcome that you want, it will also generalize and get all the other outcomes that are really needed but haven't been mentioned. The less you do in the more appropriate place, the more generalization to other contents and contexts will occur naturally. That's one reason why we stress elegance so much: "Be precise, if you're doing therapy."
If you are doing sales training, then all you need to know is what strategies you want your salespeople to have, and how to install them. If the trainer for an organization is a Neuro Linguistic Programmer, then he says "OK, we're going to have this person be a salesperson and they're going to do this, and in order to do that, you have to have these three strategies." Then he can stick them in and block them off so that nothing else gets in their way. Those strategies don't have to generalize anywhere else in the person's life. It's not necessary for that business outcome. It might be desirable, but it's not necessary. If somebody's personal life is really interrupting their business functioning, you can put a barrier around it to keep those strategies separate. There are a lot of different kinds of outcomes you're going to have as a business person, but they're fairly limited. As a lawyer, for example, you're mostly just utilizing strategies; you're not concerned with installing anything. You're only concerned with using a strategy to get a specific outcome: to make a witness look like a jerk, or to get your client to trust you, or something like that. I once did some work with a lawyer who is a trustworthy person, but nobody trusts him. His non-verbal analogues are terrible; they make everyone suspicious. His problem was that he couldn't get clients to confide in him so that he could represent them well. And half the time he was court-appointed, which made it even worse. What he really needed was a complete overhaul in his analogue system. Rather than do that, I taught him a little ritual. He sits down with his client and says "Look, if I'm going to be your lawyer, it's essential that you trust me. And so the question that's really important is how do you decide if you trust somebody?" He asks "Have you ever really trusted anybody in your life?" and he sets up an anchor when the client accesses that feeling of trust. Then he asks "How did you make that decision?" Then all he has to do is to listen to a general description of their strategy: "Well, I saw this, and I heard him say this, and I felt this." Then he presents information back in that format: "Well, as I sit here, I want you to see blah blah blah, and then I say to yourself blahdeblah blah, and I don't know if you can feel this," and fires off the anchor that he made when the person had the trusting feelings. I taught him that ritual and it was good enough. A lawyer must be a master of the art of utilization. You need to be able to do many different things in terms of eliciting responses. You have to get twelve people to respond the same way. Think about that. Imagine that you had twelve clients, and you had to get them all to agree when you weren't in the room! That's going to take skill. One thing you can do is to identify the one or two individuals, or several, on the jury who might, by virtue of their own strategies, persuade the others to go along. And of course that is what family therapy is all about.

If you're working with an individual, you can do a thousand things and get away with it, unless they go home to a family. One of the first things I always ask people when they come in is "What is your living situation?" because I want to know how many anchors I have to deal with at home. If they live with one other
person, it's not so bad. You've just got to be careful that there's no secondary gain: that they don't get rewarded for whatever behavior it is they want to change.

One of the things we strive for in our work is to make sure that **we use transference and counter-transference powerfully to get rapport, and then to make sure that we don't use it after that.** We don't need it after that. And since they don't get to sit there and tell us their problems, we don't become their best companion. There are real risks in doing content therapy because you may become someone's closest friend. Then they end up paying money to hang out with you because no one else is willing to sit around and listen to them drivel about unpleasant things in their life. We don't get much of the dependency associated with traditional content-oriented therapy. That's one of the advantages of **secret therapy.** It doesn't create that kind of dependency relationship. For one thing, we have a tool that we teach our clients to use with themselves, called **reframing.** People who work with us usually have a sense of trust; they know that we know what we are doing. Or they may be totally infuriated with us, but they are still getting the changes they want. And of course we work very quickly, and that reduces the possibility of dependency.

In our actual private practice, we tell stories. A person will come in and I don't want them to tell me anything. I just tell them stories. The use of metaphor is a whole set of advanced patterns which is associated with what we've done so far. You can learn about those in **David Gordon's excellent book Therapeutic Metaphors.** I prefer metaphor artistically. I don't have to listen to client's woes, and I get to tell very entertaining stories. Clients are usually bewildered or infuriated by paying me money to listen to stories. But the changes they want occur anyway—no thanks to me, of course, which is fine. That's another way to make sure there is no dependency. You do things so covertly that they don't have the faintest idea what you are doing, and the changes they want occur anyway.

**Milton Erickson** told you stories, and six months, eight months, or a year later you were going through changes that were somehow associated with those stories that he was telling. Milton uses boredom as one of his major weapons. If Milton were here, one thing he might do is bore you to tears. So you'd all drift off into daydreams and then he has you.

Completely overwhelming your conscious resources is a deliberate move on our part, understanding as we do that most learning and change takes place at the unconscious level. We have appealed explicitly to each of both of you, that your unconscious minds would make a useful representation necessary for your education, so that in the weeks and days and months ahead you can be delightfully surprised by new patterns occurring in your behavior. We suggest to your unconscious mind that you make use of the natural processes of sleep and dreaming, to review any experiences that have occurred during these two days,
and sort out those things that your unconscious believes will be useful for you to know, making a useful representation at the unconscious level, meanwhile allowing you to sleep deeply and soundly, so that in the days and weeks and months to come, you can discover yourself doing things that you didn't know you learned about here, so as to constantly increase, at the unconscious level, your repertoire in responding to people who come to you for assistance.... And you didn't even know they were there. Not at all.

Milton said to me "You don't consider yourself a therapist, but you are a therapist." And I said "Well, not really." He said "Well, let's pretend ... that you're a therapist who works with people. The most important thing ... when you're pretending this ... is to understand... that you are really not.... You are just pretending.... And if you pretend really well, the people that you work with will pretend to make changes. And they will forget that they are pretending... for the rest of their lives. But don't you be fooled by it." And then he looked at me and he said: "Goodbye."

There are several organizing assumptions that we use to put ourselves in a state which we find useful to operate in as we do therapeutic kinds of work. One is that it's better to have choice than no choice, and another is the notion of unconscious choice. Another is that people already have the resources they need in order to change, if they can be helped to have the appropriate resources in the appropriate context. A fourth one is that each and every single piece of behavior has a positive function in some context. It would be wanton and irresponsible of us simply to change people's behavior without taking into account a very important notion called "secondary gain." We assume that the pattern of behavior somebody is displaying is the most appropriate response they have in the context—no matter how bizarre or inappropriate it seems to be.

The context that your clients are responding to is usually composed of about nine parts of internal experience and about one part of external. So when a piece of behavior looks or sounds bizarre or inappropriate to you, that's a good signal that a large portion of the context that the person is responding to is something that is not available to you in your immediate sensory experience. They are responding to someone or something else internally represented: mother, father, historical events, etc. And often that internal representation is out of consciousness.

Reframing is a specific way of contacting the portion or part—for lack of a better word—of the person that is causing a certain behavior to occur, or that is preventing a certain other behavior from occurring. We do this so that we can find out what the secondary gain of the behavior is, and take care of that as an integral part of the process of inducing a change in that area of behavior. E.g. avoidance of something, fear of becoming successful/attractive/independent i.e. responsibilities attached etc...etc if become slender, attractive, will find it hard to
resist sleeping around, and ruining marriage etc…Reframing seeks to identify the intended function e.g protect marriage, and then find better ways to do this, so can e.g lose weight keep putting back on to prevent ruining marriage…so now can give up that symptom, having replaced the solution it was, with a better solution…

Let's demonstrate now. Who wants to change?—secretly.... OK, Dick, we want you to keep any content to yourself, leaving the people here free simply to observe the process that we go through. Either Dick is doing something now which he doesn't have a choice about, a sort of compulsive behavior which he would rather replace with something else, or there is something he would rather do but he isn't able to do. Those are the two verbal ways of coding the world of possibility. Dick: It's the first. OK. If it's all right with you, let's give the code name X to the pattern of behavior you presently have which you would rather replace with something else more appropriate. And I assume that pattern X, in your conscious judgement, is not a good representation of you as a total adult organism. We've just identified the pattern, the thing the person wants to change. That is step one. The next step is to establish communication with the part of Dick responsible for this pattern X that he wants to change. Embedded in this context is a notion that I will state directly to him and that I want to point out to the rest of you as well. Dick, I have respect for the part of you that is responsible for running X occurring over and over again in your behavior. You got here. You're sitting here and you are successful in doing a lot of the things that you do in your life. I am convinced that the part of you that runs pattern X—even though you consciously don't appreciate it—is attempting to do something positive in your behalf. I will induce no changes until the part of you that is responsible for running X is satisfied that the changes are more appropriate for it, as well as for you as a total organism. This only makes sense if you have a belief system that says "Look. If he had conscious control over this behavior, it would have changed already." So some part of him which is not conscious is running this pattern of behavior.

I can guarantee you that ninety-nine times out of a hundred when a person wants to make a change and they come to you for assistance, there's going to be a dissociation, a conflict, between their conscious desires and some unconscious set of programs. The unconscious is far more powerful. It knows far more about his needs than his conscious mind, and far more than I could ever possibly know from the outside. I ally myself immediately with the unconscious, and that's what I just finished doing. That's one way to accomplish that, verbally and explicitly: "Look, I'm not talking to your conscious mind. I'm talking to the part of you responsible for this pattern of behavior. It's going to run the show. I'm going to serve as its consultant."
Typically the conscious mind is the one that knows the least about what’s going on in their behavior. The fact that a person would come into my office and say to me "I'm X-ing and I no longer want to do that; help me make a change," is a statement to me that he's already tried to make the change with all the resources that he can get to consciously and he's failed miserably.

I want to go directly to the part of Dick which is controlling his behavior at the unconscious level in this context.

I also make the assumption that the part of you that makes you X—even though you don't like that consciously—is doing something on your behalf, something that benefits you in some way. I don't know what that is, and from your response you consciously don't know what it is, because you want to stop it. So let's establish contact with that part officially. This is step two. It's already happened, but let's do it officially. Dick, do you know how to use words to talk to yourself on the inside? OK. What I'd like you to do is to go inside in a moment and ask a question. I'll tell you what the question is. Your job, after you've asked this question, is simply to attend to any changes you sense in your body sensations, any kinesthetic changes, any images, or any sounds that occur in response to the question. You don't have to try to influence this in any way. The part of you responsible for this pattern will make its needs known through one of those sensory channels. You just have to be sensitive to detect the response.

The question I would like you to ask is "Will the part of me responsible for pattern X communicate with me in consciousness?" And then simply notice what happens—any change of feelings, images, or sounds. Your job out there, while Dick is doing this, is to observe him and always get the answer to the question I have him ask before he gives it to us. And you already have it. That's really typical. We talked the other day about meta-commenting as a choice in communication. This is one context in which I strongly recommend that you do not metacomment, unless you simply want to shake somebody up. If you can always get the answer before your client does, you have a really powerful direct channel of communication to their unconscious, outside of their awareness, that allows you to do really powerful congruency checks. If the answer that you observe is different from the answer they get in their awareness, that's an important thing to know. Dick, what was your experience after you asked the question? Dick: Confusion. OK. "Confusion" is a nominalization. It's not experience; it's a conscious judgement about experience. It's irrelevant to talk about his conscious judgements because he's already done the best he can with his conscious resources, and it hasn't worked. We need to work with experience.

What was your experience that you labeled "confusion"? How did you know you were confused? Dick: Flushing. So you felt a flushing, a change in blood pressure. Was there a temperature change that went along with it, or a sense of pressure? Was it localized in some part of your body? Dick: Some of both,
mostly in my stomach. In your stomach. OK, now that's a really elegant non-verbal response. In doing reframing we strongly recommend that you stay with primary representational systems: feelings, pictures, or sounds. Don't bother with words, because they are too subject to conscious interference. The beauty of a non-verbal kinesthetic signal such as this, is that it's considered involuntary. And you can test to be sure that it's involuntary. Dick, can you make that feeling of flushing happen consciously? No. That's also a really good way to subjectively convince someone that they are communicating with a part of them that normally is not available to them at the conscious level. And of course most hypnosis and biofeedback is based on the principle that you can alter consciousness and gain access to parts of your nervous system and physiology which you normally don't have access to. The question was a "yes-no" question; the response was a kinesthetic change, a feeling change. Now, so far all we have is a response; we don't know whether it means "yes" or "no" and neither does Dick, consciously. One of the ways people really get into trouble is that they play psychiatrist with their own parts without being qualified. They interpret the messages they get from their own parts. So they begin to feel something and they name it "fear," when it may be some form of excitement, or some kind of aliveness, or anything. By naming it and then acting as if that is the case, they misinterpret their own internal communication as easily as they misinterpret communication externally. We don't want to run that risk, and there's an easy way to be sure what that signal means. Dick, first I'd like you to go inside and thank the part for the communication it gave you, so that you validate that part for communicating with you. Next, say to it "I would like very much to understand your communication. So that I don't misunderstand what you mean, if you are saying 'Yes, you are willing to communicate with me in consciousness,' please intensify the same signal that you gave me before—the flushing in the stomach. If you are saying 'No*, you're not willing to communicate with me in consciousness,' reverse it and diminish the response." As Dick does this and you are watching to get the answer before he gives it to us, realize that if the signal had been a picture we would have simply varied the amplitude of the signal. We could make it brighter for "yes" and darker for "no." If it had been a sound we could have asked for an increase in volume for "yes" and a decrease for "no." In this way you avoid the risk of consciously misinterpreting the meaning of various internal kinesthetic, visual, or auditory signals. It gives you a very clean channel of communication with the part of Dick that is responsible for the pattern of behavior he wants to change. And of course that's just the part that knows how to make the change. This process gives you an excellent opportunity to practice seeing what are traditionally called hypnotic responses. One of Milton Erickson's more useful definitions of deep trance is "a limited focus of attention inward." That's exactly what we asked Dick to do here—to limit his focus of attention to a signal which is internally generated. And the corresponding changes in the texture of his skin, breathing, skin color, lip size, etc., are all characteristic of what official hypnotists call trance phenomena.
Dick, rejoin us back here. What happened? Dick: I had the feelings. So the feelings intensified. You got a verification. We now have communication with the part; we have a "yes-no" signal. We can now ask that particular part any question and get an unambiguous "yes-no" answer. We have an internal channel of communication that Dick is running himself. We're not doing it. We're simply consulting with him about the next step. He now has established an internal channel of communication which allows him to communicate unambiguously with the part of him responsible for the pattern he wants to change. That's all you need. You can do anything at this point. Step three is to distinguish between pattern X and the intention of the part that is responsible for the pattern. Dick, this part of you which is responding to you at the unconscious level has a certain intention it's trying to carry out for you. The way it's going about it is not acceptable to you at the conscious level. Now we're going to work with that part, through your channel of communication, to offer it better ways to accomplish what it's trying to do. When it has better ways than the way it goes about it now, you can have what you want consciously and this part can continue to take care of you in the way it wants to. I want you to go inside again and ask a question. After the question, be sensitive to the signal system you have. Go inside and ask that part "Would you be willing to let me know in consciousness what you are trying to do for me by this pattern X?" Then you wait for a "yes-no" signal....

(Dick smiles broadly.) I just said to ask "yes-no"; I didn't say "Give me the information." If you were attending, you noticed that something fairly dramatic happened. He asked for a "yes-no" answer. He got the "yes-no" signal and he also got information about the intention in consciousness. Dick: Which pleased me. Which pleased him and surprised him. Therapy is over at this point. There is now a conscious appreciation of what this part—that has been running pattern X—has been trying to do for him at the unconscious 144 level. Dick, you didn't know what it was trying to do before, did you? Dick: No, but I got a clue to it while you were talking, before I went down in. I got a feeling that it—Part of our problem doing demonstrations is that after two days with you we have such good rapport with your unconscious there's a tendency for you to do it too fast. So now he has a conscious understanding of the intention of this part of him that has been running X. Dick, is it true that you would like a part of you to have the responsibility of taking care of you in that way, even though the specific method it uses is not acceptable to you? You may not like the way that it goes about accomplishing pattern X, but do you agree that the intention is something you want to have a part do for you as a person? Dick: Yes. Now there is congruency between the intention of the unconscious part and the appreciation of the conscious. That means it's time for step number four: to create some new alternatives to the pattern X that are more successful in accomplishing the intention, and that still allow consciousness to have exactly what it wants. What we're going to do is hold the intention—the outcome—constant, and vary the ways of achieving that outcome until we find some better ways of achieving it,
ways that do not come into conflict with other parts of Dick. Dick, do you have a part of yourself that you consider your creative part? Dick: Humpf! The creative part hops out! "Hi! Here I am. What do you want?" I hope you all appreciate the sense in which I said before that multiple personality is an evolutionary step. So you do have a part of yourself that you consider your creative part. Dick: Oh, yes. I want you to go inside and ask your creative part if it would be willing to undertake the following task. Let me explain it first before you do it. Ask it to go at the unconscious level to the part that runs pattern X, and find out what that part is trying to do for you. Then have it begin to create alternative ways by which this part of you can accomplish this intention. It will create 10,20, or 1000 ways to get that outcome, and it's to be quite irresponsible in this. It simply is to generate a lot of possible ways for you to get the outcome, without trying to evaluate which ones would really work. Now, out of that multitude of things that it will offer, the part of you that's running pattern X will evaluate which of those ways it believes are more effective than pattern X in getting what it's been trying to get for you. It is to select at least three ways that it believes will work at least as effectively as, and hopefully more effectively than, the pattern of behavior it's been using up to now to accomplish that intention. Does that make sense to you? Dick: I think so. OK. Go inside and ask your creative part if it would be willing to do that. When it says "yes," tell it to go ahead. And the way I would like the part of you to notify you that it has accepted each one of the new choices is by giving you that feeling, that "yes" signal. You may or may not be conscious of what the new alternatives are. That's irrelevant for our purposes here. Dick: It sounds like a big assignment. Yes, it is, but thousands of people have done it all over the world. It's humanly possible and you are a human. You have to go inside and explain it to your creative part and to the other part, and if they both agree, tell them to go ahead. What you're going to do now is to use your own creative resources to begin to reorganize your behavior.... (long pause) Did you get your three signals, Dick? (No.) How many have you gotten? (None.) None, you've gotten none. Would you go inside and ask that same part—again "yes" or "no"—if it has been presented with choices by your creative part. Ask if your creative part has been presenting it choices.... (He nods.) OK. Then it has been receiving? Dick: Apparently.

So checking at the creative level, we find creativity is generating lots of possibilities. OK, would you go inside and ask if any of those choices that were presented were acceptable choices? Were any of them more effective than pattern X to accomplish what it wants? Some of you like to offer advice to your clients. Any time you offer advice, that's going to be less effective than if you can throw them back, with appropriate explicit instructions, on their own resources to develop their own alternative ways. You are a unique human being and so are your clients. And there may or may not be overlap, as you found the first day during that afternoon exercise when we asked you to hallucinate. Some of you could guess the content of your partner's experiences in a way that was almost
unbelievable. With other people, it doesn't work at all. If you have that incredible overlap, then you can

146 offer useful advice. There's nothing wrong with it, as long as you are sensitive to the response you are getting as you offer it. But even then it will be more effective to throw a person back on their own resources. (Dick shakes his head.) OK. You got a "no" signal. None of the new choices are acceptable. The creative part generated a lot of possible ways, none of which were as effective as the present pattern. Now, would you ask that part that runs pattern X if it would go to your creative part and become an advisor to your creative part so that it can come up with better choices about how to accomplish that intention? Ask it to explain what, specifically, about the choices the creative part has been presenting prevents them from being more effective ways of accomplishing the intention. Do you understand that instruction consciously, Dick? OK, would you go inside and explain it to that part and then ask it—"yes" or "no"—if it would be willing to do that? And if it says "yes," tell it to go ahead. This particular process differs significantly from normal therapeutic and hypnotic techniques. We simply serve as consultants for the person's conscious mind. He does all the work himself. He is his own therapist; he is his own hypnotist at the moment. We're not doing any of those things. We communicate directly only with his consciousness and instruct it how to proceed. It's his responsibility to establish and maintain effective communication with the unconscious portions of him that he needs to access in order to change. Of course, once he learns to do that—using this as an example—he can do it without us. That's another advantage. This process has autonomy for your client built into it. Dick, did you get three signals? Dick: I'm not sure. OK, would you go inside and ask that part if it now has at least three choices—whether or not you are conscious of what they are is irrelevant—which it finds more powerful than the old pattern X in accomplishing what it's trying to do. Again, use the same signal. It's important to continually refer back to the same signal, and it's important to get three new choices. If you have at least three choices, you begin to exercise variability in your behavior. Dick: That was "yes." OK, so now he got a positive; it said "Yes, I have at least three ways more effective than the old pattern X," even though he consciously doesn't know what those are.

Step five is to make sure those new choices actually occur in his behavior. Using the same signal system, Dick, we would like you to ask this part "Since you have three ways more effective than the old pattern X, would you take responsibility for actually making those things occur in my behavior in the appropriate context?" And you know that the "yes" is the intensification, and the "no" is the diminishment. Is that true?

Dick: I'm not sure that it is. OK. Ask for that part to give you a "yes" signal before you begin, so that you know which is "yes" and which is "no." If you get
them backwards, it's going to mess things up a little bit. Dick: Yeah, I ... I... I lost track. Yes. I know. That's why I'm asking you to do this. Just go inside and ask the part to give you a "yes" signal, so that you know which one is "yes." Dick: The "yes" signal is relaxing. OK, fine. Let's back up a bit. Go back inside and ask the part if it agrees that these choices will work more effectively than X. Dick: That was "yes." Fine. Now ask that part if it would be willing to accept the responsibility for generating the three new choices—instead of pattern X—for a period of, say, six weeks to try them out. Dick: "Yes."

Step six, in my opinion, is what makes this model for change really elegant. The ecological check is our explicit recognition that Dick here, and each one of us, is a really complex and balanced organism. For us to simply make a change in pattern X and not take into account all the repercussions in other parts of his experience and behavior would be foolhardy. This is a way of building in a protection against that. We would like you to thank this part for all the work it has done. It's got what it needs; it's already satisfied with that. Now we want to find out if any other parts have input to this process. Ask "Is there any other part of me that has any objection to the new choices that are going to occur?" Then be sensitive to any response in any system: feelings, pictures, or sounds.... OK, you've got a response. And? Dick: They have no objections. How do you know that? This is important. I asked you to attend to all systems. You came back and said "No. There's no objection." How do you know there's no objection? Dick: I felt no tension anywhere. Dick: Well, the relaxation. A relaxation. OK, that was an overall body relaxation. Just to be sure, just to check for congruency, thank whatever part made your body relax. And then ask "If this means no objection, relax me even further. If there is any objection, make some tension occur." Again, all we are doing is varying the signal for "yes" or "no." It's arbitrary whether you go "Yes for positive increase, No for diminish," or the reverse. It doesn't matter. Dick: I'm getting some objection. OK. What exactly was your experience? Were there changes in muscle tension? Dick: Yes, around my eyes. OK. Whenever you get a response to a general inquiry, it's important to check and be absolutely sure what that response means. Thank that part for the response of tension in the muscles around your eyes. Ask for an increase for "yes" and a decrease for "no" to the question: "Do you object to the new alternatives?"...

Typically at the ecological check almost everybody's freart speeds up. Most people associate a speeded-up heart rate with fear or anxiety. When I ask them to stop hallucinating and simply ask for an increase for "yes" and a decrease for "no," the heart rate usually slows down. My understanding of this is that it's simply a signal that some part of them is quite excited about what's going on. ask the same question "Do you have any objections?" and ask for an increase for "yes" and a decrease for "no."
We usually hold the first set of three choices constant and ask any part that objects to find alternative ways of doing what it needs to do without interfering with the first set of choices. But you could also ask both parts to form a committee and go to the creative part and select new alternatives that are acceptable to both.

The ecological check is very important. Many of you have done elegant work, and the client is congruent in your office. When he leaves, another part of him emerges which has concerns that are contextually bound. When he gets home, suddenly he doesn't have access to what he had in your office or in the group. There are other parts of him that know that if he goes home and simply changes in the way that he was going to change, he would lose the friendship of this person, or blow that relationship, or something like that. This is a way of checking to make sure that there are no parts whose positive contribution to him will be interfered with by the new pattern of behavior. Of course the only real check is in experience, but this is a way of doing the best you can to make sure that the new choices will work.

OK, now, Dick, what happens if six or seven weeks from now, you discover yourself doing the old pattern of behavior X? What are you supposed to do, then? ... You can accept that as a signal that the new choices that you came up with were not adequate to satisfy the intention. And you can go back to your creative part and give it instructions to come up with three more choices. The pattern of behavior is a barometer of how effective the new choices are. If the old behavior emerges after a test period, it's a statement that the new choices were not more effective than the old pattern. It's a signal for you to return to this process and create better choices. Regression to previous behavior isn't a signal of failure, it's a signal of incompetency, and you need to go back and fix it. Refraining will work. I guarantee his behavior will change. If his behavior changes back, that's a signal that the new kinds of behavior were not as effective at getting something for him as the old pattern. Then he goes back through the process, finds out what other secondary gain is involved, and creates new ways to take care of that as well. If you don't explicitly make the symptom a signal to negotiate, the person's conscious mind will call it a "failure" if the symptom comes back. When the symptom is identified as a signal, the client begins to pay attention to it as a message. It probably always was a message anyway, but they never thought about it that way. By doing this, they begin to have a feedback mechanism. They discover that they only get the signal at certain times.

Somebody comes in with migraine headaches and I reframe, and all parts are happy, and the client goes along for two weeks and everything's fine. Then they are in a particular context and suddenly they get a headache. That headache triggers off the instruction that the negotiations weren't adequate. The person can drop inside and ask "Who's unhappy? What does this mean?" If a part says
"You're not standing up for yourself like you promised to," then they are faced with a simple choice of having a migraine headache or standing up for themselves. I had a woman who got such severe migraine headaches that she was flat on her back. There was a part of her that wanted to be able to play every so often, and if it wasn't going to get to play, then the other parts weren't going to get to do anything! Whacko! It would give her a headache. So she made an arrangement that she would spend a defined amount of time in playing activities. After the session, when the weekend came and it was time to play, she decided to do her taxes instead! That part just laid her out. She called on the phone and said "Well, I didn't keep up my end of the bargain, and I got another migraine headache. What should I do?" I said "Don't ask me; ask the part. It's not my problem. My head doesn't hurt." So she went in and found out what she was supposed to do. That part said "Go out, get in the car, and go somewhere and have fun or else!" As soon as she got in the car, the headache was gone. So her headache no longer became something that was a burden; it became an indicator that she had better respond. She learned that getting a headache was a signal to go out and have some fun.

Dick doesn't need to be aware of what those choices are? We prefer that he not be. That could just get in his way. Woman: Dick, you're not aware of your three alternatives specifically? Dick: I'm not. In some ways I feel a failure because of it, you know, because I can't think it. Woman: Well, how does he know he has them? He got a signal from his unconscious, namely the kinesthetic feeling of relaxation. He doesn't consciously know what the new alternatives are. Dick: But it feels OK down here. His unconscious mind knows what they are, and that's all that counts. That's the one that runs the show in this area of behavior, anyway

I really believe that unconscious minds should have the freedom, and in fact have the duty, to keep out of awareness material which would not be useful for the conscious mind to deal with. We had a period when we did nothing but deep, deep trance hypnosis. A man came in once and said that there were all kinds of things standing in the way of his being happy. I said "Would you like to tell me what those things are?" And he said "No, I want to go into a trance and change it all, and that's why I came for hypnosis." So accepting all behavior, I did an induction, put him into a deep trance, sent his conscious mind away, and said "I want to speak privately with your unconscious mind." I have no idea what that means. However, when you tell them to, people do it. They talk to you and it's not the one you were talking to before, because it knows things the other one doesn't know. Whether I created that division or whether it was there already, I have no idea. I asked for it, and I got it. In this particular case, his conscious mind was, to put it as nicely as I can, inane. His unconscious resources, however, were incredibly intelligent. So I said "What I want to know from you, since you know much more about him than I do, is what change is it that he needs to make in his
behavior?" The response I got was "He's a homosexual." "What change does he need to make?" 

I've worked with people and I've made a deal with a part to allow the conscious mind to slowly become aware of something a little at a time, to discover if in fact the conscious mind can handle it or not. And usually the part discovered that the conscious mind could accept the information. At other times I've gotten an emphatic "No, there's no way I will do that. I don't want the conscious mind to know. I will change all behaviors, but I will not inform the conscious mind of anything." And people do change. Most change takes place at the unconscious level anyway. It's only in recent Western European history that we've made the idea of change explicit.

Being conscious, as far as I can tell, is never important, unless you want to write books to model your behavior. In terms of face-to-face communication, either internally or with other people, you don't need consciousness.

It's quite possible—not only possible but quite positive—for him not to know what the intention of his unconscious part is, as well as for him not to know what the new choices are. The changes will still be as profound and as effective as if he knew all that. In fact, in some ways the changes will be more effective.

have him go inside and ask the part of him that's wrinkling his brow to increase the tension there if it has some input to this process that it would like to make manifest, and decrease the tension there if not. That would give you an immediate verification, without any hallucination. You don't have to hallucinate, and he doesn't have to guess. You've got a system which allows you to get direct sensory signals in order to answer your questions.

Alternating from turning inward and coming back to sensory experience—in and out of trance.

Finger signals or ideomotor signals. A hypnotist will often make arrangements with the person in a trance that s/he will lift the right index finger with honest unconscious movements for "yes" responses, and the left index finger for "no." What we did here is nothing more than a system of natural finger signals. Finger signals are a wholly arbitrary imposition by the hypnotist. Reframing leaves much more freedom on the part of the client to choose a response signal system which is most congruent with what they need at the time. It's a naturalistic technique that also makes possible signals that can't be duplicated by consciousness. However, it's the same forhial pattern, the same principle, as finger signals. Using natural signals also allows different parts to use different channels instead of having them all use the same system.
If at some point he had gotten increased sweating in the palms, sensations in the front of the leg, visual images, a sound of a racing car—all these signals as responses? I would have said "I'm glad there are so many parts active in your behalf. In order to make this thing work, go inside and thank them all for the responses. Ask all those parts to be exquisitely attentive to what happens. First we'll take the perspiration in your hands; we'll work with that part. I guarantee all the other parts that no behavioral changes will occur until we do the ecological check and I have verified that they all accept the new behaviors. Or you could ask all those parts to form a committee and ask them to choose one signal. Then have the committee make its collective needs known to the creative part, and so on:

Say to unconscious, if it won’t co-operation: I’m offering you ways which are more effective than your present pattern. There are lots of other maneuvers. "Oh, then you are entirely satisfied with all the wasted energy that is going on inside?" Use whatever maneuvers you have in your behavior that are appropriate at that point to get the response you want. Then people soon find they’ve overcome their phobia, without even realising it consciously, until someone draws it to their attention ... i.e they are doing what previously unthinkable, without even thinking about it...i.e unconscious removes habitual earlier response as no longer optimal / legitimate / necessary i.e some other ‘solution’ found to original ‘problem’ that the phobia was unconsciously instituted as a response / solution to e.g avoidance of threat / unwanted experience etc ... replace terror with positive sense of calm, attentiveness e.g potential danger response now productive / generative Vs shut down / terror / destructive / anger / fear / immobility / excess to actual threat Vs perhaps early real threat, at time unable to find better response / solution to situation / condition. Change is the only constant in my experience and most of it occurs at the unconscious level.

It doesn't matter if you get a "yes" or "no." It only matters that you get one or the other. The "yes-no" signals are just to distract the conscious mind of the person you are working with. If you get a "no," then you offer it another way to go about it. "Then you go to your devious part and tell it to ally itself with your creative part and trick this part of you into having new choices." It doesn't matter how you do it.

I know there are lots of ways to accomplish the same thing. You can say "Do you know anyone else who is able to do this? I want you to review with vivid detail in picture and sound and feeling what they do, and then have this part of you consider those possibilities. "That's just a way of doing what we call "referential index shift."

There's a really easy way to create a creative part, using representation systems and anchoring. You say "Think of the five times in your life when you behaved in a very powerfully creative way and you didn't have the faintest idea how or what
you did, but you knew it was a positive and creative thing that you did." As s/he thinks of those five in a row, you anchor them. You then have a direct anchor to the person's creativity. You've assembled one. You've organized their personal history. Or you can ask "Do you have a part of you that makes plans? Well, have it come up with three different ways you can plan new behavior." The word "creative" is only one choice out of a myriad ways of organizing your activities. The only way you can get stuck in a process like this is if you try to run it rigidly. You say to a client "Well, do you have a part of you that you consider your creative part?" If they look you straight in the eye and say "No," then start making up other words. "Do you realize that you have a part of you that is responsible for all glunk activities? And the way you contact that is by touching your temple!" You can make up anything, as long as the result is that they generate new ways of accomplishing the intention. That is as limitless as your own creativity. And if you don't have a creative part, create one for yourself!

The point is, when you do something that doesn't work, do something else. If you keep doing something else, something will work. We want you to make it work with each other so that you have a reference experience. Find someone you don't know to be your partner and try reframing. We'll be around if you get stuck.

Reframing Outline  
(1) Identify the pattern (X) to be changed.  
(2) Establish communication with the part responsible for the pattern. (a) "Will the part of me that runs pattern X communicate with me in consciousness?" (b) Establish the "yes-no" meaning of the signal.  
(3) Distinguish between the behavior, pattern X, and the intention of the part that is responsible for the behavior. (a) "Would you be willing to let me know in consciousness what you are trying to do for me by pattern X?" (b) If you get a "yes" response, ask the part to go ahead and communicate its intention. (c) Is that intention acceptable to consciousness? (4) Create new alternative behaviors to satisfy the intention. At the unconscious level the part that runs pattern X communicates its intention to the creative part, and selects from the alternatives that the creative part generates. Each time it selects an alternative it gives the "yes" signal. (5) Ask the part "Are you willing to take responsibility for generating the three new alternatives in the appropriate context?" (6) Ecological check. "Is there any other part of me that objects to the three new alternatives?" If there is a "yes" response, recycle to step (2) above.

"I have a part that no matter what I do, all the time I'm trying to do anything, it just totally tells me I can't do it, and that I'm going to fail. It makes everything twice as hard as it needs to be." She said that she had been a high school dropout. When she decided to go back to high school, that part said "You'll never be able
to do it; you're not good enough; you're too stupid. It'll be embarrassing. You won't be able to do it." But she did it. And even when she did that, when she decided to go on to college, that part said "You're not going to be able to do it." So I said "Well, I'd like to speak to that part directly look over their left shoulder while I talk to them… a very effective anchoring mechanism, because from that time on, every time you look over their left shoulder, only that part can hear. "I know that that part of you is doing something very important for you, and it is very sneaky about how it does it. Even if you don't appreciate it, I do. I'd like to tell that part that if it were willing to tell her conscious mind what it's doing for her, then perhaps it could get some of the appreciation that it deserves." Then I had her go inside and ask the part what it was doing for her that was positive. It came right out and said "I was motivating you."

What would have happened to that woman if we had somehow gotten that part to stop doing that, but without changing anything else? … She wouldn't have had any way to motivate herself! That's why we have the ecological check. The ecological check is a way of being sure that the new behavior fits with all the other parts of a person. Up to step six we have essentially created a communication system between the person's consciousness and their unconscious part that runs the pattern of behavior they are trying to change. And we have succeeded in finding more effective alternative behaviors in that area. I don't know, of course, when I've finished that, whether this is going to be beneficial for them as a total person. Let me give you another example of this. I've seen mousy little people who went to assertiveness training and became aggressive—so aggressive that their husband or wife left them and none of their friends will talk to them anymore. They go around yelling at people and being extremely assertive, so abrasive that they no longer have friends. That's sort of a polarity flip, or a swing of the pendulum. One way to make sure that doesn't happen is to have some device like the ecological check.

When you have completed communication and created alternative new behaviors for the part that originally ran the problem behavior, you ask for all other parts to consider the repercussions of these new patterns of behavior. "Is there any other part of me that has any objection to the new choices in my behavior?" If another part objects, it will typically use a distinctive signal. It may be in the same system, but it will be distinctive as far as body part. If suddenly there's tension in the shoulders, you say "Good, I have a limited conscious mind. Would you increase the tension in my shoulders if it means 'Yes, there is an objection,' and decrease it if it means 'No.'" If there is an objection, that's a delightful outcome. That means there is another part, another resource, that's active in your behalf in making this change. You are at step two again, and you recycle.
One of the things that I think distinguishes a really exquisite communicator from one who is not, is to be precise about your use of language: use language in a way that gets you what you want. People who are sloppy with language get sloppy responses. Virginia Satir is precise about her use of language, and Milton Erickson is even more precise. If you are precise about the way you phrase questions, you will get precise kinds of information back. For example, somebody here said "Go inside and ask if the part of you responsible for this behavior is willing to change?" And they got a "No" response. It makes perfect sense! They didn't offer it any new choices. They didn't say "Are you willing to communicate?" They said "Are you willing to change?" Another person said "Will you, the part of me that is responsible for this pattern of behavior, accept the choices generated by my creativity?" And the answer was "No." And properly so. Your creativity doesn't know a thing about your behavior in this area. The part that's got to make a selection is the part that is responsible for your behavior. It's the one that knows about that. Man: What if the unconscious creative part refuses to give any choices? It never happens if you are respectful of it. If you as a therapist are disrespectful of people's creativity and their unconscious, it will simply cease communicating with you.

Almost every modern humanistic psycho-theology I know implies that it is necessary to be conscious in order to make changes. That's absurd.

**MHR ZEN again**: Woman: I'm confused about **awareness and consciousness.** Gestalt therapy talks about the importance of awareness, and— When Fritz Peris said "Lose your mind and come to your senses," and to have awareness, I think he was talking about experience. I think he suspected that you could **have sensory perception without intervening consciousness.** He wrote about what he referred to as the "DMZ of experience," in which he said that **talking to yourself was being as far removed from experience as you could be.** He said that making visual images was a little bit closer to having experience. And he said having feelings was being as close as you could get to having experience, and that the "DMZ" is very different than behaving and acting in the real world. I think what he was alluding to is that you **can have experience without reflexive consciousness, and he called that "being in the here and now." We call it "uptime."** It's the strategy we've used to organize our perceptions and responses in this workshop with you. **In uptime, you don't talk to yourself, you don't have pictures and you don't have feelings. You simply access sensory experience and respond to it directly.** Gestalt therapy has an implicit rule that accessing cues are bad, because you must be avoiding. If you look away, you are avoiding. And when you are looking away you are in internal experience, which we call "downtime." Fritz wanted everybody to be in uptime. However, he was inside telling himself that it was better to be in uptime! He was a very creative person and I think that's what he meant, but it's really hard to know.
You said we'd see when reframing doesn't work. 7 certainly did as I walked around the room! You will try it and it won't work. However that's not a comment on the method. That's a comment about not being creative enough in the application of it, and not having enough sensory experience to accept all the cues that are there. If you take its "not working"—instead of a comment about how dumb and stupid and inadequate you are—as a comment about what's there for you to learn and begin to explore, then therapy will become a real opportunity to expand yourself, instead of an opportunity for self criticism.

This is one of the things I've discovered teaching hypnosis. I think it's one of the main reasons that hypnosis has not proliferated in this society. As a hypnotist you put somebody into a trance and present them with some kind of a challenge such as "You will be unable to open your eyes." Most people are unwilling to put themselves to that kind of test. People say this to me all the time in hypnosis training seminars: "What happens if I give them the suggestion and they don't carry it out?" And I say "You give them another one!" If they don't get exactly what they intended, they think they must have failed, instead of taking that as an opportunity for responding creatively. There's a really huge trap there. If you decide before you begin a communication what will constitute a "valid" response, then the probability that you'll get it is reduced severely. If, however, you make a maneuver, some intervention, and then simply come to your senses and notice what response you get, you'll realize that all responses are utilizable. There's no particularly good or bad response. Any response is a good response when it's utilized, and it's the next step in the process of change. The only way you can fail is by quitting, and deciding you are not willing to spend any more time with it. Of course you can just continue to do the same thing over and over again, which means you'll have the same failure for a longer period of time!

It's important for some people to have the illusion that their conscious mind controls their behavior. It's a particularly virulent form of insanity among college professors, psychiatrists, and lawyers. They believe that consciousness is the way they run their lives.

I know a man who does it with groups, and he takes them all together through each step. "Everybody identify something. Everybody go inside. What did you get?" "I got a feeling." "Intensify for 'yes.'" "What did you get?" "I got sounds." "Have them get louder." "What did you get?" "I got a picture." "Have it brighten."

I worked as a consultant for the Simontons in Fort Worth. I had six people who were terminal cancer patients, so I did them as a group, and that worked fine. I had enough sensory experience, and there was enough homogeneity in them as a group, that I could do it that way. The Simontons get good responses using visualization. When you add the sophistication of all representational systems and the kind of communication system we develop with reframing, I don't know
what the limits are. I would like to know what they are. And the way to find out is to assume that I can do anything and go out and do it. We had a student who got a complete remission from a cancer patient. And he did something which I think is even more impressive: He got an ovarian cyst the size of an orange to shrink away in two weeks. According to medical science, that wasn't even possible. That client reports that she has the X-rays to prove it.

You want to vary your behavior wildly, to do whatever you need to do in order to elicit the response that you want.

People can psychologically "make themselves sick." They know that psychological cognitive mechanisms can create disease, and that things like the placebo effect can cure it. But that knowledge is not exploited in this culture in a useful way. Reframing is one way to begin to do that.

Reframing is the treatment of choice for any psychosomatic symptom. You can assume that any physiological symptom is psychosomatic, and then proceed with refraining—making sure that the person has already made use of all medical resources. We assume that all disease is psychosomatic. We don't really believe that's true. However, if we act as if that's true, then we have ways of responding appropriately and powerfully to people who have difficulties that are not recognized as psychosomatic by medical people. Whether it's aphasics that we've worked with, or people with paralysis that had an organic base, that wasn't hysterical according to the medical reports, we still often get behavioral changes. You can talk about it as if the people were pretending to be changed, but as long as they pretend effectively for the rest of their life, I'm satisfied. That's real enough for me. The question for us is not what's "true," but what is a useful belief system to operate out of.

We also treat alcoholism as a psychosomatic process—like allergies or headaches or phantom-limb pain. The alcohol is an anchor, just as any other drug is. What an alcoholic is saying to you by being an alcoholic is essentially "The only way I can get to certain kinds of experiences which are important and positive for me as a human being—camaraderie, escape from certain kinds of conscious process, or whatever it is—is this anchor called alcohol." Until the secondary gain is taken care of by some other behavior, they will continue to go back to that as an anchor. So there are two steps in the treatment of alcoholism. One is making sure the secondary gain gets picked up by some other activity: they can have camaraderie but they don't have to get drunk in order to get it. You have to find out what their specific need is, because it's different for everyone. Once you have taught them effective ways to get that secondary gain for themselves without the necessity of alcohol, then you anchor something else to take the place of the alcohol stimulus so they don't have to go through the alcohol state to get to the experiences that they want and need. We've done single sessions with alcoholics
that stick really well, as long as we make sure that those two steps are always involved.

Do you make the basic assumption that an individual is consciously able to tell you what the secondary gain is? Never! We make the assumption that they can't. Reframing in the six-step format we did here has certain advantages that we talked about. For example, this format builds in a program which the person can use by themselves later to make change in any area of their life. You can also do this behaviorally. In fact, this is a strategy and outline for behavioral therapy as well as what we've been doing here. In the more usual therapeutic relationship, the therapist takes responsibility for using all his verbal and non-verbal behavior to elicit responses, to get access to resources in parts of the person directly, and to communicate with those parts. The client in the normal therapeutic process will, in turn, become those parts. S/he will cry, become angry, delighted, ecstatic, etc. S/he will display with all output channels that s/he has altered consciousness and has become the part that I want to communicate with. In reframing we take a step back in that process and ask that s/he create a part that will have the responsibility for maintaining an efficient, effective internal communication system between parts. However, the same six-step format can be used as an organizing principle for doing more usual kinds of therapeutic work. Step one, identifying the pattern, is equivalent in a normal therapeutic context to saying "What specific change would you like today?" and getting a congruent response.

There are a lot of ways of establishing communication with a part, as long as you are flexible. There's playing polarity, for instance. Suppose that I'm with someone who is really depressed. One way for me to contact the part in him that is really depressed is to talk directly to him. If I want to contact the part that doesn't want him to be depressed, I can say "Boy, you are depressing! You are one of the most depressing—I'll bet you've been depressed your whole life. You've never had any experience other than being depressed, never at all." "Well, not my whole life, but for the past—" "Oh no, I'll bet it's been your whole life." "No, not my whole life, last week I felt pretty good for about an hour...." In other words, by exaggerating the position that is offered to you, you get a polarity response if you do it congruently. And as soon as the person accesses the polarity, you can anchor it.

I do a lot of "set-ups" before I get into this. I do a lot of pacing, matching, mirroring.

Establish a communication channel. The important thing here is to accept only reports—not interpretations from the person's conscious mind. If you accept interpretations, you're going to fall into the same difficulties that they are already in: the communication between their conscious understanding and the unconscious intent is at variance. If you take sides you are going to lose—unless
you take sides with the unconscious, because the unconscious always wins anyway. If your client refuses to have anything to do with exploring unconscious parts, you can say "Look, let me guarantee that the part of you that you are attacking consciously, the part of you that keeps you doing X, is doing something useful for you. I'm going to side with it against your conscious mind until I am satisfied that this unconscious part of you has found patterns of behavior that are more effective than what you are presently doing." Now, with that it's very hard to get any resistance. That's been my experience.

Step three of reframing is the major component of what most people do when they do family therapy. Let's say that you have a father who loses his temper a lot. Virginia Satir waits until he has expressed quite a bit of anger. Then she says "I want to tell you that in my years of doing family therapy I have seen a lot of people who are angry, and a lot of people could express it. I think it's important for every human being to be able to express what they feel in their guts, whether its happiness, or anger like you just felt. I want to compliment you, and I hope all the other members of this family have that choice." Now, that's pacing: "accept, accept, accept." And then she gets in real close to the father and says "And would you be willing to tell me about those feelings of loneliness and hurt underneath that anger?"

Another form of behavioral reframing is to say "Do you yell at everyone like that? You don't yell at the paper boy? You don't yell at your mechanic? Well, are you trying to tell her that you care about what she does? Is that what this anger is about? I mean, I notice you don't do it with people you don't care about. This must be a caring message. Did you know that this was his way of expressing that he cares what you do?"

"Well, how do you feel about knowing that now?" How many of you have heard Virginia Satir say that? That's a weird sentence; it doesn't actually have any meaning. But it works!

Carl Whittaker has one nice reframing pattern that is apparently uniquely his. The husband complains "And for the last ten years nobody has ever taken care of me. I've had to do everything for myself and I've had to develop this ability to take care of myself. Nobody ever is solicitous toward me." Carl Whittaker says "Thank God you learned to stand on your own feet. I really appreciate a man who can do that. Aren't you glad you've done that?" That's a behavioral reframe. If a client says "Well, you know, I guess I'm just not the perfect husband," he says "Thank God! I'm so relieved! I've had three perfect husbands already this week and they are so dull." What he does is to reverse the presupposition of the communication he's receiving.
We originally developed reframing by observing Virginia Satir in the context of family therapy. We have developed several other systematic models of reframing.

One aspect of reframing was introduced years ago in the process called "brainstorming," a situation in which people simply freeassociate and explicitly suspend their usual judgemental responses. When brainstorming is conducted in an effective way, people generate a lot more ideas than they do in other modes of working together. The primary way in which that works is that a really fine distinction is made between outcomes—what we are going to use this material for—and the process of generating ideas with other human beings. Reframing is the same principle applied more generally.

When somebody comes to Milton Erickson and asks for assistance in losing weight, typically he demands that s/he gain exactly eleven pounds in the next two weeks. That might seem to be irrational behavior on his part. However, it's quite effective, because one of two things will happen. Either the person will lose weight—a polarity response—which is the outcome he is working toward anyway, or they will gain eleven pounds. Typically they don't gain ten or twelve, they gain eleven. Since they were able to accomplish that, the behavioral presupposition is that they can control what they weigh. In either case it unstabilizes the situation.

I've never heard of people stabilizing. Something always happens. It's the same kind of maneuver that Salvador Minuchin makes when he allies himself with a member of the family to throw the system out of kilter. This is a really nice example of a transfer of a therapeutic technique to the organizational context. Let me offer you another utilization. As soon as you notice that the challenging behavior is disruptive, you can interrupt the process, and say "Look, one of the things I've discovered is that it's useful to assign people specific functions in a group. In my experience of consulting and working with organizations, I have found that this is a useful way of organizing meetings. One group member keeps track of the ideas, and so on." Then you can assign this person the function of being the challenger. When a well-formed proposition is brought before the group by anyone, or by a sequence of suggestions, his job is to challenge that formulation at some point. You explain that by challenging the formulation, he will force the people making the proposal to make finer and finer distinctions and to hone their proposal into a form that will be effective and realistic. You've prescribed the symptom, but you have also institutionalized it MHR made it non-personal i.e removed the ‘affect’ the emotions / losing face / competition for ‘points’ i.e wins / defeats … so now collaborating Vs competing to score points against each other…wasted energy / time / processes / brain work etc on ‘winning’ and ‘defeating’ and ‘defending’ positions etc...
You don't try to stop the problem behavior, you utilize it. The primary metaphor for utilization is the situation where I never fight against the energy offered me by anyone, or any part of them. I take it and use it. Utilization is the psychological counterpart of the oriental martial arts, such as Aikido or Judo. This is a parallel strategy for psychological martial arts. You always accept and utilize the response, you don't fight or challenge the response—with one exception, of course. If the person's presenting problem involves their running over people then you clobber them, because the presenting problem involves the very pattern that they are using: namely, they get their way. But, of course, that's a paradox, because if they were really getting their way, they wouldn't be in your office.

So let's say that Jim here makes a proposal and Tony is the guy I have assigned to be the challenger. When Tony begins to interrupt, I say "Excellent! Good work, Tony! Now, listen, Tony, what I think you ought to be sensitive to is that we haven't yet given Jim enough rope to hang himself. So let him make a more complete proposal and get responses from other people, and then I'll cue you and you jump right on it. OK?" So I've essentially delivered the message "Yes, but not yet." Woman: That works if you are the outside consultant coming in, but what if you are already in the system? If you are an inside consultant or you are a member of the system at the same level of functioning, there may be people who would resent or resist if you state it as your proposal. So you have to frame it appropriately. It's not a proposal coming from you. It's a proposal you are offering that comes from outside, which you think might be useful for you and the rest of the members of the group. You can do it metaphorically. You can say "I spent a fascinating evening the other night with a corporate consultant in Chicago. I went to a conference and the leader told us the following:" Then you present all the information that I just presented to you. If you do that congruently, it will be an acceptable proposal. You can always suggest an experiential test to find out whether it's worth doing. You can ask people to try it for two hours. If it works, people will continue it. If it doesn't, you haven't lost much, and you don't want to continue it anyway.

One strategy that always works effectively in this situation is to reframe the two responses that they are offering as alternative ways of getting an outcome that they both agree is desirable. So first you have to find the common goal—establish a frame. Then you instruct them in how to dispute each other's proposals effectively, because now both proposals are examples of how to achieve the same outcome that they both have agreed upon. Sol would do something like the following: "Look, let me interrupt you for a moment. I just want to make sure that I understand you both. Harry, you want to expand because you want the corporation to grow and realize more income, right?" I then turn to George and say "My understanding is that your objection to the expansion at the moment, and your focusing on the fact that the Milwaukee and Chicago offices are not quite
self-sufficient yet, is your way of being sure that the quality of the services that you offer as a corporation are of a certain level. You are offering a quality product and you want to maintain that quality, because otherwise the whole thing won't work anyway." And he'll say "Of course. Why do you ask these things?" And then I say "OK, I think I understand now. Both of you agree that what you want to do is expand at a rate congruent with maintaining the high quality of services your corporation offers." And they'll both say "Of course." You've now achieved the agreement that you need; you've now got the frame. You say 'Good. Since we agree on the outcome that we're all working toward, let's find the most effective, efficient way to get that outcome. Now you, George, make a specific, detailed proposal about how you will know when the Chicago and Milwaukee offices are stabilized at a quality of operation that allows you to feel comfortable about turning resources elsewhere to continue expanding. Harry, I want you to come up with the specific evidence that you can use to know when it is appropriate to open new branches. What will you see or hear that's going to allow you to know that it is now appropriate to open a new office in Chattanooga, and still maintain the quality of the services you're going to offer?" First I use language that generalizes, to establish the frame. Then I make sure it is anchored in. "Since we all agree about the outcome,..." Then I challenge them to take the proposals they've been fighting over—now embedded in a context of agreement—back to the level of sensory experience. I demand that each of them give specific evidence to support that their proposal is more effective in achieving the outcome that they have both agreed upon. Now they will have useful disputes. And I will monitor their language to be sure that they are being specific enough to make a good decision. You can always figure out what would constitute evidence that one proposal is more effective than another.

Let me give you a specific strategy for doing this. You listen to both complaint A and complaint B. Then you ask yourself "What are A and B both examples of? What is the class or category that they are both examples of? What is the outcome that both of these two people will share? What common intention lies behind or underneath both these two particular proposals?" Once you discover that, then you interrupt and state the obvious in some way. You get an agreement between these two people, so that they can then begin to usefully disagree within the context of agreement.

Now that has the same formal properties of what I did with Dick in the six-step refraining. We found a point where his conscious mind and his unconscious mind could agree about a certain outcome that was useful for him as an individual. Harry and George now agree that whatever they end up doing—either one of their proposals, both, or some alternative to those—the outcome they are working toward is to benefit the corporate entity as a unit. So I ignore the specific behaviors, and I go after an outcome that the two parts of the corporation—or the two parts of the human being—can agree upon. Now, having achieved the frame
of agreement, it becomes trivial to vary behavior in order to find a behavior that achieves the outcome that both partners can agree to. If you have more than two people involved—which is usually the case—you can simplify the situation by organizing the discussion. Just say "Look, I'm getting very confused by the way we're discussing things. Let me organize it a little bit in the following way: I want the rest of you to be exquisitely attentive. You have the job of watching and listening to exactly what these two people are going to propose, and assisting me in the process of finding what's common about what they want to do. You can reorganize it into pairs, and then work with one pair at a time. And as you do that, of course you are teaching the pattern to the observers at the same time. People have strange ideas about change. Change is the only constant in my thirty-some years of experience. One of the weird things that's happened—and this is a really good example of natural anchoring—is that change and pain are associated. Those ideas have been anchored together in western civilization. That's ridiculous! There's no necessary relationship between pain and change. Is there Linda? Tammy? Dick? There is one class of human beings in which you may have to create pain in order to assist them in changing, and that's therapists. Most therapists intrinsically believe—at the unconscious level as well as the conscious level—that change has to be slow and painful. How many of you at some point during the demonstrations have said to yourself "That's too easy; it's too fast." If you examine the underlying presuppositions that cause you to respond that way, you'll discover that they are associated with pain and time and money and stuffs of which are really powerful and valid economic considerations. Others are just junk that have been associated—like change and pain. So you might examine your own belief structure, because what you believe will come out. It will be in your tone of voice, in your body movement, in the hesitation as you lean forward to do this work with someone.

All the tools that we offer you are very powerful and elegant. They are the minimum that I think you need to operate, no matter what psychotheology you were previously trained in. If you decide that you want to fail with this material, it's possible to. There are two ways to fail. I think you ought to be aware of what those are, so that you can make a choice about how you are going to fail if you decide to. One way is to be extremely rigid. You can go through exactly the steps that you saw and heard us go through here, without any sensory experience, without any feedback from your clients. That will guarantee that you will fail. That's the way most people fail. The second way you can fail is by being really incongruent. If there's a part of you that really doesn't believe that phobias can be done in three minutes, but you decide to try it anyway, that incongruency will show up in your non-verbal communication, and that will blow the whole thing.

Every psychotherapy that I know of has an acute mental illness within it. Each one thinks that their theory, their map, is the territory. They don't think that you can make up something totally arbitrary and install it in someone and change
them. They don't realize that what they believe is also made up and totally arbitrary. Yes, their method does elicit a response from people, and sometimes it works for the problem you're working on. But there are a thousand other ways to go about it, and a thousand other responses.

For example, TA has a thing called "reparenting" in which they regress a person and give him a new set of parents. And if it's done appropriately, it will work. The TA belief is that the person is messed up because when they were a kid they didn't get certain kinds of experiences, so you have to go back and give them those experiences in order for them to be different. That's the TA theology, and accepting that belief system constitutes the mental illness of TA. TA people don't realize that you can get the same result a thousand other ways, and that some of them are a lot quicker than reparenting.

Any belief system is both a set of resources for doing a particular thing, and a set of severe limitations for doing anything else. The one value in belief is that it makes you congruent. That part is very useful; it will make other people believe you. But it also establishes a huge set of limitations. And my belief system is that you will find those limitations in yourself as a person as well as in your therapy. Your clients are going to end up being a metaphor for your personal life because you are making the ultimate tragic mistake. You believe that your perceptions are a description of what reality actually is.

MHR pure skepticism i.e believe NOTHING i.e remain Zen open to possibilities...If you simply change your belief system, you will have a new set of resources and a new set of limitations. The way out of that is to not believe what you're doing. Having the choice of being able to operate out of different therapeutic models is very valuable in comparison to only being able to operate out of one model. If you believe any of them, you will remain limited in the same way those models are limited.

One way to get out of that is to learn to go into altered states in which you make up models. Once you realize that the world in which you're living right now is completely made up, you can make up new worlds. Now if we're going to talk about altered states of consciousness, we first have to talk about states of consciousness. You are at this moment in time conscious, true or not true? Woman: I think so. OK. How do you know that you're conscious at this moment? What are the elements of your experience that would lead you to believe that you are in your normal state of consciousness? I want to know what it is about this state of consciousness that allows you to know that you are here. Woman: Ah, I can hear your voice. You can hear my voice, so you have auditory external. Is anyone talking on the inside at this moment? Woman: I may have some internal voices. Do you? While you're listening to me talk, is anyone else speaking?
That's what I want to know. And I'm going to continue to talk so that you can find out. Woman: I... yes.

180 Is it a he or a she or an it? Woman: A she. All right. So you have some external and internal auditory experience. All TA people have that. They have a "critical parent," saying "Am I doing this right?" No one else does, though—until they go to a TA therapist, and then they have a critical parent. That's what TA does for you. OK, what else have you got? Are you visualizing while I'm speaking to you? Woman: No, I'm seeing you on the outside.

OK, so you have some visual external experience. Are you having any kinesthetic experience? Woman: Not until you mentioned it. OK. What was it? Woman: Ahhhhhmmmm ... I can feel a tightness in my jaw. Another way to get this would be to say "What are you aware of?" And you would tell me about your state of consciousness at that moment in time. So we have specified auditory, visual, and kinesthetic. You weren't perceiving any smells or taste, were you? Woman: No. OK, I didn't think you were. Now, my definition of altering your state of consciousness is to change it from this to any other possible combination of these things. For example, if you were to only hear my voice and not your internal dialogue, that would constitute an altered state for you because you don't usually do that. Most of the time you talk to yourself while other people are talking. If, instead of seeing externally, you were to make clear, rich, vivid, focused images of anything inside, that would be an altered state. For example, if you were to see the letters and numbers of the alphabet, an orange, yourself sitting on the couch with your hand on your ear in an auditory accessing position, the nodding of your head.... Another thing is that your kinesthetics are proprioceptive. Tightness in the jaw is a lot different than the feeling of the couch, the warmth where your hand touches your face, the feeling of your other hand... against your thigh,... the beating of your own heart,... the rise and fall of your chest... as you breathe deeply. The intonation patterns of my voice,... the changing tonality,... the need to focus your eyes... and the changing focus of your pupils, ... the repeating blinking movements, ... and the sense of weight.... Now, can you feel your state of consciousness alter? That to me constitutes an altered state of consciousness. The way to do it is to first find out what's there, and then do something that makes something else come into consciousness. Once you are directing an altered state of consciousness, you can begin to make maneuvers that add options, add choices.

You can make somebody go into an altered state...the only people who are going to resist you are people who know that you are doing it. And then I can get somebody to resist me right into a trance, because all I have to do is to instruct them to do one thing and they'll do the opposite. They'll enter an altered state immediately. An example of that is a thing that mothers often say to children: "Don't laugh." They induce altered states in their children by playing polarity.
Kids don't have a choice about that until they have requisite variety. Who can make whom do what, is a function of requisite variety. If you have more flexibility in your behavior than your hypnotist, then you can go into a trance or you can stay out of a trance, depending upon what you want to do. Henry Hilgard made up one hypnotic induction and administered it to ten thousand people. Sure enough, he found out that only a certain percentage of them went into a trance. The percentage that went into a trance were the ones that were either pre-adapted or flexible enough to adapt to that hypnotic induction. The rest of the people who were not flexible enough to adapt to that particular hypnotic induction could not go into a trance. Going into an altered state is nothing weird. You all do it all the time.

The question is whether you use the altered state to produce change, and if so, how are you going to use it? Inducing it is not that difficult. All you have to do is talk about parameters of experience that the person isn't aware of. The question is "How will you do it with whom?" If you have a person who's very visual, you're going to do something that's very different than with someone like this woman here who talks to herself a lot and pays attention to the tightness in her jaw. For her, entering a state of consciousness where she makes rich, focused images would be altered. But for a visual person that would be the normal state. In an altered state a person has more and different choices than she does in her normal conscious waking state. Many people think that going into a trance means losing control. That's where this question "Can you make somebody go into a trance?" comes from. What you're making them do is to go into a state where they have more choices. There's a huge paradox there. In an altered state of consciousness you do not have your usual model of the world. So what you have is an infinite number of possibilities. MHR pure ZEN !!!!

Since I can represent states in terms of representational systems, I can use this as a calculus to compute what else must be possible. I can compute altered states that have never existed and achieve them. I didn't find that possibility available to me when I was a gestalt therapist or when I did other forms of therapy. Those models didn't offer these alternatives. If you want to learn in detail how to induce and utilize altered states, read our book Trance-formations: NLP and the Structure of Hypnosis.

"Close your eyes." "And begin to dream a dream in which you learn just how many other possibilities there are, and your eyes will be unable to open until you find them all." He sat there for six and a half hours! We went out in the other room. Six and a half hours he was there coming up with possibilities. He couldn't leave because his eyes wouldn't open. He tried standing and walking, but he couldn't find the door. All of the possibilities that he thought of in that six and a half hour period had been available to him all along, but he had never done anything to access his own creativity.
Reframing is a way of getting people to say "Hey, how else can I do this?" In a way it's the ultimate criticism of a human being, saying "Stop and think about your behavior, and think about it in the following way: Do something new; what you're doing doesn't work! Tell yourself a story, and then come up with three other ways of telling the story, and suddenly you have differences in your behavior.

Milton Erickson did what I think was one of the shortest cures that I've ever heard about. The story that I heard was that he was at the VA hospital in Palo Alto in 1957, a seventeen-year-old adolescent who had been knifing people and doing anything he could possibly conceive of that was damaging. The kid had been waiting in line for hours and people had been coming out in somnambulistic trances; the kid was going "Ahhhhhhhh ... What are they going to do to me?" He didn't know if he was going to get electric shock or what. They brought him in and there was this man with two canes standing there behind the table, and an audience in the room. They walked up in front of the table. Milton said "Why have you brought this boy here?" And the psychologist explained the situation, gave the case history as best he could. Milton looked at the psychologist and said "Go sit down." Then he looked at the young boy and said "How surprised will you be when all your behavior changes completely next week?" The boy looked at him and said "I'll be very surprised!" And Milton said "Get out. Take these people away." (MHR kid had seen 'odd things' i.e expectation high...then E ordered doctor to sit down and doctor DID sit down...etc). Next week, the boy's behavior changed completely, from top to bottom and from bottom to top. The psychologist said that he could never figure out what it was that Milton did. As I understand it, Milton only did one thing. He gave that boy the opportunity to access his own unconscious resources. He said "You will change, and your conscious mind won't have anything to do with it. "Never underestimate the usefulness of just saying that to people. 'I know that you have a vast array of resources available to you that your conscious mind doesn't even suspect. You have the ability to surprise yourself, each and every one of you. 'If you really congruently act as if people have the resources and are going to change, you begin to induce impetus in the unconscious

In linguistics there is something called "the tip of the tongue" phenomenon. Do you all know what that is? That's when you know a word and you even know that you know the word, but you can't say what it is. Your conscious mind even knows that your unconscious mind knows what the word is. I remind people of that as evidence that their conscious mind is less than the tip of the iceberg.

In our last workshop we were doing some things with strategies, and we programmed a woman to forget what her name was. A man there said "There's no way that I could possibly forget my name." I said "What is your name?" And he
said "I don't know! I said "Congratulate your unconscious mind, even though you don't have one."

Every form of therapy I've studied has trance experiences available in it. Gestalt is founded on positive hallucination. TA is founded on dissociation. They all have great verbal inductions.

Hypnosis! What I believe is that it's an unfortunate word. It's a name given to lots and lots of different experiences, lots of different states. We used to do hypnotic inductions before we did reframing. Then we discovered that we could do reframing without having to put people into trance. That's how we got into Neuro Linguistic Programming. We thought "Well, if that's true, then we should be able to reframe people into doing every deep trance phenomenon that we know about." So we took a group of twenty people and in one evening we programmed all the people in that group to do every deep trance phenomenon we could remember having read about anywhere. We found that we could get any "deep trance phenomenon" without doing any ritualized induction. We got amnesia, positive hallucination, tone deafness, color blindness—everything. One woman negatively hallucinated Leslie for the entire evening. Leslie would walk over and pick up the woman's hand; her hand would float up and she had no idea why. It was like those cartoons about ghosts and stuff. That's as good as any negative hallucination we ever got doing hypnosis.

In the phobia technique where you see yourself standing there, and then float out of your body and see yourself there watching the younger you—that's a deep trance phenomenon. It requires positive hallucination, and getting out of your own body. That's fairly amazing. Yet all you have to do is give somebody the explicit instructions, and out of a hundred people, ninety-five can do it quickly and easily as long as you don't act as if it's hard. You always act as if you're leading up to something else that's going to be difficult, so they go ahead and do all the deep-trance phenomena and alter their state.

NeuroLinguistic Programming is a logical step higher than anything that has been done previously in hypnosis or therapy only in the sense that it allows you to do things formally and methodically. NLP allows you to determine exactly what alterations in subjective experience are necessary to accomplish a given outcome. Most hypnosis is a fairly random process: If I give someone a suggestion, that person has to come up with a method of carrying it out. As a NeuroLinguistic Programmer, even if I use hypnosis, I would describe exactly what I want that person to do in order to carry out the suggestion. That's the only important difference between what we're doing here and what people have been doing with hypnosis for centuries. It's a very important difference, because it allows you to predict outcomes precisely and avoid side-effects.
Using reframing and strategies and anchoring—all the tools of Neuro Linguistic Programming—you can get any response you can get through hypnosis. But then that's only one way to go about it. Doing it through official hypnosis is also interesting. And combining NLP and hypnosis is even more interesting. For instance there is the "dreaming arm" technique that works great with children—and adults, too. First you ask "Did you know you have a dreaming arm?" When you have their interest, you ask "What is your favorite TV show?" As they access visually, you notice which side their eyes go to. As they do that, you lift up their arm on the same side, and say 'I'm going to lift your arm, and your arm will go down only as fast as you watch that whole TV show, and you can begin right now. So the kid watches his favorite TV show. You can even reach out and stop their arm for a moment and say "It's time for a commercial" and install messages.

I'll tell you the extremes you can take this to. I had a client who had a severe hallucination that was always with him. I could never discern quite what it was. He had a name for it which was a word I'd never heard. It was a geometric figure which was alive and that followed him everywhere. It was his own sort of personal demon, but he didn't call it a demon. He could point to it in the room, and he interacted with it. When I asked him questions, he would turn around and ask "What do you think?" Before he came to me he had been convinced by a therapist that this was a part of him. Whether it was or not, I don't know, but he was convinced that this was a part of him that he had alienated. I reached over and said 'I'm going to lift up your arm, and I want you to put it down only as fast as you begin to integrate this.' Then I pulled his arm down quickly, and that was it. The integration occurred—whammo, slappo—because I had tied the two together with words.

I once asked a TA therapist which part had total control over his conscious ongoing behavior. Because it didn't seem that people had a choice about being their "parent," or their "child." So he named some part; TA has names for everything. I said "Would you go inside and ask that part if it would knock your conscious mind out for a while?" And he went "Ah, well... "I said "Just go in and ask, and find out what happens." So he went inside and asked the question... and his head fell over to one side and he was gone! It is amazing how powerful it is to use language. I don't think people understand the impact of verbal and non-verbal language at all.

At the beginning of therapy sessions very often I say to people "If anything begins to occur to your conscious mind which is too painful in any way, I want to say to your unconscious mind that I think it has the right and the duty to keep from your conscious mind anything that is unpleasant. Your unconscious resources can do that and they should do it—protect you from thinking about things which are unnecessary in that way, and make your conscious experience more pleasant. So if anything unpleasant begins to arise in your conscious
experience, your unconscious mind can slowly allow your eyes to flutter closed, one of your hands to rise up, and your conscious mind can drift away into a pleasant memory, allowing me to speak privately with your unconscious mind. Because I don't know what the worst thing that ever happened to you was...."I'm saying when X occurs, respond this way, and then I'm providing X. I'm not saying "Think about the worst thing that ever happened." I'm saying "I don't know ..." This is the same pattern that's in Changing with Families, the pattern of embedded questions. Virginia never says "What do you want?" She says "Gee, I ask myself why a family would travel six thousand miles to see me. And I don't know, and I'm curious." When I say "I dont know exactly what the most painful and tragic experience of your whole life was," it'll be right there in consciousness. People do not process language consciously. They process language at the unconscious level. They can only become conscious of a very small amount of it. A lot of what is called hypnosis is using language in very specific ways.

It's much easier to use trance as a therapeutic tool with people who don't know that they've been in a trance, because you can communicate so much more eloquently with their unconscious processes. As long as you can establish unconscious feedback loops with that person, you'll be able to alter their state of consciousness and they are more apt to have amnesia.

Guy who claimed had tried, over and over, and failed, to be hypnotized etc...I did a hypnotic induction and the guy went right through the floor! He went into deep trance and he demonstrated all the most difficult hypnotic phenomena. Then I aroused him and said "Did you go into a trance?" And he said "No." I said "What happened?" And he said "Well, you were talking to me and I sat here and listened to you talk, and I closed my eyes, and I opened my eyes." I said "And did you X?" and I named one of the trance phenomena he had just demonstrated. And he said "No." So I thought, "Ah! well, it's just a function of his amnesia." I hypnotized him again and gave him implicit hypnotic commands to remember doing all the things he did. He still had no memory whatsoever. All the people in the room, of course, were going crazy because they've seen him do all these things. I tried things like saying "Tell Hal what you saw" and they all told him. And he said "That's not going to work on me. I didn't do that. I would know if I did that." The interesting thing about Hal was there was more than one of him, and they had no connection with one another, no means of communicating with one another. Sol thought well, I'm going to have to mix it up a little bit. I said "While you remain in the conscious state, I'd like to ask your unconscious mind to demonstrate to you that it can do things by lifting your hand so that only your right arm is in trance." His arm began to involuntarily float up. I thought "Now this is going to convince this guy," because only his arm was in trance. And he looked me straight in the eye and said "Well, my arm is in trance, but the rest of me can't go in."
I tried videotaping him and showing him the videotape. He couldn't see it! We'd turn on the videotape, and he'd just go into a trance and that was it. He could not watch the videotape. I told him that if he had not been in a trance, he would be able to watch the videotape. So he sat there with the videotape machine, and he would turn it on and drop out. We'd turn it off and he'd come back. He'd turn it on again and drop out again. He sat there for the rest of the evening trying to watch himself go into a trance. He couldn't do it. So he became convinced that he had been in a trance, but he didn't understand it. This taught me a lesson. I stopped worrying about whether people knew they were in trance or not and only noticed the results that I could get, utilizing it as phenomenon of change. Hypnotists do a terrible thing to themselves. Hypnotists are always worried about convincing people that they have been in trance, and it isn't important. It is not essential to their changing; it is not essential for anything. Whether they know that they've gone into trance or not, they will notice that they have the changes. The same is true of anchoring and reframing. As long as you use sensory experience to check your work, it's irrelevant whether your clients believe that they have changed. They will find out in experience—if they bother to notice at all.

The information and patterns that we have been presenting to you are formal patterns of communication that are content-free. They can be used in any context of human communication and behavior. We haven't even begun to figure out what the possibilities are of how to use this material. We have been unable to exhaust the variety of ways to put this stuff together and put it to use, and we don't know of any limitations on the ways that you can use this information. It's the structure of experience. Period. When used systematically, it constitutes a full strategy for getting any behavioral gain.

We personally disagree that change is a remedial phenomenon. You find something that is wrong and you fix it. If you ask a hundred people "What would you like for yourself," ninety-nine will say "I want to stop doing X." There is an entirely different way to look at change, which we call the generative or enrichment approach. Instead of looking for what's wrong and fixing it, it's possible simply to think of ways that your life could be enriched: "What would be fun to do, or interesting to be able to do?" "What new capacities or abilities could I invent for myself?"

We are currently investigating what we call generative personality. We are finding people who are geniuses at things, finding out the sequence of unconscious programming that they use, and installing those sequences in other people to find out if having that unconscious program allows them to be able to do the task. The "cloning" thing we did for the ad agency is an example of doing that at the corporate level. When we do that, things which were
problems, and would have been meat for therapy, disappear. We completely bypass the whole phenomenon of working with problems, because when the structure is changed, everything changes. And problems are only a function of structure.

"What are you going to evolve yourself to become today?" is a very different way of approaching change than "Where is it wrong?" or 'How are you inadequate?" I remember once I was in a group with a gestalt therapist and he said "Who wants to work today?" Nobody raised their hand. And he said "There's really no one in here that has a pressing problem?" People looked at each other, shook their heads, and said "No." He looked at the people and said "What's wrong with you? You are not in touch with what's really going on if there's no pain here." He really made that statement; I was flabbergasted. Suddenly all these people went into pain. They all said "You're right! If I have no pain, I'm not real." Boom, they all went into pain, so then he had something to do therapy with. That model of change does not produce really generative, creative human beings.

Whole system and the presuppositions that underlie the system of psychotherapy and counseling. Most people are totally unconscious of what those presuppositions are.

As I walked around watching and listening to you practicing refraining, I saw a lot of you reverting to other patterns that I'm sure are characteristic of your habitual behavior in therapy, rather than trying something new.

Fifteen or so years ago when the Denver zoo was going through a major renovation, there was a polar bear there, which had arrived at the zoo before a naturalistic environment was ready for it. Polar bears, by the way, are one of my favorite animals. They are very playful; they are big and graceful and do lots of nice things. The cage that it was put in temporarily was just big enough that the polar bear could take three nice, swinging steps in one direction, whirl up and around and come down and take three steps in the other direction, back and forth. The polar bear spent many, many months in that particular cage with those bars that restricted its behavior in that way. Eventually a naturalistic environment in which they could release the polar bear was built around this cage, on-site. When it was finally completed, the cage was removed from around the polar bear. Guess what happened? MHR old ‘conditioning’ of elephant from infancy until mere string restricted it i.e start with chain…

Carlos Castenada. what Juan wanted to do to Carlos—which we wouldn't, of course, want to do to you—was to find some way of motivating him to be congruent and expressive in his behavior at all times, as creative as he could be as a human being. He wanted to mobilize his resources so that each act that Carlos performed would be a full representation of all the potential that was available to him—all the personal power that he had that was available to him at any moment
in time. Specifically what Juan told Carlos was "At any moment that you find yourself hesitating, or if at any moment you find yourself putting off until tomorrow trying some new piece of behavior that you could do today, or doing something you've done before, then all you need to do is glance over your left shoulder and there will be a fleeting shadow. That shadow represents your death, and at any moment it might step forward, place its hand on your shoulder and take you. So that the act that you are presently engaged in might be your very last act and therefore fully representative of you as your last act on this planet."

Only read / attend etc NLP stuff accredited by Richard Bandler and John Grinder

Richard Bandler and John Grinder (original founders of NLP) often referring to earlier work of Erickson e.g Hypnotherapy, An Exploratory Casebook by Milton H. Erickson and Ernest L. Rossi … also Dilts ‘beliefs’…

Robert Bandler ‘Using your brain for a change’ brilliant…computer programme…modelling of successful treatments…people not broken, just doing something different systematically…can find that structure and adapt it…also to adapt as skill e.g procrastinate anger, or over-eating so never get around to feeling bad, over-eating…i.e take what exists, see how it ‘works’ Vs assume person broken and how to fix…i.e ‘function’ exists in pathology…people maintain it…it is a ‘success’ of sorts…and contains lots of valuable potential skills…

Actualised/integrated Vs broken? DSMIII over 450 pages of pathology Vs health…WWI hysterical paralysis popular, today virtually non-
existent…popular to be ‘border-line’… ‘3 faces of Eve’ 3 Vs Sybil 17 personalities i.e influence of mass media…

Positive and negative hallucinations part of ‘pathology’ can be employed generatively / productively … can teach how to determine difference between ‘made up’ and ‘real’ e.g put black border around any active hallucination as it is made, for later reference i.e how to tell between imagined and real is automatic for some people, others have to learn from them how to do it…

Mental health facilities so unnatural, add to symptoms…put ‘healthy’ people in, and the staff will diagnose them with all manner of mental health disorders, will have problems getting released…

Don’t Freudians hallucinate all sorts of ids, egos, formations etc?

Get initial communication started e.g pinch catatonic to get initial response…n.b people have to WANT to lose symptom…it is often of value as avoidance etc

Enter psychotic’s reality and spoil it for them e.g pretend to be disembodied voice yourself e.g hide speaker in power outlet…say ‘hello’…client ‘you don’t sound the same?’ ‘I’m a new voice, did you think there was only one’…use voice to give new instructions e.g ‘mind your own business’…

People not broken, just learned to do what they do…be amazed…it is amazing…most people’s experience not about reality but shared reality e.g religions not considered crazy, but if one person talks to angel is stuffed with drugs…just make sure get a lot of people to share your hallucination and you’ll be fine…can be positive i.e see what not there, or negative, not see what is there…most ‘theory’ is positive hallucination…most denial is negative hallucination…Science is about rejecting hallucinations when evidence suggests it is such…and accepting NEW realities had previously denied…i.e had negative hallucination of…

Science changes, and world stays same, so clearly it is subjective Vs objective, though tries to be objective…Einstein’s thought experiments are positive hallucination… so science is hallucinations / lies…speculated then tested and sorted by results i.e binge and purge…

Bandler learned this from a client who did this naturally i.e changed brightness of recalled past experience / memory …She Intentionally Increased and decrease brightness (or other sub-modality) of memory to increase intensity of feelings / vividness of the experience i.e internal image…take control of ‘brightness control’ vs let brain decide…. Dim
brightness on bad experience until it doesn’t bother you i.e. loses all its vividness/power… simply fades away, feelings become less intense… rather than let brain decide whether you… one of his clients explained how she did this vs let brain randomly control, and make you feel good or bad in response… won’t bother you at all… will be happy all time, don’t let unpleasant thoughts intrude… sub-modalities unrelated to content… e.g. visual… brightness, color intensity, … make picture so bright it washes out the details can reduce intensity of feelings, though usually dimming makes less intense… can be content contextual e.g. brighten image of candle-lit dinner, Vs fear of the dark… decrease fear by brightening dark-fearful image so can see what there/not there… can vary size of picture… bigger and bigger, then smaller and smaller, and observe how feelings intensify/diminish… note exceptions at either end of extremes e.g. much too large becomes absurd/amusing/ridiculous/laughable… see what relationship works i.e. so gain control of reaction/response and therefore your experience of the memory… e.g. ‘blowing out of proportion’ is literal representation of internal experience… so shrink it down… brighten up a ‘dim future’ so future looks bright… dismal to vivid/vibrant future… consciously change your responses, to control your experiences… change variables of sub-modalities…

begin with visual sub-modalities… brightness, size, move in either direction to see how changes your experience… change one element at a time to ‘calibrate’ to see which sub-modalities have greatest impact… vivid intense bright colors to black and white… distance close to very far away… depth from flat 2D photo to full 3D… duration from quick fleeting appearance to persistent image that stays for some time… clarity from crystal clear detailed to fuzzy indistinct… sharp contrast i.e. difference between dark and light e.g. from stark black and white to continuous gradations of grey… scope vary from bounded framed picture to panoramic picture than extends around behind your head, so you can turn and see more of it… movement change from still slide to movie… speed adjust speed from very slow to very fast… hue change color balance e.g. increase intensity of reds and decrease intensity of blues and greens… transparency, make image transparent so can see what is beneath the surface… aspect ratio e.g. make framed picture tall and narrow Vs short and wide… orientation, tilt top of picture away and towards you… foreground/background vary difference or separation between foreground i.e. that interests you most, and background, the context that just happens to be there, then reverse so that now background becomes interesting foreground…

Go in one direction then the other, one element at a time, so know which one is effecting your experience and how much… start with pleasant experience…
Changing these sub-modalities changes the experience...find what works, then apply it to the memories/fears etc you want to diminish in intensity...and those you want to enhance e.g erotic memory, bad memory, fear of something, hope for something...e.g use instead of coffee in morning...recall great experience and intensify it...imagine great day and intensify it...first find out how they work, then combine together to achieve even more intense changes...e.g. make movie of still slide, make it more colorful and brighter and bring closer to you as slow down speed of film...to intensify its effect/affect on you...can stop before lose temper with someone and make situation ridiculous rather than enraging...recall all good in vivid, panoramic 3D movies, up close and apply opposite to bad recollections/fears/phobia i.e. make into vague, fuzzy, still images, small, distant...etc...

Don’t let small things ruin your day/life...don’t exaggerate them automatically...deliberately minimize them/shrink them...recode experiences in ways that will make you happier/more productive/more optimistic/realistic...

Do with partners, colleagues i.e. instead of blow things out of proportion, shrink them...instead of overlooking positive, intensify and expand it in your mind...so will feel good about it all...avoid getting stuck (still image) in dismal/gloomy/oppressive ‘frame’ of mind...

We tend to depress ourselves...when we can choose to build a positive mindset...by attending to/intensifying selectively/mindfully...so avoid depression, and increase generative/resourceful beliefs/attitudes/approaches...

**Turtles all the way down**: adaptation implies it is solution to an existing problem...concept of ‘niche’...same arguments as my T...if process of adaptation to niches, then niches must pre-date the species coming to fit them i.e. empty species...but infinite number of arbitrary niches e.g. which organism makes a living as grass eating snakes...no ‘natural’ way of dividing world into niches...organisms interact with environment, e.g. trees makes soil, seeds spread by birds and other animals...if natural selection adapting organism, the organism itself changing those niches...nest building requires materials, and the nest becomes part of niche...epistemological errors e.g. human chin turns out to have no objective reality...evolution of chin...neotynic progression...chin appears to grow larger in humans as age, Vs apes virtually chinless...chin does not exist...two growth fields in lower jaw, in which teeth set, and bony part of jaw...regression of one part makes other appear to have grown...
Predictive and explanatory value of concept of ‘adaptation’ evaporates when consider facts…

Perceptual unit ‘ the human chin’ evaporates…neotynic progression, human infants and adults resemble fetal and young forms of apes more than they resemble adult apes…newborn apes and humans skull size same, but as mature apes bodies larger…chin as adaptation concept dissolves…dentary field bony structure of jaw, and alvelor field that holds teeth…it has shrunk faster, over evolution, than the dentary field…so chin mental construct…so question of what function it serves as adaptation, dissolves…meaningless…artefact of our assumptions…

NLP designed as an epistemology…assume genetic limits / potential range …need to refine sensory apparatus…barely realise full potential of these yet, before more onto super-natural … still have huge unexplored potential of what already aware of…so limits well beyond any ‘limit’ to NLP so far…so much unexplored potential … child with any genetic background will adopt / learn language and culture of ANY society it is transferred to…

BUT? … we are not blank slates…pidgins and creoles…pidgin not complete language, merely means to interact at basic levels…Hawaii, Louisisanna, Haiti…two adults interacting, no syntax, tense, aspect…but children develop creole, full spoken language with syntax, tense, etc…so where did Creole come from? … where does syntax come from? … compared to alternative outcomes…pidgin has no syntax, so it cannot be source…two languages of parents, and that of the dominant class exploiting the speakers…syntax unrelated to any of these…it emerges from??? No linguist can describe where it comes from and an rule driven structure… Chomsky argued that innate language centers of brain…why so few languages?…what is filtering it? Same part of brain circuits, language acquisition device LAG of Chomsky…creole consequence of LAG circuits…pre-specified part of human heritate a.k.a ‘deep structure’…

Syntax i.e word order key to meaning e.g cat chased rat, rat chased cat…

MHR ‘whence’ like german ‘woher’…wohin where to…don’t use whence any more…

Flip card movies require you to ‘see’ the cards in sequence, at fast rate…if view too slow, will never see the intended message / movie…

Sublmininal under 24 frames per second person can ‘make out’ i.e ‘see’…ears, eyes, skin ‘tuned’ to different frequency bandwidths…with huge gaps between
these bandwidths we appear to have no sensory receptors for ....we use them for WiFi, radio, television, blue-tooth etc...

MHR as kid though ‘air’ was ‘nothing’...but to birds is is like water to us...a fluid / solid...had to wave my arms about to ‘feel’ air, like wind...and ‘sonic boom’ where ‘crash’ into compressed air ... fill tyre with air...wing ‘compresses’ air so air pressure on top lower than on bottom i.e travels greater distance in same time, so is less densely spread out over surface area of top of wing, than below wing, the ‘aerofoil’...

If live entire life in forest, where longest distance a few meters, have no notion of distance changing perception of size e.g take out to plain, if see an elephant in distance, will not ‘correct’ for distance, and see a tiny animal...have no experience of the effect of distance on visual perception...painters during Renaissance developed methods of adding ‘perspective’ to paintings, to correct for distance, and give more realism to depictions...

If evolution about adaptation to niches, then presupposes empty niches waiting to be filled by evolution of new species...in reality infinite arbitrary possible ‘niches’ you can define e.g grass eating snakes...so concept of ‘adaptation’ arbitrary...organisms actively interact with inherited environment to change it i.e evolution of organism changes environment...seems Bandler like me, rejects idea of functionalism...human chin used as example by biologists...neotiny...chin appears to grow larger as get older i.e infant apes and humans virtually chinless...in fact chin does not exist...chin is mental construct due to one part of jaw bone structure relatively reducing in size, as infant grows, giving rise to appearance that other part is growing. i.e a ‘chin’..., appearing to become more ‘defined’, but merely reflexive i.e ‘chin’ is construct...

Huge range of human alternatives and possibilities Vs evolving to pre-determined limit / outcome i.e ‘adaptation’ to niche...much more open ended...constraints may exist, but ‘worlds upon worlds’ yet to be discovered...

Pidgin Vs Creole...adult workers use of limited use of two languages to communicate W/O syntax, aspect, tense Vs actual new language... with its own NEW syntax, tense, aspect ... Chomsky argued for pre-determined language rules...language acquisition device of Chomsky...LAD...deep structure...Syntax is ‘the cat chased the rat’ i.e word order determines meaning e.g Vs the rat chased the cat i.e same words, different order, gives very different meaning...this is
product of the syntax...Chomsky cannot account for this...we are only species with syntaxically based communication code? How would be known?...

Intervals between exposure to sequence determines the ‘meaning’ ... 24 f.ps ...anything faster will be received ‘subliminally’ i.e not consciously observed...

African travelling in car at speed same problem as me with nausea/migraines i.e I observe too much, overwhelms sensory channels...juggling was called ‘magic’ by early Europeans i.e people couldn’t ‘see’ the movements of juggler i.e too fast to be noted...until broken down into steps (what TROONATNOOR is all about), that we can ‘observe’, then reconstruct these ‘slowed down’ actions, we can then ‘construct’ the faster movements in our heads i.e actually ‘see’ the movements which before we didn’t...i.e appeared ‘magical’ ... now can ‘see’ the actual parts of the whole...

We actively construct ... and if have no experience of ‘slowed down’ or ‘background’ info, we make mistakes...fail to ‘see’ parts...context background that allows us to construct ‘missing’ gaps in our earlier ‘perception’ i.e impressions i.e what to attend to, when, and then ‘join the dots’...

If no experience of ‘distance’ have no experience of apparent size indicating distance from you...i.e merely appears ‘small’, rather than normal sized, but at a distance...MHR like ‘perspective’ in Art...appears had to be ‘learned’ i.e actually used strings etc...compare to Egyptian lack of perspective...???

‘How do you know you are depressed’? How would you know if you were happy? i.e sub-modalities...question of which experiences focus on / filter out / enlarge in own mind, ignore etc...selective recall...focus on positive or negative experiences and projections/expectations...replace/displace habitual negative thinking / ideation with generative / positive ... what is ‘normal’ for one person defined as ‘insane’ by others...

Bandler studied psychology as his choice of major, informatics, was not available...observed Gestalt therapy group...therapists people talking to empty chair and interacting with it...i.e positively hallucinating...imagining family member etc sitting in chair...If can get group to act as if ‘normal’, then everyone will treat something as ‘normal’...i.e mass hallucination ... consensual reality...get everyone to define as normal and will have constructed a ‘social reality’...people express anger towards imagined family member to get ‘resolution’ of an engram...feel better about it...but Gestalt same as angry person picking fight with stranger, taking out emotions/anger/resentments on that person, so feel better after i.e just as effective i.e virtually same method, just different content...
You can pretend you are having childhood again, and go back and change it...unfinished / unresolved can be resolved in this way...Gestalt therapy premise...

‘Secret’ therapy doesn’t require expression of content...put loud circus music over bad / sad / angry memory, and replay it ... so next time recall that memory will have this music playing over...so now same content will produce different affect...experiment...play very in reverse, then run forward again...will change affect of same content i.e will feel differently...syntax changed and thus meaning changed...run ‘movie’ of an event from different participants p.o.v...are you still so sure you were ‘right’ in that situation? i.e justified / logically / sensical? do you owe others an apology i.e will ‘hear’ and ‘see’ from other p.o.v’s i.e ‘to see ourselves as others see us’...probably will be less certain you were ‘right’ i.e when see self from other’s p.o.v...can view argument / own behavior from infinite different positions in space, or p.o.v of child, adult, observer, participant, different historical perspective, different cultural perspective...can remove self from i.e dissociation so no affects at all i.e objective, neutral...observe from distance of time e.g as if looking back on past life from 1000 years in future, or from own deathbed...re: taking out of proportion / distorting...'later when you look back on this, you will be able to laugh about it’...so what happens between now and then to make this possible? Compare what makes ‘future’ different to present re: ability to laugh out...decide what is different, and change current ‘picture’ of event in minds eye as will see it in future i.e so can laugh at NOW...

Why torture self by repeating experience in mind...happens over and over again...adopt different perspective, using dissociation, so become more realistic / reasonable...

Can focus on part of person’s body while they are angering you, so they appear ridiculous in your mind’s eye, and cannot possibly provoke you to anger...

Associated means reliving through own eyes i.e from own p.o.v ... dissociated is looking at from another p.o.v e.g down from above, or watching movie of self...return to past memory and change this i.e if you were dissociated, associate, if you were associated, switch to a dissociated observation...consider the difference this makes to your ‘experience’...

Feel self sitting in rollercoaster... associative much more thrilling than dissociative...switch between

Self-critical is dissociative i.e observing and being critical of self...so if re-live from associative p.o.v won’t be so critical ...will be more sympathetic ...

MHR if significant others always critical of self, and you identify with them e.g critical parent, then may end up adopting this dissociative framing for all self
consideration i.e will tend to be self-critical, which implies dissociated…cannot be so critical of self if your are experiencing from own p.o.v i.e associative…like a judge or jury judging someone, Vs how they would ‘see’ situation if they were the person being judged…

Can be more objective dissociated…how do you feel about feeling angry? i.e not a pleasant feeling…need to observe as observer rather than participant i.e dissociated…enjoy positive feelings associated, and for bad feelings adopt dissociated perspective…so will give more power to good feelings/memories, and make bad ones less potent…during sex need to be associative…but surgeon needs to dissociate…control of pain via dissociation… learn from past mistakes without suffering the ‘affects’… re-live best memories intensely … make this habitual until brain does this automatically…can change quality of life / experience / behavior … allows to learn lesson without increasing suffering…same as for fears…

Bandler works with process and not content…don’t need to talk about content of personal experience to change it…do it in own mind…

self-talk IS a form of NLP i.e programming…literally Neuro-Linguistic-Programming…you program yourself by how you think…you basically tell your unconscious mind what it should be working towards…failure or success…people often sabotage themselves, seeking to 'punish' themselves, in Freudian terms for 'killing their father to take his place with their mother'…many people find the idea of success fills them with guilt…the idea that by being successful, they will make their family, friends, and peers, feel bad, less successful…unless you are committed to your own happiness, that you feel you deserve it, that it will be good for you and those around you, you will not invest all the massive energy, sweat, tears, risk, effort etc etc required to succeed…no matter how talented or how high your potential is…you will sabotage yourself unconsciously 'I don't deserve this', 'How will my success make others feel worse'. you will be your own 'tall poppy syndrome'… you will attract negative people and conditions, and be attracted to negative people and conditions…for fear of succeeding, making your father feel inferior, making your friends feel like losers, and you enjoying privileges and benefits you feel, unconsciously, deep down inside, that you don't deserve…maybe your parents or early relationships TOLD you you don’t deserve to be happy, successful etc…even your school system…reminding you never to smile or show joy at your own success because it would make other people around you feel bad…and you internalised it all… you have to overcome your own objectives…the unconscious ones… find solutions to your internal conflicts e.g I will get that car and holiday, great, and also use my new wealth etc to help others…I will succeed and raise others up with me…I deserve good things as
much as anyone, but I will not get greedy, I will share my success so it becomes
good for everyone... if you believe in you, and your right, and your goodness, you
will project that out to others...many will hate you for it for their own reasons i.e
evy, jealousy, malice...but by projecting a positive / self-belief / self-worth /
confidence/ belief in your own good motives and that you deserve success, you
will project this to others, attract others like yourself, gain others trust and
willingness to give you a chance and take a chance on you...and you will have
more success which will motivate you to work even harder, longer, more
disciplined etc etc...see my other books for details...

Richard Bandler, in ‘Use your brain for a change’

DESCRIBE ‘SWISH’ TECHNIQUE: copied and pasted actual text somewhere in
these notes…

’10 minute’ phobia cures… have client imagine a movie theatre with a screen,
audience, and projection room … imagine they are sitting in the audience… then
have them place a black and white image on the movie screen of the situation just
before their phobic reaction usually occurs (I assume the situation they fear / the
thing they fear appearing, but BEFORE they have had time to have the reaction
to it?) … … then float up out of your body sitting in the audience, and up to the
projection room i.e move their p.o.v so they are now in the projection room
looking down upon themselves in the audience looking at that image …so they
can watch themselves watching themselves on the screen i.e can see self sitting in
audience, and see self in the image on the screen… then change that black and
white image into a black and white movie, and watch themselves, sitting in the
audience (from the perspective of themselves in the projection room), watching
that film, from the moment just before the phobic reaction, to just after it has
been stimulated/occurred/happened…when get to the end stop it there as a
slide…. (Stop the film after it has run through the usual terror reaction).

Now turn the slide back into a movie, after first jumping back into that movie, on
the screen (so you have gone from disassociated to associated i.e you have been
observing yourself as an objective / disinterested observer up until this point, and
now you are going to re-enter into your self in the movie, and experience the
movie as the subject, as yourself, i.e associated …) … now run the movie
backwards, experiencing it as the actor/self/subject in the film, with everything
moving backwards, people walking backwards etc…like rewinding a movie…in
color…take one or 2 seconds to do it… now associate yourself in that situation
that you usually lived in terror of i.e imagine yourself in the presence of dogs, on
an airplane, giving a speech to a large group, confronting someone etc … and
discover that the situation no longer holds any fear for you…i.e your non-
conscious can learn to respond to something neutrally as fast as it originally
learned to respond to it with fear (i.e irrational fear…be careful not to
disassociate from RATIONAL fear / empathy i.e. become a psychopath / sociopath / idiot)… once can do so in your mind’s eye, actually enter the situation in reality i.e. walk over where there are dogs, get in an elevator, stand near a spider… n.b don’t want person to become indifferent to real potential threats, i.e. rational care / precautions e.g. fear of driving cars vs carelessness …

Now run it backwards, so that the entire process from before reaction to terror reaction plays backwards from terror reaction to moment before it set in, so that the entire process takes around 2 seconds i.e. fast … point is that brain learnt the phobic reaction fast, and it can only replace the phobic reaction with indifference fast … like trying to comprehend an explanation made very slowly, one syllable at a time, would make it impossible to follow the explanation, to understand / comprehend … the brain works on processes, like a computer, without understandings / meanings (when you write a computer program all you are interested in is reproducing a process that has the desired outcome, the computer has NO ‘understandings’ or ‘meanings’ … the non-conscious mind (sub/un-conscious mind) is a black box that works the same as a computer program (in fact many people are starting to view the brain and this entire experience as nothing more than a computer program / virtual reality) … so Dilts does not concern himself with content / meanings / sources of phobias … it doesn’t help to ‘cure’ them … because the mind does not learn phobias, or desires, in this way… it learns phobias and desires via association … and the way to UN-learn a phobia or desire is via DIS-association … which is why he has the client dissociate as the observer in the projection room watching themselves watching the film of themselves … in this ‘fastest cure’ the client is dissociated at every level … and thus experiences the ‘terrifying’ thing from an objective external viewpoint … having ONCE played the experience in real time, and then ONCE played the experience in fast REVERSE, from this disassociated viewpoint, the mind dissociates whatever earlier association it had learned … phobias are an example of how exceptionally fast the mind / non-conscious learns … is programmed by experience … Dilts approaches the ‘black box’ of the mind / non-conscious as a computer programmer, which he originally was … coined term NLP to distinguish his collaborative project with from the conventional methods… as a computer programmer he never considered what meanings the computer attached to his code… it was all about heuristics… getting the software computer program to output a certain product / action in the hardware e.g. move a mouse cursor, display a letter/word/image etc … there was no need to consider ‘meanings’ in this context … and the non-conscious mind appears to work on the same model… in that Dilts can cure a phobia etc in minutes … because he accepts that the non-conscious mind works in positives and processes… NOT outcomes … NOT meanings … you don’t tell a computer what NOT to do, but what TO do… in the form of a process, rather than an outcome… you cannot load an image of what you want the computer to do (like Osho would have it) and leave it to write its own program to realise that image (whatever that would mean
to the computer … imagine what the unconscious does when presented with the poster of the sportscar and sexy woman … it has NO meanings … are you asking it for more posters of sportscars and sexy women? … well it will probably lead you to buying more of those posters… But if you want it to realise YOU HAVING sportscars and sexy women, you have to show it the process that is going to lead to that reality … i.e not show the unconscious the posters, but show the unconscious a process / program it can follow e.g study hard, work out, improve your appearance, lose weight, save, (or learn how to cheat people most likely) etc…

Dissociation allows you to ‘learn the painful lessons’ without having to constantly re-experience the pain, to retain the lesson…you can re-play a bad experience as an objective observer, to learn what there is to learn, without having any emotional / subjective experience i.e pain / suffering …

Association lets you invigorate experiences with pleasure, by maximizing the pleasurable sensations / feelings as you replay them … use this to reinvigorate a relationship … disassociate from the negative experiences you’ve had with that person and exclusively associate / re-associate the pleasurable experiences, and you will fall in love with them, again and again … associate with exclusively the negative, and you will end up hating them, and breaking up…demonizing each other as you earlier, when you were ‘in love’ and actively focusing on / associating with the pleasurable experiences, glorifying each other…each situation is equally a product of your own selective association / disassociation of pleasurable/positive and painful/negative experiences … producing ideals…rather than ‘reality’ … you are in love with an ideal and hate an ideal … but the great thing is to realise that you actively did both, whether or no consciously or non-consciously…and now you can consciously CHOOSE to do this…to fall in love with ANY woman, even the one you married and now ‘hate’ … learn to ‘fear’ or ‘hate’ anything e.g smoking, drinking, over-eating, gambling i.e things you are ‘addicted to’ because of their positive associations in your non-conscious, you can re-program by dissociation with the pleasure and re-association with the ‘pain’ … so that you now love your wife, love moderate eating, hate smoking, hate drinking, hate gambling, love spending time with your kids, love learning, … it is all within YOUR power to CHOOSE, once you understand that YOU can program your mind, re-program your mind, as YOU want it to be…you are not helpless…not a victim… MIND CONTROL…you can learn to control your own mind, and take back that control from others, from society, from priests, from banksters, from the propagandists…

Dilts offers another slightly slower, less successful method…have client recall a memory of a past experience of exciting, pleasurable, humorous, and see what you saw at the time that it occurred…anchor self in those feelings with that image … anchor self in the exquisite joy, pleasure, happiness, satisfaction … then have
them ‘turn up the brightness’ of that memory slightly, so it is a bit more intense, vivid, powerful, clear, i.e more powerful impression… (sub-modalities refer to intensity and density and power of the image / picture they have formed in their minds eye… e.g brighter, softer, bigger, further away, bitter, sweet, colorful, high contrast, definition i.e the things that make an experience ‘more’ of what it is or ‘less’ powerful / moving / intense … that make it more of what it is e.g scarier, more peaceful, more wonderful, more colorful, tastier, more fragrant, more emotionally dis/satisfying…) … … then have the thing they most fear into that image …e/g fear of dogs, come / emerge / enter come right through the middle of that picture into that picture …have a dog appear in that picture, in their mind’s eye image… and then brighten the image a bit, so it is even more pleasant /satisfying /rewarding /pleasurable/ enjoyable … i.e the addition of the dog has made it even more pleasurable (replacing the earlier association the non-conscious mind had earlier formed/learned probably just as quickly, and from just as superficial an impression) …And now the client’s non-conscious has learned to associate dogs (which used to leave them terrified) with something pleasant/positive… the phobia is cured…

Disassociation also great for pain relief… instead of experiencing pain from subjective position, as experiencer, just observe self from second position of observer watching you experience that pain… so don’t have to feel it… but still aware of whatever causing it, so can still avoid source e.g relax with migraine, avoid danger if can move away from … like Buddhist monks burning alive / torture training … disassociation … MKUltra used pain to produce disassociation / multiple personalities etc…

N.B require ‘bad’ experiences to learn how to cope in world… but don’t need to continually live in fear / re-experience pain of those bad experiences … ideal is to disassociate self from the experience, so can learn from it without having the pain/ suffering… i.e Zen… reproduce the ‘lesson’ without the pain… like learning from someone ELSE’s experience… so have lesson, growth, but free to enjoy life… otherwise constantly reproduce the pain/suffering/misery/depression…

Phobia cure will work for positive memories too… like when couples demonise each other after divorce…

Uninvolved observer dissociated…

Selective associative / dissociative approach leads people to ‘fall in love’ with someone i.e dissociate from negative parts of person/relationship…

Recall very positive memory… see from own p.o.v … turn brightness up a bit… keep picture, and have dog come right through middle of picture and
become part of picture, while making picture brighter again...to remove dog phobia...

Ask client about sub-modalities associated with their phobia ... do they make image? Still photo? Movie? Is it bright? ... learn how clients generate their phobias, and thus how to reverse engineer, and use same method with other clients i.e how to make something more vivid/ powerful i.e generate NLP...what do people do to produce negative and positive hallucinations...

Good = like, bad = don’t like i.e good and bad memories...bad experiences teach you important lessons, teach coping skills...

I can NOT = I can’t...so means you have found a way NOT to do something...i.e you have a choice to, or not to, so you can, and you can not, it is up to you...how do you know when to be shy? Scared? Angry? Frustrated? Depressed? Happy? Optimistic? Positively expectant? ...Identify sub-modalities i.e what images, feelings, etc generate to feel / respond that way...

Therapists blame clients ‘they weren’t ready to change’...so why did you take their money? Why not tell to go home and come back when ready....Therapists job is to make them ready to change...imagine mechanic saying your car wasn’t ready to change, would you pay him? Client resistant?

If doesn’t work, do it again, louder, more often, for longer? Like shouting at child, punishing more, for longer? More of the same?

‘You’re just trying to...’ just? Discounts everything else in statement...

‘I wasn’t myself”? insanity and multiple personality defence / excuse

Try ANYthing else if what you are doing is not working...ANYthing is better than repeating the same thing louder, harder, longer, more often...

MHR phobia of confrontation obvious way to avoid unpleasant confrontations...BUT why confront people if it is not necessary? What is function of confrontation? Some people will kill you for it. So what is motive? Is it always better to confront people? How do you know who to confront, to feel better? And who not to? What makes something important enough to risk confrontation?

Solutions become symptoms ... e.g avoidance...of pain can lead to inability to enjoy...avoidance of threats via sickness ... fear of intimacy leads to overweight...depression gains attention and sympathy... offer unconscious alternative more effective / less negative side effects solution to replace current ‘symptoms’...what problem is it solution to? Originally? ...rebellion against
overbearing parent via refusing food when mother used food to control i.e anorexia in M & F … assert independence…

Look at behavior rather than client …

Ideomotor signaling…let unconscious say ‘yes’ or ‘no’ via subtle unconscious movements…

Can negotiate with unconscious to only forget specific things i.e to protect, but agree to remember things that are harmless and useful i.e forget to forget, where forgetting practical stuff was symptom e.g forget appointments…

Access clients hypnotic talents…to evoke therapeutic trances…e.g age regression e.g immaturity or emotional immobility can be employed in therapeutic trance…age regression to recall repressed experienced, take client back to time before illness/injury/traumatic experience i.e anchor this and revert to … project self into future where behaving as desire e.g weight control…enjoying sex… anesthesia to block emotional and physical pain can be employed to manage pain etc…i.e 20% of population respond well to hypno-anaesthesia…i.e can be used in lieu of pain killers etc….or alongside conventional pain control… people conditioned to respond with withdrawal to slight provocation i.e emotionally raw after life of abuse or as part of withdrawal symptoms e.g drug use…selective recall to avoid being overwhelmed by traumatic memory… spontaneous dissociation i.e lose sense of time, place, or self…natural talent to help clients distance self from painful experience or lessen physical / emotional distress…many clients slaves to feelings i.e unable to stop preoccupation, need to learn to dissociate…i.e overwhelmed by affects / cognitions / memories i.e too associated…focused attention can be used to induce hypnosis…emotional catalepsy = sustained e.g arm levitation…though can be emotionally stuck in traumatic grief, memory, unable to move forward with life…despair is emotional catalepsy…focus on any symptom i.e sustained focus, can be used to induce trance … can be frozen in mid step by therapist…time distortion – expansion and contraction …everyday … time condensation don’t have enough time, expansion = boredom…can use in trance to allow client all the time necessary even during limited session…time condensation to speed up time when have to wait e.g remain still after surgery for long periods…positive hallucination e.g girl in window, spiders when first open eyes during night…negative hallucination e.g overlook car keys right on table…emotional denial to avoid distress i.e negative hallucination…abusive relationship typical i.e ignore pattern of abuse i.e make excuses…

Expand upon skill client already has, to induce trance, and as part of therapeutic trance…start some momentum towards change…from standstill, slowly begin, then builds up momentum…
Forget about forgetting…use symptom to advantage…symptoms represent solution / ingenuity of unconscious…so employ these talents…

Self-hypnosis e.g MRI…fear of future 30 minutes in MRI scanner…imagine self in favorite place, enjoying time e.g sunbathing on warm day…so time flies, in pleasant manner…i.e using the ability to fear something not yet happening, and to imagine 30 minutes as an eternity, and the hard surfaces as uncomfortable…these are skills that can be employed to achieve the opposite…i.e look forward to luxurious half hour of quality time in pleasant surroundings i.e both what fear and desire represent age regression i.e to future…and relating to 30 minutes as an eternity (in boredom/discomfort) or too short a time (for pleasurable experience) uses same skill of time distortion, so employ it favorably

**Linguistic Deletions** are elements of deep structure ‘deleted’ from surface structure i.e what is expressed…but remains implicit…e.g comparative constructions e.g she is a better woman for me (than whom?)… recover deleted material e.g ‘compared to what/whom?’ … ‘with respect to what/whom?’ … e.g the hardest / best etc … compared to what? …

e.g ‘obviously’ / ‘clearly’? why? What justification for this belief? It is obvious? Why? To whom? In what way? …

Recover full deep structure … to challenge the implicit assumptions … bring assumptions to attention of person by expressing them explicitly…then challenge validity of assumption…i.e discover full linguistic representation…see if valid once revealed in totality… ‘I have to…’, ‘why?’, ‘what will happen if don’t i.e consequence’ i.e finish sentence so complete … repressed fear of what will happen not explicitly stated…can challenge assumption of outcome i.e If you don’t X, will the feared outcome really occur? … e.g Must, Have to… questions to discover deleted material … what would happen if X ? … so know what dealing with…so client knows…Generalisations easily rebuffed with one example and thus collapsed … Need only discover one example that contradicts to ‘resolve’ fear / must / have to … What makes X impossible / necessary / scary … find missing material…e.g WHAT stops you from … ? e.g assumption that monogamy necessary, religion necessary, wealth and status necessary, have to win, have to succeed…rules and generalisations represent limiting beliefs …ask questions to recover deleted material e.g what stops you from X? … Others from X? … represent limits in clients model of options / reality i.e beliefs…ask for what implicit / not said i.e complete expression…reveal deep structure underlying surface structure i.e what said…

Nominalizations … make ‘thing’ of process … nominalization in surface structure e.g assumption of finality of action e.g a decision as if it is final, can
never be changed later, when can always change mind later / decision … e.g
failure is a process that is ongoing, not an event…need to see it that way…avoid
nominalizing it as an event that is finished / done, when it is an ongoing process
that can be changed / managed…translate nominalization back into ongoing
process, to give chance at managing / dealing with it…Our divorce / refusal /
perception / laughter / confusion/ anger…Vs our divorcing, refusing, perceiving/
laughing/being confused/being angry … i.e irrevocable, fixed, finished event Vs
something that can be changed … i.e process Vs thing…can take responsibility
for ongoing process, Vs fait accompli that is beyond your control… then seek out
material that has been deleted i.e why? How? What?

Aim is ‘well formed in therapy formulations’…

Nominalisations can be placed in mental wheelbarrow… so test own expressions,
and those of client, to identify the limiting nominalisations…

MHR state of war is great example…We are at war…when in fact we are
deciding, from moment to moment, to wage war…so can stop at any
moment…cease war…tho offered as fait accompli we have no power over, just
have to fight until die or win…

Women don’t like me? Which women? How do you know? Define ‘liking’. No
woman ever liked you? Generalisations. References vague… e.g ‘women’ or
‘people’ not specific. So challenge. Make ‘well formed in therapy’ statements out
of.

Replace impressions i.e displace, with more desirable / tolerable ones from past
i.e enter trance, and take current inputs and interpret them as pleasant things , or
as part of otherwise pleasant experiences e.g flies on gorgeous day at beach, so
can incorporate irritations into positive trance experience…as in dreams i.e
alarm clock or external disturbance incorporated into dream, so don’t wake
you…unconsciously done automatically … can use to reinforce experience want
to construct out of experience want ‘out’ of…

Relaxation NOT pre-requisite to trance…absorption in narrow band of
impressions / thoughts / feelings e.g own breathing, own emotion, own
experience, … progressive deepening of trance using clients own natural
absorption / interest / focus…naturalistic induction … produces more vivid / deep
trance than artificially forced…rapport / safety / comfort / relaxation / muscular
lethargy/ receptive to suggestion…unresponsive to external stimuli…deepest
trance total disconnection from external world / sense of self…absorb them in
own experience i.e get them focused on self / own experience…on hypnotic
phenomena…to deepen and broaden trance from natural level to more
therapeutically useful…use symptoms they present with e.g hallucinations, time
distortions, i.e natural tendencies of client… e.g muscle tension, anxiety…get
them to focus deeper on what already doing … what comes natural… rather than
directing artificially … though both work in therapy…natural absorption in task
leads to ignoring external stimuli i.e unaware of environment, time seems to ‘fly’
between starting task and coming out of trance state …

Focus on breathing rhythm, racing thoughts, muscle tension, fear, … immersion
in trance free from usual limitations especially possibilities that consciousness
would otherwise reject / deny … observe client so notice what client thinking,
feeling, what state they are in, so can use this as focus / absorption to induce
trance…even to become aware WHEN already in trance…i.e behavioral
cues…learn to ‘read’ client…so know what absorbs client…what can use as
locus of absorption/focus… can use any voice … no one path or tone of voice to
induce trance…don’t get too self-conscious…observe what works, is working, …
each trance experience and client unique…no one trick to use for all clients, or
same on different occasions…internal focus / absorption is aim…not some
‘script’ …

‘Listen to your unconscious mind, to the words it knows you need to hear, it
knows what you need, listen to it’ … seed bypassing of conscious resistance by
encouraging interaction with unconscious…

Though some clients respond better to authoritarian style i.e direction by
therapist…

Focused absorption…use clients symptoms / talents already present…get them to
employ these more intensely, become more narrowly focused / absorbed in
them…increase this focused absorption to induce and deepen trance…

Dissociative client’s talent for dissociation can be used to guide client into trance
i.e utilize client’s usual tendency e.g wandering mind, promote this
detachment…suggest ‘you have nowhere to be, nothing you need to do, you can
just be, relaxed, empty’…but if hypervigilant/ anxious, get client to focus on
pounding of own heart, and racing thoughts, become narrowly absorbed in
them…

Hallucinate balloon lifting arm, so arm levitates…to validate power of
unconscious i.e validate trance…power of unconscious…

Cookbook / mechanical/scripted induction Vs naturalistic…ultimately client
responsible for trance…not therapist…false premise of many therapists…learn to
evoke range and depth of client’s own natural trance talents…

Confusion to A-ha…run backwards return to point of confusion…running it
backwards…so now no longer believe understand i.e open to new ideas…
Observe same experience from different P.O.V i.e perspective…running backwards gives you that different perspective…rather than simply learning from experience from only original perspective…often simply changes how you FEEL about it…changes syntax i.e sequence and therefore meaning …just like in language…(at least English language?)…same events in different order produce different understanding therefore response…so to get most from experience, experience it from multiple P’s.O.V…can play forwards, backwards, divide into parts and replay these in different sequences …multiple different sequences of same elements of one experience…most innovation is like this, taking existing innovation / knowledge and applying it differently e.g oil for light, then internal combustion, then petro-chemicals…

Success can be limiting i.e want to reproduce success, so do things the same way…miss out on all the alternative possibilities i.e opportunity cost of reproducing a pattern / approach / method / belief because it ‘worked’ in the past…

Beliefs dangerous e.g dogma and war / violence / torture …beliefs motivate worst and best in people…can motivate to do worst, and not do best, or vice versa…

Not born with beliefs…conditioned / learned …but feel ‘natural’ and ‘self-evident’ …beliefs about self and world i.e TROONATNOOR…can change self by changing beliefs about self and world …find belief don’t want to have…then think about something you are skeptical about i.e doubt i.e do not believe…compare sub-modalities e.g big, vivid, bright, detailed, framed, constant picture Vs fuzzy, small, indistinct, unframed, alternating appearing/disappearing…observer will see your ‘cues’ i.e which direction looking…posture, etc…find which sub-modalities most powerful at changing belief to doubt to disabuse self of limiting belief (opposite of what propagandists / programmers / conditioners / brain washers do)…by analyzing sub-modalities of doubt Vs conviction …can ‘replace’ sub-modalities of doubt and belief, so now doubt limiting beliefs i.e they no longer have power over you…include physical ‘accessing cues’ others observe in you is a vis a vis doubt and belief, certainty and skepticism…work out what you WANT to believe, and do NOT want to believe, and ‘swap’ sub-modalities…

State new desired belief in terms of process (not outcome), and in the positive i.e what DO want (never want DON’T want)…

N.B beliefs more categorical and global i.e hard to maintain two opposite beliefs, so can displace / replace existing with new … Vs conflicting understandings, which are more easily accommodated …
Multiple personalities represent mind fracturing due to conflicting beliefs i.e. so mind can retain them all... ascribing each a different ‘personality’...

Void can appear if lose a belief, with nothing to replace ... better to have new belief ready at hand to replace it...

Identify limiting / unwanted belief... observe how you represent it i.e. all modalities and sub-modalities... how is it represented in internal experience (World as will and representation)... contrast sub-modality differences between belief and doubt, confusion and understanding, optimism and pessimism, happiness and sadness, fear and hope, satisfaction and dissatisfaction...

I believe I can learn to manage my weight Vs I want to be 50kg or I want to stop eating too much or I don’t want to be fat...

e.g. slow vivid 3D panorama down to fuzzy still frame image ... to weaken it, or vice versa...

Brains learn quickly, not slowly... so expect changes to be sudden too... Vs medical professionals’ idea of ‘slow progress’ over costly repeated sessions of therapy...

Core belief change can lead to major re-organisation of total noetic structure... i.e. locus of belief system... organised around... so change such core beliefs can lead to major re-organisation... associated with lots of sensations / shifts in non-verbal indicators...

Change belief that ‘losing weight will be hard’ to ‘losing weight will be easy’, by changing sub-modalities associated with confidence and pessimism, certainty / doubt, self-belief / self-doubt...

Change belief that CAN learn new things e.g. learn piano ... chunk down task into modules you can learn ...

Expressions, Posture, swallowing, breathing, accessing cues ... unconscious processes ... observe ... bypass conscious thought and resistance via naturalistic language... use indisputable facts and clients idiosyncratic behavior... gain client’s attention / trust ... use truisms appropriate to client to gain rapport / yes set... predict client’s idiosyncratic responses to surprise client e.g. cold reading ...

Access, observe, and utilize client’s voluntary and involuntary behavior... adaptive resistance, and unconscious process...
Listen and observe to determine client’s dominant representation system. Visual people use language full of visual metaphors, figures of speech... e.g. everything looks dark and gloomy, the future looks threatening, I see terrible things ahead, I don’t see any chance of improvement... mirror/match/pace their language usage i.e use visual references / figures of speech...

Breathing, blinking, fluttering eyelids, pulse, heartbeat, sweat, tension/relaxation of limbs / posture, swallowing, changes in skin color/tone, facial muscles e.g. smile, frown, all manner of emotions indicated, pupil dilation... can predict next likely action / state of mind ... Visual/Auditory/Tactile language corresponding to language client uses... matching client’s breathing facilitates rapport and trance induction i.e pacing suggestions with clients inhalations and exhalations Erickson believed... indirect language allows us to image we are in control / self-determination i.e. offer illusion of choice / freedom of will VS direct command... so use indirect / permissive language, allow client to choose to respond, and how... freedom to refuse one alternative while pondering / choosing the other... ‘when you come to a fork in the road, take it’... easier on ego, and more respectful of client... also unconscious knows best / better than you... encourage unconscious to seek own answers... perhaps, maybe, you might, I really don’t know... so therapist not required to know anything of content etc...

Predict inevitable so when happens gains clients trust / belief in process / placebo fxt/ self-fulfilling prophecy...

Most trusting, motivated, talented, confused often respond to direct suggestions, so often it will be appropriate... e.g. cataleptic inertia of depression... some clients need clear direction to overcome childhood directions e.g. not to enjoy sex / be sexual etc... i.e nurturing authoritarian often wanted by client... permissive of... to replace childhood directives against sexual enjoyment... asking for permission from authority figure to displace earlier directions... want to be told what to do to overcome internalized childhood directives... open to direct suggestion / direction...

Direct inductions involve authoritative language, concrete predictions of hypnotic phenomena, simple declarative affirmations prescriptive solutions... trusting, motivated, positive expectations, sense of urgency, highly hypnotizable...

Hypnotic scripts can be used openly or secretly... formal inductions... can wait until their eyes closed, or read from script openly i.e. tell them this will work... sure this is perfect for them etc...

Still, eyes fluttering... cues that in trance, open to suggestions...
Memorise Erickson’s inductions to use as scripts…incorporate into own inductions…can tailor to particular client’s needs…i.e their dominant representation systems…

Cataleptic = ‘stuck’ …

Pacing, leading, yes-set, so become open to suggestions…accepting of new ideas

Match their emotions…then suggest alternatives that open up… You really wonder…You really don’t know how you will…x, y, z i.e escape current situation, and move onto achieving desirable new states…

Trance depth often not necessary in attaining goals…utilization breadth of individual talents of client more efficacious…So once client exhibits trance behaviors / indications they are in some level of trance, simply continue to suggest greater absorption in these phenomena / trance experiences e.g. lose self in them…increase immersion in dissociation / association / time distortion-age regression… slower breathing rate typical of trance state…’slow down and take things slower / easier’…

Resistance is adaptive self-protective behavior…ward off threats to familiar reality…durable unconscious barriers to change…psychological prison…resistance is a solution like any other symptom…access these and utilise as part of strategy of therapy…embrace defenses…2 layers / types of resistance…Firstly active/passive resistance to induction of trance…Second is preference for safety of known maladaptive behavior over uncertainty and anxiety of change…i.e fear of losing control / change … MHR so make change seem sexy, exciting, positive, i.e new is better / offers more, focus on benefits rather than risks…

Make client comfortable with idea of trance i.e pleasant everyday experiences of … get lost in thoughts? … Daydreaming… so feel more comfortable about idea of trance…

Permissive language allows disruption of rigid perceptions…puts client in control…instill hope, co-operation…cover all possibilities e.g. predict ‘perhaps you will enter trance quickly, slowly, or in some other way that feels more natural to you’ …re-framing identifies positive aspects of symptom … chronic pain client pain re-framed as positive feedback that there is a problem, but feedback can be toned down to more bearable level i.e so can reduce experience of pain … while retaining actual feedback… makes manageable…change perception of situation…reduce level of pain, and duration of pain i.e allow as feedback, but reduce suffering it produces…duration and level of that suffering…

‘Can you focus / think of one thing so intensely that you can shut out the external world?’
Client can interpret permissive language as choice among alternatives, put them in charge of experience, as if of their own volition / intention...can disrupt rigid, fixed, conscious perceptions...chose among alternatives Vs have to accept/reject single direct suggestion puts client in charge of own experience...

Covering all possibilities...predict ‘perhaps you will enter trance quickly, perhaps you will...slowly, or in some other way that feels more natural to you’...all options lead client in direction you want...

Firewalking shatters old belief...but assumption ‘If I can walk on fire, I can do anything’ is ‘junk’ belief ‘installed’ by a stunt...opens mind up to possibilities i.e challenged assumption...but what was assumption? ... anyone can walk across hot coals without any training...(6 hours preparation) 1.5 to 1.9 seconds duration of walk...10 foot...about 2 steps on each foot...0.5 seconds contact per step...burning requires heat transfer...contact time and conductivity determine transfer of heat...e.g steel feels colder than sheepskin...steel heated to same temperature...Leidenfrost effect...thin vapor between relatively moist foot sole and coals protects foot from heat transfer...most people’s supposed beliefs have no impact on their actual behavior...exceptionalism typical e.g golden rule not reciprocal...also question of intentions i.e well intentioned act of violence e.g inquisition...what beliefs actually limiting person? ... belief can’t walk on hot coals? ... how is it a model for other beliefs? ...

NLP about process rather than content...installed belief must be ecological / holistic...Bandler flunked Psych 101...Got ‘D’ for public speaking...few people who ‘can’, can teach ‘how’ others can be taught how to do this...

Most people cannot visualize same as the teacher...so teacher’s approach doomed most to failure...question of how people learn...

Study people who can do thing well, and model their behavior Vs study what does NOT work, to teach how it should work?

Maths phobia...bad feelings triggered by association with bad experience of math etc...need to replace these anchors / sub-modalities with positive associations...using typical ‘swish’ process...or at least ‘neutral’ anchors...Frogs into Princes, anchor integration...

School experience typically negative, boredom, frustration, discomfort and learn to associate these sub-modalities...computers more patient, no prejudices...more fun...

More about learning how to find and use information than to memorise it...
Most of us have amnesia for most of school years…to remember it, would have to re-experience the bad feelings…and who wants to do that?

Being told to forget something, over and over, tends to reinforce recall of it…

Auditory recitation slower then visual e.g remembering ‘times tables’ auditorially Vs visually … speed readers don’t ‘hear’ words in mind, simply see words … don’t verbalise in head…

Remember names by typing name on a picture of them…or focus on something unique about that person as hear their name, then look away to visualize that feature while repeat name in head / write it on the picture…can adapt to auditory system i.e what unique / distinct about their voice / tempo / tone / pitch…if use all three major representational systems increase chances of recall…i.e recall image, sound, etc… if put keys in same place each time, more likely to remember…Vs if keep putting keys down in different place…can construct mental filing cabinet…file item in same place each time to strengthen connection between location and object … aim to recall as little as possible i.e chunking, grouping as meaningfully as possible…e.g 357 is 356+1 i.e days of year…

Can chunk series of numbers as years, or any other pattern that occurs to you…i.e code new data in terms of existing data…

Learning difficulties / handicap Vs teaching disability? Kids failing or teachers failing? Blame victim of system…teachers want ‘excuse’ for their own failure…blame on some ‘condition’ of kids…i.e take responsibility off system / teachers…stop looking for new ways to try to teach… give up on kids…

Reframing…reframe need for control…using presuppositions that speak to conscious and unconscious at same time…how and where will change occur…so conscious wonders how and where, while unconscious ‘hears’ suggestion that change should occur… ‘just how comfortable can you become’…and you won’t let yourself go into trance too quickly…so give conscious mind something to attend to/focus on/ absorb in, while suggestion bypasses conscious therefore its resistance, and unconscious can ‘hear’ and attend to…

If client has history of failure at therapy, and assumes won’t be able to enter trance, reframe current ‘challenges’ as ‘talents’…state positively that on the contrary, you have observed a number of distinct ‘talents’ in the client, that will serve them very well in terms of entering trance…give trance ratifying experience… take typical occurrence e.g have you ever lost track of time? Talent
for time distortion…need to reframe negativity as hypnotic talent…’ As you go into trance, you can continue considering X and Y … your ability to concentrate will help enter trance i.e. go with resistance…

Erickson projected hypnotized clients to time in future after successful treatment, and asks them what Erickson had done to bring about these changes…then Erickson used these ideas …

Get client in trance to meet with future wiser, happier self, so can advise self about what can do to change…also presupposes success of therapy, self-fulfilling prophecy… basically asking unconscious for what it already knows a-la Buddha, ‘remember’ Vs discover

Use of metaphor in hypnosis…Erickson’s stories captivating…seeding suggestions to coax into trance by telling stories…every culture has own myths…people use stories to make sense of their world i.e cannot logically explain mysteries of life, so revert to poetry, myths, stories, legends…human dilemma of choice … logical/practical Vs following your bliss i.e. heroes’ journey…

Stories universal, speak to our unconscious…story lets us dissociate as passive listener…lessons enter unconsciously…while we are being entertained consciously…therapeutic metaphors…anecdote… which is relevant to client…animal stories, legends, fairy tales, jokes, song lyrics…with appropriate message…appropriate to clients symptom formation / needs and offer alternative solutions so client can replace these symptoms with more generative / positive solutions…

MHR suggestion as ‘seed’, can’t control when and how will sprout and blossom…just plant the suggestion in unconscious…

Fear of being dependent on others, being a nuisance, can be turned into chance to give loved ones a chance to show their love, affection, gratefulness for everything they have done for them…tell story of how it helped you deal with a loved ones death, by knowing what a great benefit you could provide them in their last weeks…to make it easier for them to accept help, not feel shame etc, a burden etc..

Challenges in story should mirror challenges faced by client … metaphor / analogy for…characters face same challenges, and have client’s unconscious resources…prepared for journey into unknown…hero beats odds to succeed i.e. hope / self-fulfilling prophecy… often have ‘helpers’ e.g. trainers, friends, wise teachers…
Allow own unconscious free reign…trust in it…observe non-verbal responses to see if your story is ‘hitting the mark’ … or if trance deepening…ensure your metaphor is increasing your rapport with client…it has engaged unconscious on one level, as engaged conscious on another…keep hopeful, honest and cannot do any harm…at worst miss mark, and have to try a different tack…

Logic of saying if brain damaged here, and person can’t talk, then this must be ‘talk’ center of brain …when in fact child can re-learn everything after losing one hemisphere of brain…or most of skull full of fluid university student…no new neurons formed after birth? In canary some cells grow, then die off, seasonally, more plastic than much theory suggests…

Literacy-Reading = connect meaning with sound first, then to associate image with that sound i.e word…so now literate…i.e auditory association then visual association…so why ‘reading problems?’

Ritalin slows kids down so teachers can keep up with them…allow kids to endure boring disinteresting lessons…Ritalin speeds up adults though…and perfectly safe with no harmful side effects? So why not give Ritalin to teachers instead? Few ‘teachers’ or Psychiatrists willing to take ‘harmless’ medications they happily force children / patients to take… Drug abuse? Teachers commonly and regularly take valium etc to ‘calm down’, sleep at night, but teaching kids ‘just say no’, and forcing many to take drugs…

‘The Swish’ NLP Generative programming…e.g for breaking bad habits…NLP pattern to replace nail biting etc with alternative action / habit…automatic…not aware have started till have already been doing it some time… work out typical scenario where habit usually kicks in…then imagine that scenario…produce image of what see in mind / outside, just before begin habit e.g reaching for smoke, drink, food, getting angry/frustrated/despairing… what see just before begin habitual action … imagine scenario where habit usually arises to do this…Now imagine how would see yourself i.e new you, without that habit i.e value / benefit of stopping this habit …now vividly visualize image of what happens just before habit usually kicks in… then imagine a small dark image of the ‘new you’ that would result from ‘breaking’ that habit i.e with all the benefits e.g confidence, empowerment, sex appeal, success e.g of breaking over-eating, smoking, drinking, nail biting, getting angry, getting frustrated, getting irritated…then perform the ‘swish’ … make the small dark image quickly get bigger and brighter until it covers the other image, in less than one second, then immediately totally blank screen completely or open eyes and look around…then repeat 5 times, blanking screen or opening eyes after each time… now …always start with big bright image of typical action, then replace with swish of ‘new you’ without that habit… swish pattern gives mind new direction…directionalises mind…behavior tends to move in same direction as
mind… move from unpleasant to pleasant image… can do behavioral
test…original impulse will be translated to some other compulsion / impulse i.e
replace negative habit with positive habit…change response to original situation /
idea i.e trading compulsions…will no longer ‘desire’ the habit e.g chocolate,
tobacco, alcohol… can quit smoking in 11 minutes… original stimulus (that you
automatically respond to) is called ‘cue image’ i.e it ‘cues’ the habit / provokes it…like in any script / screenplay…sets up stage for habit to be repeated e.g
stress leading to cigarette / alcohol / anger / frustration… so ‘cue’ this image i.e
the factors that tend to precede the unwanted habit / desire / urge …could be
another person acting out in some way … and the habit is your response…test
your ‘new self’ i.e if broken habit, by ‘cueing’ these typical stimuli…see if feel
old impulse…if do, repeat the swish process again… if still feel original habitual
urge, work out what doing wrong…first picture has to be from your own p.o.v e.g
see hand with cigarette in it? Or seeing cigarette? i.e what fires off impulse,
precedes impulse? Just seeing packet? Seeing own hand reaching for smoke?
Seeing other person offering you a smoke? New behavior NOT substituted for
old i.e no specific behavior / content…just new DIRECTION i.e the new, better
self is the motivation for the unconscious to take this new direction… so ‘it
doesn’t fit with the way I see myself” … generalized therefore more powerful
than particular…unconscious can generate new behaviors faster than any
conscious action could i.e too specific…not generative…simply replaces one
with other…whereas this approach is more profound for personal evolution…set
up new direction…will be drawn towards new image i.e liking self more, feeling
in control, feeling more attractive, self-empow…

Stepping into new self was old technique…but required very detailed notion of
that new self…if anchor confidence in incompetent person dangerous i.e
overconfident, unaware of own competence…need to seek competence i.e open
ended…and image of self will direct unconscious to seek out the competence,
and not just allow delusion of / false sense of security / confidence…

Make sure don’t take more than 2 seconds to do each swish…brains don’t learn
slowly, they work fast… like speaking very slowly, words no longer connected in
context of whole, so lose meaning…so do fast…key to process…brain learns
fast, so do it fast…5 times…should not take long…pause in between each
repetition…test if worked…nonverbal responses … observe client smelling
cigarette and see if compulsion present i.e can see the desire in features…have
client imagine smelling tobacco, seeing fresh packet, being invited to smoke with
someone…need to test immediately, and repeat process until it works…test
rigorously right away…where hasn’t worked, try something else…

This is a simplified version of a more general pattern…
Can swish in all sub-modalities / systems...but usually the visual works without engaging smell, taste, feelings, auditory etc...

Erickson first to develop ideomotor signaling, but limited its use to trance induction and trance deepening and trance ratification...communication with unconscious via...expression of unconscious process e.g. blushing, automatic head nodding, facial gestures, posture...interpret these gestures ...initiate communication with unconscious via finger signaling, pendulums...

Later employed for exploring and re-integrating unconscious...to bypass resistance, and communicating with unconscious...conscious resists, so deal with unconscious directly...ideomotor signaling...unconscious mind offered finger movements to indicate yes, no, don’t know, don’t want to answer...acknowledge any conscious intervention, then ask to allow unconscious to express self i.e. remain out of...observe for difference between conscious and unconscious finger signaling...creative use of clients idiosyncratic motor movements i.e assign meaning to each, to allow unconscious to employ...e.g unconscious can use with post hypnotic suggestions...to remind client of suggestion...e.g. nose itch = unconscious signal...can get unconscious to signal when have reached deep enough trance for work...convenient unobtrusive means communicating...resistance is unconscious effort to protect self...better to gain insights into them, rather than directly challenge...

Re-direct current symptoms i.e. liabilities, as assets i.e. represent talents e.g. time distortion, age regression, hyper-hypo awareness/sensitivity to criticism and pain, positive and negative hallucinations (fail to see good, hyper-aware of any negatives etc)...hypnotic talents...trance talents...discover representation preferences e.g. auditory, visual, kinesthetic...employ to advantage of client...start long term road to open positive future i.e. overcoming symptoms just start of generative cycle to self realisation...redirect hyper-vigilance from negative to positive i.e. become more aware of pleasurable sensations, positive responses from people, positive experiences / feedback...‘You may wonder how soon it will change, and what pleasurable positive changes are on their way to you...

What is ‘function’ of symptom? Go back to just before first appearance...e.g avoidance...first time experienced period pain allowed way out of undesired social interaction...unconscious offered this solution to avoiding interaction...offer alternative ways to avoid...i.e. menstrual pain let off the hook by parents, and gave self sense of entitlement to avoid...i.e. needed excuse, so unconscious provided in form of debilitating pain / sickness / illness / ill health / migraine / headache / nausea...
Inner re-synthesis, re-organization, re-association, by patient themselves, vs direct suggestion…

Being ‘dumbstruck’ is form of momentary trance…

Therapeutic trance should be extension of existing skills as therapist / doctor…ego-strengthening suggestions should be part of every session, to instill hope and prepare client for change…stabilization and preparation for further interventions…empower, re-affirm strength, sense of self-control Vs overwhelmed by situation/circumstances…chronically weak ego self-destructive, show clients capacity to enter peaceful, centered state of consciousness and experience power of unconscious for good / improvement…positive trance ratification, revisit positive past experiences, emphasize strengths / positive anticipation of relief and positive changes ahead for them…natural normal and expect…will gain confidence and strength, calm, deeper understanding…state all suggestions in positive terms…

Brains learn to go in directions Vs achieve results / objectives…i.e so imagine process and general outcome in terms of feeling of success…not actual objects…i.e everything is ‘process’…Vs any state / outcome / result…so aim to set own directions …or someone else will…

Chef Vs cookbook reader…understanding of process Vs following directions …

So investigate / observe / find out what happens when you change some sub-modality… analog can be changed gradually over range Vs digital which is either / or …

Repeat swish using distance from you (rather than original size) as representative system i.e sub-modality i.e bring picture closer, remove to distance …to see impact of these changes…

Brightness and size powerful for most people, distance is also important to many people…if none of these prove important to person, need to find ones with greatest impact, and perform ‘swish’ with these…

Need to set up ‘swish’ by observing language / accessing cues of client, to choose representative system and sub-modalities that are dominant / most powerful on client’s belief system / strategies…

Get client to teach you how to do what they do i.e manifest their symptoms e.g how do you work yourself up into such a state? How do you build up fear? How do you distort time / age regress…i.e how limiting belief / compulsion achieved? What is amplified, exaggerated, distorted to generate the limiting belief /
behavior / phobia / compulsion (to smoke, drink, eat, get angry, hate self, deny self pleasure, defeat self, etc)…

How do they ‘create’ their problem? What say to self, imagine, visualize, focus on…what is critical sub-modality i.e habitual ‘swish’ they perform to achieve their undesired state i.e positive / negative hallucination etc i.e how get self into state don’t want to be in…changing brightness of image changes intensity of feeling? …Synesthesias…what changes to ‘picture’ make their response weaker or stronger… e.g narrow problem picture down to vertical line, then expand that line back out, to a wide picture of the solution image…

How does client get to panic state? What process follows? What sub-modalities engaged / important i.e changes to…

Visual system Vs auditory i.e simultaneous Vs more sequential i.e can load two pictures at same time i.e see both at same time, and change both at same time…auditory can be harder to swish…harder to pay attention to two voices at once…

Dovetail joint held by different angled nails / screws / joints, so vary at least 2 powerful sub-modalities at once, so person won’t be able to easily ‘un’ do your work…i.e ‘nail it shut’ …as people usually only vary one sub-modality at a time, on their own, and to undo this swish, would need to vary two at once…

Can do auditory components of swish as client swishes with pictures…yourself…using their voice, while they do visual swish, you do the auditory swish mimicking their voice…don’t need to match perfectly, just get a few distinct characteristics, so they won’t notice whether it is you or them that is talking…

Discover 1 or 2 most powerful analog sub-modalities most important in producing the limitation…limiting belief / picture for client…Association in first and dissociation in second key element of swish…THEN get client to imagine image of self without that limitation / problem / symptom …i.e how client would see self differently if they didn’t suffer from that limitation / symptom / problem…this second internal visualization must be Dissociated, while the first much be associated)… Next build switch using 2 analog sub modalities identified as important / powerful…first get client to make associated picture of the cues, using whatever sub modalities create the strongest response… a big bright picture…now have them form dissociated picture of themselves as they would like to be, beginning with the opposite extreme of those same sub-modalities e.g small, indistinct, vague, dim picture…when swish, those sub-modalities will change so as to rapidly weaken the response to the first picture, at the same time as they rapidly strengthen the response to the second picture…
Try and try again, until find sub-modalities that work…if doesn’t work at first tries…but practice will let you identify most powerful sub-modalities via non-verbal accessing cues etc…sub-modality accessing cues…

Can create problem situation and observe for behavioral cues as to what going on internally in them…to calibrate sub-modalities…even if client not aware of themselves…and to covertly judge if they are really doing what you ask them…with practice become more observant / sensitive to subtle behavioral cues…all sub-modality shifts are accompanied by some external behavior / cues / tells…

e.g when someone brightens a picture, head rotates back and up, but when picture comes closer, head moves straight back…i.e accessing cues…so observe them as ask them to make particular sub-modality changes, for the appropriate ‘cues’ or ‘tells’ that unconsciously occur…these will reveal/betray if they are doing what asked or not…behavioral shifts called sub-modality accessing cues…

Check by asking ‘Are you sure you are doing it right?’ so they will repeat, and you can observe…sometimes client needs to practice a few times…so ask that question, so she will have to repeat…a few times…each time faster and easier as less conscious each subsequent time…

You can tell immediately if you have produced a change or not…brain learns quickly…sets client in evolutionary direction i.e becomes basis for a whole range of future changes…doesn’t define destination, only direction…often foundation for generation of totally unpredicted outcomes client not aware of i.e eliminate some particular phobia, but this is merely start of new journey / evolution…catalyst for wide ranging improvements in clients life…often most important experiences in our lives, that led us to huge positive changes in the long run, were not obvious at time, or appeared to be ‘bad’ experiences…frustrating, confusing, painful, embarrassing, irritating…

Meta model questioning…i.e surface structure interrogated…so material which enactment technique implicitly recovers is…to provide close approximation of reference structure from which impoverished portion of linguistic representation derived…to provide more ‘well-formed in therapy’ conditions / linguistic representations…

The therapist subjects the surface structures to the ‘well formed in therapy’ conditions using meta-model questioning which interrogates to ensure material which enactment technique makes available implicitly is recovered in a completely explicit manner…makes available close approximation to the reference structure…includes verbal and analogical forms of communication…fuller representation…via enactment…to compare to clients verbal description…are feelings being explicitly represented?...sensations i.e sub-modalities…is client hearing self and others in dramatization?
Guided fantasy...create new experience in fantasy...sometimes more compelling than reality...renew energy, start new direction in life...something no previously fully represented in their mental model...i.e don’t have experience of desired process e.g success...happiness...confidence, so need to manufacture ‘experiences’ of such...create situations haven’t had in life...February man...reference structure...offers more choices, resources...tool...therapist can observe client producing a representation ...i.e how client does this...what most powerful sub-modalities for client...therapist may use questions to get client to report of feelings, sub-modalities as creating them...e.g inability to get angry / confront / express anger, has never done this...no examples of ‘success’ to draw on i.e to undermine generalisation ‘I cannot’ ... ‘Its impossible’...so give them a fantasy scenario that challenges generalisation i.e ‘You did / I did, I can’...

Get client to explore vague feelings...give details of what hear, smell, see, fear, as ‘enter’ that situation feared / limiting belief situation...new reference structures/experiences expand client’s model i.e belief in own efficacy / can do / I can...fantasy problem resolved leads to real life problem resolved by unconscious i.e challenge clients limiting general belief of self / world by offering a similar class of experience in fantasy ...face that fantasy fear efficaciously, gives experience / reference structure of success in facing fear...as phobia’s generalisations, only need 1 positive exception to undermine it i.e noetic structure limiting belief embedded in...dramatise experience that contradicts generalisation...create experience that contradicts this generalisation via guided fantasy...

Double bind can be employed...i.e client’s response contradicts clients assumption / generalisation e.g I can’t say no to anyone’...challenge to say no to some people...when they say NO to therapist, this is itself an example of saying NO, without feared consequences...so whatever client does, double bind ensures client has said NO to SOMEONE...e.g case of client who said NO to significant other in past with terrible consequences, generalized fear of saying NO to ANYONE...re-enacting that past experience may not resolve problem...so use therapeutic double bind technique i.e if client refuses to say ‘NO’ to participants in group, is implicitly saying NO to therapist...at some point therapist points this out...and that no bad consequences occurred i.e therapist fine, no-one hurt...so client has generated experience in contradiction to her general rule ...so ‘cause-effect’ relationship proven untrue...can give client ‘contract’ i.e ‘homework’ to do certain things between sessions...‘I can’t try anything new as I might fail’...fear of consequences of failing...so therapist gave client homework to try something new and fail at it...creates double bind...because she is trying to fail at it...contract a double bind...so when she fails at it, she is succeeding...or if she actually succeeds at trying something new, she has ALSO contradicted her generalisation ...nothing bad happened either way...she tried and failed and thus succeeded, or failed at failing and thus succeeded in her ‘try’...
Representative systems/maps other than linguistic…analog Vs digital… digital is natural language system i.e either or…Vs body language which has ‘degrees’ of response … voice quality is analogical though expressing digital i.e natural language…dreams contain analog and digital…full linguistic representation is derived model/representation of full system…i.e most complete representation system…total life experience…complete model…reference structure for all analog and digital… how to represent and communicate our experience in any/all of the possible representational systems… having headache is kinesthetic representation of some experience i.e as headache…pain as feedback…can shift representation systems i.e express experience visually rather than kinesthetically…have client form image of headache i.e visual representation of what the pain/feedback/headache is currently expressing…

Consciousness does not have available all the knowledge that is in the unconscious, which actually governs our perceptions and behavior.

You can induce trance most subtly and easily by simply letting a person focus on what is of most interest to them. Trance is initiated when they become absorbed in something they are really interested in. This is the basis of all indirect induction of trance.

why do your subjects become so absorbed in their interest areas that trance behavior is evident? We all talk about what's intensely interesting to us in normal conversations every day without falling into trance.

E: Because I stick to that one thing!

R: The conversation does not jump to something else. You focus on one thing, you intensify that absorption, and that's what trance is.

E: I don't let the conversation jump to anything else. Yes, trance is a focusing on one thing. Watkins has written a paper describing a trance as dropping all the peripheral foci and narrowing it down to one focus. I agree with that.

Conditioned responses can be effectively established even when the subject is not consciously aware of the stimuli !!!! MILTON ERICKSON’S EXPERIENCE…PROVES HOW POWERFUL / DANGEROUS MASS MEDIA MUST BE i.e PROPAGANDA…CONDITIONING…

our theory of hypnotic phenomena
Erickson: E: One time you didn't know those were your hands, so you tried to pick up your right hand with your right hand. It took you a long time to learn to pick up your left hand with your right hand and your right hand with your left hand. So you have a whole bank full of memories and understandings, and all I do is say something that touches upon those memories. Yesterday when I said, 'Try to stand up, I tapped into your memory bank to a time when you couldn't stand up. And there was a time when you couldn't sit down because you didn't know what sit down meant. There was even a time when you didn't know you were a people. All I needed to do was tap into your memory bank and you couldn't talk.

R: That is our theory of hypnotic phenomena.

In these closing remarks you are actually giving a clear outline of our utilization theory of hypnotic suggestion. Suggestion is not putting something into the subject; suggestion is the process of stimulating memories and ideas that you already had that can be acted on by the subject. Suggestion is simply the process of evoking the subjects' own internal associations and helping them utilize these associations for new purposes. All so-called hypnotic phenomena are actually dissociated bits and pieces of behavior that were once normal in earlier stages of development and the initial stages of learning.

E: Knowing things and not knowing them at the same time. [Erickson tells another of his favorite stories about his daughter Christie, who screamed and carried on for seven days until she finally stood up and took 142 consecutive steps the first time she walked. She just knew she was a people and thus had to prove it.]

Trance Induction: The Early Learning Set

E: Now sit with your hands on your thighs like this. And just look at one spot there. And just look at it continuously. You do not need to talk. You do not need to move. You actually do not need to move. Just look at that one spot. And many years ago you went to kindergarten, first grade. And you were confronted with what seemed then an insurmountable task of learning the letters of the alphabet in all their many forms. And it seemed an insurmountable task. But you did form mental images for every letter of the alphabet. And you formed mental images of the numbers. And you formed those mental images to remain with you for the rest of your life.

R: Here you induce trance without any initial introductory remarks because this professional man already knows its therapeutic possibilities and he has a positive expectation about it. This early learning set induction (Erickson, Rossi, and Rossi, 1976) tends to facilitate age regression by indirect ideodynamic focusing that evokes early learning experiences. This activation of early learning
experiences is a foundation for the hypnotic phenomena you will later evoke. Ratifying Trance: Body Language in Trance

While I have been talking to you your respiration has changed, your pulse has changed. Close your eyes N ... O ... W.

[Pause as the patient's eyes close and his head bows down very slowly, bit by bit, until it almost touches his chest]

You go deeply into a trance and enjoy the feeling of comfort and satisfaction all over.

[Pause as patient's body tips forward a bit precariously]

You can lean back in the chair.

[Pause as patient's body reorients back comfortably in the chair]

R: You begin your process of vocal conditioning with your slow drawn-out N . . . O . . . W and then emphasize that in a deep trance one can enjoy the feeling of comfort and satisfaction all over. This is a form of indirect suggestion because we know that such comfort is a characteristic of trance.

E: My emphasis on satisfaction all over includes his scalp, nose, buttocks, and penis.

R: The patient does not recognize this as an indirect suggestion by generalization: Since his penis is the problem his unconscious will tend to automatically focus some of that suggested satisfaction there.

E: The fact that his body tips forward may be an indication that he is leaning toward the light of love; he had been leaning away from it after his wife died.

R: Leaning forward may be an indication of a positive rapport. Does that mean that a leaning backward or pulling in a direction away from the therapist is an indication of a negative transference reaction or a problem between therapist and patient?

E: It can indicate a difficulty with the ideas being presented. Posthypnotic Suggestions Initiating Somnambulistic Training: Being in Trance Without Knowing It

And now I want you to realize something. Shortly after you awaken I'm going to say something to you.
R: This posthypnotic suggestion is a way of initiating somnambulistic training. It is a very easy suggestion to accept because after a patient awakens he naturally expects you will say something. He doesn't realize, however, that when you do say something, you're actually giving a posthypnotic cue that will initiate another trance. Your earlier research (Erickson and Erickson, 1941) indicated that subjects reenter trance when receiving posthypnotic cues and carrying out posthypnotic suggestions. When you begin to say something after trance, they will tend to reenter trance even though their eyes may be open and they may act as if they are awake. This is your definition of the somnambulistic state: A person acting as if he is awake but capable of following the therapist's hypnotic suggestions.

E: Yes, with hypnotic training you want them to be content with the thought that they are awake.

R: Even though they are really not. Do you define that as the somnambulistic state? The patient thinks he is awake, but he is following you so closely and is thereby capable of carrying out so many hypnotic responses that we say he's actually in an altered state called trance. He is not critical and initiating his own behavioral directions; he is waiting for your suggestions. He is in trance without being aware of it.

E: I once told a subject to act as if he was awake with all of us who were in the room. But when a totally unexpected person came in the room, the subject could not respond to his presence. He never heard the newcomer speaking to him.

R: Indicating that there was a special rapport with those already present in the room that excluded any strangers. Such an intense state of rapport is characteristic of somnambulistic trance. I'm beginning to believe that patients are frequently in somnambulistic trance without the hypnotherapist recognizing it or knowing how to use it.

E: I certainly agree! Most have such fixed and rigid ideas of what somnambulistic behavior is. [The senior author goes on to point out how subtle changes in behavior that indicate the presence of therapeutic trance are frequently missed by many therapists. See Erickson, Rossi Rossi, 1976.] Utilizing Patients' Motivation to Reinforce Suggestions

And you can be surprised that you ever really have doubted yourself.

[Pause]

R: You throw in a therapeutic suggestion here?

E: To reinforce the preceding posthypnotic suggestion.
R: You utilize the patients' own motivation for therapy to reinforce your suggestions.

E: All your suggestions in therapy should be a connected whole. Hypnotic Amnesia Facilitating Somnambulistic State

Now it isn't necessary for you to remember what I say to you in the trance state. But your unconscious mind will remember. But all of us know very little about what the unconscious mind knows.

R: This is a permissive suggestion for amnesia. You don't command amnesia—that might only arouse conscious resistance. You are apparently letting the patient do something easy: It isn't necessary for you to remember. This implies that it's too hard to remember (as we all well know from many experiences in everyday life.)

E: If you tell anyone they have to do something, they invariably come back with they don't.

R: You then admit Your unconscious mind will remember. But all of us know very little about what the unconscious mind knows. This tends to reinforce amnesia and the role of the unconscious while depotentiating the importance of his more limited conscious mental sets. This emphasis on conscious amnesia and the significance of unconscious functioning is another way of facilitating the somnambulistic state. Deepening Trance by Rehearsal

I'm going to arouse you and put you back into trance.

E: Awakening and putting a patient back into trance repeatedly is a way of deepening trance (Erickson, 1952).

R: Is it also a way of further depotentiating his conscious orientation, a sort of confusion approach to somnambulistic training?

E: Yes, you're training the patient to respond in a therapeutic way.

R: You're training him to respond to you.

E: And you base your therapeutic suggestions on his own patterns of behaving.

R: By deep trance you mean that the patient is following you very closely in accord with his needs. Questions as Direct Suggestion in a Permissive Manner

And you are going to do everything I ask you to do. Can you be surprised at your ability to make true whatever I say?
R: Your first sentence here seems to be a shocking authoritarian demand for obedience.

E: Everything I ask you to do. I did not say, Do what I tell you to do.

R: When you ask, you are actually making a permissive request that the patient could refuse. Then you follow it up with a very innocuous-sounding but strongly reinforcing question about being surprised at your ability to make true whatever I say?

E: Even infants like surprises.

R: A surprise also implies that the unconscious will be active and surprise the conscious mind.

E: Too many therapists tell their patients to do this or that rather than ask. That's an iron hand covered with a lot of velvet. Discharging and Displacing Resistance: Use of the Negative

And you will make true whatever I say, will you not?

E: You will, will you not? If anybody is going to use the negative, it had better be me.

R: If the patient has a resistance in the form of a no within, then your use of will you not? tends to displace and discharge the no. Beginning students in hypnosis are usually trained to express suggestions in a positive manner. That is a valid approach. You assume, however, that resistance in the form of contrary trends is always present. You therefore use negatives in this rather curiously concrete way to pick up the patient's negative and convert it into a constructive direction. This does not make sense from a rational, left-hemispheric point of view, but it may be effective because trance is a right-hemisphere phenomenon, where such concrete transformations are easily possible. Hypnotic Poetry Bypassing Conscious Resistance

In spite of any thinking you do, what I say will be true.

R: This poetic couplet is another way of dealing with resistance. Many patients fear that if they have contrary thoughts during trance, the therapeutic suggestions cannot be effective. Your couplet reassures them on this point. The smooth pattern of sound and stress in this couplet suggests it may be an example of Snyder's Hypnotic Poetry (1930), which bypasses the critical, intellectualistic left-hemisphere so it can be accepted by the right.
E: I'm bonding my therapeutic suggestion to whatever resistance he may have within.

R: In this case you don't necessarily eliminate resistance but rather add your therapeutic suggestions to it. It's a way of utilizing the patients' resistance so that whenever they express it to themselves, they find themselves also expressing the therapeutic suggestion. This is especially important for this type of patient, who seems so cooperative in his manifest behavior. Since he is so cooperative on the outside, his resistances must be hidden within. You therefore utilize this inner resistance by adding a constructive suggestion to it without even having to bring it up with the patient. Apparent Trance Awakening and Spontaneous Reinduction: Individual Characteristics of Somnambulism

Take your time and mentally, silently, count backward from twenty to one. Awakening one-twentieth of the way at each count. And begin the count now.

[Pause as P appears to awaken in about one minute]

Pretty hard to awaken wasn't it?

P: Um-hum.

[E answers the phone, and as he does so P closes his eyes and evidently goes back into trance.]

E: And it's hard to awaken, but you can awaken again.

[Pause as P opens his eyes slowly. He does not reorient much to his body, however, so we may presume he is still in trance.]

And awaken with a very comfortable feeling.

P: I feel comfortable.

E: Why did you go back into trance the second time?

[Pause as P looks perplexed]

Your unconscious mind understands a lot more than you do.

R: It's an indication of his intense somnambulistic rapport with you that he closes his eyes and goes back into trance when you remove your attention from him by answering the phone. He is now following your earlier posthypnotic suggestions.
that he would go back into trance after awakening. If he were really awake, he might have moved about a bit or related to me since I was right next to him. But he completely ignores me and all the recording equipment. Deep trance does not mean a patient is stuporous or unconscious; it does mean that a patient’s attention is intensely focused on what is relevant, so that everything else is ignored. You ask him to awaken again, but he only opens his eyes. When you tell him to awaken with a very comfortable feeling, he responds in an almost exact paraphrase, I am comfortable. This exact following of your words is another indication of the somnambulistic state. Why is he perplexed when you ask him why he went into trance the second time?

E: There is a retardation of intellectual processes that easily leads to perplexity in the somnambulistic state.

R: So here we have three characteristics of somnambulism: (1) the intense rapport; (2) the exact following of the therapist’s remarks that are in accord with the patient’s own needs; and (3) the lack of mental initiative. The somnambulistic state does not mean the patient is an automaton but that he is extraordinarily well related to the therapist.

E: It’s his conscious mind that is perplexed. I verify that by adding that his unconscious understands a lot more than he does. I keep out of the situation; don’t say, I know what’s going on. I say, Your unconscious knows.

R: Are there any general characteristics of somnambulism, or do we have to pick them out as highly individualized manifestations in each person?

E: You have to pick them out for each individual; they will vary depending upon the purposes of the patient.

R: This patient showed little initiative in his somnambulistic state, but other persons might show a lot - expressing their fantasies, etc. Is there a general difference between an active and passive somnambulism?

E: This patient did not like what he was receiving from himself, therefore he remained passive in order to get what he could from me. That’s why I worked for amnesia and perplexity to depotentiate his conscious sets.

R: Those were ways of depotentiating his habitual conscious attitudes so that an unconscious search and process could be initiated to facilitate a therapeutic response. Thus, even when the patient is in a very passive and receptive state, you do not resort to directly programming him with what he is to do. Rather you make an effort to help him sidestep his own conscious limitations so his unconscious potentials can become manifest.
E: The patient had better believe in his own unconscious. Hypnotic Phenomena as Early Patterns of Behavior: Implication Evoking Early Psychomotor Patterns? Two-Level Communication for Therapeutic Suggestion via Metaphor

E: And all of your life since the age of one you have known you could stand up. Right?

P: Um-hum.

E: And now you know you can't. Try it. You can't. [Said very quickly and softly]

[Pause as the patient makes a few slight abortive movements with the upper part of his body and looks about, a bit distressed]

E: Since the age of one you have known you could stand up implies that before the age of one you could not. At the same time this is a two-level communication dealing with his problem in a metaphorical way: Not being able to stand up is like not being able to get an erection.

R: You choose a hypnotic phenomenon that has an unconscious connection with his psychological problem, so that when you later resolve the hypnotic phenomenon (allow him to stand up) you may also be resolving his sexual impotence to some degree. This is an unusually clear example of indirect therapy being done on an unconscious level. This also appears to be an unusually clear example of your utilization approach to hypnotic phenomena. Do you believe that you are actually evoking an early psychomotor level of not being able to walk and then utilizing it as the basis of this hypnotic phenomenon? Hypnosis is not just imagination; it is based on the activation of the relevant neurological circuits—very often those from infancy and early childhood.

E: Yes. Those infantile and early childhood patterns have a long history

R: Because of their long history they have a certain prepotency within us; they have never been really extinguished, and when properly activated they can be expressed in behavior. It is usually more effective to activate such early psychomotor patterns by indirect means such as implication, because a direct command could evoke the doubting attitudes of consciousness that in turn block the hypnotic response.

E: You deal with the patient as a total historical being. You can rely on those neurological tracks and memories of long duration much more than you can on the very recent ones.

R: It would be well for the hypnotherapist to study early childhood development to gain a more adequate understanding of the type of phenomena he can evoke as
well as hints about how they may be evoked. Most if not all hypnotic phenomena are actually early patterns of functioning. This is a distinctive aspect of your work: you believe you are evoking real mental mechanisms and unconscious processes in hypnotic phenomena. It is the utilization of an individual's early experiential learning rather than hypersuggestibility or imagination per se that is the basis of hypnotic phenomena.

E: Patients can only respond out of their own life experiences. The Creative Process of Therapeutic Analogy

E: And now you truly know how an idea can take possession of you.

[P closes his eyes and appears to lapse deeper into trance]

E: In mentioning that he now truly knows how an idea can take possession of one, you are by analogy referring, of course, to his problem: Just as an idea can prevent him from standing up, so can an idea prevent his penis from standing up.

R: He probably closed his eyes again because of a sudden realization of standing up having those different meanings?

E: Closing his eyes probably corresponded to the inner search and unconscious processes that actually create that meaning. To grasp such an analogy requires a creative effort on his part. Because it is his own creative effort, he is less likely to reject it than if it was simply thrust upon him as a direct statement. Two-Level Communication: Further Somnambulistic Training

E: And rouse again and feel very comfortable all over.

[Pause as P opens his eyes again]

How do you feel about not being able to stand up?

P: Well, it didn't bother me. I didn't want to stand up.

E: And now you can't remain seated.

[P looks around and stands up, seemingly a bit embarrassed for a moment or two]

Now you can sit down

[P sits]

E: When he said he didn't want to stand up, that implied he had a choice. On an unconscious level it also means he has choice about his penis not standing up.
R: I see - he may want to make that choice at times. He may be using two-level communication here without quite realizing it. The further suggestion that he can't remain seated in this context now has the symbolic meaning of not being able to keep his penis down and may account for his apparent embarrassment at this point. It is also a means of further training in somnambulistic behavior wherein he follows your hypnotic suggestions even while acting as if he's awake.

E: To say that he can't remain seated is therapeutic on an unconscious level. Notice that I carefully avoided saying You have to stand up. I wanted to avoid the stand up issue because he had such difficulty with his penis standing up that it could have defeated the hypnotic suggestion on an unconscious level. Part Two: A Rapid Hypnotherapeutic Approach Utilizing Therapeutic Symbolism with Hand Levitation: Hemispheric Interaction in Trance Induction and Suggestion

E: I want you to enjoy this experience. One or the other or both of your hands will lift up toward your face. And no matter how hard you try to press down, it's going to lift up toward your face.

[Fingers of the patient's right hand lift tentatively, and then the whole hand lifts with a gentle, bobbing motion]

And you can't stop it.

[Pause as P's right hand slowly approaches his face]

And there is nothing you can do to stop it.

[Pause as the hand bobs up toward P's hairline]

A little bit higher. There is nothing you can do to stop your hand from feeling hair.

[P's hand approaches and finally touches the hair on his head]

The feeling of hair, and you can't stop your hand from doing that. And now you know that whenever you wish your penis can stand up and feel hair.

[Pause]
